4. In a sash-fastener, the combination of the pivoted spring captive-quadrant lock-bolt 21, the captor-cord 31, that when said lock-bolt is not engaged holds it captive, the spring 27, that when said bolt is released by said cord throws it into its engaged position, the keeper 34, and the safety-box 81, the said box having the anti-rattler locking-surface 82, against which said bolt locks, substantially as described.

5. In a sash-fastener, the combination of the countersunk boxing of the spring-lock, embedded in one of the sash-rails, the keeper-plate having its safety-boxing 81 embedded in the corresponding sash-rail, the pivoted quadrant-bolt, the spring that projects said bolt into engagement with said keeper-plate, the captor-cord 31, the captor-plate 58, that holds the initial end of said cord, the serrated rack on said captor-plate, the pivoted pawl 66, whose point when the spring-bolt is held captive engages with said rack, the spring 67, that projects said pawl, the trip-bolt 75, having the elongated neck 77, and the trip-bolt-carrier lugs 50, between which said elongated neck is seated and works, substantially as described.

6. In a sash-fastener, the combination of the window-sill, the boss 80, embedded in said sill, the upper and the lower sash, the spring-lock countersunk in the meeting-rail of one sash, the keeper countersunk in the corresponding meeting-rail of the other sash, the captor-cord 31, secured to the spring-actuated bolt of said lock, the perforate seat 33, in which said cord is secured, the serrated rack and grooved captor pivoted plate 58, the perforate seat 62, in which the other end of said captor-cord is secured, the pivoted spring-pawl which engages with said rack, the trip-bolt 75, that vertically surmounts said boss 80 and when the sash is closed strikes the same and trips said pawl from engagement with said rack, substantially as described.

7. In a sash-fastener, the combination of the spring-lock 8, the captor-cord 31, that controls the action of the spring-bolt of said lock, to which bolt it is secured, the pivoted captor-plate 58 with its serrated rack 65, to which captor-plate the other end of said cord is secured, the pivoted spring-pawl 66, the automatic trip-bolt 75, the key-seat stem of the journal-shaft of said captor-plate, and the key that operates the same, substantially as described.

482,281. WRENCH. GEORGE B. STEVENSON, Chicago, Ill. Filed May 4, 1892. Serial No. 431,809. (No model.)

Claim.—In a wrench, the rigid jaw having a transverse slot, the forward wall c of which has its upper portion beveled and its lower portion straight and also having the longitudinal slot which extends into the shank or handle thereof and is open on the upper or outer side of said handle and has its lower wall in advance of the transverse slot beveled downwardly and forwardly, in combination with the movable jaw having a threaded shank or stem arranged in the slotted head and

shank or handle of the rigid jaw, and a threaded nut arranged on said stem and within the transverse slot of the rigid jaw, the whole adapted to operate substantially as specified.

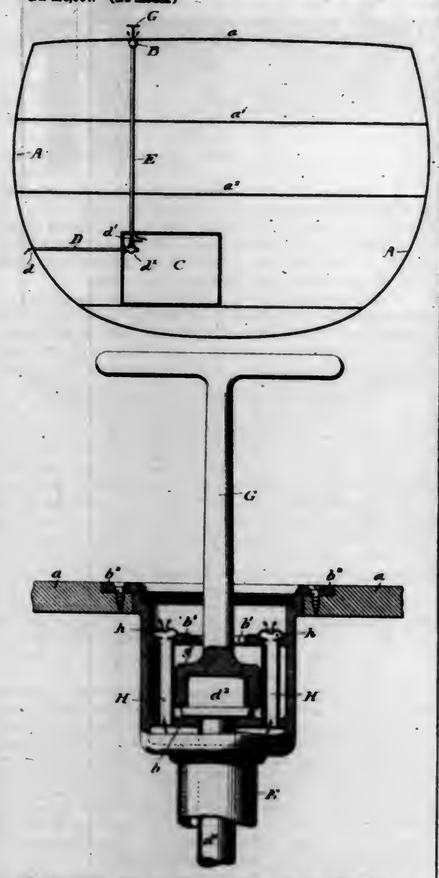
482,282. DEVICE FOR FLOODING SHIPS' MAGAZINES. WILLIAM TAIT, Philadelphia, Pa., assignor to the William Cramp & Sons Ship and Engine Building Company, same place. Filed Apr. 13, 1892. Serial No. 428,967. (No model.)

out of registry with said opening cannot be withdrawn, substantially as set forth.

3. In combination, in a ship, a magazine or compartment to be flooded, a water-inlet thereto provided with a flood cock or valve, a valve-stem leading from said cock to a casing or deck-plate and terminating therein in a key head or socket located above a tight diaphragm through which said stem passes, a casing or deck-plate provided at or near its lower portion with a tight diaphragm and near its upper portion with a diaphragm or cover having a non-circular opening through it, an air-pipe leading from said magazine to said deck-plate and surrounding said valve-stem, one or more alarms opening through the tight diaphragm of the deck-plate, and a valve-key the valve-stem-engaging end portion of which is conformed to the key-head or socket

---

482,284. FRUIT PITTING AND SPREADING MACHINE. JUDGE D. THOMAS and EDWARD E. THOMAS, San José, Cal. Filed May 4, 1892. Serial No. 431,826. (No model.)



wardly upon the table after being cut, substantially as herein described.

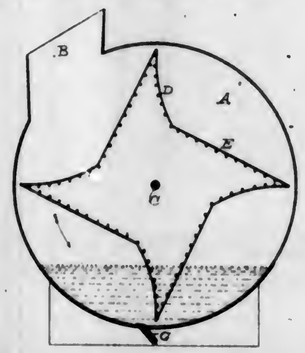
5. In a fruit-pitting machine, the reciprocating carriers, the inclined delivery-channels by which the fruit is delivered in proper position to the carriers, stationary and movable knives by which the fruit is split and the pits separated therefrom, inclined plates by which the two halves of the fruit are separated and laid side by side, and a reciprocating rake by which the fruit after being thus laid is drawn backwardly and delivered and arranged upon a tray beneath the table, substantially as herein described.

6. In a fruit-pitting machine, the carriers, the knives by which the fruit is split and the pits separated therefrom, means for turning

shank or handle of the rigid jaw, and a threaded nut arranged on said stem and within the transverse slot of the rigid jaw, the whole adapted to operate substantially as specified.

482,282. DEVICE FOR FLOODING SHIPS' MAGAZINES. WILLIAM TAIT, Philadelphia, Pa., assignor to the William Cramp & Sons Ship and Engine Building Company, same place. Filed Apr. 13, 1892. Serial No. 428,967. (No model.)

Claim.—1. In combination, a magazine or compartment to be flooded, a water-inlet thereto provided with a flood cock or valve, a valve-stem leading from said cock to a casing or deck-plate and terminating therein in a key head or socket, a casing or deck-plate provided with a diaphragm or cover having a non-circular opening through it, and a valve-key the valve-stem-engaging end portion of which is conformed to the key head or socket of the valve-stem and registrable with the key-opening in order that it may be introduced through it, the arrangement being such that the key can only be introduced when its stem-engaging portion or socket registers with the key-opening, and when so introduced applied to the key-head and with it turned out of registry with said opening cannot be withdrawn, substantially as set forth.

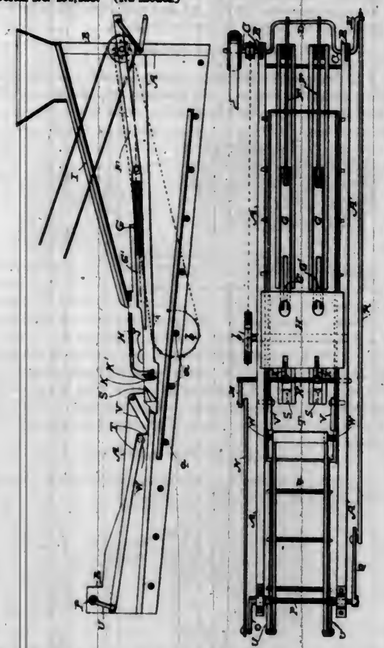


2. In combination, a magazine or compartment to be flooded, an air-pipe leading from said magazine and terminating in an alarm, a water-inlet thereto provided with a flood cock or valve, a valve-stem leading from said cock to a casing or deck-plate and terminating therein in a key head or socket, a casing or deck-plate provided with a diaphragm or cover having a non-circular opening through it, and a valve-key the valve-stem-engaging end portion of which is conformed to the key head or socket of the valve-stem and registrable with the key-opening in order that it may be introduced through it, the arrangement being such that the key can only be introduced when its stem-engaging portion or socket registers with the key-opening, and when so introduced applied to the key-head and with it turned out of registry with said opening cannot be withdrawn, substantially as set forth.

3. In combination, in a ship, a magazine or compartment to be flooded, a water-inlet thereto provided with a flood cock or valve, a valve-stem leading from said cock to a casing or deck-plate and terminating therein in a key head or socket located above a tight diaphragm through which said stem passes, a casing or deck-plate provided at or near its lower portion with a tight diaphragm and near its upper portion with a diaphragm or cover having a non-circular opening through it, an air-pipe leading from said magazine to said deck-plate and surrounding said valve-stem, one or more alarms opening through the tight diaphragm of the deck-plate, and a valve-key the valve-stem-engaging end portion of which is conformed to the key head or socket of the valve-stem and registrable with the key-opening in order that it may be introduced through it, the arrangement being such that the key can only be introduced when its stem-engaging portion or socket registers with the key-opening, and when so introduced applied to the key-head and with it turned out of registry with said opening cannot be withdrawn, substantially as and for the purposes set forth.

4. In combination, a compartment to be flooded, a water-inlet thereto provided with a flood-cock or valve, a valve-stem leading from said cock to a casing or deck-plate and terminating therein in a key-head d^3, a casing or deck-plate B, provided with a diaphragm or cover $b^\times$, having formed through it the key-opening b', and a valve-key G, having a socket g externally conformed to the key-opening b' and internally to the key-head d^3, the arrangement being such that the key can only be introduced when its socket registers with the key-opening, and when so introduced applied to the key-head and with it turned out of registry with said opening cannot be withdrawn, substantially as and for the purposes set forth.

5. In combination, a compartment to be flooded, an air-pipe leading from said compartment and terminating in an alarm, a water-inlet to said compartment provided with a flood cock or valve, a valve-stem leading from said cock to a casing or deck-plate and terminating therein in a key-head d^3, a casing or deck-plate B, provided with a diaphragm or cover $b^\times$, having formed through it the key-opening b', and a valve-key G, having a socket g externally conformed to the key-opening b' and internally to the key-head d^3, the arrangement being such that the key can only be introduced when its socket registers with the key-opening, and when so introduced applied to the key-head and with it turned out of registry with said opening cannot be withdrawn, substantially as and for the purposes set forth.



482,283. FRUIT-DIPPER. EDWARD R. THOMAS, San José, Cal. Filed Apr. 13, 1892. Serial No. 429,048. (No model.)

Claim.—1. A fruit-dipping apparatus consisting of a wheel rotating within a casing having a dipping-trough in the lower portion, said wheel having buckets formed with curved surfaces D and straight surfaces E, both composed of open network, substantially as herein described.

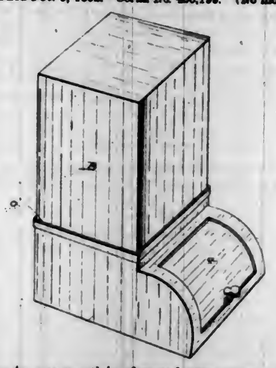
2. An apparatus for dipping fruit, consisting of a casing having a dipping trough in the lower part, an open front from which the fruit is delivered, a closed back, and a supply chute or hopper at the upper back portion, in combination with a wheel journaled within the casing, having network-buckets adapted to receive the fruit which is delivered through the supply-chute and carried down into the liquid in the trough, and corresponding network-extensions from the rear of said buckets by which the fruit is swept out and discharged from the front of the machine, substantially as herein described.

482,284. FRUIT PITTING AND SPREADING MACHINE. JUDGE D. THOMAS and EDWARD E. THOMAS, San José, Cal. Filed May 4, 1892. Serial No. 431,835. (No model.)

Claim.—1. A fruit-pitting machine consisting of horizontal reciprocating vertically-slotted carriers having the elastic sides between which the pits fall, a table beneath which said carriers reciprocate, said table having holes made through its surface to receive the fruit and deliver it to the carriers, and inclined-channeled chutes in which the fruit is automatically placed with its longest diameter in a vertical position and by which it is delivered to the holes in the table, substantially as herein described.

2. In a fruit-pitting machine, the horizontally-reciprocating carriers having the front ends slotted vertically with elastic sides and the concaved depressions adapted to receive and retain the fruit, a table beneath which the carriers reciprocate, having holes made in it of such diameter as to allow the fruit to fall through the holes and guide it to the carriers, inclined chutes by which the fruit is automatically placed with its longest diameter in a vertical position and by which it is delivered into the openings in the table, stationary knives fixed in the table beneath the carriers, projecting upwardly in the slots in the same so as to split the lower part of the fruit as it is moved over them, and sickle-shaped knives fixed to a shaft journaled across the lower part of the table, with a means for partially rotating said shaft, whereby the edges of the knives are caused to split the upper part of the fruit and to press upon the pits and force them downward through the slotted front ends of the carriers and through the corresponding slots in the lower part of the frame, substantially as herein described.

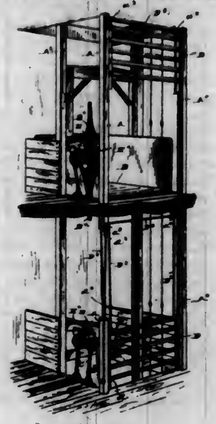
3. In a fruit-pitting machine, the horizontally-reciprocating carriers having the slotted elastic front ends and concave depressions in which the fruit is received, the inclined delivery-channels by which the fruit is automatically arranged with its greatest diameter in a vertical direction and in which it is allowed to roll down a table having holes in line with the lower ends of the delivery-chutes, into which the fruit is received therefrom and by which it is delivered to the carriers, stationary knives by which the lower part of the fruit is split as it is forced over the knives by the movement of the carriers, sickle-shaped knives fixed to a shaft, by which they are caused to split the fruit from above and force the pits down between the elastic front ends of the carriers and the openings in the table, and receiving-trays placed beneath the table, into which the pits fall, substantially as herein described.



4. In a fruit-pitting machine, the horizontally-reciprocating carriers, the inclined feeding-channels by which the fruit is placed and delivered to the carriers, stationary and semi-rotating knives by which the fruit is split and the pits forced out of it, and inclined plates or shares by which the two parts of the fruit are separated and laid outwardly upon the table after being cut, substantially as herein described.

5. In a fruit-pitting machine, the reciprocating carriers, the inclined delivery-channels by which the fruit is delivered in proper position to the carriers, stationary and movable knives by which the fruit is split and the pits separated therefrom, inclined plates by which the two halves of the fruit are separated and laid side by side, and a reciprocating rake by which the fruit after being thus laid is drawn backwardly and delivered and arranged upon a tray beneath the table, substantially as herein described.

6. In a fruit-pitting machine, the carriers, the knives by which the fruit is split and the pits separated therefrom, means for turning the two halves of the fruit and laying it properly upon the table, a reciprocating rake and the inclined pivoted plates upon each side of the table or frame, pins projecting from the sides of the rake, which move up the inclined plates as the rake moves toward the carriers and allows the rake to drop from the rear ends of said plates, so as to draw the fruit backward in its return stroke, the pins passing beneath the pivoted plates on the return movement, substantially as herein described.



7. In a fruit-pitting machine, the reciprocating carriers, knives by which the fruit is split and the pits removed therefrom, reciprocating rakes by which the fruit is drawn backward from the carriers and knives, carriers situated beneath the table, adapted to support drying-trays, and a means by which the tray is moved rearwardly during each reciprocation of the rake, whereby the fruit is evenly delivered and spread upon the trays, substantially as herein described.

482,285. GROCER'S CADDY. CORNELIUS TOOHEY, San Francisco Cal. Filed Feb. 3, 1892. Serial No. 420,199. (No model.)

Claim.—As a new article of manufacture, a grocer's caddy consisting of a base having an open top and provided with a horizontal ledge surrounding its inner walls below said top, and a removable top B, having its lower end adapted to enter said opening and rest upon said ledge, substantially as herein described.

482,286. ELEVATOR-GATE. ENOCH D. TOOPS, Indianapolis, Ind. Filed Apr. 23, 1892. Serial No. 430,215. (No model.)

Claim.—1. The combination of an elevator-gate mounted to slide between vertical posts alongside a hatchway, cords running over appropriately-arranged sheaves and connecting said gate with a pair of stocks pivotally supported at their lower ends alongside the hatchway, and a spreading device mounted on the elevator and arranged to come between said stocks and force them apart as said elevator comes to the proper position, whereby said gate is automatically operated, substantially as set forth.

2. The combination of an elevator-gate, a pair of vibrating stocks arranged alongside the hatchway, cords running over appropriate sheaves and connecting said gate with said stocks, and a cam secured to the side of the elevator and arranged to pass between said stocks, whereby they are spread apart and the gate elevated, substantially as set forth.

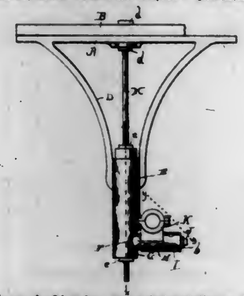
482,288. CAR-COUPLING. SANFORD R. WILLIAMS, Monmouth, Oreg., assignor of one-half to J. J. Malloy and Susie Malloy, same place. Filed Dec. 24, 1891. Serial No. 416,051. (No model.)

mental reservoir, an open-end tube passing through the float from top to bottom and secured water-tight, a rod passed through said tube, having a lateral projection near one end resting against the end of the float, a key engaging the rod and resting against the other end of the float, a valve for controlling the supply of fluid, and connections between said rod and valve, whereby the latter is operated by the slightest movement of the float either up or down, substantially as set forth.

5. In a lamp, the combination of the main reservoir, the supplemental reservoir having a valve-piece in its base, provided with a screw-threaded stem fitting within a central screw-threaded opening in the base of the supplemental reservoir, said valve-piece and its stem having passages, a pipe connecting the passage in said stem with the duct 16 and socket 19, the stem 21, fitted in socket 19, the filter 65, placed in duct 27, and the burner, supplied with fluid from the supplemental reservoir, said socket 19, duct 18, socket 8, duct 13, and socket 12 being in direct vertical line, so that the sediment arrested by the filter may be removed by removing the follower, substantially as set forth.

11. The combination, with the main reservoir, the supplemental reservoir, and the pipe communicating at one end with said main reservoir and at the other end with a duct in the center of the bottom of the supplemental reservoir, of a valve-piece having a stem communicating with said duct and having a branch extending radially toward the

Claim.—1. The combination of an elevator-gate mounted to slide between vertical posts alongside a hatchway, cords running over appropriately-arranged sheaves and connecting said gate with a pair of stocks pivotally supported at their lower ends alongside the hatchway, and a spreading device mounted on the elevator and arranged to come between said stocks and force them apart as said elevator comes to the proper position, whereby said gate is automatically operated, substantially as set forth.



2. The combination of an elevator-gate, a pair of vibrating stocks arranged alongside the hatchway, cords running over appropriate sheaves and connecting said gate with said stocks, and a cam secured to the side of the elevator and arranged to pass between said stocks, whereby they are spread apart and the gate elevated, substantially as set forth.

3. The combination of the elevator having the cam rigidly secured to its side, a pair of pivoted stocks arranged alongside the hatchway and provided with sheaves and antifriction-rollers, the elevator-gate, and cords running over appropriate sheaves and connecting said gate and sheaves on said vibrating stocks, said cam being arranged to pass between said antifriction-rollers on said stocks and spread them, whereby the gate is operated, substantially as set forth.

4. The combination of the elevator-gate, the vibrating stocks pivoted or hinged at their lower ends alongside the hatchway and formed to engage with appropriately-formed tracks at their upper ends, cords connecting said gate with said vibrating stocks, and the device secured to the elevator for spreading said stocks, whereby said gate is operated, substantially as set forth.

5. The combination of an elevator-gate arranged to slide in vertical ways, cords upon which said gate is hung, and means for operating said cords so as to raise the gate, one of said cords being connected with the operating mechanism and the other being fastened securely at one end and extended through a loop or around a sheave on the end of said first cord and formed with a loop in its other end through which the cord which is connected to the gate extends, one end being connected with one corner of the gate and the other end passing to the other side and being connected to the other side of the gate, substantially as set forth.

482,287. SHAFTING-HANGER. AUBERT H. WAGNER, Chicago, Ill. Filed Dec. 31, 1891. Serial No. 416,710. (No model.)

Claim.—1. In a shafting-hanger, substantially as described, the combination, with the beam B, the top plate connected to said beam, the hanger-arms depending from said top plate, the vertically-disposed sleeve E, carried by said hanger-arms, and the sleeve G, loosely mounted in the sleeve E and carrying a journal-box, of the vertical rod taking up through the sleeve G and through the top plate A and the beam B and having threads at its end and at intermediate points in its length and nuts mounted on said rod, substantially as and for the purpose specified.

2. In a shafting-hanger, the combination, with the sleeve G and the interiorly-threaded sleeve extending laterally from said sleeve G, of the sleeve loosely mounted on the interiorly-threaded sleeve and having an annular flange at its outer end and a threaded rod headed at its outer end and taking loosely through the end of the loosely-mounted sleeve and into the bore of the threaded sleeve, substantially as and for the purpose set forth.

3. In a shafting-hanger, the combination, with the sleeve G, the interiorly-threaded sleeve extending laterally from said sleeve G, and the sleeve loosely mounted on the interiorly-threaded sleeve and having an annular flange at its outer end, of a threaded rod headed at its outer end and taking loosely through the end of the loosely-mounted sleeve and into the bore of the threaded sleeve and a nut or washer mounted on said threaded rod on the inside of the annular flange of the loosely-mounted sleeve, substantially as and for the purpose set forth.

4. In a shafting-hanger, substantially as described, the combination, with the vertically-disposed sleeve E, hung as described and having a slot in its lower portion, the sleeve G, loosely mounted in the sleeve E, and the sleeve extending laterally from the sleeve G and through the slot of the sleeve E and supporting a journal-boxing, of the vertically-disposed threaded rod and nuts mounted on said rod, substantially as and for the purpose set forth.

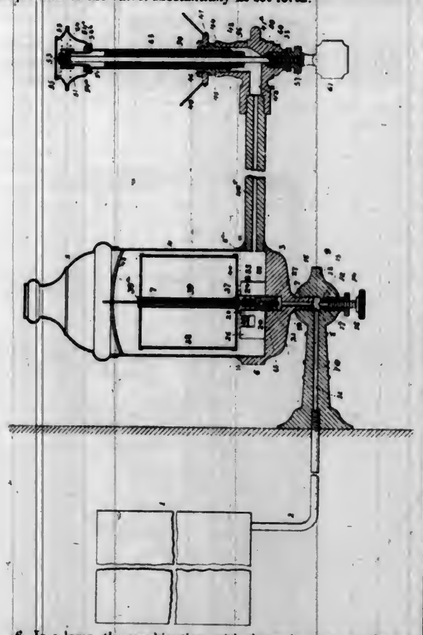
482,288. CAR-COUPLING. SANFORD R. WILLIAMS, Monmouth, Oreg., assignor of one-half to J. J. Malloy and Susie Malloy, same place. Filed Dec. 24, 1891. Serial No. 416,051. (No model.)

Claim.—In a car-coupling, the combination of a draw-head having vertical grooves in its sides and a horizontal groove in its bottom, a hook arranged at the center of the bottom of said mouth and having a beveled front and approximately-vertical rear face and a flat top face, a block pivoted in a draw-head and having a flat lower face adapted to rest upon the upper face of the hook, a spring bearing the block normally upon the hook, means for raising the block against the tension of the spring, and a rectangular loop pivoted in a perforation of the block and working in the grooves on the sides and bottom of the draw-head in rear of the hook, all as and for the purpose herein-before set forth.

482,289. BUCKLE. JACOB ZIEGLER, Arlington, Nebr. Filed June 26, 1892. Serial No. 437,982. (No model.)

Claim.—In a trace-buckle, the combination of a buckle-frame consisting of side pieces joined at one end and in the middle, but open at the other end, the sides of said open end terminating in forks, said pieces joining the middle of said side pieces, having an upwardly-projecting stud, with an outer piece secured to the other trace-section and having recesses adapted to receive the upper prongs of the fork, and a downwardly-projecting cross-piece, substantially as described.

482,290. LAMP. ISAAC F. BLAKE, GEORGE R. SMITH, and EDWIN M. DOTE, Denver, Colo. Filed Nov. 14, 1887. Serial No. 255,138. (No model.)



Claim.—1. In a lamp, the combination of the main reservoir, a supplemental reservoir, a pipe communicating at one end with the main reservoir and at the other end with the supplemental reservoir, a valve in the bottom of the supplemental reservoir for closing the opening through which the fluid enters said supplemental reservoir, said valve having a screw-threaded stem, a suitable bearing for said stem, a float situated within the supplemental reservoir above the valve, connections between the float and the valve-stem, whereby the latter is rotated by the movement of the former, and a burner supplied with fluid from the supplemental reservoir, substantially as set forth.

2. In a lamp, the combination of the main reservoir, the supplemental reservoir, a pipe forming communication between them, a removable valve-piece having passages communicating with said pipe and terminating in a conical discharge-opening, a needle-valve placed opposite said opening and having a screw-threaded stem, a suitable bearing for said stem, a lever projecting from said stem, a float situated in the supplemental reservoir, connection between the float and lever, and a burner supplied with fuel from the supplemental reservoir, substantially as set forth.

3. In a lamp, the combination, with the main reservoir, the supplemental reservoir, pipe connecting them, and the burner supplied with fuel from the supplemental reservoir, of the valve for controlling the supply of fluid from the main reservoir, having a screw-threaded stem, a suitable bearing for said screw-threaded stem, a lever projecting from the stem, a float situated in said supplemental reservoir and having an open-end tube passing therethrough from top to bottom, and a rod fixed to the lever of the valve-stem, passing up through said tube and detachably affixed to the float, substantially as set forth.

4. In a lamp, the combination, with the main reservoir, the supplemental reservoir, pipe connecting them, and the burner supplied from said supplemental reservoir, of a float situated in said supplemental reservoir, an open-end tube passing through the float from top to bottom and secured water-tight, a rod passed through said tube, having a lateral projection near one end resting against the end of the float, a key engaging the rod and resting against the other end of the float, a valve for controlling the supply of fluid, and connections between said rod and valve, whereby the latter is operated by the slightest movement of the float either up or down, substantially as set forth.

5. In a lamp, the combination of the main reservoir, the supplemental reservoir having a valve-piece in its base, provided with a screw-threaded stem fitting within a central screw-threaded opening in the base of the supplemental reservoir, said valve-piece and its stem having passages, a pipe connecting the passage in said stem with the main reservoir, a valve for controlling the supply of fluid to the supplemental reservoir, and a float situated in said reservoir for controlling the position of the valve, substantially as set forth.

6. In a lamp, the combination, with the main reservoir, the supplemental reservoir, the pipe connecting them, and the burner, of a valve for controlling the admission of fluid to the supplemental reservoir, a float in said reservoir having connection with the valve, the rod projecting from said float, and the removable spring-metal plate perforated for the passage of said rod and adapted to be supported by springing it between the sides of the supplemental reservoir, substantially as set forth.

7. In a lamp, a supplemental reservoir consisting of a base portion formed of a solid casting having a chamber on its upper side and a rabbet formed in the wall of the chamber, sheet-metal sides fitting within said rabbet, and a cap fitted on the sides, substantially as shown and described.

8. In combination with the bracket 10, having an enlargement 9, provided with a screw-threaded socket 8, said bracket being provided with a duct 11, communicating with said socket, and a supplemental reservoir having a screw-threaded stem adapted to be screwed in said socket, substantially as set forth.

9. In a lamp, the combination of the main reservoir 1, the supply-pipe 2, leading therefrom, the bracket 9 10, having duct 11, sockets 8 and 12, situated directly in line with each other and connected by duct 13, the supplemental reservoir having the stem 7 secured in the socket 8, and the duct 18, located directly in line with the axis of the duct 13, the internally-screw-threaded follower 16, fitted in the socket 12, and the valve 15, having screw-threaded stem 14 engaging the thread of the follower, said valve being adapted to enter and close the duct 18, substantially as set forth.

10. In a lamp, the combination of the main reservoir 1, the supply-pipe 2, the bracket 9 10, having duct 11, sockets 8 12, formed vertically in opposite sides of the bracket, and duct 13, connecting said sockets, the removable follower fitted in and closing the socket 12, the valve 14, fitting in the follower, the supplemental reservoir having the duct 18 and socket 19, the stem 21, fitted in socket 19, the filter 65, placed in duct 27, and the burner, supplied with fluid from the supplemental reservoir, said socket 19, duct 18, socket 8, duct 13, and socket 12 being in direct vertical line, so that the sediment arrested by the filter may be removed by removing the follower, substantially as set forth.

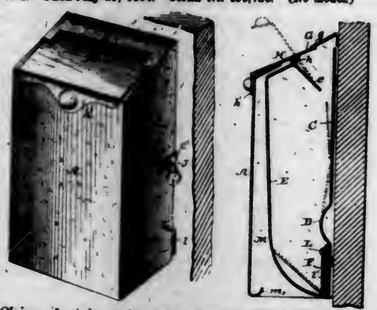
11. The combination, with the main reservoir, the supplemental reservoir, and the pipe communicating at one end with said main reservoir and at the other end with a duct in the center of the bottom of the supplemental reservoir, of a valve-piece having a stem communicating with said duct and having a branch extending radially toward the side of the reservoir, a second branch at right angles thereto, lugs projecting from said second branch, one of said lugs being provided with the ingress-opening and the other with the bearing for the stem of the valve, the valve, a lever secured thereto and projecting to about the center of the reservoir, and a float having connection with said lever, substantially as and for the purposes set forth.

12. In a lamp, the combination, with the main reservoir, the burner, and suitable connecting-pipes, of the supplemental reservoir having the centrally-located screw-threaded socket with which one of the connecting-pipes communicates, the valve-piece 20, having the stem 21, adapted to be secured in said socket, the branches 22 23, the lug 26, projecting laterally therefrom, the fluid-duct extending through the stem 21, the branches 22 23, and the lug 26 and there communicating with the interior of the supplemental reservoir, the valve 34, having the screw-threaded stem, the lug 26, having the screw-threaded perforation forming a bearing for the screw-threaded valve-stem, the lever projecting laterally from the valve-stem, and the float having connection with said lever, substantially as set forth.

13. A valve-piece consisting of the stem 21, the branch 22, forming an L therewith, the branch 23, forming a T with the branch 22, and the projection 26, said parts having the ducts 27 28 30 32 and the chamber 31, with which the duct 32 communicates, the opening for the escape of fluid being formed through one of the walls of the said chamber, and the projection 24, having the screw-threaded perforation, in combination with a main reservoir, a supplemental reservoir, a pipe for connecting said reservoirs, a valve having a screw-stem fitting the threaded opening through the projection 24, a float situated in the supplemental reservoir, connections between the said float and valve-stem, and a suitable burner, substantially as set forth.

14. The combination, with the herein-described valve-piece, consisting of the casting comprising the stem 21, the branch 22, the T branch 23, the projection 26, and the lugs 24 25, having the duct 27 extending through the stem 21, the duct 28, extending through the branch 22 and with which the duct 27 communicates, the duct 30, extending through the branch 23 and communicating with the duct 28, the groove 33 in the extremity of the branch 23, the chamber 31, with which the groove 32 communicates, the escape-aperture formed through one of the walls of the chamber, the screw-threaded perforation formed through the lug 24, and the smooth perforation through the lug 25, the plug 29, closing the extremity of the duct 28, the plate 33 for closing the end of the chamber 31 and duct 30 and covering the groove 32, of a reservoir within which said valve-piece is screwed and a screw-threaded valve fitting in the screw-threaded perforation in lug 24, and the smooth perforation in lug 25, adapted to regulate the size of the escape-aperture, substantially as set forth.

15. In a lamp, the combination, with a main reservoir, a supplemental reservoir, a pipe connecting them, and a burner, of a float situated in the supplemental reservoir, a valve having a screw-threaded stem, connection between the float and valve-stem, and a valve-piece having the opening for the egress of fluid surrounded by the seat for the valve, and a suitable bearing for the screw-threaded stem of the valve, the parts of said valve-piece being rigid one with another, substantially as set forth.



482,291. DRAWBRIDGE-GUARD. FRANK BOUCHER, Fond du Lac, Wis., assignor of one-half to Peter T. Corbeille, same place. Filed Apr. 22, 1892. Serial No. 430,282. (No model.)

Claim.—1. The spindles carrying lateral wings or gate-panels and provided with guide-pins adapted to rotate the spindles in an arc of ninety degrees by their passage in slots or grooves cut on the inside and in spiral form of the fixed thimbles or sleeves set in and through the floors of the draw and pier, respectively, of the bridge structure, in combination with said thimbles, grooved as described, and the actuating levers and weights under the bridge and pier, all substantially as and for the purposes set forth.

2. In a system of automatic guards for drawbridges, the combination of the rotating posts *a*, carrying gate-panels *b*, sockets or sleeves *c c*, with spiral slot *m*, the weighted levers *g h*, and segments *e f* with bridge and pier A B C D E.

482,292. HOUSE LETTER-BOX. PHILIP C. BROWN, Washington, D. C. Filed July 20, 1891. Serial No. 400,726. (No model.)

Claim.—1. A house letter-box having a closed and an open compartment and a clamp for yieldingly holding the mail-matter in the open compartment, substantially as described.

2. A house letter-box divided into a closed and an open compartment by a spring-partition which acts as a clamp to hold the mail-matter in the open compartment.

3. The combination, with the plate C, adapted to be secured to a building and provided with the corrugation D, of the box A, hinged thereto and provided with a slotted top and shutter and the deflecting-plate *e*, substantially as described.

4. The combination, with the plate C, adapted to be secured to a building and provided with a hasp *c'*, of the box A, hinged to said plate and provided with a staple J, secured to the free end of a spring K, said staple projecting through a slot in the box and engaging the hasp, and means for locking said staple and hasp, substantially as shown and described.

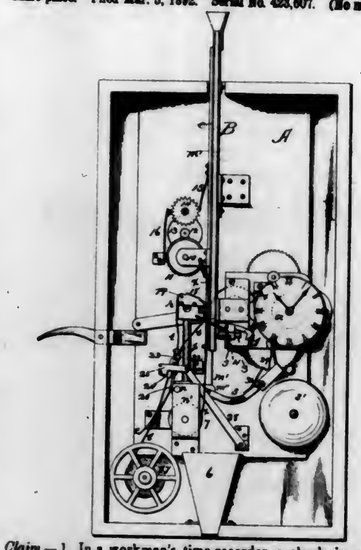
5. The combination, with the plate C, adapted to be secured to a building, of the box A, hinged thereto and having a slotted top and shutter and provided with a partition E, curved at its lower end and extending from the lower inner edge of the box to near the top thereof, forming a receptacle for mail-matter and a compartment open at the bottom for the reception of newspapers, substantially as shown and described.

6. The combination, with the plate C and the box A, hinged thereto, of the curved partition E, secured within said box at its top and bottom and constituting a spring, said partition, in connection with said box and plate, forming a closed receptacle for mail-matter and an open receptacle for newspapers, substantially as shown and described.

7. The combination, with the plate C and box A, hinged thereto, of the spring-partition E, curved at its lower end and extending from the rear lower edge of the box to near the top thereof and dividing the box into a closed receptacle for mail-matter and an open compartment for newspapers, the lower front edge of the box being turned inwardly and upwardly to form a flange, substantially as shown and described, and for the purpose specified.

8. In combination with a letter-box, an indicator consisting of a pivoted rod provided with a finger projecting within the box and engaging the mail contained therein and provided with a finger projecting without the box, by means of which the rod is rotated, substantially as described.

9. In a house letter-box, the combination, with the slotted top thereof, of a flat hinged shutter projecting partially within and partially without said slotted top and opened by the pressure exerted by the insertion of the letter and closed by gravity and constituting a guide to cause a letter when inserted in the box to drop vertically therein, substantially as described.



10. In a house letter-box, the combination, with the slotted top thereof, of a flat hinged shutter H, projecting partially within and partially without said slotted top, and a corrugation D, formed in the box at a point beneath the rear end of the shutter, said shutter opening by pressure exerted by the insertion of a letter and closing by gravity and constituting a guide to cause the letter to strike the corrugation D to deflect the same to the position shown, and for the purpose specified.

11. In a house letter-box, the combination, with a box provided with a slotted top and having a curved bottom and a corrugation D, of a hinged shutter H, projecting partially within and partially without said slotted top and opened by the pressure exerted by the insertion of a letter and closed by gravity, said shutter constituting a guide to cause the letter to strike the corrugation D and be deflected over upon the curved bottom of the box, substantially as shown and described.

12. In a house letter-box, the combination, with a slotted top, of a flat shutter hinged to said slotted top and serving as a guide to direct the letters toward the rear wall of the box and a corrugation formed in said rear wall and acting to deflect the letters in the manner shown, and for the purpose specified.

13. In a house letter-box, the combination, with the slotted top, of a flat shutter hinged within said slotted top and projecting partially within and without said top, the rear end of the shutter normally resting against the under side of the top of the box and the forward end resting upon the upper side of the top, said shutter being automatically opened by the insertion of a letter and closing by gravity, substantially as shown and described.

482,293. WORKMAN'S TIME-RECORDER. WILLARD L. BUNDY, Binghamton, N. Y., assignor to the Bundy Manufacturing Company, same place. Filed Mar. 3, 1892. Serial No. 423,607. (No model.)

Claim.—1. In a workman's time-recorder, a check, in combination with a check-chute, a lever projecting into it, a rod connected to said lever, a rock-shaft, and a crank arm thereon to which said rod is connected.

2. In a workman's time-recorder, a check, in combination with a check-chute, a lever projecting into it, a rod connected to said lever, a rock-shaft, a crank-arm thereon to which said rod is connected, and an impression-platen mounted upon an arm secured to said rock-shaft.

3. In a workman's time-recorder, a check, in combination with a check-chute, a lever projecting into it, a rod connected to said lever, a rock-shaft, a crank-arm thereon to which said rod is connected, a hammer-rod secured to said crank-arm, and a bell.

4. In a workman's time-recorder, a check, in combination with a check-chute, a lever projecting into it, a rod connected to said lever, a rock-shaft, a crank arm thereon to which said rod is connected, an impression platen mounted upon an arm secured to said crank-shaft, actuated by the insertion of a check into the check-chute.

5. The combination, with the impression-platen, of a rock-shaft to which it is connected and means to rotate said crank-shaft, actuated by the insertion of a check into the check-chute.

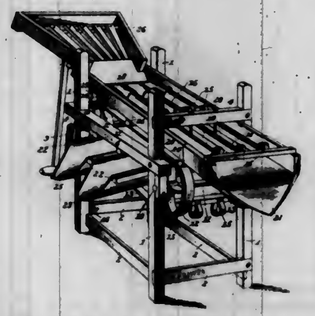
6. The combination, with the impression-platen and the hammer-rod and bell, of a rock-shaft to which they are connected and means to rotate said shaft by the insertion of a check into the check-chute.

7. In a workman's time-recorder, a rock-shaft, an impression-platen connected thereto, a hammer-rod also connected thereto, and means to rotate said shaft, and a check-chute, in combination with a trip-hook mounted upon said chute and adapted to engage with a pin upon said hammer-rod when said rock-shaft is rotated.

8. In a workman's time recorder, a rock-shaft, an impression-platen connected thereto, a hammer also connected thereto, and means to rotate said shaft, and a check-chute, in combination with a trip mounted upon said chute and provided with a hook upon one end, adapted to engage with said hammer-rod when said rock-shaft is rotated, and having a trip-arm upon the other end, projecting into the chute and with which a check engages to disengage said hook.

9. In a workman's time-recorder, a rock-shaft and means to rotate it and an impression-platen connected thereto and provided with a lateral arm, in combination with a sliding stop adapted to project into the check-chute and with which said arm is adapted to engage to withdraw it from the chute.

10. In a workman's time-recorder, a rock-shaft, a hammer-rod connected thereto, and a spring-finger thereon, in combination with a sliding stop with which said finger engages when said rock-shaft is rotated.



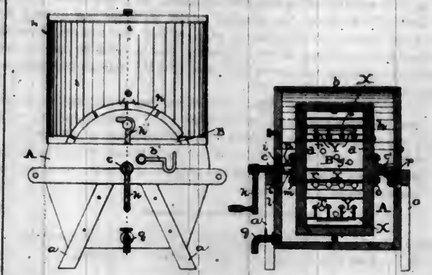
11. In a workman's time-recorder, a check-chute, a check, a ribbon-reel mounted upon a shaft, and a train of gearing operatively connected to said shaft, in combination with a vertically-movable rod and a finger thereon adapted to engage with the terminal gear when said rod is operated by the passage of the check through the chute.

12. In a workman's time-recorder, a rock-shaft, a paper-chute secured thereto, a slide upon said chute, a rocking frame mounted upon said slide, a grip upon said frame, and means to rock said frame when said shaft is rotated, in combination, as set forth.

13. In a workman's time-recorder, a clock, time-wheels synchronous therewith, a rock-shaft, and an impression-platen connected thereto and actuated thereby, in combination with a check-chute, a rod connected to said rock-shaft, a lever connected to said rod and projecting into the check-chute, and a check operatively engaging with said lever to rotate said shaft when inserted into said chute.

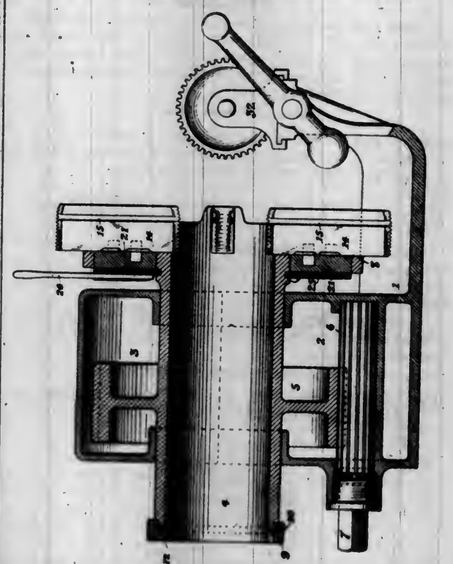
14. In a workman's time-recorder, a check, a check-chute, and a sliding stop holding the check upon the printing-line, in combination with an impression-platen thrown away from the chute by the insertion of the check into the chute and an arm upon the platen engaging said stop to release said check at the same moment that the impression blow is given by the platen.

482,294. FRUIT-SIZER. ASHBEL C. BURER, Gypsum, assignor to D. A. Scott, Catawba Island, Ohio. Filed Mar. 19, 1891. Serial No. 385,707. (No model.)



Claim.—1. In a fruit-sizer, the combination, with a framework, a front and a rear shaft, pulleys mounted on the shafts, endless belts connecting the pulleys, a series of cleats connecting the belts, resilient fingers extending upward from the cleats in line with each other, and chutes formed of canvas and arranged under and transverse to the belt, of a superimposed distributing-table having a series of slots graduated in width and increasing in size over each successive chute, the fingers of the belt extending through the slots, and a chute at the end of the table, substantially as specified.

2. In a fruit-sizer, the combination, with the framework and a distributing-table having a series of slots, of an endless belt located under the table and having a series of fingers extending through the slots, and transverse troughs arranged under said slots, which slots increase in width from rear to front above the troughs, substantially as specified.



3. In a fruit-sizer, the combination, with the distributing-table having a series of longitudinally-disposed slots increasing in size at intervals from rear to front, side bars located at the sides of the table and having their ends extending beyond the front end of the table and connected by a canvas chute, of a front and rear shaft, one of which is provided with a crank, a pair of pulleys mounted on each shaft, endless belts passing around the pulleys, cleats connecting the belts, inverted-U-shaped resilient fingers secured to the front and rear edges of the cleats and projecting through the slots of the table, the transverse series of bars located between the upper and lower sides of the belt and at the beginning of each increase of width in the slots, and the canvas blank mounted on the bars and sagging between the same, the end of the blank between the bars being scalloped, substantially as specified.

482,295. WASHING-MACHINE. RAMON K. BURT, Haddam, Kans. Filed Feb. 20, 1892. Serial No. 422,216. (No model.)

Claim.—In a cylinder washing-machine, the combination of an outside casing, a revoluble cylinder within said casing and provided with suitable openings, a rock-bar journaled in said cylinder and having an extension to stop against the peripheral wall of the cylinder, and projecting pegs fastened to said rock bar.

482,296. PIPE-THREADING MACHINE. ARTHUR W. CASE, Bridgeport, Conn. Filed Nov. 27, 1891. Serial No. 413,225. (No model.)

Claim.—1. In a machine substantially as described, the combination, with the hollow main shaft having a gear thereon, a pinion having means for the application of power thereto meshing with and adapted to operate the said gear, the head carried by the main shaft and provided with suitable threading-tools, and a threaded leader-ring detachably secured upon the opposite extremity of the said shaft, of a polygonal leader-nut having a plurality of its faces concaved, said faces bearing threads of different pitch, and a single yoked plane projecting face, said leader-nut being mounted eccentrically and provided with a handle whereby it may be revolved into or out of engagement with the said leader-ring, as set forth.

2. The combination, with the hollow shaft and the head secured thereto, of the dies adapted to cut at either end thereof, having means for the attachment of independent shoes and provided with grooves and seated in the head, means, as described, for holding the dies, the said independent shoes having means for attachment with the dies, and a scroll-plate adapted to engage the said shoes, and means for operating and locking the scroll-plate.

3. In a machine of the character described, the combination, with the head, of the grooved dies seated therein, retaining-plates fitting the grooves and adapted to hold the dies, shoes independent of said dies, provided with projecting studs for engagement with suitable

openings therein, and a scroll-plate for engaging the shoes, and means for operating the scroll-plate.

4. In a machine of the character described, the combination, with the head, of a series of dies adapted to cut at either end thereof, seated and adapted to slide therein and provided with sockets, shoes independent thereof and having projecting pins or studs for engagement with said holes, and a scroll-plate engaging the shoes and through them adapted to operate the dies.

5. In a machine of the character described, the combination, with the head, of a series of dies mounted therein and adapted to have a radial movement, each die provided with a socket, shoes 19, independent of said dies, each having a stud 20 for engagement with the die-socket, and a scroll-plate engaging and adapted to operate them and the dies, substantially as set forth.

4. A coffee-pot, in combination with a grounds-receptacle formed of two sections comprising, respectively, a top and bottom portion, each of said sections being provided with gauze ends held in place by a slip ring or band, means for securing the receptacle in place, lugs located around the receptacle and adapted to engage the inner side of the pot, and a handle secured to the lower section or body portion, as set forth.

5. A coffee-pot of the class described, having a grounds-receptacle, in combination with a valve secured to the receptacle and commanding the opening in the spout, substantially as described.

6. A coffee-pot provided with a grounds receptacle having a gauze bottom and top and a pocket formed in the top, substantially as described.

482,301.

482,303.

openings therein, and a scroll-plate for engaging the shoes, and means for operating the scroll-plate.

4. In a machine of the character described, the combination, with the head, of a series of dies adapted to cut at either end thereof, seated and adapted to slide therein and provided with sockets, shoes independent thereof and having projecting pins or studs for engagement with said holes, and a scroll-plate engaging the shoes and through them adapted to operate the dies.

5. In a machine of the character described, the combination, with the head, of a series of dies mounted therein and adapted to have a radial movement, each die provided with a socket, shoes 19, independent of said dies, each having a stud 20 for engagement with the die-socket, and a scroll-plate engaging and adapted to operate them and the dies, substantially as set forth.

482,297. ELECTRIC INSULATOR. WILLIAM H. CLARK, Brooklyn, N. Y. Filed May 31, 1891. Serial No. 393,667. (No model.)

Claim.—An insulator for electric wires, having a screw-threaded stem and a flat collar over said stem to protect the same from moisture, said insulator having a square hole in its lower end and being provided with a depression in its top and with side projections, substantially as described.

482,298. WRITING-PEN. FREDERICK C. COLBURN, Arlington, N. J., assignor to the Arlington Manufacturing Company, New York, N. Y. Filed Aug. 5, 1890. Serial No. 361,051. (No model.)

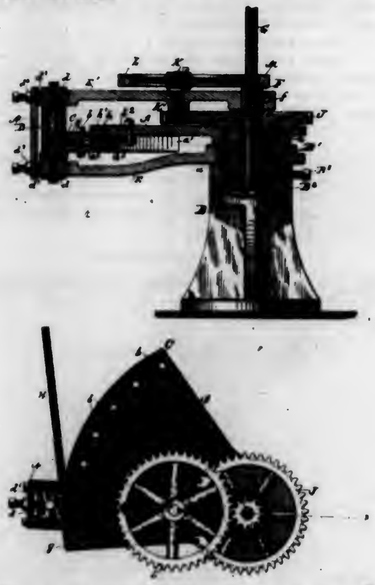
Claim.—1. As an improved article of manufacture, a non-corrosive writing-pen composed of pyralin or other pyroxiline compound which is unaffected by moisture and adapted to be cut or trimmed, substantially as described.

2. A non-corrosive writing-pen composed of a tube of pyralin or other pyroxiline compound extended at one end into a split nib, substantially as described.

482,299. COFFEE-POT. WILLIAM H. COMSTOCK, Oskaloosa, Iowa. Filed Jan. 9, 1892. Serial No. 417,517. (No model.)

Claim.—1. A coffee-pot, in combination with a coffee-grounds receptacle composed of two sections, the lower end of which is provided with downwardly-extending braces and hooks in the bottom of the pot, in the manner and for the purpose substantially as set forth.

2. A coffee-pot, in combination with the herein-described grounds-receptacle, composed of two sections comprising, respectively, a body and its lid, the lid being constructed of two rings fitting one within another in such a manner as to form a pocket on its top, in the manner and for the purpose stated.



3. A coffee-pot, in combination with a coffee grounds receptacle having a handle and a valve or door secured to said handle, whereby the opening in the spout may be opened or closed, as and for the purpose set forth.

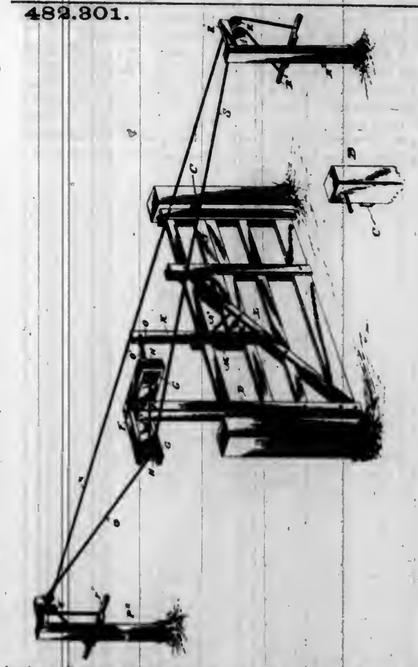
4. A coffee-pot, in combination with a grounds-receptacle formed of two sections comprising, respectively, a top and bottom portion, each of said sections being provided with gauze ends held in place by a slip ring or band, means for securing the receptacle in place, lugs located around the receptacle and adapted to engage the inner side of the pot, and a handle secured to the lower section or body portion, as set forth.

5. A coffee-pot of the class described, having a grounds-receptacle, in combination with a valve secured to the receptacle and commanding the opening in the spout, substantially as described.

6. A coffee-pot provided with a grounds receptacle having a gauze bottom and top and a pocket formed in the top, substantially as described.

482,300. HOOP-FLARING MACHINE. THEODORE A. COOK, Calliscoon Depot, assignor to James Mathison and Walter Mathison, Brooklyn, N. Y. Filed May 1, 1891. Renewed Aug. 13, 1892. Serial No. 442,946. (No model.)

Claim.—1. In a hoop-flaring machine, a segment fixed upon a standard and a gear-wheel J fixed above the segment on a post or stud, in combination with a sweep-arm journaled at the center of the said fixed gear-wheel, a power-shaft journaled at the axis of the sweep-arm, a pinion M, shaft K', journaled in the sweep-arm, and the gear-wheels K L, fixed on said shaft and meshing, respectively, with pinion M and gear-wheel J, substantially as described.



2. The standard B, provided with a segment A, secured thereto, and having a bearing B' beneath said segment, and provided with the shaft or stud F, in combination with the sweep-arms E F', one above and the other below the segment, the fixed gear-wheel J between the segment and the upper sweep-arm, the shaft K', held by the upper sweep-arm, the pinion K meshing with the gear-wheel J, and the upper gear-wheel L, meshing with the pinion on the power-shaft, the sweep-arms being provided with a bender held adjacent to the curved edge of the segment, substantially as described.

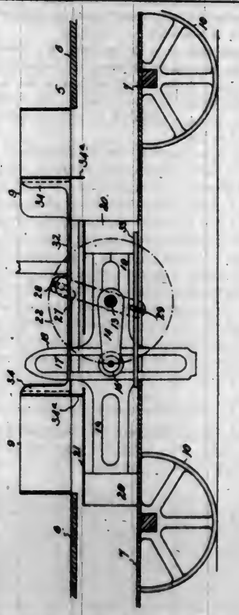
482,301. GATE. WILLIAM S. COULTER, Stockwell, Ind. Filed Feb. 1, 1892. Serial No. 419,941. (No model.)

Claim.—The combination, with a gate, of a frame at its hinged end composed of two arms arranged at right angles to each other and

482,301.

having pulleys at their outer ends, a latch-bar, an arm for operating the latch, levers supported upon posts at the roadside, a cord passing over the pulleys on the angle-frame and connecting the outer end of one of these levers with the latch-arm, a cord connecting one arm of said angle-frame with the inner end of the other lever, and a cord connecting the remaining ends of said levers, substantially as described.

482,302. SNAP-HOOK. JAMES L. COX, Moore's Salt Works, Ohio. Filed Dec. 14, 1891. Serial No. 415,008. (No model.)



Claim.—1. In combination with a hook having a hollow enlargement or swell, the tongue pivoted to the rear wall of the latter, being in part surrounded or inclosed by the same, with a straight portion extending through a slot in its front wall and beneath a cross portion thereof and having all of its surface within the plane of the outer edge of said swell, and a spring contained in the latter, engaging the inner side of the tongue, and thus being completely housed, substantially as shown and described.

2. The hook described, consisting of the body portion formed with hollow enlargement, with slot at its forward end, and a hook, the tongue pivoted at the rear of said enlargement and having flat upper face below the upper edge of the enlargement, and a portion extended through the said slot and confined beneath a front cross portion of the wall of the enlargement, and a compression-spring within the enlargement beneath the tongue between its pivot and outer end, substantially as described.

482,303. BALING-PRESS. HENRY DEYE, Denver, Colo. Filed Nov. 20, 1891. Serial No. 412,135. (No model.)

Claim.—1. In a baling-press, the combination, with a supporting-frame, of a shaft journaled therein, a slotted yoke, crank mechanism made fast to the shaft and engaging the yoke, a lever fulcrumed on the shaft, two movable frames slidingly supported on the stationary frame and on opposite sides of the main shaft, the movable frames being respectively connected with two arms of the lever, one of these frames being flanged and the other lying in the path of the yoke, suitable hoppers supported upon the stationary frame and in line with the flanged movable frames, and means for rotating the shaft, whereby a reciprocating movement is imparted to the yoke and the flanged movable frame, substantially as described.

482,308.

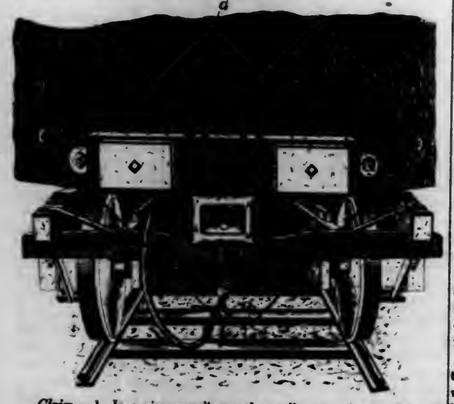
2. The combination, in a baling-press, of a stationary frame provided with a chamber and corresponding hopper, a rotating shaft, a cam mounted thereon, a feeding-lever fulcrumed upon the frame, and a vertically-movable arm connected with the cam at one extremity and with the lever at the opposite extremity, whereby as the shaft rotates the lever is actuated, substantially as and for the purpose set forth.

3. The combination, in a baling-press, of a stationary frame provided with baling-chambers and corresponding hoppers, a condenser consisting of a flanged movable frame slidingly supported in line with the hoppers, a rotating shaft journaled in the frame, a yoke, plungers secured thereto in line with the baling-chambers, crank mechanism connecting the shaft with the yoke, a lever centrally fulcrumed on the stationary frame and having its upper arm connected with the condenser, and a horizontally-sliding frame lying in the path of the yoke and connected with the lower arm of the lever, whereby as the shaft rotates a reciprocating movement is imparted to the yoke, the plunger, and the condenser, the condenser and the yoke moving simultaneously in opposite directions, substantially as and for the purpose set forth.

4. The combination, in a baling-press, of a stationary frame provided with baling-chambers and corresponding hoppers, a condenser slidingly supported upon the frame in line with the hoppers, a shaft, a yoke carrying plungers and connected with the shaft by crank mechanism, a lever fulcrumed on the frame and having slotted arms, a pin connected with the condenser and engaging the slot in one arm of the lever, a horizontally-sliding frame lying in the path of the yoke and provided with a projection engaging the slot in the other arm of the lever, and means for rotating the shaft, whereby a reciprocating movement is imparted to the condenser and the plunger simultaneously in opposite directions, substantially as and for the purpose set forth.

5. In a baling-press, the combination, with a supporting-frame provided with baling-chambers and corresponding hoppers, of a shaft journaled in said frame, feeding-levers fulcrumed on the frame and having their inner arms slotted and their outer arms fashioned to engage the material in the hopper, grooved cams oppositely disposed on the shaft, vertically-reciprocating arms provided with pins engaging the grooves in the cams and the slots in the inner arms of the lever, and means for rotating the shaft, whereby the feeding-arms are actuated, substantially as described.

6. The combination, in a baling-press, of a stationary frame, a shaft centrally journaled therein, a baling-chamber and a corresponding hopper located on each side of the shaft, a slotted yoke carrying two plungers, moving in line with the chambers, crank mechanism connecting the yoke with the shaft and provided with an antifrictional bearing located in the slot of the yoke, a condenser supported upon the frame in line with the hoppers, levers connecting the condenser with the yoke, and automatic feed mechanism consisting of two levers fulcrumed on the frame, cams oppositely disposed on the main shaft,



and vertically-movable slotted arms connected with the levers and actuated by the cams, substantially as described.

7. The combination, in a baling-press, of a frame, a shaft journaled therein, and automatic feed mechanism consisting of a lever fulcrumed on the frame, a cam rigidly secured to the main shaft, and a vertically-movable slotted arm mounted on the shaft and connected with the feeding-lever and actuated by the cam as the shaft rotates, substantially as described

8. In a double baling-press, the combination of the supporting-frame, a shaft journaled therein, two chambers, one on either side of the shaft, and automatic feed mechanism consisting of two levers, one for each chamber, these levers being fulcrumed on the frame, cams rigidly secured to the main shaft and oppositely disposed thereon, and vertically-movable slotted arms mounted on the shaft, connected with the feeding-levers, and actuated by the cams, substantially as described.

9. In a baling-press, the combination, with a supporting-frame, of the shaft, a reciprocating yoke and plungers, and condensing mechanism consisting of horizontally-movable heads, a lever centrally fulcrumed on the shaft and having slotted extremities, a pin attached to the condenser and engaging the upper slot in the lever, and a horizontally-movable frame lying in the path of the yoke and provided with a projection engaging the lower slot in the lever, substantially as described.

482,804. PIPE-COUPLING AND COUPLING ATTACHMENT FOR RAILWAY-CARS. FRED DU MOUTIER, Ogdensburg, N. Y. Filed Dec. 8, 1891. Serial No. 414,494. (No model.)

Claim.—1. In a pipe-coupling and coupling attachment for railway-cars, the combination, with a flexible pipe, of a coupling-head thereon, and a pipe secured to the car, and a supporting chain or rope passing freely therethrough and having its ends attached to the coupling-head.

2. In a pipe-coupling and coupling attachment for railway-cars, the combination, with a flexible pipe, of a coupling-head thereon, and a pipe with curved ends secured to the car, and a supporting chain or rope passing freely therethrough and having its ends attached to the coupling-head.

3. In a pipe-coupling and coupling attachment for railway-cars, the combination, with a flexible pipe, of a coupling-head thereon, a T-iron having its stem secured to said pipe at or near the coupling-head, a pipe secured to the car, and a supporting chain or rope passing freely therethrough and having its ends attached to the arms of the T-iron.

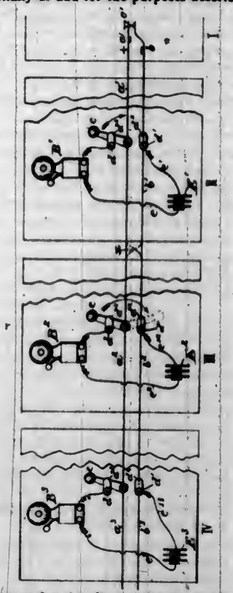
4. In a pipe-coupling and coupling attachment for railway-cars, the combination, with a coupling-face set at an angle to the line of piping, of an elastic annular packing removably secured within the coupling-head, and upon the rear edge of the face of said coupling-head a wedge-shaped horn, and on the opposite side of said face a projecting headed lug adapted to engage with a similar horn on a companion duplicate coupling-head, substantially as herein shown and described.

482,805. GUN. GEORGE F. FOGERTY, Cambridge, Mass., assignor of one-half to George Fogerty, same place. Filed Nov. 21, 1891. Serial No. 412,669. (No model.)

Claim.—1. In a magazine-gun, the tube d', fitted in the stock and provided with holders b at one side and with a slide-bar b^3, provided with engaging devices b^4, at the opposite side, combined with the cartridge-receiver d at the forward end of the tube, the support d^3, to which said receiver is pivoted, and means for moving said support to bring the cartridge into alignment with the barrel, and means for pushing the cartridge into the barrel, substantially as described.

2. In a magazine-gun, the tube d' to receive the cartridges and means for feeding them forward, combined with a cartridge-receiver at the forward end of the tube, a support to which said receiver is pivoted, and projections i i' on said support, which are engaged and moved by the breech-block to bring the cartridge into alignment with the barrel and to return the support to its normal position, and means for pushing the cartridge into the barrel, substantially as described.

3. In a magazine-gun, a cartridge-chamber and cartridge-holders therein and a cartridge-moving device for feeding the cartridges forward one at a time, combined with a pivoted cartridge-receiver and a pivoted support therefor, means for moving said support on its pivot in either direction, and means for turning said receiver on its pivot to bring the cartridge held by it into alignment with the barrel, and means for pushing the cartridge into the barrel, substantially as described.

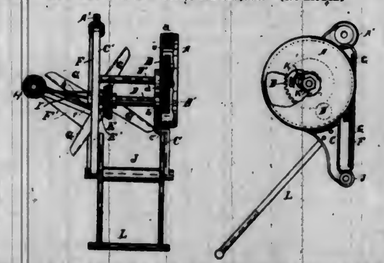


4. In a magazine-gun, a cartridge-chamber and cartridge-holders therein and a cartridge-moving device for feeding the cartridges forward one at a time, a handpiece, and a projection o^3, connecting said handpiece with the cartridge-moving device, combined with a pivoted cartridge-receiver, a pivoted support therefor, a projection o', connected to said handpiece for moving the said support on its pivot in either direction, and means for turning said receiver on its pivot to bring the cartridge held by it into alignment with the barrel, and means for pushing the cartridge into the barrel, substantially as described.

5. In a magazine-gun, a cartridge-chamber and spring-acting cartridge-holders therein, a cartridge-moving device consisting of a slide-bar with cartridge-engaging devices carried by it, and a handpiece connected with said slide-bar, combined with a pivoted cartridge-receiver and a pivoted support therefor, and a projection moved by said handpiece for moving said support on its pivot in either direction, and means for turning the cartridge-receiver on its pivot, and means for pushing the cartridge into the barrel, substantially as described.

482,806. ELECTRIC RAILWAY-SIGNAL. CHARLES K. HALL, New Orleans, La., assignor of forty-nine one-hundredths to William B. Lillard, same place. Filed Apr. 4, 1892. Serial No. 427,728. (No model.)

Claim.—1. An apparatus for signaling from car to car on railway-trains, having two continuous conductors insulated from each other and connected from car to car throughout the train, an electric bell and a source of electricity in each car, electrically connected together and having one terminal connected to a contact-strip connected to one of said conductors and the other terminal connected to a contact-strip insulated from both conductors, and a switch in each car, adapted to connect either the second continuous conductor to said insulated contact-strip or to connect the two continuous conductors together, substantially as and for the purposes described.

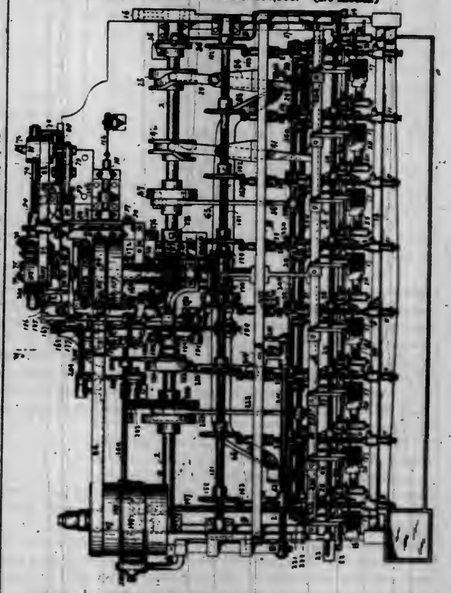


2. An apparatus for signaling from car to car on railway-trains, having two continuous conductors insulated from each other and connected from car to car throughout the train, a contact-maker in the engine, adapted to electrically connect said conductors, and an electric bell and a source of electricity in each car, electrically connected together and having one terminal connected to a contact-strip connected to one of said conductors and the other terminal connected to a contact-strip insulated from both conductors, and a switch in each car, adapted to connect either the second continuous conductor to said insulated contact-strip or to connect the two continuous conductors together, substantially as and for the purposes described.

3. In an apparatus for signaling of the character described, the combination, with a block of insulating material M, having two wire-couplings N secured therein, of the metallic spring-plunger P, having guide-piston p', engaging in said block, and having curved surfaces p^2, adapted to come into contact with said wire-couplings, and a buffer p^3 to press said curved surfaces back clear of said couplings when the wires are connected to the next car, and the spring Q, tending to press said plunger forward and hold said curved surfaces against said wire-couplings, substantially as and for the purposes described.

4. In an apparatus for signaling of the character described, the combination, with a block of insulating material M, having two wire-couplings N secured therein, of the metallic spring-plunger P, having guide-piston p', engaging in said block, and having curved surfaces p^2, adapted to come into contact with said wire-couplings, and a buffer p^3 to press said curved surfaces back clear of said couplings when the wires are connected to the next car, and the spring Q, tending to press said plunger forward and hold said curved surfaces against said wire-couplings, and a pin for holding said spring-plunger clear of said wire-couplings, substantially as and for the purposes described.

482,807. LAWN-TRIMMER. HANS P. HANSEN, Grand Rapids, Mich. Filed June 4, 1892. Serial No. 435,562. (No model.)



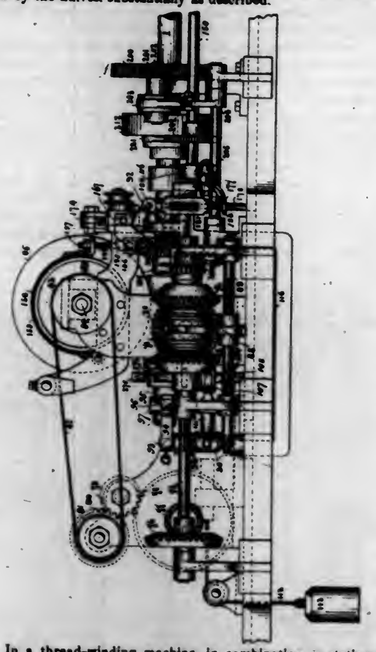
Claim.—1. In a lawn-trimmer, a traction-wheel supported upon a shaft, gear-wheels within said traction-wheel, provided with a clutching device for transmitting the motion of the traction-wheel and shafts, in combination with bevel-gears, revolving knives supported upon a vertical shaft, a stationary knife, and a revolving brush, substantially as and for the purpose set forth.

2. The combination, in a lawn-trimmer, of a supporting-frame having a traction-wheel provided with an overreaching rim for the protection of the power-transmitting mechanism, gear-wheels within said traction-wheel, and a shaft extending from one of said gear-wheels across the frame and provided at the opposite end with a bevel-gear, a vertical shaft provided at its upper end with a bevel-gear, a knife-frame securely attached to the lower end of the vertical shaft, a series of revolving knives, an adjusting-screw for said frame, a shoe for supporting the knife-frame, said shoe provided with a forwardly-inclined projecting arm for the support of a stationary knife, a stationary knife, a revolving brush, and rollers for the support of the mower-frame, substantially as and for the purpose set forth.

3. The combination, in a lawn-trimmer, of a supporting-frame having a traction-wheel, supporting-rollers, and power-transmitting mechanism, with an outwardly-projecting stationary knife, revolving knives supported above said stationary knife upon a vertical shaft, the edges of said knives being tangential from the rim of the hub g of the frame that supports them, so as to form a perfect shearing cut with the stationary knife, an adjusting-screw, and a revolving brush, substantially as and for the purpose set forth.

4. The combination, in a lawn-trimmer, of a supporting-frame having power-transmitting mechanism, with an outwardly-projecting forwardly-inclined horizontal stationary knife, a revolving brush, and a series of revolving knives supported upon a vertical shaft and arranged to co-operate with the stationary knife in producing a shearing cut, substantially as and for the purpose set forth.

482,808. THREAD-WINDING MACHINE. CHARLES HILL, Newark, N. J., assignor, by direct and mesne assignments, to Thomas Russell, Montclair, N. J., and Robert W. Ferguson, New York, N. Y., trustees. Filed Oct. 2, 1891. Serial No. 407,533. (No model.)



Claim.—1. In a thread-winding machine, in combination, a stationary frame, a reciprocating frame parallel thereto, a series of divided and parallel spindles crossing the space between said frames, means whereby said reciprocating frame is actuated and means whereby the spindles are rotated, a laterally-traversing bar arranged transversely of the spindles, a slide on said bar, a series of thread-guides mounted on said slide, and means whereby said slide is actuated to intermittently retract the thread guides, substantially as described.

2. In a thread-winding machine, in combination, a stationary frame, a reciprocating frame parallel thereto, a series of divided and parallel spindles crossing the space between said frames, means whereby said reciprocating frame is actuated and means whereby the spindles are rotated, a laterally-traversing bar arranged transversely of the spindles, a series of thread-guides mounted thereon, a series of hoppers in-

termediate the spindles, a series of reciprocating hopper-bottoms, a slide transversely of the spindles, and connections between said slide and said hopper-bottoms, whereby the hopper-bottoms are moved transversely of the spindles, substantially as described.

3. In a thread-winding machine, in combination, a stationary frame, a reciprocating frame parallel thereto, a series of divided and parallel spindles crossing the space between said frames, means whereby said reciprocating frame is actuated and means whereby the spindles are rotated, a laterally-traversing bar arranged transversely of the spindles, a series of thread-guides mounted thereon, a series of knives reciprocating parallel with the spindles, means whereby they are reciprocated, and means whereby the threads are inserted in the slits formed by the knives, substantially as described.

4. In a thread-winding machine, in combination, a stationary frame, a reciprocating frame parallel thereto, a series of divided and parallel spindles crossing the space between said frames, means whereby said reciprocating frame is actuated and means whereby the spindles are rotated, a laterally-traversing bar arranged transversely of the spindles, a series of thread-guides mounted thereon, a series of spool-slitting knives, a series of fingers, means whereby they are moved in a plane parallel with the spindles, and a series of hooks and means whereby they are reciprocated across the path of the fingers, substantially as described.

5. In a thread-winding machine, in combination, a stationary frame, a reciprocating frame parallel thereto, a series of divided and parallel spindles crossing the space between said frames, means whereby said reciprocating frame is actuated and means whereby the spindles are rotated, a laterally-traversing bar arranged transversely of the spindles, a series of thread-guides mounted thereon, a series of spool-slitting knives, a series of mechanisms whereby the thread is placed in the slit and cut, an abutment for the end of the spool, an ejector separate from the abutment, and means whereby the ejectors are moved parallel with the spindles, substantially as described.

6. In a thread-winding machine, in combination, a stationary frame, a reciprocating frame parallel thereto, a series of divided and parallel spindles crossing the space between said frames, means whereby said reciprocating frame is actuated and means whereby the spindles are rotated, a laterally-traversing bar arranged transversely of the spindles, a series of thread-guides mounted thereon, a series of spool-abutments, a series of spool-slitting knives, a series of mechanisms whereby the thread is carried into the slits and cut and to a retainer, a retainer, and a series of pins whereby the thread is carried forward of the face of the abutments, substantially as described.

7. In a thread-winding machine, in combination, a stationary frame, a reciprocating frame parallel thereto, a series of divided and parallel spindles 2 and 3, crossing the space between said frames, means whereby said reciprocating frame is actuated and means whereby the spindles are rotated, a laterally-traversing bar arranged transversely of the spindles, a series of thread-guides mounted thereon, a traverse screw-shaft, a nut engaging the same, a clutch adapted to drive said shaft in opposite directions, and means whereby said clutch is shifted at the end of each traverse, substantially as described.

9. In a thread-winding machine adapted for winding a series of spools at one time, in combination, the main frame, a series of thread-guides, a traversing-bar, a member mounted to move on said bar with which the thread-guides are connected, mechanism whereby said member is moved to cause the retreat of the thread-guides intermittently, end pieces extending from said traversing-bar by the frame of the machine, bearings in said frame for said end pieces, a yoke on the opposite side of the frame connecting said end pieces, mechanism whereby said yoke is caused to traverse, mechanism whereby said traverses are stopped, and mechanism whereby said traverses are started automatically, substantially as described.

10. In combination, the spindle, the knife below the central level of the spindle, the thread-guide above the central line of the spindle, the finger moving in a downwardly-inclined direction between the guide and spool and over the knife, the hook intercepting the path of the finger and moving beneath the spindle, the retainer, and the pusher, whereby the thread is thrust in front of the shoulder of the spindle, substantially as described.

11. In combination, the spindle, the thread-guide, the knife whereby the spool is slit, the finger whereby the thread is placed in the slit, the hook 39, and a spring cheek-plate 43, whereby the thread from the thread-guide is held against the side of the hook, and means whereby said hook is reciprocated relatively to said cheek-piece, substantially as described.

12. In combination, the frame of the machine, the spindle, the thread-guide, the spool-slitting knife, the finger oscillating between the thread-guide and the spool, a reciprocating hook 39, a slide whereon this hook is mounted moving at right angles with the axis of the spindle, and means of securing the thread on the opposite side of the spindle from the thread-guides, substantially as described.

13. In a thread-winding machine, in combination, a divided spindle, a spool-abutment on each part thereof, mechanism whereby one part of the spindle is pressed toward the other part with a maximum pressure when the spindle is not rotating and a minimum pressure when the spindle is rotating, and a spring permitting the parts to yield to such pressure, substantially as described.

14. In a thread winding machine, in combination, a divided spindle, mechanism whereby one-half is reciprocated, a reciprocating spool-carrier, and an upwardly-inclined guideway, whereby the spool-carrier is caused to approach from one side and below, whereby the spool neither interferes with the direct retreat of the carrier nor the carrier with the dropping of the spool when wound, substantially as described.

15. In a thread-winding machine, in combination, a spindle, a slitting-knife, and mechanism whereby said knife is moved in a line crosswise of the flange of the spool, substantially as described.

16. In a thread-winding machine, in combination, a spindle, a slitting-knife, a knife-stock, and mechanism whereby said knife is moved in a line crosswise of the flange of the spool, said knife-stock being provided with a recess in the plane of motion of the knife wherein the knife may be adjusted, substantially as described.

17. In a thread-winding machine, in combination, a spindle having a spool-abutment, a slitting-knife, a finger whereby the thread is moved laterally, a hook and knife whereby the thread is held and cut, and a member whereby the thread is returned laterally in front of the abutment, substantially as described.

18. In a thread-winding machine, in combination, a spindle, a spring-pressed spool-abutment on the spindle, an ejector whereby the spool is ejected from the spindle, a knife separate from the ejector, whereby the spooled thread is severed from the unspooled thread, and a member whereby the end of the unspooled thread is brought into position across the end of the abutment to be clamped against the same by the spool to be placed upon the spindle, said member being mounted on the ejector, substantially as described.

19. In a thread-winding machine, in combination, a divided spindle, a spring-pressed abutment upon each part thereof, and mechanism whereby one part of the spindle is pressed toward the other part with a maximum of pressure when the spindle is rotating, substantially as described.

20. In a thread-winding machine adapted to wind a series of spools at once, in combination, a series of spindles, a transversely-arranged bar, as 40, guideways in the frame wherein said bar slides transversely of the spindles, a series of hooks carried by said bar, a shaft, as 34, arranged transversely of the spindles, means whereby said shaft is rocked, and a series of fingers upon said shaft, each adapted to draw the thread over the spool-flange into position to be engaged by one of said hooks, substantially as described.

21. In a thread-winding machine adapted for winding a plurality of spools at once, in combination, a series of spindles arranged approximately parallel with one another and projecting in front of the main frame of the machine, a series of hoppers arranged one between every two spindles, a series of sliding hopper-bottoms, whereby the spools are carried transversely to the spindles, a slide extending transversely of the spindles, to which all of said hopper-bottoms are connected, and means whereby said slide is reciprocated, substantially as described.

22. In a thread winding machine adapted for winding a series of spools at once, in combination, a series of spindles arranged approximately parallel with one another and projecting to the front of the main frame of machine, the following slides having transverse guideways in the main frame of the machine, viz: the slide for carrying the series of half-spindles, the slide for carrying the slit-cutting knife, the slide for carrying the ejector, the slide for carrying the traversing bar, and the following slides having longitudinal guideways in the main frame of the machine, viz: the slide for carrying the thread-securing hook, the slide for carrying the mechanism whereby the spools are conveyed from the hopper to the spindle, and the slide for carrying the scrap-end cutter, substantially as described.

23. In a thread-winding machine adapted for winding a series of spools at once, in combination, a series of spindles arranged approximately parallel with one another and projecting to the front of the main frame of the machine, a traversing slide having guideways transverse of the main frame of the machine, a slide superposed upon the same, mechanism whereby said last-mentioned slide is moved in a direction longitudinally of the main frame, and the series of thread-guides mounted upon said last-mentioned slide, substantially as described.

24. In a thread-winding machine, in combination, mechanism for completing and changing the spools, the traverse screw-shaft, and mechanism whereby the motion of the said first-named mechanism is communicated to the said shaft, whereby the thread-guide while the spindle is at rest is moved to the end of the short traverse by the rotation of said screw-shaft, substantially as described.

25. In a thread winding machine adapted to wind a plurality of spools at once, in combination, the series of thread-guides, a rod with which they are all connected, a cam actuating said rod to cause the retreat of the guides from the spools, a ratchet-wheel connected with the said cam, a rocker, two pawls connected with the opposite ends of the rocker, and means whereby said rocker moves in unison with the traverses, whereby the ratchet is actuated by one pawl for the forward traverse and the other pawl for the backward traverse, substantially as described.

26. In a thread-winding machine, in combination, traversing mechanism, a thread-guide, a cam by which it is retreated from the spool, a friction-clutch mounted on the traversing mechanism, a rod connected with said friction-clutch, mechanism whereby the motion of said rod actuates said cam, and an adjustable stop whereby the extent of motion of said rod is regulated, substantially as described.

27. In a thread-winding machine, in combination, traversing mechanism, a thread-guide, a cam by which it is retreated from the spool, a friction-clutch mounted on the traversing mechanism, a rod connected with said friction clutch, a rocker, two pawls, a ratchet-wheel, and two adjustable stops whereby the extent of motion in both directions received by said rod is regulated, substantially as described.

28. In a thread-winding machine, in combination, the bed-plate E, the spindle-turning shaft 151, the cam-shaft 1, the traverse screw-shaft 69, the bearings of all of said shafts mounted upon said bed-plate, the vertical plate A, mounted upon the front edge of said bed-plate, the spindle-shafts 2, having bearings in the plate A and projecting at right angles therethrough, substantially as described, whereby the bearings of all said shafts are mounted upon the same bed plate.

29. In a thread-winding machine, in combination, a traverse screw-shaft, a nut permanently engaging therewith, a traversing frame, a clutch adapted to cause the rotation of said shaft in either direction, a shaper connected with said clutch, a stud co-operating with said shaper and connected to and moving in unison with the traverse-frame, a spool-dismounting mechanism, a pulley whereby the same is actuated, a pulley whereby the traversing mechanism is actuated, a belt, a belt-shifting mechanism, and mechanism connecting the traverse-frame with the belt-shifting mechanism, substantially as described.

30. In a thread-winding machine, a bed-plate E, a vertical plate A, mounted thereon, provided with a front horizontally-extending flange G, having guideways, a series of spindle-shafts 2, having their bearings in the plate A and projecting at right angles therethrough above the flange G, and the spool-conveyers 21 and the slide 23, mounted in said guideways, substantially as described.

31. In a thread-winding machine, in combination, a thread-winding mechanism and a pulley for actuating the same, a mechanism for completing and changing the spools and a pulley for actuating the same, a belt to drive said pulleys alternately, mechanism whereby said belt is shifted from one of said pulleys to the other, and vice versa, automatically, a traverse-frame, a traverse screw-shaft, a nut permanently engaging the same, a clutch adapted to drive said shaft in either direction, a shaper connected with said clutch, a stud co-operating with the shaper, and means whereby said stud is moved in unison with the traverses, substantially as described.

32. In a thread-winding machine, in combination, a thread-winding mechanism and a pulley for actuating the same, a mechanism for completing and changing the spools and a pulley for actuating the same, a belt to drive said pulleys alternately, a traverse-frame, a traverse screw-shaft, a clutch adapted to drive said shaft in both directions, mechanism whereby said clutch is shifted at the ends of the traverses, and the following mechanism whereby said belt is shifted from one pulley to the other, and vice versa, viz: a belt-shifter, a weight connected with the same, a pawl whereby the belt-shifter is held in antagonism to said weight, means whereby said pawl is tripped at the end of each winding operation, and mechanism whereby the belt-shifter is returned into engagement with said pawl at the commencement of each winding operation, substantially as described.

33. In a thread-winding machine, in combination, a thread-winding mechanism and a pulley for actuating the same, a mechanism for completing and changing the spools and a pulley for actuating the same, a belt to drive said pulleys alternately, and the following mechanism whereby said belt is shifted from one pulley to the other, and vice versa, viz: a belt shifter, a slide upon which the belt-shifter reciprocates, weights urging the belt-shifter and slide respectively in opposite directions, the latter overbalancing the former, a pawl whereby the belt-shifter is held in antagonism to the slide-weight, a pawl whereby the belt-shifter is held in antagonism to its own weight, means whereby said first pawl is tripped at the end of each winding operation, means whereby the slide is returned in antagonism to its weight, and means whereby said second pawl is tripped at the commencement of each winding operation, substantially as described.

34. In a thread-winding machine, a shaft connected both with the mechanism for revolving the spindles and with the mechanism for producing the traverses, a sleeve mounted loosely on said shaft connected with the mechanism for completing and changing the spools, means whereby said shaft and said sleeve are actuated alternately, a traverse screw-shaft, a nut permanently engaging the same, and a clutch whereby said shaft is turned alternately in opposite directions, substantially as described.

35. In a thread-winding machine, in combination, a stationary frame, a reciprocating frame parallel thereto, a series of divided and side-by-side spindles, means whereby the spindles are rotated, the bar 14, connected with said reciprocating frame, and the cam by which it is operated, provided with a centrally-flattened surface, whereby the pressure is reduced intermediate the mounting of the spool and the operation of the knife, substantially as described.

36. In a thread-winding machine, in combination, a series of divided and side by-side spindles, means whereby one division of said spindles is reciprocated relatively to the other, spindle-rotating mechanism, a series of spool-conveyers 21, and the following parts for operating said conveyers, viz: the slide 23, transversely of the spindles, the lever 24, the cam 25, and means for operating said cam, substantially as described.

37. In a thread-winding machine, in combination, a series of divided and side-by-side spindles, means whereby one division of said spindles is reciprocated relatively to the other, spindle-rotating mechanism, a series of knives 29, a series of longitudinally-sliding knife-bars 31, a series of arms 330, and the following parts for operating the same, viz: rock-shaft 340, arm 350, connecting rod 56, cam 57, and means whereby said cam is operated, substantially as described.

38. In a thread-winding machine, in combination, a series of divided and side-by-side spindles, means whereby one division of said spindles is reciprocated relatively to the other, spindle-rotating mechanism, a series of ejectors 26, a series of longitudinally-sliding bars 27, a series of arms 28, and the following parts by which the same are operated, viz: rock-shaft 220, arm 221, connecting-rod 222, cam 223, and means whereby said cam is operated, substantially as described.

39. In a thread-winding machine, in combination, a series of divided and side-by-side spindles, means whereby one division of said spindles is reciprocated relatively to the other, spindle-rotating mechanism, a series of oscillating fingers 33, and the following parts by which said fingers are operated, viz: rock-shaft 34, arm 38, connecting-rod 37, cam 35, and means whereby said cam is operated, substantially as described.

40. In a thread-winding machine, in combination, a series of divided and side-by-side spindles, means whereby one division of said spindles is reciprocated relatively to the other, spindle-rotating mech-

anism, a series of hooks 39, and the following parts by which said hooks are operated, viz: slide 40, lever 41, cam 42, and means whereby said cam is operated, substantially as described.

41. In a thread-winding machine, in combination, a series of divided and side-by side spindles, means whereby one division of said spindles is reciprocated relatively to the other, spindle-rotating mechanism, the series of knives 46, the series of knife-arms 47, and the following parts by which the same are operated, viz: slide 49, lever 52, cam 233, and means whereby said cam is operated when the spindles rotate, substantially as described.

42. In a thread-winding machine, in combination, a series of divided and side-by-side spindles, means whereby one division of said spindles is reciprocated relatively to the other, spindle-rotating mechanism, a series of thread-guides, a traversing frame carrying the same, a nut 68, connected therewith, a screw-shaft 69, and the following parts for operating said screw-shaft, viz: gear 71, fast thereon, shaft 74, gears 72 and 73, turning freely thereon and meshing with gear 71, and a clutch 75, splined to said shaft 74, substantially as described.

43. In a thread-winding machine, in combination, a series of divided and side-by-side spindles, means whereby one division of said spindles is reciprocated relatively to the other, spindle-rotating mechanism, a series of thread-guides, slide 140, carrying the same, cam 143, moving said slide, shaft 147 upon which said cam is mounted, traversing mechanism, and means whereby said shaft 147 is moved at each traverse of the thread-guides, substantially as described.

44. In a thread-winding machine, in combination, a series of divided and side-by-side spindles, means whereby one division of said spindles is reciprocated relatively to the other, spindle-rotating mechanism, a series of thread-guides, a screw-shaft whereby they are caused to traverse, mechanism for finishing the spool after winding, and the following parts whereby the thread-guides are moved to the commencement of the short traverse intermediate the winding operations, viz: the ratchet-wheel 206, means whereby it is operatively connected with the traverse-screw, the pawl 207, and means whereby it is operatively connected with the said mechanism for finishing the spool after winding, substantially as described.

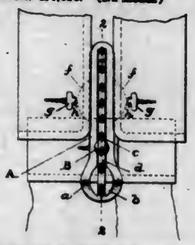
482,809. BEARING. PHILIP H. HOLMES, Gardiner, Me., assignor to the Holmes Fibre-Graphite Manufacturing Company, Chicago, Ill. Filed Sept. 18, 1891. Serial No. 406,064. (Model.)

Claim.—1. A bearing made of a composition of lubricating material and fiber intimately mixed and compressed, the fibers at the bearing-surface being mainly in a direction transversely to the longitudinal line of the bearing-face.

2. A bearing made of a composition of plumbago and fiber intimately mixed and compressed, the fibers at the bearing-surface lying mainly in a direction transversely to the longitudinal line of the bearing-face, and a binder, substantially as described.

3. A bearing made of a composition of plumbago or other lubricating material, the fiber intimately mixed and united, said bearing having a curved bearing-face, the fibers lying mainly in lines radiating from the center from which said curved face is produced, substantially as described.

482,810. PROCESS OF MANUFACTURING COMPOSITION JOURNAL-BEARINGS. PHILIP H. HOLMES, Gardiner, Me., assignor to the Holmes Fibre-Graphite Manufacturing Company, Chicago, Ill. Filed Jan. 2, 1892. Serial No. 416,856. (No specimens.)



Claim.—1. The process herein described of forming a plumbago composition for bearings, &c., said process consisting in, first, mixing plumbago, fiber, and liquid; second, expelling the liquid by pressure, and, third, impregnating the mass with a liquid binder, substantially as set forth.

2. The process herein described of forming a plumbago composition for bearings, &c., said process consisting in, first, mixing plumbago, fiber, and an inert mineral substance in liquid; second, expelling the liquid by pressure, and, third, impregnating the mass with a liquid binder, substantially as described.

3. The process herein described of forming a plumbago composition for bearings, &c., said process consisting in, first, mixing plumbago, fiber, and liquid; second, expelling the liquid under pressure; third, impregnating the compressed composition with an oil-binder, and, fourth, drying the composition to set the binder, substantially as set forth.

4. The process herein described of forming a plumbago composition for bearings, &c., said process consisting in, first, mixing plumbago, fiber, and gypsum with liquid; second, expelling the liquid by pressure; third, impregnating the compressed composition with an oil-binder, and, fourth, drying the composition to set the binder, substantially as described.

482,811. CUFF-HOLDER. HARRY W. JOHNS, Baltimore, Md., assignor of one-tenth to Augustus H. Brinkmann, same place. Filed June 13, 1892. Serial No. 436,626. (No model.)

Claim.—1. A cuff-holder comprising a body portion constructed for attachment to the buttonhole of a cuff and having a longitudinal slot which receives the shank of the sleeve-button and a resilient strip extending lengthwise of the slot and having permanent position over the same, said strip rigidly attached at the two ends to the body portion at the ends of the slot and provided with a series of indentations which confront the slot and engage the top of the head of the sleeve-button, the strip extending over the same, in the manner described.

2. A cuff-holder comprising a metal plate having a longitudinal slot which receives the shank of the sleeve-button, a corrugated or indented strip over said slot to engage the head of said button, and lateral extensions or enlargements on two opposite sides of the plate having means of attachment at their outer ends with the buttonholes in the confronting edges of the cuff, said enlargements or extensions serving as a spreader, substantially in the manner described.

482,812. COMPUTING-MACHINE. PETER J. LANDIN, Minneapolis, Minn., assignor to Thomas B. Walker and Sarah R. Wilson, same place. Filed Feb. 3, 1891. Serial No. 379,966. (No model.)

Claim.—1. The combination, with a suitable casing, of a series of ratchet-wheels arranged therein and a series of slides arranged in said casing and partially exposed and provided with a series of notches arranged to engage said ratchet-wheels as the slide is moved in one direction and to pass said ratchet-wheels without moving them as the slide is moved in the opposite direction and provided, also, with a numbered series of notches arranged in the exposed portion of said slides and corresponding with the series of notches which engage with the wheels, substantially as described.

2. The combination, with a suitable casing and a series of slides arranged in said casing and partially exposed, of a series of ratchet-wheels arranged in said casing and adapted to be engaged by said slides as they move in one direction and to remain stationary as the slides move in the opposite direction and provided with a series of numbers or figures, and means for automatically retracting said slides after each movement thereof.

3. The combination, with a suitable casing, of a series of ratchet-wheels arranged therein provided with figures or characters and a series of slides engaging said ratchet-wheels and provided with a series of numbered notches or recesses arranged on exposed portions of said slides, whereby as said slides are moved by placing an instrument upon one of the notches the corresponding ratchet-wheel will be moved to register a number corresponding to the number of the notch so engaged and will remain in this position while the slide is returned to its normal position.

4. The combination, with a suitable casing, of a series of ratchet wheels arranged therein, means for resetting said wheels after each operation, and a series of slides arranged to engage directly with said wheels and turn them as the slides are moved in one direction and to pass without turning them as the slides are moved in the opposite direction and provided with a series of numbered notches arranged outside of said casing, for the purpose specified.

5. In a machine of the class described, the combination of a notched slide provided with a series of numbers, a stop arranged in the line of movement of said slide, and a ratchet-wheel engaged and turned by the said slide as it is moved in one direction and provided with a series of numbers, whereby as said slide is moved to bring any one of its numbers opposite said stop the ratchet-wheel is turned and the same number is registered, substantially as described.

6. In a machine of the class described, the combination, with the casing having an inclined lower wall and an open lower front portion, of a series of slide arranged in said casing and provided with numbered notches arranged opposite the open portion of said casing and a series of registering-wheels arranged in said casing opposite an opening through which the numbers on the wheels may be seen and adapted to be engaged and operated by said slides as they are moved in one direction and to remain stationary as they are moved in the other direction, substantially as described.

7. In a machine of the class described, the combination, with the casing having a portion of its front open, of a series of slides arranged in said casing and having a series of numbers arranged opposite the open portion of said casing, whereby said slide may be moved by the application of a suitable instrument to any one of its notches, springs for returning said slides to their normal positions after each operation, and a series of registering-wheels arranged in said casing opposite a suitable opening and adapted to be engaged and operated by said slide as they are moved in one direction only, substantially as described.

8. The combination, with a series of registering ratchet-wheels, of a series of slides provided with a series of notches corresponding to the ratchet-teeth upon said wheels and adapted to engage and turn said wheels as the slides are moved in one direction, means for preventing a reverse movement of said wheels as the slides are turned in the opposite direction, and a series of numbered notches upon said slides corresponding to the numbers upon said wheels, whereby said slides are adapted to be moved by engaging a suitable instrument with any one of said notches.

9. The combination, with a suitable casing, of a series of ratchet-wheels arranged therein and provided with a series of characters or figures, a series of slides engaging said ratchet-wheels and provided with a series of numbered notches or recesses arranged in portions of said slides that are exposed, means for preventing said wheels from moving in a reverse direction, and means for automatically retracting said slides after each operation, substantially as described.

10. The combination, with a series of registering-wheels and provided with ratchet teeth or notches, of a series of slides provided with a corresponding series of ratchet teeth or notches adapted to engage directly with the teeth upon said wheels as said slides are moved in one direction, means for retracting said slide after each movement, and means for preventing a reverse movement of said wheels.

11. The combination, with a casing 2, provided with a shaft 4, of the series of ratchet-wheels arranged upon said shaft and having a figure or character for each ratchet tooth or notch upon each wheel, said wheels being arranged opposite an opening in said casing, a series of slides provided with ratchet-teeth corresponding with the teeth upon said wheels and provided with a corresponding series of numbered notches arranged in a portion of said slides that is exposed, and springs for returning said slides to their normal positions after each movement, and means for preventing a reverse movement of said wheels.

12. The combination, with a series of registering-wheels and means connecting said wheels whereby each wheel is caused to move one notch or space when the next lower wheel in the series moves a complete revolution, each of said wheels being provided with a series of ratchet-teeth or notches, of means for preventing said wheels from moving in the reverse direction, a series of slides, each provided with a series of teeth or notches corresponding with the ratchet-teeth or notches on said wheels and adapted to engage and turn said wheels as the slides are moved in one direction, and means for retracting each of said slides after each movement thereof.

13. The combination, with a series of registering-wheels and means connecting said wheels whereby each wheel is caused to turn one space when the next lower wheel in the series makes a complete revolution, of means for preventing said wheels from moving in the reverse direction, means for simultaneously setting all of said wheels at zero, a series of slides, each provided with a series of ratchet-teeth corresponding to the teeth upon said wheels and adapted to engage and turn said wheels as the slides move in one direction, and means for retracting said slides after each movement.

14. The combination, with a suitable case, of a series of registering ratchet-wheels arranged therein, means connecting said wheels whereby each wheel is caused to move one space as the corresponding wheels make a complete revolution, means for preventing the reverse movement of said wheels, a series of slides, each provided with a series of ratchet-teeth or notches corresponding to the teeth upon said wheels and with a corresponding series of numbered notches arranged in exposed portions of said slides, and means for retracting each of said slides after each movement thereof.

482,818. DISH-WASHING MACHINE. HAMILTON F. LOW, Cleveland, Ohio. Filed Jan. 11, 1892. Serial No. 417,607. (No model.)

Claim.—1. The combination, in a machine of the character described, of a tank, an agitator which travels in a circle within the tank and which rotates upon its own axis, and a basket or frame supported within the tank, said basket being adapted to hold dishes, substantially as described.

2. The combination, in a machine of the character described, of a tank, a stationary gear within the tank, a shaft that turns in the hub of a stationary gear, an arm fixed upon the shaft, a pinion driven by the arm and meshing with the stationary gear, an agitator which turns with the pinion, and a basket or frame supported within the tank, said basket or frame being adapted to hold dishes, substantially as described.

3. The combination, in a machine of the character described, of a tank, an agitator which travels in a circle within the tank and which rotates on its own axis, braces within the tank above the agitator, a screen supported by the braces, and a basket or frame supported within the tank by the braces, said basket being adapted to hold dishes, substantially as shown and described.

4. The combination, in a machine of the character described, of a tank, a stationary gear within the tank, a shaft that turns in the hub of the stationary gear, an arm fixed upon the shaft, a pinion driven by the arm and meshing with the stationary gear, an agitator which turns with the pinion, braces within the tank, a screen, and a basket or frame supported by the braces, said basket or frame being adapted to hold dishes, substantially as shown and described.

482,814. TRANSPLANTER. HIRAM MOOS, Red Creek, N. Y. Filed July 30, 1891. Serial No. 401,183. (No model.)

Claim.—1. The combination, with the spring frame-bars hinged together at one end, of the handles adapted to slide thereon and the points upon the handles adapted to be opened by squeezing the handles together.

2. The combination, with the spring-bars hinged together at one end, of the handles mounted and adapted to slide thereon and the concaved points upon the handles adapted to be opened by squeezing the handles together.

3. The combination, with the frame and the handles mounted thereon and the points, of the grip-springs mounted upon the frame and projecting backward between the points.

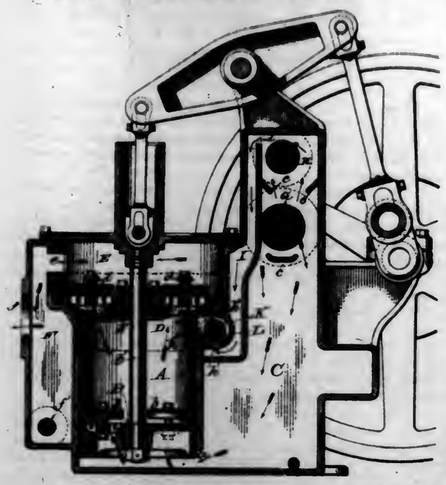
ward said cylinder and closing toward said condensing-chamber, substantially as and for the purposes set forth.

482,816. MECHANISM FOR OPENING AND CLOSING JAIL-DOORS. PETER J. PAULY, Sr., and PETER J. PAULY, Jr., St. Louis, Mo., assignors to Pauly Jail Building and Manufacturing Company, same place. Filed Mar. 15, 1892. Serial No. 425,042. (No model.)

482,817. TYPE-WRITING MACHINE. ADDISON N. PRITT, New York, N. Y. Filed June 18, 1891. Serial No. 396,673. (No model.)

from the trigger and the other end within range of the operating-key, substantially as set forth.

13. A type writer composed of a sliding carriage provided with a rack-bar beneath, in combination with a trigger and pawl, said trigger having attached thereto the spring for moving the carriage, a lever for operating but disconnected from said trigger independently of the printing mechanism, and a lever connected with the printing mechanism, substantially as set forth.



14. A type-writer composed of a sliding carriage provided with

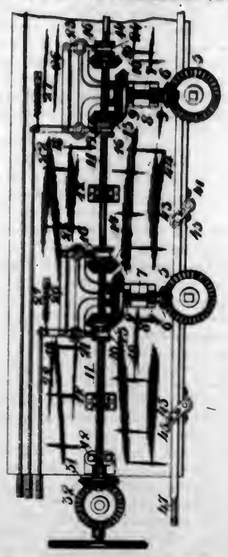
Claim.— 1. The combination, with the spring frame-bars hinged together at one end, of the handles adapted to slide thereon and the points upon the handles adapted to be opened by squeezing the handles together.

2. The combination, with the spring-bars hinged together at one end, of the handles mounted and adapted to slide thereon and the concaved points upon the handles adapted to be opened by squeezing the handles together.

3. The combination, with the frame and the handles mounted thereon and the points, of the grip-springs mounted upon the frame and projecting backward between the points.

482,815. AIR-PUMP FOR CONDENSERS. BRUNO V. NORDBERG, Milwaukee, Wis., assignor to the Bruno Nordberg Company, same place. Filed Nov. 17, 1891. Serial No. 412,147. (No model.)

Claim.—1. In a pump for condensers, the combination, with the cylinder, piston, and suction and discharge valves, of a condensing-chamber having an opening into the space between the suction and discharge valves of the pump and an air-valve placed in said opening and closing toward said condensing-chamber, substantially as and for the purposes set forth.



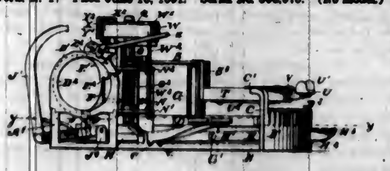
2. In a pump for condensers, the combination, with an upright cylinder, an outwardly-opening discharge-valve, and a piston provided with an inwardly-opening valve, of a condensing-chamber communicating with the pump-cylinder through an opening into the space between the piston and the discharge-valve and an air-valve placed in said opening and closing toward said condensing chamber, substantially as and for the purposes set forth.

3. In a pump for condensers, the combination, with an upright cylinder, a condensing-chamber communicating therewith, a piston provided with one or more upwardly-opening valves, and an upper head also provided with one or more upwardly-opening valves, of a cylindrical valve-chamber formed in the side of the pump-cylinder, with open ends, which are closed by caps or plugs, said valve-chamber communicating through a port in its under side with the condensing-chamber and through a lateral port with the cylinder above said piston, and a cylindrical valve seated in the lower side of said valve-chamber and normally closing the port from said condensing-chamber, substantially as and for the purposes set forth.

4. In a pump for condensers, the combination, with the cylinder, piston, suction and discharge valves, and a condensing-chamber communicating with the lower end of the pump-cylinder, of a passage leading from the upper part of the condensing-chamber in a space between the suction and discharge valves of the pump and an air-valve placed in said passage and opening toward said space, substantially as and for the purposes set forth.

5. In a pump for condensers, the combination of a piston provided with one or more upwardly-opening valves, an upright cylinder provided with one or more outwardly-opening valves in its upper end and with a horizontal cylindrical valve-case opening into said cylinder between the valve or valves in its upper end and said piston, and a condensing-chamber communicating with the lower end of said cylinder and with said valve-chamber through a port in the bottom thereof, and a cylindrical valve seated by gravity over said port, opening toward said cylinder and closing toward said condensing-chamber, substantially as and for the purposes set forth.

482,816. MECHANISM FOR OPENING AND CLOSING JAIL-DOORS. PETER J. PAULY, Sr., and PETER J. PAULY, Jr., St. Louis, Mo., assignors to Pauly Jail Building and Manufacturing Company, same place. Filed Mar. 15, 1892. Serial No. 425,049. (No model.)



Claim.—1. Mechanism for opening, closing, and locking cell-doors, consisting of a hinged door, a gear-wheel rigidly secured to the same, a shaft mounted in suitable bearings secured to the top of the cell, a pinion keyed to one end of said shaft, adapted to mesh with said gear-wheel, a gear-wheel keyed to the opposite end of the said shaft, an operating-shaft journaled in suitable bearings and adapted to be turned by suitable mechanism, and pinions movable upon said operating-shaft and adapted to be successively brought in contact with the last-named gear-wheel for locking the door or operating the same when the said operating-shaft is rotated, substantially as described.

2. Mechanism for opening, closing, and locking cell-doors, consisting of a hinged door, a shaft rigidly secured to the same, a beveled gear-wheel fixed to said shaft, a shaft, such as 7, mounted in suitable bearings secured to the top of the cell, a pinion keyed to one end of the said shaft and adapted to mesh with said gear-wheel, a beveled gear-wheel 10, keyed to the opposite end of said shaft, an operating-shaft, and beveled pinions movable upon said shaft, one of which is locked against rotation and the other adapted to be rotated by said shaft, both of which are adapted to be successively brought into contact with the said beveled gear-wheel 10, substantially as described.

3. Mechanism for opening, closing, and locking cell-doors, consisting of a hinged door, a beveled gear-wheel fixed to the same, a pinion adapted to mesh with the said gear-wheel, a gear-wheel, such as 10, adapted to impart motion to the said pinion, an operating-shaft 11, beveled pinions loosely mounted upon said shaft and adapted to be successively brought in contact with the said gear-wheel 10, levers attached to the said pinions, a plate, such as 26, attached to the said levers, a bar, such as 22, attached to one of the said levers, and a lever adapted to be attached to the cell, to which one end of the said bar is loosely attached for operating the said pinions independent of the said shaft, substantially as described.

4. A device for opening, closing, and locking cell-doors, consisting of a rotating shaft, such as 3, to which the cell-door is attached, a beveled gear-wheel fixed to the upper end of the said shaft, suitable gearing in connection with said gear-wheel, and an operating-shaft, such as 11, beveled pinions, such as 13 and 15, adapted to be moved in a horizontal direction upon the same, one of which is adapted to be rotated by the said shaft, levers for operating said pinions successively, a spring attached to one of the said levers, a bar attached to the lever to which the spring is attached, and a lever attached to the cell, to which one end of the bar is attached, substantially as described.

482,817. TYPE-WRITING MACHINE. ADELBERT H. PETIT, New York, N. Y. Filed June 16, 1891. Serial No. 396,673. (No model.)

Claim.—1. A type-writer having, in combination, a vertically-movable non-rotatable type-wheel shaft, a type-wheel rotatably mounted on its upper end, a pulley below said type-wheel, connected therewith by a vertical stem, a segmental wheel engaging with the pulley, and an arm connected with said segmental wheel having a hinged key-bar therein, as set forth.

2. A type-writer having, in combination, a vertically-movable non-rotatable type-wheel shaft, a type-wheel rotatably mounted on its upper end, a pulley below said type-wheel, connected therewith by a stem, a segmental wheel engaging with the pulley, an arm connected with said segmental wheel having a hinged key therein, a circular lettered plate above said arm, and a toothed circular plate below the hinged key, substantially as set forth.

3. A type-writer having beneath the carriage a toothed rack, in combination with a trigger centrally hinged, having at one end a tooth normally in engagement with the carriage-rack, a spring-pressed hinged pawl on the toothed end of the trigger, projecting in the direction of the pivot of the latter, a hinged lever having one end beneath the end of the trigger and its opposite end projecting forward and provided with a horizontal key-bar, and a spring connected with said trigger for drawing the same back to its normal position and moving the carriage, substantially as set forth.

4. A type-writer having a hammer for printing the characters, in combination with a lever having at its inner end a lateral or right-angled bend adapted to actuate the hammer and a key-bar for throwing the proper character in position and operating said lever, substantially as set forth.

5. A type-writer having a hammer for printing the characters, a trigger carrying alternately-actuating pawls, and the carriage actuated by said pawls, in combination with a lever adapted to simultaneously actuate said hammer and trigger and a key-bar for throwing the proper characters in position and operating said lever, substantially as set forth.

6. A type-writer having a hammer for printing the characters, a trigger carrying alternately-operating pawls, and the carriage actuated by said pawls, in combination with a lever having the right-angled bend at one end, one arm of said bend being adapted to engage said trigger and the other arm to engage said hammer, and a key-bar for throwing the proper character in position and operating said lever, substantially as specified.

7. A type-writer having, in combination, a vertically-movable type-wheel shaft carrying a pulley having a sliding stem connection with the rotatable type-wheel, a segmental wheel having connection with said pulley by oppositely-wound bands, and its arm provided with a hinged key-bar, substantially as and for the purposes set forth.

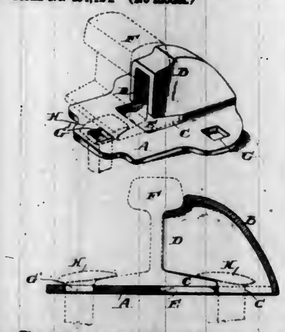
8. A type-writer having a sheet-feeder composed of two rolls mounted on the slotted paper-receiving tube, said rollers mounted within keepers at each end and having a lever hinged between the journals of the rollers, having cams arranged between and for spreading apart said rollers, substantially as set forth.

9. In a type-writer, a carriage having two rollers movable to and from each other by the paper-guard comprising the inverted-V-shaped wire guards adapted to overhang said rollers, one of the journals having a hand-wheel, and two or more sets of faces on said journal, and a spring-finger laterally movable and adapted to engage with either set of faces, substantially as set forth.

10. In a type-writer, a base having two horizontal parallel ways, in combination with a carriage mounted thereon having a central horizontal rack-bar beneath and a hooked post or standard extending up from the base and around said rack-bar to hold the carriage in position, substantially as set forth.

11. In a type-writer, a carriage composed of two horizontal parallel gained bars, a head at each end, having centrally below a connecting rack-bar and on the upper side keepers for rollers, in combination with said rollers, springs for holding the same together, and a lever with cams thereon arranged between and for separating said rollers, substantially as set forth.

12. A type-writer composed of a sliding carriage provided with a rack-bar beneath, in combination with a trigger and pawl beneath said rack-bar having attached thereto the spring for moving the carriage and a lever having one end in engagement with but disconnected from the trigger and the other end within range of the operating-key, substantially as set forth.



13. A type writer composed of a sliding carriage provided with a rack-bar beneath, in combination with a trigger and pawl, said trigger having attached thereto the spring for moving the carriage, a lever for operating but disconnected from said trigger independently of the printing mechanism, and a lever connected with the printing mechanism, substantially as set forth.

14. A type-writer composed of a sliding carriage provided with a rack-bar, in combination with a trigger having a pawl adapted to normally engage said rack-bar and having a spring-pressed pawl or latch also adapted to engage said rack-bar and move the carriage when the aforesaid pawl is disengaged from said rack-bar and having attached thereto the spring for actuating the carriage, and a lever having one end adapted to engage said trigger and the other end adapted to be actuated by the operating-key, substantially as and for the purpose set forth.

15. A frame composed of the single post with two brackets or ledges, a type-wheel shaft passing through said brackets, two vertical shafts on the front side, carrying on their upper ends rotatable ink-fountains, and on the rear side of the upper bracket two swiveled posts for holding vertically-disposed rollers, and the endless ribbon around said rollers.

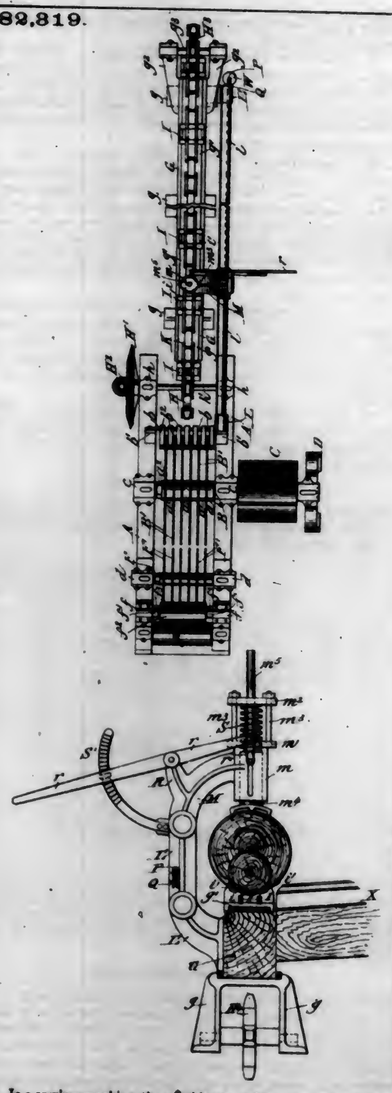
16. A type-writer having rotatable ink-fountains and suitable tension rollers and an endless ribbon around the same, in combination with inverted-U-shaped guard-pieces over said tension-rollers, substantially as set forth.

482,818. TIE-PLATE AND BRACE. WILLIAM H. PHILLIPS, Philadelphia, Pa., assignor to Paul Thompson, same place. Filed Apr. 29, 1892. Serial No. 431,194. (No model.)

Claim.—The cast-metal tie-plate and brace having a platform A, a brace B, cast integral therewith, formed with a cavity D, and adapted to fit closely against the rail-head, and an opening E, formed in the platform A beneath the cavity in brace B, all substantially as and for the purpose specified.

482,819. SAWING-MACHINE. ALEXANDER RODGERS, Sr., Muskegon, Mich., assignor to the Rodgers Iron Manufacturing Company, same place. Filed Mar. 28, 1892. Serial No. 426,804. (No model.)

Claim.—1. In a sawing-machine, the combination of the main feeding mechanism, the frame mounted independent of the said mechanism and movable parallel with the same, and a dog carried by the said frame, substantially as described.



2. In a sawing-machine, the combination of the ways, the endless sprocket-chain, the dogs or bunks carried by the said chain, the frame mounted to move parallel with the said chain, and the dog carried by the said frame, substantially as described.

3. In a sawing-machine, the combination of the main feeding device consisting of the main support or base, the ways mounted thereon, the sprocket-wheels journaled one at each end of the said support or base and one of them being adjustable, the chain carried by the said wheels, and the bunks or dogs carried by the said chain, with the frame mounted to move parallel with the said feeding device, and the dog carried by the frame, substantially as described.

4. In a sawing-machine, the combination of the main feeding mechanism, the movable frame mounted independent of the said mechanism, the dog carried by the said frame, and the means for retracting the said frame, substantially as described.

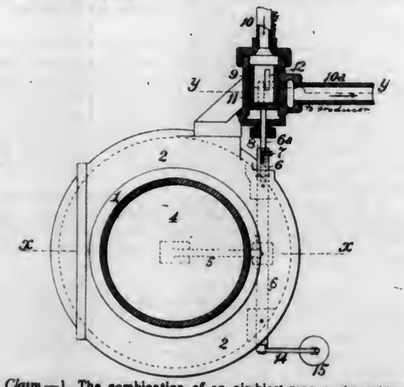
5. In a sawing-machine, the combination of the ways, the endless sprocket-chain, the dogs or bunks carried on the said ways by the said chain, the guides parallel with the said ways, and the auxiliary dogging device carried by the said guides, substantially as described.

482,819.

6. In a sawing-machine, the combination of the ways, the endless sprocket-chain, the dogs or hooks carried on the said ways by the said chain, the guides parallel with the ways, the frame carried by the guides, and the spring-actuated dog carried by the said frame, substantially as described.

7. In a sawing-machine, the combination of the main feeding mechanism, the guides mounted parallel with the said mechanism, the frame mounted on the said guides, the dog carried by the said frame, and the rope leading from the frame to the front of the machine, passing over a sheave, and having a weight attached to its end, substantially as described.

8. In a sawing-machine, the combination of the main feeding mechanism, the guides parallel with the line of movement of the said mechanism, the frame movably mounted on the said guides, the cylinder carried by the frame, and the dog movably mounted in the said cylinder, substantially as described.



9. In a sawing-machine, the combination of the main feeding mechanism, the frame mounted independent of the said mechanism and movable parallel with the same, the cylinder carried by the frame, and the spring-actuated dog mounted in the said cylinder, substantially as described.

10. In a sawing machine, the combination of the main feeding mechanism, the frame mounted independent of the said mechanism and movable parallel with the same, the cylinder carried by the frame, and the spring actuated dog mounted in the said cylinder, substantially as described.

11. In a sawing-machine, the combination of the main feeding mechanism, the frame mounted independent of the said mechanism and movable parallel with the same, the cylinder carried by the frame, the perforated plate or guide mounted above the cylinder, and the spring-actuated dog mounted in the cylinder and having a shank registering with the perforation in the said guide or plate, substantially as described.

12. In a sawing-machine, the combination of the main feeding mechanism, the frame mounted independent of the said mechanism and movable parallel with the same, the cylinder carried by the frame, the spring-actuated dog mounted in the cylinder, and the lever pivoted to the frame and connected with the dog, substantially as described.

482,320. AUTOMATIC STEAM-REGULATOR FOR GAS-PRODUCERS. EDWIN RUUD, Pittsburg, Pa., assignor to the Fuel Gas and Manufacturing Company, same place. Filed Aug. 29, 1891. Serial No. 404,108. (No model.)

Claim.—1. The combination of an air-blast pipe, a steam-blast pipe, valve-chambers interposed between sections of each of said pipes, a regulating-valve controlling the air-blast pipe, a shaft journaled in bearings and connected to said valve, a regulating-valve connected to said shaft and fitted to move circumferentially within the valve-chamber of the steam-blast pipe and having ports adapted to register with ports formed therein, and a counter-balance connected to the valve-shaft and acting thereon in opposite direction to the opening movement of the valves, substantially as set forth.

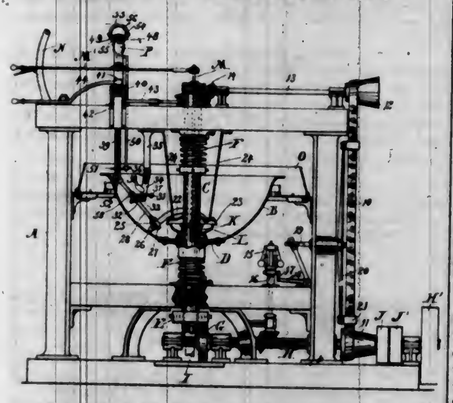
2. The combination of an air-blast pipe, a steam-blast pipe, valve-chambers interposed between sections of each of said pipes, a regulating-valve controlling the air-blast pipe, a shaft journaled in bearings and connected to said valve, a regulating-valve constructed to move longitudinally and circumferentially within the valve-chamber of the steam-blast pipe and having ports adapted to register with ports formed therein, a shaft secured to said valve and connected adjustably to the shaft of the regulating-valve, and a counter-balance coupled to the valve-connecting shafts and acting thereon in opposite direction to the opening movement of the valves, substantially as set forth.

482,321. CULTIVATOR FOR LISTED CORN. LAMBERT P. SCHRADER, Clay Centre, Kans., assignor of one-half to John C. Johnston, same place. Filed Oct. 26, 1891. Serial No. 409,771. (No model.)

Claim.—1. In a cultivator, the combination of a crank-axle and wheels with the runners having adjustable knives attached to the rear thereof, substantially as shown and described.

2. In a cultivator for listed corn, the combination, with runners D D, of the crank-axle and wheels, rear knives A A, connected with said runners by means of draft-bars *i i*, and crank-lever *d* and link *g* for regulating the depth of said knives in the soil, substantially as shown and described.

3. In a cultivator for listed corn, the combination, with the cranked axle and wheels, of runners D D, cross-head C, knives *a a*, secured to said cross-head, rear knives A A, and lever *d* for regulating the depth thereof, substantially as shown and described.



4. In a cultivator for listed corn, the combination, with adjustable knives A A operated by lever *d*, of knives *a a*, secured to the

482,320.

periphery of carriage-wheels H H, substantially as and for the purposes set forth.

482,322. ORE-CONCENTRATOR. CHARLES E. SEYMOUR, Lake Geneva, Wis., assignor to the Seymour Concentrator Company, Chicago, Ill. Filed Sept. 19, 1891. Serial No. 406,183. (No model.)

Claim.—1. In an ore-concentrator, the combination, with a pan-carrying shaft, of a governor connected to and actuated by the driving mechanism, a bell-crank lever, one arm of which is connected by a link to the movable collar of the governor and the other arm of which bell-crank is connected to movable belt-guiding arms, and a pulley-belt passing around a cone-pulley on the driving-shaft and a reversed cone-pulley on a counter-shaft, said belt being adapted to be engaged by the movable arms connected to the bell-crank and to be shifted by the same with relation to its position on the cone-pulleys, substantially as set forth.

2. In a centrifugal concentrator or separator, the combination, with a revoluble pan fixed on a vertical shaft capable of vertical movement and a cam secured to and actuated by the driving-shaft, which cam is arranged by its revolution to regularly elevate the pan and permit it to fall, of a counter-shaft geared to and driving the pan-shaft and connected to the driving-shaft by a belt on reversed cone or speed pulleys, and a governor geared to the driving-shaft and arranged to automatically shift the belt so as to regulate the speed of the pan at a uniform rate and a predetermined speed varying, as desired, from the speed of the pan-elevating cam, substantially as described.

3. In a centrifugal ore-concentrator, the combination, with a revoluble pan fixed and carried on a vertical hollow shaft, of a flexible discharge-pipe having an open mouth at one end adapted to sweep along the side of the pan and gather deposits therefrom and secured at its other end to a part fixed on the frame and arranged to discharge into a cup or sleeve and thence through a port into the hollow shaft, substantially as described.

4. In a centrifugal ore-concentrator having a revolving pan fixed on a hollow shaft, a flexible discharging-tube arranged to sweep the sides of the pan and gather deposits therefrom and discharge them into the hollow shaft, and a metal mouthpiece secured adjustably to the flexible tube, combined substantially as described.

5. In a centrifugal ore-concentrator having a revolving pan fixed on a hollow shaft, a flexible discharging-tube arranged to sweep the sides of the pan and gather deposits therefrom and discharge them into the hollow shaft, a metal mouthpiece secured to the flexible tube, and a soft-metal lip or scoop secured to and projecting from the mouthpiece, combined substantially as described.

6. In an ore-concentrator having a revoluble pan fixed on a hollow shaft and a flexible tube arranged to gather and discharge deposits from the sides of the pan, a rod connected to the tube, a rack connected to the rod, and a worm connected operatively with and so as to be revolved by a revolving shaft of the mechanism, which worm is arranged to be put in gear with the rack to elevate it, combined substantially as described.

7. In a concentrator having a revoluble pan fixed on a hollow shaft and a flexible tube arranged to gather and discharge deposits from the sides of the pan, a rod connected to the tube, a finger on the rod, bearing movably on a pin in a supporting-arm, and means for raising the rod, substantially as described.

8. In an ore-concentrator having a revoluble pan fixed on a hollow shaft and a flexible tube arranged to gather deposits from the sides of the pan and discharge them into the shaft, a rod connected to the tube, a finger hinged on the rod, arranged to fold in one direction and bearing on a pin in a supporting-arm, and a stud arranged to receive the bearing and thrust of the finger as the rod is raised and lowered, combined substantially as described.

9. In an ore-concentrator having a revoluble pan and a swinging discharge-pipe adapted to sweep the sides of the pan and gather and discharge deposits therefrom, a means for elevating the flexible tube, comprising a rack connected to the tube, a worm adapted to mesh with the rack, a block movable on the frame, on which block the worm is axled, a spring arranged to retrieve the block and hold the worm out of gear with the rack, and means for moving the block and putting the worm temporarily in gear with the rack, combined substantially as described.

10. In an ore-concentrator having a revoluble pan and a flexible pipe arranged to sweep the sides thereof and gather and discharge deposits therefrom, means for automatically elevating the flexible tube, comprising a rack connected to the tube, a worm adapted to mesh with the rack, a block movable on the frame, on which block the worm is axled, a spring arranged to retract the block and hold the worm out of gear with the rack, a tripping-lever arranged to shift the block and put the worm temporarily in gear with the rack, and an endless cable provided with a button adapted to engage the tripping-lever and tilt it, combined substantially as described.

11. In an ore-concentrator having a revoluble pan and a flexible pipe arranged to sweep the sides thereof and gather and discharge deposits therefrom, means for automatically elevating the flexible tube, comprising a rack connected to the tube, a worm adapted to mesh with the rack, a block movable on the frame, on which block the worm is journaled, a spring arranged to retract the block and hold the worm out of gear with the rack, an endless cable provided with a button adapted to engage the tripping-lever and tilt it, and a detaching device consisting of a rod movable vertically in the frame, having an arm arranged to engage a pin on the rack as it is elevated and to be raised thereby, which rod is adapted to strike the button on the cable and throw it out of engagement with the tripping-lever, combined substantially as described.

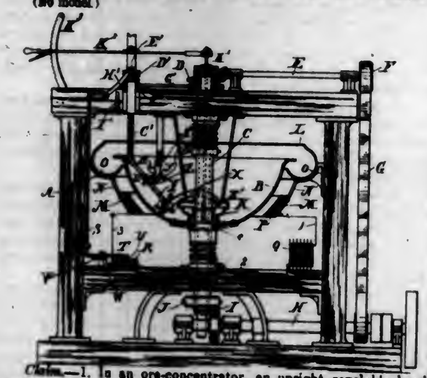
12. In an ore-concentrator having a revolving pan, a flexible discharge-pipe and an automatic device for lifting the pipe, operated by an endless cable provided with a button, a motion-checking device comprising a ring secured to the frame, through which ring the endless cable passes, and a funnel in two parts or jaws, one of which is rigid to the ring and the other of which is hinged to the fixed part and is provided with a spring closing the movable jaw yieldingly against the fixed jaw, which funnel is adapted to receive yieldingly the thrust of the button on the cable and check the motion of the cable temporarily, substantially as described.

482,323. MAGNETIC SEPARATOR FOR ORE-CONCENTRATORS. CHARLES E. SEYMOUR, Lake Geneva, Wis., assignor to the Seymour Concentrator Company, Chicago, Ill. Filed Oct. 2, 1891. Serial No. 407,524. (No model.)

482,324.

of insulated spring-pressed fingers adapted to meet over the trolley-wire.

12. A trolley having a flanged trolley-wheel and an oscillatory head having flanges extending above the flanges of the trolley-wheel, in combination with fingers carried by the said head and meeting over the trolley-wire.



13. A trolley having a flanged trolley-wheel and an oscillatory head having flanges extending above the flanges of the trolley-wheel, in combination with spring-pressed fingers carried by the said head and meeting over the trolley-wire.

482,326. FRICTION-CLUTCH. WILLIAM A. WILKINSON, Minne-

482,327.

482,323. MAGNETIC SEPARATOR FOR ORE-CONCENTRATORS.

CHARLES R. SEYMOUR, Lake Geneva, Wis., assignor to the Seymour Concentrator Company, Chicago, Ill. Filed Oct. 2, 1891. Serial No. 407,534. (No model.)

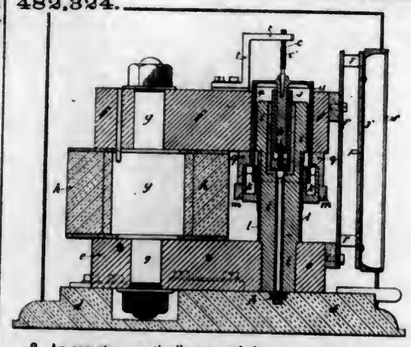
Claim.—1. In an ore-concentrator, an upright revoluble bowl adapted to receive and hold pulverized ores while being separated by centrifugal force by the rotation of the bowl, in combination with electric devices arranged around the bowl on the outside thereof at a distance from and opposite to its upwardly and outwardly flaring sides, which electric devices are adapted to magnetize or charge the bowl electrically by induction, substantially as described.

2. In an ore-concentrator, an upright revoluble bowl adapted to receive and hold pulverized ores while being separated by centrifugal force by the rotation of the bowl, in combination with a coil of insulated wire about the bowl on the outside thereof opposite to and at a distance from its sides, which coil of wire is in and forms a part of the electric circuit, whereby when in activity electrically the bowl is by induction magnetized or charged electrically, substantially as described.

3. In an ore-concentrator, an upright revoluble bowl adapted to receive and hold pulverized ores while being separated by centrifugal force by the rotation of the bowl, in combination with a coil of insulated wire about the bowl on the outside at a distance therefrom, which wire forms a part of an electric circuit, a circuit-breaker in the circuit, and a battery also in the circuit for generating the electricity therefor, substantially as described.

4. In an ore-concentrator, the combination of a concentrator pan or bowl, means for magnetizing the same, an electric circuit, spring-actuated contact-points within said circuit, a pivoted key provided with an arm bearing upon one of the contact-points, and a vertical rod connected to the outer end of said key, substantially as set forth.

5. In an ore concentrator, the combination of a concentrator pan or bowl, means for magnetizing the same, an electric circuit, a circuit-breaker within the circuit, said circuit-breaker consisting of spring-closed contact-points, a pivoted key, a rod bearing against the key, a bell-crank lever having one arm secured to the upper end of the rod, and a pivoted button constructed to engage said bell-crank lever and hold the contact-points out of engagement, substantially as set forth.



6. In an ore-concentrator, the combination of a concentrator pan or bowl, means for magnetizing the same, an electric circuit, a circuit-breaker within said circuit, a rod for controlling the circuit-breaker, a bell-crank lever having one arm secured to the upper end of the rod, and a rack or part arranged to be moved vertically in the frame of the machine and adapted to engage the inner member of the bell-crank and cause the operation of the circuit-breaker, substantially as set forth.

482,324. ELECTRIC METER.

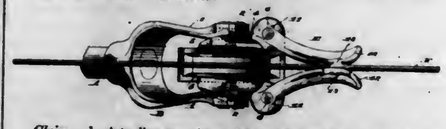
FRANCIS TRAGUE, London, England, assignor to John Abbott Iliffe, same place. Filed Nov. 17, 1891. Serial No. 412,186. (No model.) Patented in England Jan. 8, 1891, No. 389; in France Feb. 26, 1891, No. 211,733; in Germany May 2, 1891, No. 60,792, and in Italy June 30, 1891, No. 29,640/265.

Claim.—1. An electric meter operating on the known principle of the rotation of currents by magnets, comprising an electro-magnet of horseshoe form with a hole through and near the end of the upper limb, a polar extension from the lower limb into the said hole to form an annular field therein, an insulated annular mercury-cup surrounding the said polar extension, and an insulated mercury-cup sunk axially in the center of the said polar extension with a step-pivot therein, a vertically-pivoted armature supported on said pivot and making electrical contact within the said mercury-cups, circuit connections, and a train of wheels and indexes mounted in a framework upon the said magnet and driven from the armature-axle, substantially as and for the purpose herein described.

482,324.

2. An armature vertically suspended on pivots and rotatable in a truly concentric annular field, the armature-axle being immersed nearly the whole of its length in an insulated central mercury-cup sunk within a polar extension and the outer part of the said armature immersed in an adjustable annular mercury-cup, substantially as and for the purpose herein described.

3. In an electric meter, the combination of a polar extension within a cylindrical polar space forming a truly concentric annular field, an insulated central mercury-cup sunk axially in the said polar extension, a vertically-arranged armature supported upon a pivot at the bottom of said cup, and an outer annular mercury-cup vertically adjustable upon said polar extension and adapted for the rotation therein of the edge of the armature, substantially as and for the purpose herein described.



4. In an electric meter, the combination of a magnetic field of force with an armature having a central mercury contact and an outer annular mercury-trough adjustable to regulate the immersion therein of the armature, substantially as herein described.

5. In an electric meter, the combination of a truly concentric annular field, with an armature pivotally supported within a central mercury-cup, an air-chamber situated at the base of the armature-axle and protecting its pivot from mercurial contact, an outer mercury contact, and circuit connections, substantially as and for the purpose herein described.

6. In an electric meter, the combination of an electro-magnet of horseshoe form with a detachable framework containing indicating devices, said framework being secured in a vertical position against the upper and lower limbs of the said magnet, an armature rotatable in an annular field, and a driving-shaft communicating motion from the armature-spindle to the said indicating devices, substantially as and for the purpose herein described.

482,325. TROLLEY FOR ELECTRIC RAILWAYS.

JAMES M. C. TYNER and SAMUEL S. IRVINE, Minneapolis, Minn. Filed Nov. 30, 1891. Serial No. 413,588. (No model.)

Claim.—1. A trolley carrying a detent adapted to occupy a position over the trolley-wire at a point in rear of the trolley-wheel.

2. A trolley carrying a series of fingers adapted to meet over the trolley-wire at a point in rear of the trolley-wheel.

3. A trolley carrying a series of insulated fingers adapted to meet over the trolley-wire.

4. A trolley carrying a series of spring-pressed fingers adapted to meet over the trolley-wire at a point in rear of the trolley-wheel.

5. A trolley carrying a series of insulated spring-pressed fingers adapted to meet over the trolley-wire.

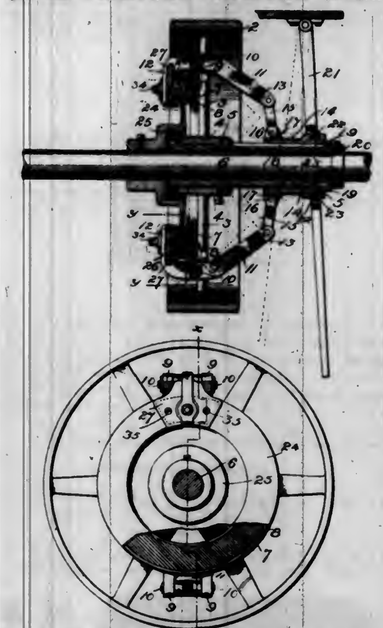
6. A trolley having an oscillatory head carrying a series of fingers adapted to meet over the trolley-wire.

7. A trolley having an oscillatory head carrying a series of insulated fingers adapted to meet over the trolley-wire.

8. A trolley having an oscillatory head carrying a series of insulated spring-pressed fingers adapted to meet over the trolley-wire.

9. A trolley having an oscillatory balanced head carrying a series of fingers adapted to meet over the trolley-wire.

10. A trolley having an oscillatory balanced head carrying a series of insulated fingers adapted to meet over the trolley-wire.



11. A trolley having an oscillatory balanced head carrying a series of insulated spring-pressed fingers adapted to meet over the trolley-wire.

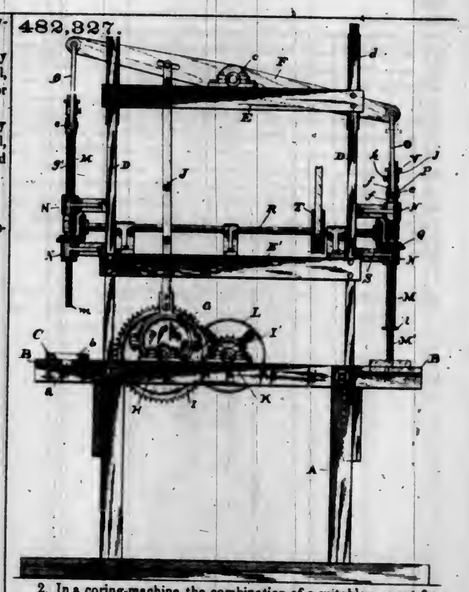
12. A trolley having a flanged trolley-wheel and an oscillatory head having flanges extending above the flanges of the trolley-wheel, in combination with fingers carried by the said head and meeting over the trolley-wire.

13. A trolley having a flanged trolley-wheel and an oscillatory head having flanges extending above the flanges of the trolley-wheel, in combination with spring-pressed fingers carried by the said head and meeting over the trolley-wire.

482,326. FRICTION-CLUTCH.

WILLIAM A. WILKINSON, Minneapolis, Minn. Filed Nov. 6, 1891. Serial No. 411,044. (No model.)

Claim.—1. The combination, in a friction-clutch, of the shaft with the sleeve 5 loosely journaled thereon, the pulley fixed on said sleeve, the sleeve 14, slidably secured on the sleeve 5 and adapted to move therewith, a shipper-rod for moving said sleeve 14 longitudinally, the recessed ring 7, fixed with respect to the pulley, the wooden ring 8, fixed thereon, the arms or levers 11, lugs fixed with respect to the ring 7 and whereon said levers are pivoted, the inwardly-extending ends of said levers provided with sector-like recessed jaws 27, having the wooden friction-blocks 26, the friction-disk 24, arranged between said blocks and wooden ring and having a strong hub 25 securely fixed on the shaft, links 15, pivotally connecting the ends 13 of the levers 11 with said sliding sleeve 14, said blocks 26 being pivotally secured in said jaws and adapted to adjust themselves to the disk when pressed into contact therewith, substantially as described.



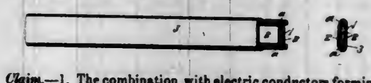
2. The combination, with the shaft, of a friction-disk fixed thereon, the pulley loosely arranged with respect to the same, the friction device thereon, levers or arms 11, having jaws 27, the wooden blocks 26, arranged therein, follower-plates 28, whereon the same are secured, the threaded sleeve 30, having the ball-bearing end to engage the followers, said followers provided with the ball-bearing surfaces 33, and the locking-bolts 31, having heads bearing on said surfaces 33 and secured by nuts 34, substantially as described.

482,327. FRUIT-CORING MACHINE.

JOHN ADAMS, Baltimore, Md., assignor to the A. Booth Packing Company of Baltimore City, same place. Filed June 4, 1892. Serial No. 435,473. (No model.)

Claim.—1. In a coring-machine, the combination of a stand or table, vertical coring-tubes mounted to slide and revolve in suitable bearings, a walking-beam connected with said coring-tubes, a bevel gear-wheel on each tube and having spline connection therewith, and a drive-shaft carrying gear-wheels meshing with those on the coring-tubes.

482,327.



2. In a coring-machine, the combination of a suitable support for the article under treatment, a vertically-reciprocating coring-tube, and a sliding gravity-plunger within the said tube to push out the core, substantially as described

3. In a coring-machine, the combination of a suitable support for the article under treatment, a walking-beam, a coring-tube, links connecting said walking-beam and coring-tube, and a plunger-rod within the coring-tube and having a cross-head arranged to slide on the said connecting-links.

482,328. ELECTRIC CABLE.

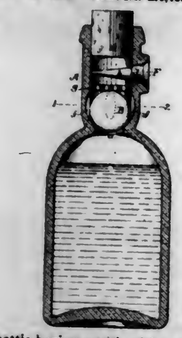
JOHN A. BARRETT, Brooklyn, N. Y., assignor to The Standard Underground Cable Company, Pittsburg, Pa. Filed Aug. 28, 1891. Serial No. 403,962. (No model.)

Claim.—1. The combination, with electric conductors forming one or more circuits, of a core upon which the conductors are secured at a distance from each other, said core consisting of a hollow structure constructed to provide fixed space for dry-air insulation between said conductors, substantially as described.

2. The combination, with electric conductors forming one or more circuits, of a core upon which said conductors are arranged at a distance from each other and insulating material binding said core and conductors together, said core consisting of a hollow structure constructed to provide fixed space for dry-air insulation between said conductors, substantially as described.

3. A single-strand anti-induction electric circuit consisting of a core and one or more electric circuits thereon, each circuit consisting of a pair of conductors arranged on opposite sides of said core and a covering of insulating material binding the core and conductors together, said core consisting of a hollow structure constructed to provide fixed space for dry-air insulation between the conductors, substantially as described.

4. The combination, with electric conductors forming one or more circuits, of a core consisting of a hollow structure, of paper or similar insulating material, upon which the conductors are secured at a distance from each other, substantially as described.



5. In an electric cable, the combination, with an inclosing sheath, of a plurality of single-strand electric circuits, each circuit consisting of an oblong core of insulating material, and electric conductors forming a circuit secured on the core at the opposite edges of the same, said core being constructed to provide space for dry-air insulation between the conductors, substantially as described.

6. In an electric cable, the combination, with an inclosing sheath, of a plurality of cores and electric conductors forming one or more circuits secured in position upon each core, said cores being constructed to provide space for dry-air insulation between the conductors, substantially as described.

7. In an electric cable, the combination, with an inclosing sheath, of a plurality of cores of insulating material, electric conductors forming one or more circuits arranged upon each core, and insulating material outside said conductors binding each of said cores and the conductors thereon together, said cores being constructed to provide space for dry-air insulation between the conductors, substantially as described.

8. An electric cable consisting of an inclosing sheath and a plurality of single-strand electric circuits, each single strand consisting of a core of insulating material and one or more circuits thereon, each circuit consisting of a pair of conductors arranged in position upon opposite sides of said core, and a covering of insulating material binding said conductors and core together, said cores being constructed to provide space for dry-air insulation between the conductors, substantially as described.

482,329. BOTTLE DESIGNED TO PREVENT REFILLING. EDWIN L. TEVIS, Philadelphia, Pa., assignor of one-half to Joshua Tevis, same place. Filed Mar. 28, 1892. Serial No. 426,733. (No model.)

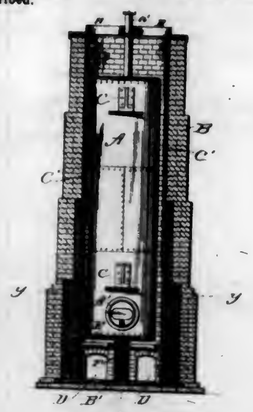
Claim.—1. A bottle having a neck with a detachable stopper, a valve-seat in said neck, a valve adapted to said seat and serving to close the bottle against inflow, and a second opening provided with a non-removable plug or stopper having a finger projecting across the neck of the bottle above the valve, substantially as specified.

2. A bottle having a neck with detachable stopper, a valve-seat in said neck, a valve adapted to said seat and fitting snugly to the neck of the bottle so as to close the same against inflow, narrow grooves or passages in the neck above the valve-seat and alongside of the valve, an obstruction to prevent the removal of the valve from the bottle, and a second opening having a non-removable plug or stopper, substantially as specified.

3. A bottle having a neck with detachable stopper, a valve-seat in said neck, a valve adapted thereto and serving to close the bottle against inflow, a second opening provided with a non-removable plug or stopper having a finger projecting across the neck of the bottle, and a perforated plate interposed between the valve and said finger, substantially as specified.

REISSUES.

11,267. MANUFACTURE OF YELLOW DYES. MEINHARD HOFFMANN, Mainkur, near Frankfort-on-the-Main, assignor to Leopold Cassella & Co., Frankfort-on-the-Main, Germany. Filed July 19, 1892. Serial No. 441,953. Original No. 472,121, dated Apr. 5, 1892. Patented in France Sept. 29, 1890, No. 206,526.



Claim.—The yellow dye-stuff herein described, derived from tetrazo naphthaline beta-disulpho-acid and phenols, which is easily soluble in water, difficultly soluble in spirit, dissolving with a brilliant violet shade in strong sulphuric acid, from which, on diluting with some water, the free acid of the dye-stuff separates in the form of a dark-green precipitate, which, by further addition of water, is dissolved with a yellow shade.

11,268. SETTING FOR STEAM-BOILERS. SEBASTIAN RUBNER, Greenville, Pa. Filed Apr. 4, 1892. Serial No. 427,764. Original No. 454,771, dated June 23, 1891.

Claim.—1. In combination with a casing, a boiler located therein, said casing being divided into two parts by a vertical division-wall of which said boiler forms a part and an independent source of heat for each part, substantially as described.

2. In combination with a casing having a vertical partition-wall a horizontal transverse wall at the base of the chimney, heat-entrances D D on each side of the partition-wall, and a boiler set within the casing, said boiler having vertical sets of flues on each side of the partition-wall, substantially as described.

3. In combination with the casing B, provided with a vertical partition-wall, a boiler set centrally therein, arches or openings D D, connected to independent heat-supplies, a feed-water pipe located above said arches and apertures provided with casings G, substantially as described.

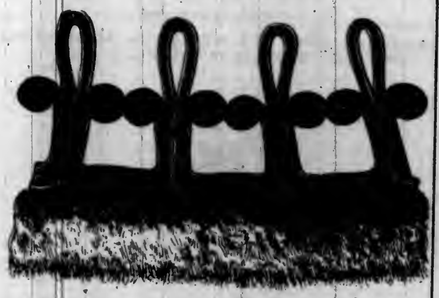
4. In combination with the casing B, having a transverse and vertical partition-wall, heat-entrances D D on each side of the partition-wall, brackets attached to the boiler and let into the vertical partition-wall, the external diameter of the boiler being less than the internal diameter of the casing to provide flues, and apertures in the casing above and below the boiler connecting with said flues, said apertures having doors, together with a top plate having openings connecting with the flues, substantially as described.

DESIGNS.

21,830. TRIMMING. CHARLES LEKOW, Rosebank, N. Y. Filed June 21, 1892. Serial No. 437,524. Term of patent 3½ years.

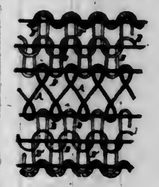
Claim.—The design for trimmings, as herein shown and described.

21,831. TRIMMING. JOSEPH W. SCHLOSS, New York, N. Y. Filed July 29, 1892. Serial No. 441,622. Term of patent 3½ years.



Claim.—The design for fur trimming herein shown and described.

21,832. TRIMMING. HENRY M. SACKS, Madison, N. J. Filed Aug. 13, 1892. Serial No. 443,038. Term of patent 3½ years.



Claim.—The design for a trimming, substantially as herein shown and described.

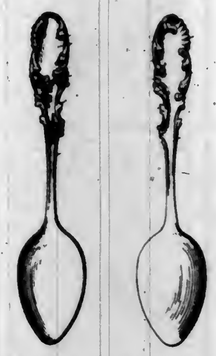
21,833. TRIMMING. HENRY M. SACKS, Madison, N. J. Filed Aug. 13, 1892. Serial No. 443,039. Term of patent 3½ years.

Claim.—The design for a trimming, substantially as herein shown and described.

21,834. TRIMMING. LOUIS TIESE, New York, N. Y. Filed June 25, 1892. Serial No. 438,041. Term of patent 3½ years.

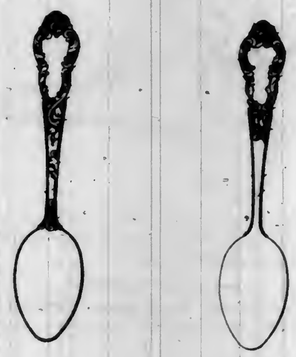
Claim.—The design for a flat band trimming herein described and shown.

21,835. SPOON. RICHARD H. ACTON, Alexandria, Va. Filed Aug. 6, 1892. Serial No. 442,391. Term of patent 7 years.



Claim.—The design for a spoon herein shown and described.

21,836. SPOON. ALTON H. FANCHER, Brooklyn, N. Y., assignor to the E. W. Bliss Company, Limited, London, England. Filed July 15, 1892. Serial No. 440,163. Term of patent 3½ years.

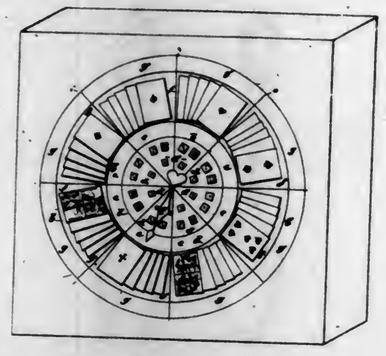


Claim.—The design for a spoon, substantially as shown and described.

21,837. HANDLE FOR SPOONS, &c. JOHN W. MAILLOT, Attleborough, Mass. Filed Aug. 6, 1892. Serial No. 442,383. Term of patent 3½ years.

Claim.—The design herein described and shown for the handle of a spoon or other like article.

21,838. HANDLE FOR SPOONS, &c. CHARLES C. WEBSTER, Providence, R. I., assignor to The Howard Sterling Company, same place. Filed Aug. 9, 1892. Serial No. 442,619. Term of patent 7 years.



Claim.—The design for handles of spoons and similar articles, as herein shown and described.

21,839. HANDLE FOR SPOONS, &c. GEORGE WILKINSON, Providence, R. I., assignor to The Gorham Manufacturing Company, same place. Filed Aug. 9, 1892. Serial No. 442,618. Term of patent 7 years.

Claim.—The design for handles of spoons and similar articles, as herein shown and described.

21,840. BOX. CHARLES L. DOBRICK, New York, N. Y. Filed Nov. 12, 1891. Serial No. 411,740. Term of patent 7 years.

Claim.—The design for boxes, as described in the specification, and shown in the drawing.

21,841. TRUMPET. ALBERT SCHOENHUT, Philadelphia, Pa. Filed Aug. 13, 1892. Serial No. 443,081. Term of patent 7 years.

Claim.—The design for a trumpet, as herein described, and as shown in the accompanying drawing.

21,842. TRUMPET. ALBERT SCHOENHUT, Philadelphia, Pa. Filed Aug. 13, 1892. Serial No. 443,083. Term of patent 7 years.

Claim.—The design for a trumpet, as herein described, and as shown in the accompanying drawing.

21,843. BUTTON. WILLIAM J. VAN KEUREN, Honesdale, Pa. Filed July 11, 1892. Serial No. 439,705. Term of patent 3½ years.

Claim.—The design for a button, as herein shown and described.

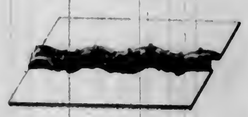
21,844. THIMBLE. HENRY A. WHEMAN, Philadelphia, Pa., assignor to Simons, Brother & Co., same place. Filed Feb. 20, 1892. Serial No. 422,298. Term of patent 14 years.

Claim.—The design for a thimble, as herein described and shown, consisting of the representation of a "Liberty bell" having the upper roughened surface A.

21,845. CLASP. SARA BAXTER, New York, N. Y. Filed Aug. 10, 1892. Serial No. 442,718. Term of patent 3½ years.

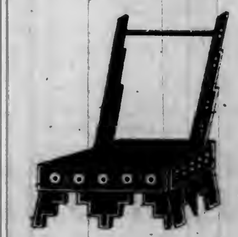
Claim.—The design for a clasp herein shown and described.

21,846. BADGE. WILLIS R. MUNGER, Harrisburg, Pa. Filed Aug. 9, 1892. Serial No. 442,622. Term of patent 3½ years.



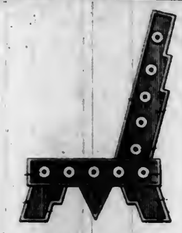
Claim.—The design for a badge herein shown and described.

21,847. BACK OF A BRUSH OR SIMILAR ARTICLE. CHARLES C. WIENTGE, Providence, R. I., assignor to The Howard Sterling Company, same place. Filed Aug. 9, 1892. Serial No. 442,630. Term of patent 7 years.



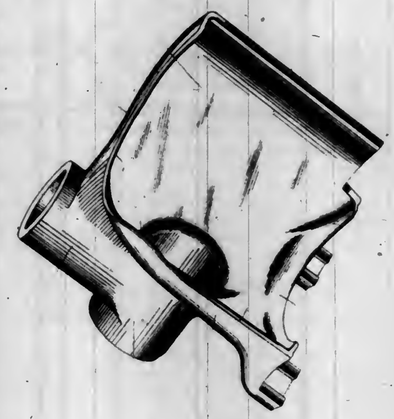
Claim.—The design for the back of a brush or similar toilet article, as herein shown and described.

21,848. METAL BORDER. CHARLES GEORGE, New York, N. Y., assignor to the Whiting Manufacturing Company, same place. Filed Aug. 4, 1892. Serial No. 442,186. Term of patent 3½ years.

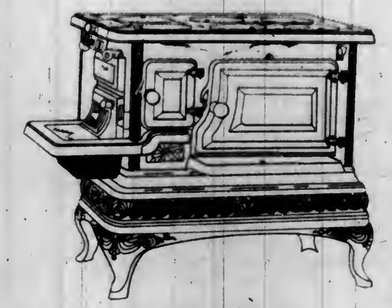


Claim.—The design for a metal border herein shown and described.

21,849. CHAIR. ZELIA NUTTALL, Dresden, Germany. Filed Aug. 5, 1892. Serial No. 442,382. Term of patent 3½ years.



21,849.



Claim.—The design for a chair herein shown and described.

21,850. CUTTER-HEAD HOOD FOR PLANERS. JAMES ROBERTS, Boston, Mass., assignor to the S. A. Woods Machine Company. Filed Aug. 4, 1892. Serial No. 442,185. Term of patent 14 years.

Claim.—The design for a cutter-head hood for planers and matchers, substantially as herein shown and described.

21,851. STOVE OR RANGE. OSCAR G. THOMAS, Taunton, Mass. Filed July 26, 1892. Serial No. 441,557. Term of patent 7 years.

Claim.—The design for a stove or range, substantially as shown and described.

21,852. OIL OR GAS STOVE. EARL A. TERRELL and WILLIAM H. WILDER, Florence, Mass. Filed Aug. 11, 1892. Serial No. 442,813. Term of patent 14 years.

Claim.—The design for an oil or gas stove, as herein shown and described.

21,853. OIL HEATING-STOVE. MAURICE G. BENEDICT, Detroit, Mich. Filed July 30, 1892. Serial No. 441,751. Term of patent 7 years.

21,853.

Claim.—The design for an oil heating-stove, consisting of an ornamental square leg-frame, a square tank chamber, a burning-chamber having deeply-seated light-openings, the side and bottom approaches to said openings being ornamented with scrollwork, the meeting edges of contiguous openings being rounded and finished vertically in a cyma curve terminating at its upper end with an open flower, a round heating-chamber, and a dome-shaped top, substantially as shown and described.

TRADE-MARKS

REGISTERED SEPTEMBER 6, 1892.

21,716. PORTUGUESE WINES. COMPANHIA GERAL D'AGRICULTURA DOS VINHOS DO ALTO DOURO, Oporto, Portugal. Filed June 30, 1892.

Essential feature.—The representation of a shield surmounted by a crown with a woman holding a bunch of grapes at the right side and a dragon couchant regardant at the other side of said shield. Used since 1852.

21,717. CASH-REGISTERING MACHINES. THE COLUMBIA CASH REGISTER COMPANY, Miamisburg, Ohio. Filed July 30, 1892.

COLUMBIA

Essential feature.—The word "COLUMBIA." Used since March 1, 1892.

21,718. PANTS AND OVERALLS. JOHN G. LEWIS, Jefferson City, Mo. Filed Aug. 9, 1892.

BUX KIN

Essential feature.—The word-symbol "BUX KIN." Used since June 1, 1892.

21,719. LAGER AND OTHER BEERS. ELFRETH & OTT, Philadelphia, Pa. Filed June 18, 1892.

EISEN

Essential feature.—The word "EISEN." Used since February 5, 1892.

21,720. CHICORY. GEO. FLOTO'S SONS, Brooklyn, N. Y. Filed July 9, 1892.

Essential feature.—The representation of a shield bearing the figure of a Maltese cross surmounted by a bird and inclosed by a circle. Used since July 1, 1890.

21,721. MONTHLY PUBLICATION. MATTHIAS N. FORNEY, New York, N. Y. Filed Aug. 11, 1892.

AMERICAN ENGINEER

Essential feature.—The words "AMERICAN ENGINEER." Used since August 9, 1892.

21,722. TABLETS FOR THROAT AND LUNG DISEASES. KURUM CHEMICAL CO., St. Paul, Minn. Filed Aug. 11, 1892.

KURUM

Essential feature.—The word "KURUM." Used since July 20, 1892.

21,723. DRESS AND NEGLIGÉE SHIRTS. MISSOULA MERCANTILE COMPANY, Missoula, Stevensville, Victor, Corvallis, and Demersville, Mont. Filed May 28, 1892.

CORONET

Essential feature.—The word "CORONET." Used since April 1, 1892.

21,724. HAIR-CURLING COMPOUNDS. ADA M. PETRI, Minneapolis, Minn. Filed July 25, 1892.

MURLINE

Essential feature.—The word "MURLINE" and a rear view of a woman's head showing short or close curls. Used since January 1, 1891.

21,725. WATCHES AND JEWELRY. HAYDEN W. WHEELER & Co., New York, N. Y. Filed Aug. 5, 1892.

HW

Essential feature.—A W-shaped symbol having the letters "H" and "W" in its loops. Used since February 2, 1888.

21,726. METALLIC BEDSTEADS AND WIRE MATTRESSES. STEPHEN WILKES, Minton, England. Filed Aug. 10, 1892.

ATLAS

Essential feature.—The word "ATLAS." Used since 1884.

21,727. VASELINE. CHESEBROUGH MANUFACTURING COMPANY, New York, N. Y. Filed Aug. 13, 1892.

21,729.

Essential feature.—The representation of an ornamental center piece in blue color, within the lower border of which appears ornamental flower-work; over the center is an ornamental scroll in the same color surmounted by two grape-leaves, and the whole is set off by displayed rays in the same color in which are printed the words "PREMIÈRE QUALITÉ" and "SILLERY MOUSSE." Used since July 1, 1891.

DECISIONS

OF THE

COMMISSIONER OF PATENTS

21,727. VASELINE. CHESEBROUGH MANUFACTURING COMPANY, New York, N. Y. Filed Aug. 13, 1892.

Essential feature.—The words "BLUE SEAL." Used since October 10, 1888.

21,728. ENAMELED AND BUFF BUILDING BRICKS OR BLOCKS. JOSEPH CROMLEY, Trenton, N. J. Filed Aug. 8, 1892.

+LEY

Essential feature.—The rebus "+LEY." Used since May 26, 1892.

21,729. CHAMPAGNE. KUPFERMANN & Co., Rheims, France. Filed July 26, 1892.

21,729.

Essential feature.—The representation of an ornamental center piece in blue color, within the lower border of which appears ornamental flower-work; over the center is an ornamental scroll in the same color surmounted by two grape-leaves, and the whole is set off by displayed rays in the same color in which are printed the words "PREMIÈRE QUALITÉ" and "SILLERY MOUSSE." Used since July 1, 1891.

21,730. MEDICINAL PLASTERS. FREDERICK MERZ, Brooklyn, N. Y. Filed Aug. 6, 1892.

Essential feature.—A half-length portrait of a child with the conventional representation of a heart upon its breast. Used since January 1, 1887.

THE NORRIS PETERS CO.

DECISIONS

OF THE

COMMISSIONER OF PATENTS

AND OF

UNITED STATES COURTS IN PATENT CASES.

COMMISSIONER'S DECISIONS.

HUTT AND PHILLIPS *v.* FOGLESONG.

Decided July 29, 1892.

PRACTICE—RULES 122 AND 124.

Upon a motion to dissolve an interference upon the ground of irregularity in declaring the same the Primary Examiner is not at liberty to decide the question of patentability.

ON petition.

MACHINE FOR MAKING PAPER VESSELS.

Application of James W. Hutt and Arthur J. Phillips filed January 2, 1891, No. 376,508. Application of Washington Foglesong filed January 26, 1891, No. 379,148.

Messrs. D. C. Ridout & Co. for Hutt and Phillips.
Messrs. Whitaker & Prevost for Foglesong.

SIMONDS, *Commissioner:*

In this case a motion was made before the Primary Examiner to dissolve the interference on the ground of such irregularity in declaring the same as will preclude a proper determination of the question of priority. The Primary Examiner granted the motion. He stated his reasons at full length, and they are that Hutt and Phillips are estopped from making the claim which is in interference. Thereupon Hutt and Phillips took an appeal to the Examiners-in-Chief, and they reversed the Examiner's decision.

Now comes Foglesong with a petition to the effect that—

Your petitioner therefore prays that you will personally consider the question of the jurisdiction of the Board of Examiners-in-Chief on said motion as on appeal or otherwise and will direct the Primary Examiner that his decision dissolving the interference is of full force and effect, and that you instruct him to send the application of Foglesong to issue.

Rules 122 and 124 are as follows:

122. Motions to dissolve an interference upon the ground that no interference in fact exists, or that there has been such irregularity in declaring the same as will preclude a proper determination of the question of priority, or which deny the patentability of an applicant's claim, or his right to make the claim, should, if possible, be made not later than the twentieth day after the statements of the parties have been received and approved. Such motions, when in proper form, will be transmitted by the Examiner of Interferences, with the files and papers, to the proper Primary Examiner for his determination.

When the motion has been decided by the Primary Examiner, if no appeal has been taken therefrom, at the expiration of the time limited for appeal, the Examiner will return the files and papers, with his decision, to the Examiner of Interferences. Such decision will be binding on the Examiner of Interferences unless reversed or modified on appeal. (Rule 124.)

124. Appeal may be taken directly to the Commissioner from decisions of the Primary Examiner on all motions except the following: (1) On motions to dissolve which deny the patentability of applicant's claim; (2) on motions to dissolve which deny the right of an applicant to make the claim; (3) on motions involving the merits of the invention. Decisions on these motions, when appealable, go to the Examiners-in-Chief, and upon such appeals the party only whose claim is affected shall have the right to appear and be heard, unless the question is *inter partes.*

One effect of Rule 124 is to exclude the motions it specifies from consideration under a motion based—

upon the ground * * * that there has been such irregularity in declaring the same as will preclude a proper determination of the question of priority.

But that is precisely what the Primary Examiner did, and his action, although it might have been a right one for a proper motion, was unwarranted by the motion which was before him for consideration. The Examiner's action being practically a nullity, it follows that the decision of the Examiners-in-Chief thereon is a nullity, although it must be said that the question coming before them as it did the Examiners-in-Chief could have been expected to take no other action than that which they did take.

It is true that appeals lie from decisions themselves and not from the reasons given; but when, as in this case, it clearly appears from the decision itself that the Examiner was acting outside of the jurisdiction which he possessed at the time the reasons of the decision must be taken into account.

The decisions of the Primary Examiner and of the Examiners-in-Chief stand vacated without prejudice to Foglesong's right to make further motion for dissolution.

EX PARTE L. J., H. C., AND J. H. HUNTER.

Decided June 17, 1892.

PRACTICE—MODEL NOT REGULARLY FILED MAY BE RETURNED.

The Office required a model, which applicant furnished, clearly indicating, however, at that time and subsequently, that he wished the model returned. The Office did not, in response to applicant, insist upon the permanent filing of a model, nor were the receipt and application of the model to the case under consideration entered on the file-wrapper, under Rule 56. *Held*, on renewed request by the applicant for its return, that the model was not regularly filed, and should be returned.

REQUEST for return of model.

APPARATUS FOR REGISTERING CAR-FARES.

Application of L. J., H. C., and J. H. Hunter filed January 28, 1892, No. 419,521.

Mr. William H. Fisher for the applicants.

FROTHINGHAM, *Assistant Commissioner:*

The first action had in this case was a requirement for a model. The application was thereafter transferred to another examining division. Applicants on April 28, 1892, forwarded a model to the Patent Office, accompanying the same by a letter stating:

We hope it will be possible for you to retain this model but a few days, as it is the only one we have, and it will be necessary for us to have it back here at the earliest moment possible.

The model was duly received, but its receipt and application to the case under consideration have never been entered on the file-wrapper, as required by Rule 56. Before any action was taken by the Office a letter was received asking for the return of the model if the Office was through with it. Ample notice was therefore received that these applicants did not intend to permanently file the said model, and if the model

solidated Brake Shoe Co. v. *Detroit Steel & Spring Co.*, 47 Fed. Rep., 894; *Coop* v. *Institute, Id.*, 899.) Upon this ground I shall sustain the demurrer, with costs, with leave to the complainant to amend its bill within ten days.

Demurrer sustained.

in any position on the seat by means of a set-screw. This mechanism is simple and easily understood, and the elements are specifically set out in the first claim.

Stress is laid by the complainant upon the fact that the specification says that—

the slide carrying the handle-bar and the seat on the head may have a figure other than the dovetail figure represented.

I do not think that this language should be construed

U. S. Circuit Court—Northern District of Illinois, Northern Division.

PASTEUR CHAMBERLAND FILTER COMPANY *et al. v.* FUNK *et al.*

Decided May 16, 1892.

PATENT—INFRINGEMENT—WHEN BOND WILL NOT BE REQUIRED OF COMPLAINANT AS A CONDITION OF PRELIMINARY INJUNCTION

The model was duly received, but its receipt and application to the case under consideration have never been entered on the file-wrapper, as required by Rule 56. Before any action was taken by the Office a letter was received asking for the return of the model if the Office was through with it. Ample notice was therefore received that these applicants did not intend to permanently file the said model, and if the model was necessary in order to understand the invention the Office should have promptly advised applicants that action on the merits would be suspended pending the filing of a model, which would become a part of the permanent records of the said application for patent. It appears that no such action was taken, but that the Examiner proceeded with the case and wrote a letter of rejection.

The request for the return of the model has been renewed. Under the circumstances it is held that the model has not been regularly filed, and should therefore be returned to the applicants.

The Examiner has stated orally that a model is not, in his opinion, necessary to an understanding of the invention.

It is directed that the model be returned.

DECISIONS OF THE U. S. COURTS.

U. S. Circuit Court—District of Massachusetts.

OVERMAN WHEEL COMPANY *v.* ELLIOTT HICKORY CYCLE COMPANY.

Decided March 24, 1892.

PATENTS FOR INVENTIONS—INFRINGEMENT—PLEADING.

Under Revised Statutes, section 4886, providing for the issuing of a patent where, *inter alia*, the invention has not been patented or described in any foreign country before the date of the invention, a bill for infringement of a patent is demurrable which does not allege such facts.

SUIT by the Overman Wheel Company against the Elliott Hickory Cycle Company for infringement of a patent. Heard on demurrer to the bill. Demurrer sustained.

Messrs. Chamberlin, White & Mills for the complainant.

Mr. William A. Redding for the defendant.

COLT, *J.:*

Upon inspection of the patent granted to A. H. Overman April 14, 1885, numbered 315,537, for improvements in rubber tires for wheels, I am not prepared to say that it is invalid for want of patentable novelty. Taking this view, it seems to me it would serve no good purpose to enter into a discussion of the patent at this stage of the proceedings. The first three grounds of demurrer are therefore overruled.

The fourth special ground for demurrer is that the bill does not aver that the alleged invention shown and described in said Letters Patent had not been patented nor described in any printed publication in this or any foreign country before the date of said alleged invention. An allegation of this character appears to be necessary under the provisions of the statute, and the courts have so held. (Rev. Stats., sec. 4886; *Consolidated Brake Shoe Co.* v. *Detroit Steel & Spring Co.*, 47 Fed. Rep., 894; *Coop* v. *Institute, Id.*, 899.) Upon this ground I shall sustain the demurrer, with costs, with leave to the complainant to amend its bill within ten days.

Demurrer sustained.

U. S. Circuit Court—District of Massachusetts.

POPE MANUFACTURING COMPANY *v.* WARWICK CYCLE MANUFACTURING COMPANY *et al.*

Decided April 30, 1892.

PATENT—INFRINGEMENT—BICYCLES.

The claims of Letters Patent No. 245,071, to George Illston, August 2, 1881, for improvements in bicycles, must, in view of the prior state of the art, be limited to the specific forms of devices therein described, and, the claim being for a dovetail grooved seat, the words of the specification "the slide carrying the handle-bar and the seat on the head may have a figure other than the dovetail figure represented" cannot be construed to include other and different forms of adjustable mechanism and must be held to include at most a modification of the dovetail form.

Mr. William A. Redding and *Mr. Charles E. Pratt* for the complainant.

Mr. John L. S. Roberts for the defendants.

COLT, *J.:*

The bill in this case is based upon the alleged infringement of Letters Patent No. 245,071, granted to George Illston, August 2, 1881, for improvements in bicycles.

The invention relates to the construction of the head of a bicycle so that the handle on the head may be adjusted and readily removed from the machine.

The specification says:

On one face of the head I make a vertical dovetail or grooved seat, on or in which a slide works, the said slide being fixed in any position on the said seat by means of a set-screw. In the upper part of the said slide the handle-bar is secured. The handle-bar may either be permanently fixed to the said slide or be capable of detachment therefrom.

When it is required to adjust the height of the handle on the head it is only necessary to slacken the set-screw of the slide, when the said slide carrying the handle-bar may be raised or lowered on its seat and refixed in its adjusted position by driving home the set-screw.

Instead of this arrangement there is another form of mechanism set forth in the patent, consisting of a vertical slot on the face of the head of the bicycle, in which a sliding socket works. This sliding socket carries the handle-bar and is fixed at the required height by a screw-nut.

The first form of the device if covered by the first claim of the patent, which is as follows:

1. The improvements in constructing the heads of bicycles and tricycles hereinbefore described and illustrated in Figs. I, II, III, IV, V, VI, and VII of the accompanying drawings, for the purpose of readily adjusting the vertical height of the handles on the said heads and rendering the handles detachable from the heads—that is to say, making on the face of the head a dovetail or grooved seat, on or in which a slide carrying the handle-bar works, the said slide being adjusted at any desired height on the said seat, and fixed in its adjusted position by means of a set-screw or other equivalent arrangement, substantially as described and illustrated.

The scope of the Illston invention seems to me to be clear. He describes in his patent two forms of mechanism for adjusting the handle on the head of a bicycle "with great nicety."

In the present suit we are only concerned with the first form, which consists in placing on one face of the head a dovetail grooved seat, in or upon which a slide carrying the handle works, the slide being fixed

in any position on the seat by means of a set-screw. This mechanism is simple and easily understood, and the elements are specifically set out in the first claim.

Stress is laid by the complainant upon the fact that the specification says that—

the slide carrying the handle-bar and the seat on the head may have a figure other than the dovetail figure represented.

I do not think that this language should be construed to include other and different forms of adjustable mechanism, but that within the sense of the patent it can only include at most a modification of the dovetail form in which the slide works.

The claim itself, by reference to the figures shown in the drawings and by its specific language, refers to the dovetail construction.

An examination into the prior state of the art forbids any such broad construction of this claim as the complainant contends for.

In the Hanlon patent, of July 7, 1868, there is found adjustable mechanism for the seat and the cranks of a velocipede, and that patent says, after describing these devices, that—

the handles e may, if desired, be also made extensible.

In the McCleave patent, of April 13, 1869, the handle, in connection with the frame of the machine, is raised and lowered for the purpose of adjusting the distance of the crank from the seat to the size of the rider.

The use of a dovetail seat with a slide and set-screw for the purpose of adjustability appears to be old in other branches of the art. In the old milling-machine what was known as the "back-rest" or "back center" was constructed after this form.

In view of the prior state of the art the Illston patent must be limited to the forms of devices therein described.

The defenses to this suit are non-infringement and want of patentability.

In the defendants' device the handle-bar is connected with the spindle, which slides in a socket upon the head of the machine and is fastened at any desired place by a set-screw.

I question, in view of what was old and well known, whether there is anything patentable in the defendants' device; but, however this may be, it is perfectly clear to my mind that the defendants' device is no infringement of the first claim of the Illston patent.

Although argued with much force by complainant's counsel, it would be going beyond all sound rules in the construction of patents to so construe the first claim of the Illston patent as to cover the defendants' mechanism, not only because of the position which that patent occupies in the art, but also because the defendants' device is different in construction.

The spindle, socket, and set-screw, which make the defendants' handle adjustable, are not the dovetail grooved seat on the face of the head, with its slide carrying the handle-bar, of the Illston patent.

Taking the Illston patent to mean what it says and construing it in the light of the prior state of the art, I am clearly of opinion that no case of infringement has been made out.

It is unnecessary to consider the second ground of defense.

Bill dismissed.

U. S. Circuit Court—Northern District of Illinois, Northern Division.

PASTEUR CHAMBERLAND FILTER COMPANY *et al. v.* FUNK *et al.*

Decided May 16, 1892.

PATENT—INFRINGEMENT—WHEN BOND WILL NOT BE REQUIRED OF COMPLAINANT AS A CONDITION OF PRELIMINARY INJUNCTION.

Where a defendant has been guilty of bad faith toward a complainant in an infringement suit, he is not equitably entitled to ask a bond from complainant as a condition to the granting of a preliminary injunction, and the court will waive the requirement of bond where the record discloses proof of such a state of facts.

Messrs. Kerr & Curtis, Mr. L. Hill, and *Messrs. Staley & Shephard* for the complainants.

Mr. H. A. Toulmin, Mr. L. L. Bond, and *Messrs. Poole & Brown* for the defendants.

BLODGETT, *J.:*

This case is now before the court on a motion for a preliminary injunction to restrain the alleged infringement of Patent No. 336,385, granted February 16, 1886, to Charles Edouard Chamberland, for a filtering compound.

The scope and characteristics of the patent are perhaps best disclosed by the patentee himself in his specifications, where he says:

The means hitherto employed for filtering water ordinarily consist in the use of burned brick, powdered substances, and various other materials, but which, either from the character of the materials themselves or from the manner in which they are used or compounded, are not fully satisfactory where great thoroughness in filtering is requisite. However efficient the named substances may be for filtering purposes, yet they do not, however, retain all germs or microbes or extremely fine organisms which are in suspension in the water or other liquid. * * *

My invention is designed more completely to hold back and retain such germs.

The compound is formed, substantially, of pipe-clay or any other suitable clay and porcelain-earth, or its equivalents, hereinafter named. The clay is diluted in water, and then mixed with the porcelain-earth or its equivalents. The porcelain-earth is ground or reduced to fine powder in any suitable mill, after having been previously baked in any suitable kiln. The proportions are from twenty to forty per cent. of clay to sixty to eighty per cent. of porcelain-earth or its equivalents. They may, however, vary more or less. I wish it, however, to be understood that I do not limit myself to the above-named substances, for the same or very much the same result may be attained by using, for instance, silex, magnesia, or its equivalent, instead of porcelain-earth. * * *

A filtering-body produced from the above compound is homogeneous and fulfills the required conditions for filtering.

I do not wish to be understood as laying claim, broadly, to the materials hereinabove mentioned as a filtering compound, but only when they are treated as above specified.

The proof is, I think, quite convincing that defendants use a filtering compound made by combining kaolin clay or porcelain-earth and finely-ground silex in about the proportions of thirty to forty-five per cent. of kaolin and the balance ground silex. This, I think, is an infringement of the patent, as the patentee expressly says:

I do not limit myself to the above-named substances, [pipe-clay and porcelain-earth,] for the same or very much the same result may be attained by using, for instance, silex, magnesia, or its equivalent, instead of porcelain-earth.

The utility of this compound for filtering purposes is, I think, abundantly established by the proof as it now stands for the purposes of this motion.

The infringement being established, as I think it is by the proof, an injunction will be ordered as prayed.

A bond would be required as a condition of granting this injunction but for the proof in the record showing that the defendants in this suit have been guilty of bad faith toward the complainants to such an extent that they are not equitably, as I think, entitled to the protection of the bond from complainants.

U. S. Circuit Court—Eastern District of Missouri, Eastern Division.

SMITH & DAVIS MANUFACTURING COMPANY *v.* MELLON.

Decided June 1, 1892.

1. PATENT—PUBLIC USE—BED-BOTTOMS.

Letters Patent No. 269,242, issued December 19, 1882, to John G. Smith, is void for the reason that the bed-bottoms were on

Messrs. Dyrenforth & Dyrenforth for the defendants.

JENKINS, *J.:*

The bill is filed for an infringement of a patent for peppered enameled iron-ware, issued to Chester Comstock, the Letters Patent being numbered 415,161, dated November 12, 1889, and a motion is made for a

of the second claim in the Comstock patent, as to whether the words—

having the properties and characteristics substantially as hereinbefore set forth—

are to be limited to the process described in the specification or whether it is a claim for peppered enamelware, however produced.

Some months after these patents Vollrath filed a claim for another patent, his claim being for an article

served, it was not a question for the officers of the Patent Office to construe. That is within the province of the court.

Upon this motion there have been presented the *ex parte* affidavits of two experts on each side construing this claim differently, so that it may be said, at the least, that the proper construction of this second claim of the Comstock patent is not altogether free

U. S. Circuit Court—Eastern District of Missouri, Eastern Division.

SMITH & DAVIS MANUFACTURING COMPANY *v.* MELLON.

Decided June 1, 1892.

1. PATENT—PUBLIC USE—BED-BOTTOMS.
Letters Patent No. 269,242, issued December 19, 1882, to John G. Smith, is void for the reason that the bed-bottoms were on sale more than two years before the application for the patent.
2. A CHANGE MADE WITHIN THE TWO YEARS, WHICH IS ONLY A "PREFERABLE FORM," WILL NOT SAVE A PATENT OTHERWISE VOID FOR PUBLIC USE.
A change made in the bed-bottoms within the two years prior to the application for the patent, but which is described only as a preferable form, will not save the patent.

Mr. William M. Eccles for the complainant.
Mr. George H. Knight for the defendant.

THAYER, (orally:)

In view of the testimony the court is of the opinion that the invention covered by Letters Patent No. 269,242 was in public use and on sale for more than two years prior to the date of the application for the patent and that the patent is for that reason void. (*Smith Co.* v. *Sprague*, 123 U. S., 249; *Egbert* v. *Lippman*, 104 U. S., 333; *Manning* v. *Cape May Co.*, 108 U. S., 462; *Andrews* v. *Hovey*, 123 U. S., 267.)

It hardly admits of a doubt that complainant made and sold wire bed-bottoms which embodied all of the material features or elements of the invention for a period of more than two years prior to October 14, 1882, and that it did so not as an experiment, but for the purpose of realizing a profit.

The closing of the head of the spiral springs by passing the top wire around the second before extending it to form a hook cannot be regarded, under the specifications, as a material feature of the invention. That is merely a preferable mode of construction. The patentee would be entitled to claim (and no doubt would claim if there was occasion to do so) that the use of a spring with an open head was an infringement of his patent as well as the use of a spring with a closed head.

Bed-bottoms embracing all of the material elements of the invention having been in public use and on sale for more than two years prior to the application, the patent is void and the bill must be dismissed.

U. S. Circuit Court—Eastern District of Wisconsin.

IRON-CLAD MANUFACTURING COMPANY, INCORPORATED, *v.* JACOB J. VOLLRATH MANUFACTURING COMPANY, LIMITED, *et al.*

Decided June 27, 1892.

1. PATENT—INFRINGEMENT—PRELIMINARY INJUNCTION—RULE.
A motion for a preliminary injunction in advance of any adjudication by the courts or an adjudication by the Patent Office as to priority will not be allowed unless the case is entirely clear and unless irrevocable injury is to result from withholding the injunction.
2. FUNCTION OF THE PATENT OFFICE AND COURTS IN CERTAIN CASES.
The province of the Patent Office in interference cases is to determine the issue of priority, the construction of patents being for the courts to determine when the occasion arises upon infringement proceedings.

Messrs. L. L. Bond, Marcellus Bailey, and Ernest C. Webb for the complainant.
Messrs. Dyrenforth & Dyrenforth for the defendants.

JENKINS, *J.:*

The bill is filed for an infringement of a patent for peppered enameled iron-ware, issued to Chester Comstock, the Letters Patent being numbered 415,161, dated November 12, 1889, and a motion is made for a preliminary injunction to restrain the defendants from the alleged infringement pending this litigation.

The specification, after stating the process for obtaining the "foundation coating," as it may be called, of the vessel that is to be enameled, proceeds:

When the metallic surface to be enameled has been properly pickled and cleansed in the usual way and a paste of suitable material has been prepared in any one of the usual ways for the production of either the "mottled" ware, "white" ware, or "plain" ware, I incorporate in such paste, perferably, comminuted or granular oxide of iron, and after coating the surface of the iron with such paste having so commingled with it the comminuted oxide of iron it is subjected in the muffle to the usual fusing process, which produces the glazed appearance, but which also leaves the comminuted or granular oxide, in its natural or substantially natural condition, in practically mechanical suspension within the body of the glaze, and prodncing an appearance in the finished article which I here denominate as "peppered" enameled iron-wire, in contradistinction to the æsthetic appearance of the severally and previously described well-known articles in the trade. While, as I have said, I prefer to use granular or comminuted oxide of iron to produce this effect, it will be understood that I may employ any other suitable contrasting body which will not fuse at the ordinary temperature employed for fusing the paste which subsequently constitutes the coating, and I therefore do not wish to be limited in any degree to the character or quality of the material employed for this purpose, so long as it results in the production of what I have termed "peppered" enameled iron-ware, by which term I intend and mean enameled iron-ware having mechanically suspended or held in and throughout the glaze a granular or comminuted material in color contrasting with that of the body of the enameled coating, and comparatively infusible as compared with the glaze, so that when the latter is fused on the ware the granular or comminuted contrasting colored material, although mixed with and held in the glaze, will preserve unimpaired its original form, and thereby give the enamel a peppered appearance.

The first claim of the patent is for the process described.

The second claim is stated to be—

As a new article of manufacture, peppered enameled iron-ware having the properties and characteristics substantially as herein-before set forth.

On the 19th of November, 1889, just a week following the issuance of the patent to Comstock, a patent was issued to Vollrath, which is the foundation of the defendants' claim, and his process differs from the other as stated in the specification. After the foundation coating he makes a mixture which he calls "A." Then, according to the color desired, he takes the necessary ingredients and adds them to a separately-prepared mixture in substantially the same porportions as the mixture A, the amount of the coloring ingredient added being more or less as a light or dark result is desired, and this mixture is melted, cooled, and ground dry into a condition like sand, forming a mixture B, and is ground to a different degree of fineness from the mixture A. He mixes A and B in the necessary proportions to produce the desired effect, according as the finished product is to have more or less of the color prominent. This mixed mass, composed of A and B, is of a paste-like consistency, and is applied by pouring or dipping the articles having the first-described foundation coating, and then they are put into a muffle and subjected to a temperature of about 1,000° Fahrenheit, and it produces what is called in the patent "a speckled appearance," consequent upon the different degrees of fineness of the mixture.

The question in this litigation is upon the construction

of the second claim in the Comstock patent, as to whether the words—

having the properties and characteristics substantially as herein-before set forth—

are to be limited to the process described in the specification or whether it is a claim for peppered enamel-ware, however produced.

Some months after these patents Vollrath filed a claim for another patent, his claim being for an article of manufacture, namely:

Iron-ware having incorporated in the enamel throughout the entire coating specks contrasting in color with the remainder of the enamel.

There was an interference declared upon that claim, and it was held by the Patent Office that the second claim of the complainant's patent was in anticipation of this alleged discovery, and it is asserted by the complainant that that decision substantially forecloses this claim of the defendants, and substantially holds that the second claim of the complainant's patent is to be construed as a claim for articles of enameled iron-ware having this peppered appearance, however produced. The court cannot agree with that conclusion. The issue before the Patent Office was whether this claim for the article of peppered ware, or speckled ware, as claimed by Vollrath, was anticipated by the second claim of Comstock, and the controversy there was as to which was the first invention. The sole controversy was as to whether Vollrath or Comstock had first invented peppered ware. The Patent Office held that Comstock was the first inventor; but it was not within the province of the Patent Office to construe this second claim of the patent, nor was it essential to the determination of the question there involved.

There were some things said in the opinions by the different officers of the Patent Office which have been supposed to bear upon this question, and, so far as the court is advised by reading their decisions, there would seem to be some comfort to be gained from them by both parties.

The decision of the Examiner-in-Chief asserts:

The appearance may be given in various ways, amounting to but little beyond the ordinary resources of the craft in manipulating their enameling processes; but it appears from the record that each party to the interference has secured a patent to his peculiar method of producing the effect, and each has also been allowed a claim for his specific product resulting from his specific process. Each of these claims is supposed to correspond to the product resulting from the pursuance of the method set out in the patent of the respective parties. The issue in interference is deemed to be somewhat generic, thus covering the species made by either party. Hence this interference. The title to the generic claim must turn upon the evidence as to what each party did in arriving at the general result of speckled or peppered ware and the dates of such experiments. In any case, each party's species, as defined by its mode of production, is secured to him beyond cavil. This is an instructive instance, moreover, of the utility, if avoidance of litigation be an object, of defining and limiting the novel product of a process by the terms of that process in setting forth the true and patentable substance, contrary to usual practice, but correctly set out and distinguished by the Commissioner in *ex parte* Painter, (57 O. G., 999.)

The existing allowed claims to both parties we regard as specific, being based on their respective processes.

Now, upon the other side, the Acting Commissioner of Patents, in his decision, said:

Without setting forth the various facts upon which a conclusion is based as to just what will meet the terms of the issue, it is sufficient to state that such subject matter is held to be enameled iron-ware having incorporated in the enamel specks, fusible or infusible in their inherent characteristics, scattered throughout the enamel, and giving it a speckled or peppered appearance.

It would thus seem that the Acting Commissioner of Patents, so far as his attention was called to the subject, took a different view of this second claim from that taken by the Examiner; but, as before observed, it was not a question for the officers of the Patent Office to construe. That is within the province of the court.

Upon this motion there have been presented the *ex parte* affidavits of two experts on each side construing this claim differently, so that it may be said, at the least, that the proper construction of this second claim of the Comstock patent is not altogether free from doubt. The court need not go further than to say that, without expressing any opinion whatever upon the construction which should be given to that second claim, for upon a motion for an injunction in advance of any adjudication by the courts or an adjudication by the Patent Office as to priority it is well settled that a preliminary injunction will not be allowed unless the case is entirely clear and unless irrevocable injury is to result from withholding the injunction. Here there is no sort of dispute that the defendants are responsible for any damages which the complainants may sustain if there should be a final adjudication in their favor upon the construction contended for their claim. As the question is not free from doubt and is one respecting which the experts are not in accord, it would seem to be improper for the court, as a preliminary step in the litigation, to do that which might work great injury to the defendants, when, if the complainants shall finally be adjudged entitled to relief, the defendants are amply able to compensate them for the injury.

The motion for an injunction will therefore be overruled.

OPINION OF THE ATTORNEY-GENERAL.

OATHS—WHO MAY ADMINISTER.
A notary who is not authorized by the laws of his country to administer oaths or take affidavits lacks the requisite authority to administer the oath required by Revised Statutes, section 4892.

DEPARTMENT OF JUSTICE,
Washington, August 25, 1892.

SIR: Your communication of the 13th instant relating to the taking of the oaths prescribed by section 1892 of the Revised Statutes before notaries of foreign countries who are not authorized by the laws of those countries to administer oaths, with accompanying documents, came to hand duly.

Said section reads:

The applicant shall make oath that he does verily believe himself to be the original and first inventor or discoverer of the art, machine, manufacture, composition, or improvement for which he solicits a patent; that he does not know and does not believe that the same was ever before known or used; and shall state of what country he is a citizen. Such oath may be made before any person within the United States authorized by law to administer oaths, or when the applicant resides in a foreign country before any minister, chargé d affaires, consul, or commercial agent holding commission under the Government of the United States, or before any notary public of the foreign country in which the applicant may be.

It is shown by the letter of the Commissioner of Patents and otherwise that some countries have omitted to give their notaries any statutory authority to administer oaths or to take affidavits. This is the case in Austria-Hungary, and only cases arising there will be considered in this opinion.

The question submitted to me for an opinion is, in substance, whether an oath made by an applicant for

a patent and sworn to before a notary of Austria-Hungary who has no authority by the law of his domicile to administer an oath or take an affidavit is to be regarded as a valid and lawful oath under said statute in the procedure of the Patent Office.

It is understood that in many foreign countries and in all of the States of the United States notaries are authorized by the local statutes to perform the acts of administering oaths and taking affidavits.

that have authority to give the same, calling Almighty God to witness that his testimony is true.

An affidavit is defined to be "an oath or affirmation reduced to writing, sworn or affirmed before some officer who has authority to administer it." (19 Tex., 155.)

It is stated (Wharton's Law Lexicon, 573) that—

The administering of unlawful oaths is an offense against the Government and punishable by penal servitude.

THE
OFFICIAL GAZETTE

a patent and sworn to before a notary of Austria-Hungary who has no authority by the law of his domicile to administer an oath or take an affidavit is to be regarded as a valid and lawful oath under said statute in the procedure of the Patent Office.

It is understood that in many foreign countries and in all of the States of the United States notaries are authorized by the local statutes to perform the acts of administering oaths and taking affidavits. It is scarcely to be supposed that in a minor matter of this kind Congress makes inquiry as to the exact status of notaries among all the nations.

It may be fairly inferred that Congress intended by the words "any notary public" to include those and only those authorized by their local laws to administer oaths.

Our statute requires that the "applicant shall make oath," and permits that—

such oath may be made before any person within the United States authorized by law to administer oaths,

as well as before the specified United States officers. It can hardly be implied that it was intended that, outside of this country, persons not authorized to administer oaths were to be called upon to act for this Government in administering oaths. Our Government neither appoints the foreign notary its officer, nor authorizes him to act, it merely permits the non-resident applicant, for his own convenience, to make oath before a designated local officer, supposed to possess authority to take the affidavit. If a notary public, from the nature of his office, the practice under the law-merchant, or the rules of international law, could rightfully be regarded as possessing the right to administer an oath of this character, that would, doubtless, be sufficient to connect the statute with any act that the notary might perform under it; but an assumption that he has this power by virtue of his office is not sustained by the authorities.

Although a notary, or a notary public, is an officer known to the law of the nations, and of great antiquity, he is not, according to ancient custom or general usage, authorized to take affidavits or administer oaths.

The power to administer oaths is not one of the incidents of the office of notary public under the general law-merchant, nor was it under the Roman law, from which it was derived. When that power is annexed to the office, it is so by virtue of positive enactment. (Proffatt on Notaries, 165, 178.)

Neither the taking of affidavits nor the administering of oaths is done by a notary under the law-merchant.

Authority is given in most of the States to notaries to administer oaths and to take affidavits; but this authority is one derived from statute law and did not belong to the officer originally. (16 A, and E, Ency. of Law, 768.)

The act of administering a solemn oath, "calling on God to witness the truth of what is said" by the person sworn, seems of necessity to require the individual officiating to be clothed by law with an especial authority.

For a private person to assume to administer an oath with its adjuration would be presumptuous in the highest degree, to say the least.

Said Lord Coke:

An oath is an affirmance or denial * * * before one or more that have authority to give the same, calling Almighty God to witness that his testimony is true.

An affidavit is defined to be "an oath or affirmation reduced to writing, sworn or affirmed before some officer who has authority to administer it." (19 Tex., 155.)

It is stated (Wharton's Law Lexicon, 573) that—

The administering of unlawful oaths is an offense against the Government and punishable by penal servitude.

An extra-judicial oath is defined to be—

An oath taken without the direction or authority of law.

It is added that—

An extra-judicial oath when false does not expose the person to punishment for perjury. (And. Dic., 720.)

It is true that Lord Eldon states (6 Vesey, 824,) that "a notary public by the law of nations has credit everywhere;" but it may be fairly contended that this credit must be limited to acts which pertain to the nature of the office, or to such as he is authorized by the laws of his country to perform.

In *Haggett* v. *Iniff* (31 Eng. L. and E., 202) the court refused to receive affidavits taken before a notary public of the State of New York until it was shown that—

according to the law of the United States a notary public was duly qualified to administer oaths and take affidavits in any law proceedings in that country.

It is also true that the Commissioner of Patents, in a decision dated January 5, 1884, in answer to a suggestion that "a notary in Germany is not authorized to administer an oath, that he acts merely as a conveyancer," says that—

such designated officials in administering the oath act by virtue of the authority conferred by the statute of the United States and not by virtue of any power or authority conferred by the foreign government.

The only question shown to be before the Commissioner was whether an affidavit taken before a judge of the Royal Prussian Court at Buckau, was sufficient to comply with section 4892. No notarial oath or affidavit is referred to as being before the Commissioner. The matter of notarial action and authority was argumentative merely. It was not before the Commissioner for decision, and therefore could not have been decided by him. It is not necessary for me to hold that he intended to determine it.

It is clear that the applications to which you refer, and which are illustrated by the communications of Consul-General Goldschmidt and Mr. Jentzsch—viz, those that are signed or signed and sworn to in blank and afterward filled in, and those which bear merely a certificate of the signing, but no applicant's oath or affidavit—furnish no sufficient ground for official action in the Patent Office.

The practices referred to relate to administrative matters within the purview of your Department and are such as may well be called to the attention of Congress; but they are not such as now require an official opinion from me.

In conclusion, it is my opinion that a notary of Austria-Hungary who is not authorized by the laws of his country to administer oaths or take affidavits lacks the requisite authority to administer the oath required by section 4892 of the Revised Statutes.

Very respectfully,

W. H. H. MILLER,
Attorney-General.

The Secretary of the Interior.

Changes in Classification.

(ORDER No. 774.)

DEPARTMENT OF THE INTERIOR,
UNITED STATES PATENT OFFICE,
Washington, D. C., September 8, 1892.

In Division XXIII, Class 73, Measuring-Instruments, a new subclass is formed entitled "Platform-scales."

In Division IV the following sub-classes are formed in Class 159, Fire Escapes and Ladders:

Friction—
- Jaw,
- Jaw, set-screw,
- Hand-clamp,
- Reel—
  - End-thrust,
  - Strap-brake,
  - Jaw brake,
  - Jaw-brake, tension,
- Shooting lines,
- Tortuous,
- Tortuous and jaw—
  - Set-screw,
- Wheel-brake.

Hoists—
- Fixed guides,
- Movable guides,
- Pulley-block,
- Reciprocating cages,
- Hoists—
  - Shooting-spar.

Ladders—
- Collapsible,
- Extension,
- Feet,
- Hooks,
- Sectional,
- Stops,
- Trussed.

Flexible ladders—
- Reel,
- Sectional,
- Sectional, elevator,
- Single stile,
- Trolley.

Step-ladders—
- Store-service.

In Division IV the following sub-classes are formed in Class 61, Hydraulic Engineering:

Chutes—
- Screens,
- Water-power.

Dams and levees—
- Cores,
- Mattresses.

Pile-drivers—
- Jigs,
- Monkey,
- Piston,
- Swinging-hammer,
- Pile-drivers—
  - Sinking.

Piles—
- Metallic,
- Protected.

Tunnels—
- Excavators,
- Shields.

Water-gates—
- Sliding,
- Swinging.

W. E. SIMONDS,
Commissioner.

Attorneys.

DEPARTMENT OF THE INTERIOR,
OFFICE OF THE SECRETARY,
Washington, D. C., September 7, 1892.

SIR: I am directed by the Secretary to inform you that the order of the Department dated April 26, 1889, disbarring Daniel O'Driscoll, of Washington, D. C., from practice before this Department and its Bureaus has this day been rescinded.

Very respectfully,
E. M. DAWSON.
Chief Clerk.

The Commissioner of Patents.

World's Columbian Exposition.

DEPARTMENT OF THE INTERIOR,
UNITED STATES PATENT OFFICE,
Washington, D. C., March 8, 1892.

To the Inventors and Manufacturers of the United States:

It is the intention of the Patent Office to make at the World's Columbian Exposition at Chicago in 1893 an exhibit which will show that great advance in the several arts which is due, in large measure, to the encouragement and support afforded by our patent system. This exhibit is to consist of models of patented inventions, which will be carefully selected, to show as far as is possible the inception of each art, the stages through which the art has advanced, and the final development reached at the present time. This display of typical inventions, embodied in concrete form and properly arranged, will, it is believed, constitute a grand historical exhibit of the progress of the useful arts and one which will be of great interest not only to inventors and manufacturers, but to the public generally.

The Office collection of models has been seriously impaired by fire, and is further incomplete by reason of the fact that models have not generally been required or received during the last ten years. The Office is not, therefore, in possession of the models of many valuable inventions which might properly be included in such an exhibit, and without which indeed, the exhibit would be incomplete. The limited appropriation for this exhibit will not permit the Office to make such models. An urgent appeal is therefore made to all inventors and manufacturers to come to the assistance of the Office in this matter, either by loans of models already built or by the construction of such models not in the possession of the Office as should properly be placed in such a collection. Of course, where models are loaned to the Office all proper credit will be given both in labels and catalogues to the parties by whom the loans are made, and such disposition will be made of the models after the close of the exhibit as the owners shall direct. Many inventors and manufacturers have already indicated a willingness to co-operate with the Office in this matter, and it is confidently expected that such a response will be made to this general appeal as will assure the unparalleled success of this attempt to graphically and concretely show the development of American invention.

W. E. SIMONDS,
Commissioner.

Notice.

All solicitors, agents, or attorneys who, in circulars or advertisements or otherwise, refer to the Commissioner of Patents, or to any other official of the Patent Office, for evidence of their professional standing, do so without authority.

DISCLAIMER.

428,638.—*Hermann Schulze-Berge* and *Franz G. A. Schulze-Berge*, Brooklyn, N. Y. IMPROVEMENT IN AIR-PUMPS. Patent dated May 27, 1890. Disclaimer filed September 2, 1892, by the patentees.

Enter their disclaimer to "any kind of bearing included in claims 1 and 3 except such which secure a constant direction of the axis of rotation of the pump-vessel."

Issue of September 13, 1892.

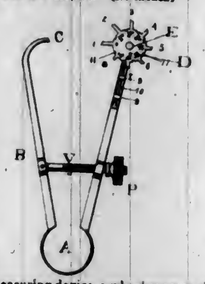
PATENTS

GRANTED SEPTEMBER 13, 1892.

482,330. ORE CRUSHER AND GRINDER. NELSON F. ACKER, Kansas City, Mo. Filed Feb. 8, 1892. Serial No. 420,762. (No model.)



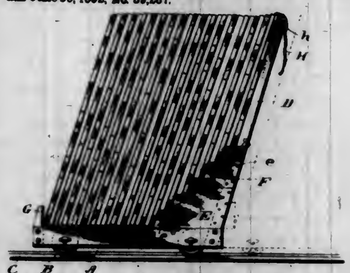
Claim.—1. A combined ore crusher and grinder comprising a vertical supporting frame or standard, a vertical operating-shaft axially revoluble and vertically or longitudinally reciprocatory upon said standard, a tappet carried by said shaft, and a sliding bracket having a vertical cam and vertically adjustable upon the standard or frame, so as to cause its cam to either engage or disengage the tappet of the operating-shaft, substantially as set forth.

2. A combined ore crushing and grinding machine comprising a vertically reciprocatory and axially-revoluble operating-shaft carrying a pestle and a mortar mounted upon the bed of the machine and movable forwardly and backwardly on the bed and also arranged to tilt forwardly from the bed, substantially as set forth.

3. A combined ore crushing and grinding machine comprising a suitable base or bed, a pair of guides mounted on said bed and having each a groove open at its rear end and closed at its front end, and a mortar having an extended base provided with a pair of trunnions to engage said grooves, substantially as set forth.

4. A combined ore crusher and grinder comprising a vertical supporting frame or standard, a sliding bracket vertically adjustable thereon and carrying a vertical cam, a horizontal and revoluble actuating-shaft mounted in the upper end of said standard and carrying a beveled gear-wheel at one end, and a vertical operating-shaft axially revoluble and vertically or longitudinally reciprocatory upon said standard, a tappet carried by the shaft, and a beveled gear-wheel carried by the upper end of the operating-shaft and meshing with the beveled gear-wheel on the actuating-shaft, the sliding bracket being arranged to engage and disengage its cam with the tappet of the operating-shaft, substantially as set forth.

482,331. DIFFERENTIAL CALIPER-POINT. GEORGE T. BECHTOL, Elmira, N. Y., assignor of one-half to Fred. W. Parsons, same place. Filed Mar. 15, 1892. Serial No. 425,068. (No model.)

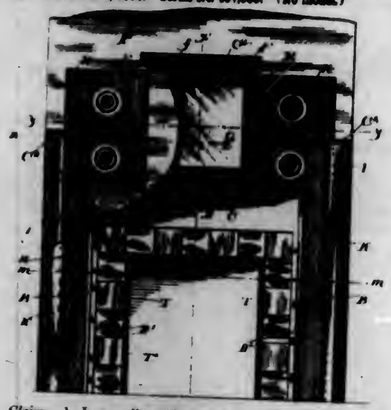


Claim.—1. In a measuring device, a wheel or cam suitably mounted and having one or more points on its periphery set eccentrically with reference to the center, whereby the distance between contact-points may be increased or diminished at will, substantially as described.

2. In a measuring device, the combination of ordinary calipers with a wheel suitably mounted, having one or more spokes or projections of unequal lengths from the center, varying from each other by a definite and certain amount, and provided with means for locking said wheel in position, and a graduated scale or index, substantially as described.

3. The combination, in a measuring device, of a body suitably mounted, comprising one or more contact-points whose motion about its axis increases or diminishes the distance between the measuring-points, means for locking the same, and a graduated scale or index adapted to indicate the amount of adjustment, substantially as and for the purposes set forth.

482,332. LUMBER-TRUCK. ALBERT T. BENIS, Louisville, Ky. Filed June 3, 1892. Serial No. 435,393. (No model.) Patented in Canada June 30, 1892, No. 39,237.



Claim.—1. In a truck for lumber-drying kilns, the combination, with the body of the truck, of an inclined standard secured at its lower end to the body of the truck and adapted to serve as a support for lumber piled upon the truck, substantially as described.

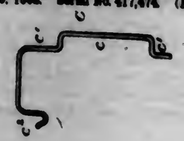
2. The combination, with the truck, of the inclined standard, the brace for said standard, the planking E, notched as described, and the

standards D at the opposite end of the truck, substantially as shown and described, and for the purpose specified.

3. In a lumber-drying truck for dry-kilns, the combination, with the truck, of the inclined standard thereon and the curtain H, extending from the upper end of the standard to the upper face of the lumber piled upon the next adjacent truck in the train, substantially as shown and described, and for the purpose specified.

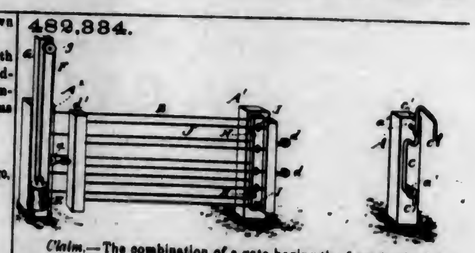
482,888. ADJUSTABLE MANTEL. ELIJAH B. BENBOW, Chicago, Ill. Filed Oct. 2, 1891. Serial No. 407,586. (No model.)

Claim.—1. In an adjustable mantel, the combination, with a central frame having a fireplace opening and an over-mantel above the central frame, of separate back pieces having inner edges adapted to lie behind the outer edges of the central frame and over-mantel and to be symmetrically adjusted with reference to the central line of the mantel and to be fastened to said central frame and over-mantel, substantially as and for the purpose set forth.



2. The combination, with the central frame made up of the jambs B B, mantel-shelf C, and facing D D', of the over-mantel above the central frame, having jambs E E, and the back pieces H H, having inner edges conforming substantially to the outline of the central frame and over-mantel, said back pieces being adapted to be symmetrically adjusted with reference to the central frame and over-mantel and to be secured to the rear edges of the jambs B B E E and mantel-shelf C, substantially as shown and described.

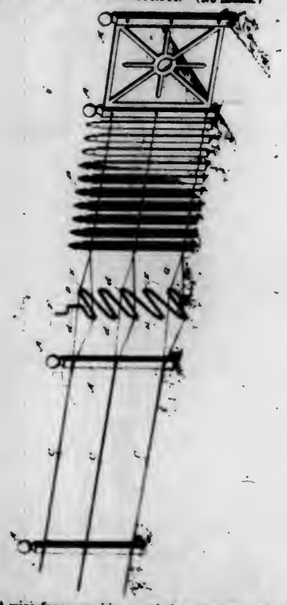
3. In an adjustable mantel, the combination, with a central frame having a fireplace-opening and an over-mantel resting on the frame, of back pieces whose inner edges lie behind the central frame and over-mantel and are fastened thereto, wall-plates lying in the plane of the back pieces and beside the outer edges thereof, and pilasters covering the space between said wall-plates and back pieces, substantially as shown and described.



4. In an adjustable mantel, the combination, with a central frame having a fireplace-opening, an over-mantel resting on the central frame, back pieces having their inner edges behind and fastened to the outer edges of the central frame and over-mantel, wall-plates lying in the plane of the back pieces and beside the outer edges thereof, and pilasters covering the spaces between said wall-plates and back pieces and permitting necessary variation of said spaces, of shelves fastened to said back pieces and covering the upper ends of said wall-plates and pilasters, substantially as shown and described.

5. The combination, with the central frame and over-mantel, of the back pieces H H, the wall-plates I I, the pilasters K K, and the shelves C^3 C^3, fastened to the back pieces and covering the upper ends of the wall-plates and pilasters, said shelves being formed at their inner rear angles with notches *n*, adapted to pass over the outer edges of the over-mantel, and thereby to permit adjustment of the back pieces, substantially as shown and described.

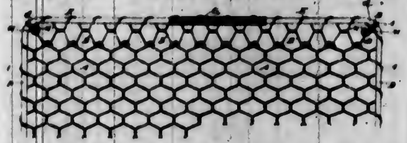
482,884. WIRE-FENCE GATE. HENRY BLANKENBURG, Lohrville, Iowa. Filed Jan. 9, 1892. Serial No. 417,674. (No model.)



482,884.

Claim.—The combination of a gate having the front hooks *d d*, a post having the eyebolts *d' d'* on the front face, and a latch journaled in said eyebolts, the said latch being provided with a crank *c* between the journals *d' d'* and with a bent-over hook end d^3, as and for the purpose described.

482,885. FENCE-MACHINE. HENRY G. CADY, Pine Bluff, Ark. Filed Jan. 14, 1890. Serial No. 336,916. (No model.)



Claim.—A wire-fence machine consisting of a crosser-frame formed of a single continuous piece of wire bent to form small diverging angles opening upon opposite sides of said frame alternately and turned at the ends of said frame into substantial coincidence with the vertical axis of the crosser-frame, the diverging arms and alternate angles having an elastic yield in the direction of said axis and the angles being provided with loops for the wires, while the lower arm of the frame has a pivotal point to enter the coil, substantially as specified.

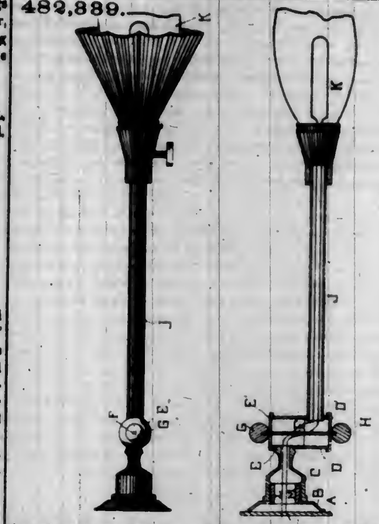
482,886. SPIROMETER. HENRY G. CADY, Pine Bluff, Ark. Filed Dec. 1, 1891. Serial No. 413,743. (No model.)

Claim.—In a toy, a figure formed with a chamber and openings at the top and bottom thereof, an air-receptacle within the chamber, and a tube connected at one end to the air-receptacle and extending through the opening in the top to the exterior thereof for inflating the air-receptacle.

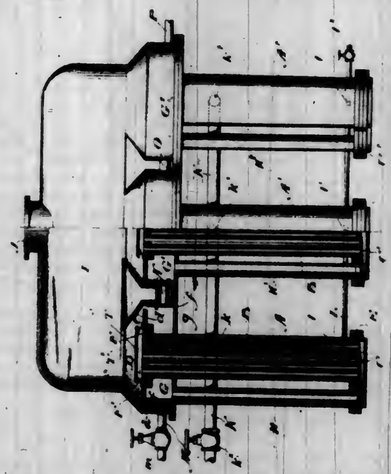
482,887. WOVEN-WIRE BED-BOTTOM. WILLIAM B. CAMPBELL, Brooklyn, N. Y., assignor, by mesne assignments, to Emily H. Campbell, same place. Filed June 20, 1891. Serial No. 396,690. (No model.)

Claim.—A length of spiral-wire fabric having a transverse spiral wire extending across at each end in the manner known as "cording," with the longitudinal spiral wires engaged together along their entire lengths, and also connected in pairs at each end by linking the folded ends of said longitudinal wires in the angular position shown and engaging them jointly with the cording-wire by the passage of the latter through the angle so formed and clinching the ends of the longitudinal wires upon the cording-wire, the said parts being combined with each other and with one or more additional cording-wires extending across the fabric at the end and the whole inclosed in a frame of stiffer material, as herein specified.

482,888. NAIL-EXTRACTOR. MASCHIL D. CONVERSE, New York N. Y. Filed Jan. 29, 1891. Serial No. 379,522. (No model.)



Claim.—In a nail-extractor, movable jaws for impingement of the nail, constructed with diagonal faces relatively to the vertical plane of the pivotal axis when the tool is in a vertical position, in combination with a fulcrum, substantially as and for the purposes shown and described.



482,889. ELECTRIC-LIGHT FIXTURE. EDWIN R. CHOLLAR, Chicago, Ill. Filed Jan. 4, 1892. Serial No. 417,042. (No model.)

Claim.—In a joint for an electric-light fixture, the combination of two open-ended tubular parts adapted to fit snugly together end to end with removable caps adapted to cover the ends, two pipes removably secured one to each of such tubular parts, and a bolt passing through such tubular parts and through the caps parallel with the length of the tubular parts and adapted to hold them securely together.

482,889.

482,340. APPARATUS FOR EVAPORATING LIQUIDS. CHARLES W. COOPER, New York, N. Y. Filed June 30, 1891. Serial No. 397,966. (No model.)

Claim.—1. An evaporating apparatus in which provision is made for the continuous supply, continuous circulation, and continuous discharge of liquid to be concentrated, and wherein are combined the following elements: an evaporating-chamber, a tube-supply chamber located at the base of said evaporating-chamber, a vapor and liquid separating chamber located at the upper portion of said evaporating-chamber, evaporating-tubes leading from said tube-supply chamber upward to said separating-chamber, an independent return channel or conduit leading from said separating-chamber downward to said tube-supply chamber, a feed-pipe or liquid-supply for the tube-supply chamber, an overflow or discharge passage leading from said separating-chamber near its basal portion, a vapor-exit from said separating-chamber, and means for supplying a heating medium to the evaporating-chamber, substantially as set forth.

2. An evaporating apparatus in which provision is made for the continuous supply, continuous circulation, and continuous discharge of liquid to be concentrated, and wherein are combined the following elements: a tube-supply chamber located at the base of the evaporating-

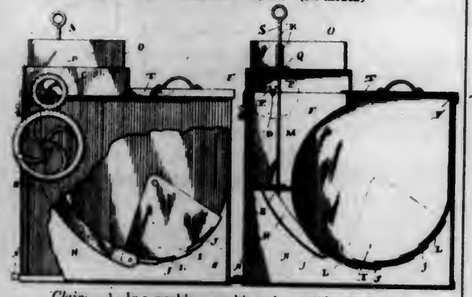
chamber, a vapor and liquid separating chamber located at the upper portion of the evaporating-chamber, evaporating-tubes leading from said tube-supply chamber upward to said separating-chamber, an evaporating chamber or casing which incloses the evaporating-tubes and is provided with tube-heads through which said tubes pass and also with means for supplying it with a heating medium, an independent return channel or conduit leading from the basal portion of the separating-chamber downward to the tube-supply chamber, a deflector diaphragm within the separating-chamber, a feed for supplying liquid to the tube-supply chamber, an overflow or discharge passage leading from the separating-chamber near its basal portion, and a vapor-exit from the separating-chamber, substantially as set forth.

3. The combination, with the tube-supply chamber, the evaporating-tubes, the separating-chamber, and the return-conduit, of the deflector diaphragm, substantially as set forth.

482,842.

conveyer, an opposing friction-roller turning axially in insulated bearings, a car, and a traveling contact-maker adapted to pass between said friction-rollers, all combined and arranged as described.

4. In an electric conduit for electric railways, the combination of opposing friction-rollers, one of which is adapted to be pushed into electrical contact with an otherwise insulated electric conducting-wire, and a traveling contact-maker made in parts, one of said parts being an electrical conductor and being in electrical connection with the car, another of said parts being of insulating material and adapted to prevent the passage of electricity except to said car, substantially as and for the purpose described.



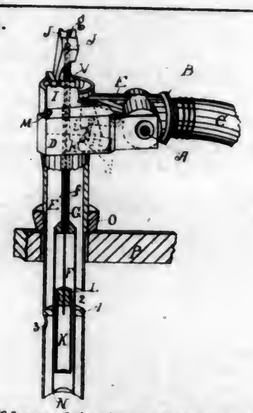
as the sashes move in an opening direction, exerting an increasing pressure upon the sashes, which are thereby locked against opening until released from the stops.

6. The combination, substantially as set forth, of two sashes arranged to move, two pairs of movable stops arranged one pair in contact with each sash, means adapted to cause the stops to move with the sash and exert an increased pressure as it moves in an opening direction, a spring or springs pressing the stops against the sashes, means for connecting each pair of stops together, and an operating-handle and connections whereby both sashes are held in the closed position by

chamber, a vapor and liquid separating chamber located at the upper portion of the evaporating-chamber, evaporating-tubes leading from said tube-supply chamber upward to said separating-chamber, an evaporating chamber or casing which incloses the evaporating-tubes and is provided with tube-heads through which said tubes pass and also with means for supplying it with a heating medium, an independent return channel or conduit leading from the basal portion of the separating-chamber downward to the tube-supply chamber, a deflector diaphragm within the separating-chamber, a feed for supplying liquid to the tube-supply chamber, an overflow or discharge passage leading from the separating-chamber near its basal portion, and a vapor-outlet from said separating-chamber, substantially as set forth.

3. An evaporating apparatus in which provision is made for the continuous supply, continuous circulation, and continuous discharge of liquid to be concentrated, and wherein are combined the following elements: a series of evaporating-chambers substantially such as hereinbefore set forth—that is to say, a series each of which is composed, essentially, of a basal tube-supply chamber from which evaporating-tubes lead upward to a separating-chamber and of an independent return channel or conduit, and each of which is provided with means whereby it is supplied with a heating medium to heat its evaporating-tubes—a vapor-chamber common to each evaporating-chamber of the series, a liquid-supply to the tube-supply chamber of the first evaporating-chamber of the series, overflow-passages or discharge-outlets from a preceding to a succeeding separating-chamber of each evaporating-chamber throughout the series, and an overflow-passage or discharge-outlet from the separating-chamber of the last evaporating-chamber of the series, substantially as set forth.

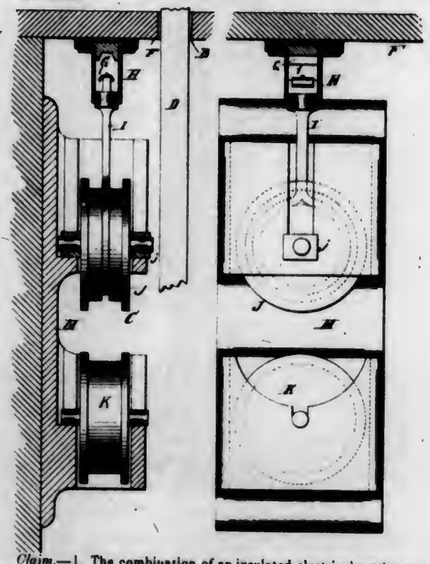
482,341. WASHING-MACHINE. CHARLES C. DAVIS, Mercer, S. C.
Filed Oct. 28, 1891. Serial No. 410,085. (No model.)



Claim.—1. In a washing-machine, the combination, with an outer tank and a removable receptacle adapted to fit within said tank and which is provided with a slotted apartment, of an oscillating frame within the tank, agitators on said frame which reciprocate in the slots of the said apartment, a crank-shaft journaled on the said receptacle, and arms connecting the said frame with the shaft, substantially as shown and described.

2. In a washing-machine, the combination, with an outer tank and cylindrical receptacle therein provided with a series of slots arranged in step order, of a frame pivoted to the centers of the receptacle sides, a series of curved agitators on said frame arranged in step order and which reciprocate through said slots, and a means for operating the said frame, substantially as shown and described.

3. In a washing-machine, an outer tank, a cylindrical receptacle supported therein and provided with a series of slots arranged in step order, an oscillating frame pivoted to the outer side of the said receptacle, a series of agitators or plates adapted to reciprocate through the said openings, a crank-shaft, and arms connecting the said shaft and oscillating frame, the parts being combined to operate substantially as shown and described.

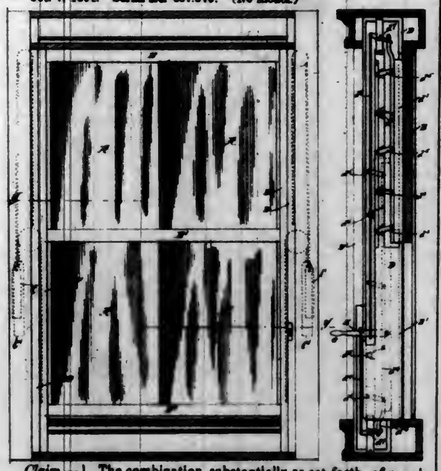


482,342. AUTOMATIC-CUT-OFF CASK-FILLING FAUCET. JOHN H. DRILLER, Los Angeles, Cal. Filed May 22, 1891. Serial No. 393,681. (No model.)

Claim.—1. In a barrel-filling device, the combination of a suitable faucet-head and plug, operative means connected with the plug to normally close it, a trigger for retaining such plug-operating means in its set position to hold the faucet open, and a hammer pivoted to the faucet and arranged to normally rest upon such trigger, a float arranged to be operated by the rising liquid within the barrel, and suitable means detachably connecting the float with such hammer to hold the hammer elevated above such trigger and arranged to be lifted out of its engagement with the hammer when the rising liquid elevates the float, thereby releasing the hammer to allow it to fall to actuate the trigger to release the plug-closing device.

2. In a cut-off faucet of the class set forth, the combination of operative means connected with the plug to normally close it, the pivoted catch-plate provided with the weight-sustaining shoulder and the trigger-supporting shoulder, the pivoted catch-releasing trigger provided with the diagonally-arranged catch-engaging shoulder, the trigger-actuating hammer, and means for retaining and releasing the same connected with a float to be operated by the rising liquid.

482,343. INCLOSED CONDUCTOR FOR ELECTRIC RAILWAYS. GEORGE A. DUPUI, Detroit, Mich. Filed May 16, 1891. Serial No. 393,041. (No model.)



Claim.—1. The combination of an insulated electrical conductor, a traveling car, a traveling contact-maker connected to said car, and contact-pieces hung below said conductor and reaching through the insulation of said conductor, normally out of contact with said conductor, but arranged to be pushed upward by said traveling contact-maker into contact with said conductor and to drop by gravity out of electrical contact, substantially as and for the purpose described.

2. The combination of an insulated electrical conducting-wire, conducting piston-rods or plungers reaching through the insulation of said electrical conductor, friction-rollers on the outer end of said plungers moving with them, fixed friction-rollers opposite the first-mentioned friction-rollers, and a contact-making traveler arranged to travel between said friction-rollers and of a thickness sufficient to force the rollers apart and the pistons into contact with the main conductor, substantially as and for the purpose described.

3. In an electric railway, in connection with a friction-roller adapted to be brought into electrical contact with an insulated electric conveyer, an opposing friction-roller turning axially in insulated bearings, a car, and a traveling contact-maker adapted to pass between said friction-rollers, all combined and arranged as described.

4. In an electric conduit for electric railways, the combination of opposing friction-rollers, one of which is adapted to be pushed into electrical contact with an otherwise insulated electric conducting-wire, and a traveling contact-maker made in parts, one of said parts being an electrical conductor and being in electrical connection with the car, another of said parts being of insulating material and adapted to prevent the passage of electricity except to said car, substantially as and for the purpose described.

482,344. WINDOW. OLIVER M. EDWARDS, Syracuse, N. Y. Filed Oct. 7, 1891. Serial No. 407,979. (No model.)

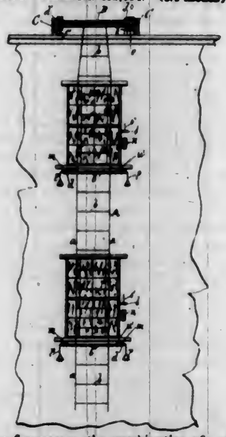
Claim.—1. The combination, substantially as set forth, of a sash, two movable stops arranged one at each of two edges of one side of the sash, means adapted to cause the stops to move with the same with an increased pressure upon the sash as it moves in an opening direction, and a spring or springs pressing the stops against the sash, whereby the movable stops are held in contact with the sash and are moved by such contact as the sash moves in an opening direction, exerting an increasing pressure upon the sash, which is thereby locked against opening until released from the stops.

2. The combination, substantially as set forth, of a sash, two pivoted movable stops arranged one at each of two edges of one side of the sash, pivotal connection between the stops and the window-frame, adapted to cause the stops to move the same with an increased pressure upon the sash as it moves in an opening direction, and a spring or springs turning the stops on their pivots, whereby the movable stops are held in contact with the sash and are turned on their pivots by such contact as the sash moves in an opening direction, exerting an increasing pressure upon the sash, which is thereby locked against opening until released from the stops.

3. The combination, substantially as set forth, of a sash, means for automatically moving it in an opening direction, movable stops and means adapted to cause the stops to move with the sash as it moves in an opening direction and exert an increased pressure thereon, whereby the sash is held by the stops against moving automatically until released from the stops.

4. The combination, substantially as set forth, of a sash, two movable stops arranged at each of two edges of one side of the sash, means adapted to cause the stops to move with an increased pressure upon the sash as it moves in an opening direction, a spring or springs pressing the stops against the sash, and means adapted to move the stops against the stress of the springs, whereby the movable stops are held in contact with the sash and are moved by such contact as the sash moves in an opening direction, exerting an increasing pressure upon the sash, which is thereby locked against opening until released by the movement of the stops against the stress of the spring or springs.

5. The combination, substantially as set forth, of two sashes arranged to move in opposite directions, two pairs of movable stops arranged one pair in contact with each sash, means adapted to cause the stops to move with the sash and exert an increased pressure as it moves in an opening direction, and a spring or springs pressing the stops against the sashes, whereby the two pairs of movable stops are held in contact with their respective sashes and are moved by such contact as the sashes move in an opening direction, exerting an increasing pressure upon the sashes, which are thereby locked against opening until released from the stops.



6. The combination, substantially as set forth, of two sashes arranged to move, two pairs of movable stops arranged one pair in contact with each sash, means adapted to cause the stops to move with the sash and exert an increased pressure as it moves in an opening direction, a spring or springs pressing the stops against the sashes, means for connecting each pair of stops together, and an operating-handle and connections whereby both sashes are held in the closed position by the stops and either sash is released from the control of the stops by the handle and connections.

7. The combination, substantially as set forth, of two sashes arranged to move in opposite directions, two pairs of movable stops arranged one pair in contact with each sash, means adapted to cause the stops to move with the sash and exert an increased pressure as it moves in an opening direction, a spring or springs pressing the stops against the sashes, means for connecting each pair of stops together, and an operating-handle and connections whereby both sashes are held in the closed position by the stops and either sash is released from the control of the stops by the handle and connections.

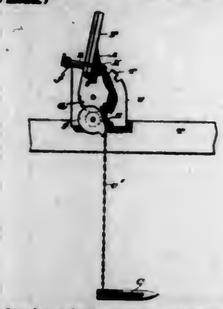
8. A compound window-stop composed of a stationary and a movable portion, the latter being embraced by the former on substantially two of its sides and secured thereto by links pivoted at one end to the stationary part, forming a portion of the window-frame, and at the other end to the movable part.

9. A compound window-stop composed of a stationary portion provided with a sash-abutment or stationary stop and a movable portion, the latter being embraced by the former on substantially two of its sides and secured thereto by a movable connection and such movable portion adapted to contact with another sash.

482,345. FIRE-ESCAPE. ALEXANDER FERGUSON, Lewiston, Me. Filed Nov. 23, 1891. Serial No. 412,851. (No model.)

Claim.—1. In a fire-escape, the combination of a pliable metallic ladder having some of its rounds *b'* extended beyond its sides, with a bracket having arms *d d*, which are provided with grooves *c c* to receive the extended ends of the said rounds, substantially as set forth.

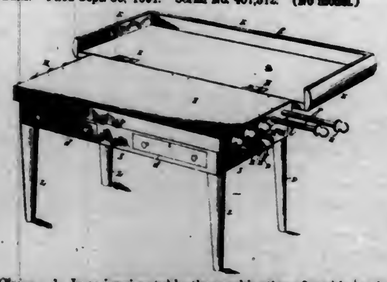
2. An improved fire-escape consisting of a pliable metallic ladder, reel B, spring *g*, spring-starter *e*, wires *i i'*, cam *j*, and sprig *k* to regulate the descent of the ladder, all substantially as herein described.



3. An improved fire-escape consisting of a pliable metallic ladder with rounds *b' b'*, reel B, with its operating mechanism, hinged bracket with its arms *d d*, grooves *c c*, sprig *n*, catch *l*, and wire *i'*, all constructed and operating substantially as described.

482,346. LUBRICATOR. MARION H. FINK, Alden Station, Pa. Filed Jan. 21, 1892. Serial No. 418,771. (No model.)

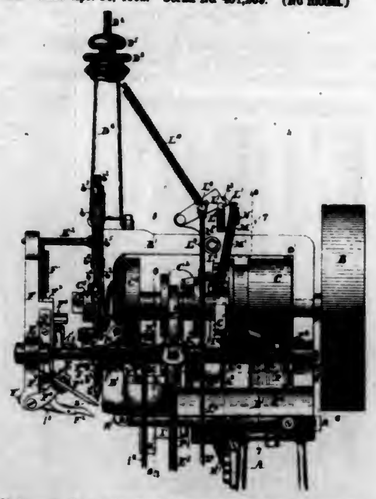
Claim.—The combination, with a shaft and a sleeve or drum working thereover and having a threaded nipple, of a funnel-shaped oil-cup or revolving lubricator carried by said sleeve or drum and provided with a threaded spout secured within said nipple and of a less diameter than the same and an inclosing cap or cover provided with a clamping-plate having a series of clamping-jaws, a buffer and spring-imparting cushion removably secured between said clamping-jaws, and a feeding plunger-rod, of the same diameter throughout, working in said oil-cup and spout and adapted by the revolutions of said sleeve to be thrown alternately against said cushion and the shaft, substantially as set forth.



482,347. FOOT-LEVER FOR THE CUTTER-BARS OF MOWERS. LEWIS I. FOLSOM, Stone House, Nev. Filed Feb. 8, 1892. Serial No. 420,712. (No model.)

Claim.—1. A foot-lever for harvesters, comprising a base having an upright with a toothed segment, large and small intermeshing gears pivoted on the upright, the small gear being connected with the cutting apparatus, an arm projecting radially from the large gear and carrying a foot-plate, a spring-actuated pin connected to the arm and normally engaging said toothed segment, and an L-shaped lever pivotally connected at its angle with the plate, one arm being connected with said pin and the other arm standing over the plate, substantially as described.

2. A foot-lever for harvesters, comprising a base having an upright with a toothed segment, large and small intermeshing gears pivoted on the upright, the small gear having a grooved hub, a chain passing around said hub to the cutting apparatus, an arm projecting radially from the large gear and carrying a foot-plate, a transverse casing beneath the foot-plate, a pin in the casing, a spring also therein forcing the pin into engagement with said rack-bar, a support on the foot-plate, a bell-crank lever pivoted at its angle to said support with its inner arm standing above the foot-plate, and a rod connected to the outer arm thereof and leading through the spring to said pin, substantially as hereinbefore described.



482,348. IRONING-BOARD. ELIZABETH R. FOWLER, Chetopa, Kans. Filed Sept. 30, 1891. Serial No. 407,312. (No model.)

Claim.—1. In an ironing-table, the combination of a table-top having a padded cover and supporting-legs and also provided with holes in the opposite ends thereof, clothes-supporting rods removably inserted in said holes in the opposite ends of the table and having enlarged heads, and a cover hinged to the rear edge of said top and of a length to cover the top and said heads, said cover having depending edges or flanges at the ends and front thereof of slightly-greater width than the thickness of the table-top, substantially as described.

2. In an ironing-board, the combination of a table-top provided with a padding and having holes in the opposite ends thereof in which rods are movably mounted, side bars beneath said top, the rearmost whereof is of double thickness and provided with a hinged section, legs at the ends of said side bars, a half-leg at the free end of said hinged section, a button pivoted in a notch in the inner face of said section, the end side bar having a lip thereon to frictionally engage said half-leg, and a cover hinged to the rear side of said table-top adapted to be supported by said button and provided with a flange of slightly-greater width than the table-top is thick to thereby embrace the edges of said table top and the heads of the clothes-supporting rods, substantially as described.

482,349. LASTING-MACHINE. ISAIE PRUDENTTE, Montreal, Canada. Filed Apr. 30, 1892. Serial No. 431,269. (No model.)

Claim.—1. In a lasting-machine, the combination of a horizontally-reciprocating bar or frame, an arm secured to said bar or frame, an upper pincher-jaw pivoted to said bar or frame, two jaw-levers pivoted one to each side of said arm and adapted to operate either in conjunction therewith as a single rigid jaw or independently thereof, according to the style of work desired to be done, a spring for holding said lower-jaw levers in position to operate in conjunction with said arms as a rigid jaw, mechanism for moving said main pivoted jaw about its pivot to open said pinchers, mechanism for moving said main pivoted jaw about its pivot to co-operate with one or both of said lower-jaw levers to grip the upper and retain a grip thereon while the upper is being drawn over the inner sole, mechanism for moving one or the other of said side jaws about its pivot when desired to raise its operating end and cause it to co-operate with said upper jaw and draw the upper inward at a higher level, thereby forming a crimp of the slack leather, and mechanism for feeding and driving a fastening to secure said upper to the inner sole when the pull thereon has been completed.

2. In a lasting-machine, the combination of a horizontally-reciprocating bar or frame, a lower pincher-jaw secured to said bar or frame, an upper jaw pivoted to said bar or frame and adapted to co-operate with said lower jaw, a spring for moving said upper jaw about its pivot and holding said jaw away from the lower jaw during the movement of said pinchers toward the shoe upper to be lasted, a cam, a vertically-reciprocating block mounted upon said pincher-carrying bar or frame and operated by said cam, a lever carried by said block and constructed and arranged to engage with said pivoted jaw and move it about its pivot to co-operate with said rigid jaw and grip the upper of the shoe being lasted and retain said grip during a portion of the reverse movement of said pinchers, and a nailing mechanism for securing said upper to the inner sole when the pull thereon has been completed.

3. In a lasting-machine, the combination of a horizontally-reciprocating pincher-carrying bar or frame, a rigid arm secured to said bar or frame, two side jaw levers pivoted to said rigid arm, a spring to hold said side jaws in positions to act in conjunction with said arm as a rigid jaw when desired, an upper pincher-jaw pivoted to said bar or frame and adapted to co-operate with said side-jaw levers, a spring for moving said upper jaw away from said lower jaws and holding said jaws open during their movement toward the shoe-upper to be lasted, a cam, a reciprocating block operated by said cam, a lever pivoted to said block and provided with three downwardly-projecting arms, two of which are adapted to engage, together or separately, with some portion of the said upper jaw, while the other arm is constructed and arranged to engage with one or the other of said side-jaw levers to raise it to a higher level when it is desired to have said upper jaw co-operate with only one of said side-jaw levers, mechanism having provision for moving said lever about its fulcrum, and a nailing mechanism for securing said upper to the inner sole when the pull thereon has been completed.

4. In a lasting-machine, the combination of a horizontally-reciprocating pincher-carrying bar or frame, a rigid arm secured to said bar or frame, two side-jaw levers pivoted one to each side of said rigid arm, a spring to act upon both of said side-jaw levers and hold them normally in positions to act in conjunction with said rigid arm and to form a single rigid jaw when desired, an upper pincher-jaw pivoted to said bar or frame and adapted to co-operate with both of said side jaws as a single rigid jaw or with either of said side-jaw levers independently, as may be desired, a spring for moving said upper jaw about its pivot to open said pinchers and hold them open during the movement of said pinchers toward the shoe-upper to be lasted, a cam, a reciprocating block operated by said cam, a lever pivoted to said block and provided with three downwardly-projecting arms, and one upwardly-projecting arm having a wedge-shaped cross-section, the two outer of said downwardly-projecting arms engaging when said lever is in its central position with said upper jaw to move it a predetermined distance about the pivot and cause it to co-operate with both of said side jaws in their normal positions and acting as one rigid jaw to grip and pull the upper, and when said lever is moved about its fulcrum one or the other of said outer downwardly-projecting arms will engage with said pivoted jaw at a different level and move it a lesser distance, while the central downwardly-projecting arm at the same time will engage with one or the other of said side-jaw levers to raise its operating end to co-operate with the upper jaw to grip the upper and pull it in laps over the inner sole, two spring-operated pins mounted in bearings in said reciprocating block, one on either side of the center of the wedge-shaped upwardly-projecting arm of said lever, an adjustable stop or abutment adapted to be moved into the path of one or the other of said pins and to be engaged thereby to force it against the beveled side of the upwardly-projecting arm of said lever to move it about its fulcrum, and mechanism having provision for moving said stop into or out of the path of one or the other of said pins, so that either or neither of them may be engaged thereby at the desire of the operator.

5. In a lasting-machine, the combination of a horizontally-reciprocating pincher-carrying bar or frame, a rigid arm secured to said bar or frame, a jaw-lever pivoted to each side of said rigid arm, a spring to hold both of said jaw-levers in position to act in conjunction with said arm to form a single rigid lower jaw when desired, an upper pincher-jaw pivoted to said bar or frame and adapted to co-operate with both of said lower-jaw levers when acting as a single rigid jaw or with either of said side jaws independently, as may be desired, a spring for moving said upper jaw about its pivot to open said pinchers and hold them open during their movement toward the shoe-upper to be lasted, means having provision for moving said upper jaw about its pivot to co-operate with one or both of said jaws to grip the upper and retain a grip thereon during a portion of the reverse motion of said pinchers, means having provision for moving one of said lower-jaw levers about its pivot, when desired, to raise its gripping end and cause it to co-operate with said upper jaw and pull the gripped portion of the upper upward and then toward the center of the sole, thereby forming a fold or lap of the slack leather, and a horizontally reciprocating slide provided with a forked or notched end to co-operate with said pinchers to assist in forming said fold and laying it upon the inner sole.

6. In a lasting-machine, the combination of a horizontally reciprocating pincher-carrying bar or frame, a pair of pincher-jaws mounted thereon, a horizontal guide rod or bar carrying said bar or frame and fitted to and movable endwise in suitable fixed bearings, an arm mounted upon said rod, a cam constructed and arranged to act upon said arm to move said rod and bar or frame in one direction to allow said pinchers to grip the upper, and a spring for moving said rod and bar or frame in the opposite direction to strain the leather over the inner sole preparatory to securing it thereto.

7. In a lasting-machine, the combination of a pincher-carrying bar or frame, a pair of pincher-jaws mounted thereon, a horizontal rod firmly secured by one end to said pincher bar or frame and fitted to and movable endwise in suitable fixed bearings, an arm mounted on said rod, a cam provided with a throw to act upon said arm to move said rod and the pincher bar or frame to a position to grip the upper, and also provided with two reverse throws to allow said bar to move in the opposite direction, and a standstill between said reverse throws of sufficient length to allow the fastening of the upper to the inner sole before the completion of the movement of the rod in that direction, and a spring for moving said pincher-carrying bar in said opposite direction.

8. In a lasting-machine, the combination of a horizontal rod fitted to and movable endwise in suitable bearings, a pincher-carrying bar or frame secured to said rod, an arm mounted on and movable about but not endwise on said rod, a cam provided with a throw to act upon said arm and move said rod and the pincher-carrying bar or frame in the direction of the length of said rod when said arm is held in its normal position, a spring for moving said rod in a direction opposite to the throw of said cam, and means having provision for moving said arm about said rod at the will of the operator.

9. In a lasting-machine, the combination of a horizontal rod fitted to and movable endwise in suitable bearings, a pincher-carrying bar or frame secured to said rod, a pair of pincher-jaws mounted on said bar or frame, a bell-crank lever mounted upon and movable about but not endwise on said rod, a cam engaging with one arm of said lever and adapted to move said lever about said rod to prevent the reciprocating movement of said pincher-carrying bar or to move said arm and the rod upon which it is mounted lengthwise of said rod to produce the said reciprocating movement of said pincher-carrying bar, a spring for moving said rod and its pincher-carrying bar in the opposite direction to produce the strain upon the leather, and a removable stop to prevent or permit the movement of said lever about said rod at the will of the operator.

10. In a lasting-machine, the combination of a horizontal rod mounted in suitable bearings, a pincher carrying bar or frame secured thereto, a pair of pincher-jaws mounted on said bar or frame, a bell-crank lever mounted upon and movable about said rod, but immovable thereon relative to its length, a cam engaging with one arm of said lever and adapted to move said lever about said rod to prevent the reciprocating movement of said pincher carrying bar or to move said arm and the rod upon which it is mounted lengthwise of said rod to produce the said reciprocating movement of said pincher-carrying bar, a spring for moving said rod and its pincher-carrying bar in the opposite direction to produce the pull upon the upper, a vertical rod secured to the horizontal arm of said lever, a stand provided with a bearing for the lower end of said rod, a lever pivoted to said stand and constructed and arranged to serve as a removable stop to limit the downward movement of said rod, a spring for holding said rod normally in its elevated position, a spring to hold said stop-lever in its normal position with its vertical arm under the said vertical rod, and a system of treadle-levers adapted to trip said lever when it is desired to prevent the reciprocating movement of said pincher-carrying bar

11. In a lasting-machine, the combination of a horizontally-reciprocating bar constructed and arranged to turn the flap of the upper over upon the inner sole, a second bar or rod fitted to a slot in said first bar and provided with a nail or fastener receiving pocket, and means having provision for reciprocating the latter bar to carry the nail from the receiving-point to a position beneath the driver and at the same time move the other slide a sufficient distance to accomplish its object.

12. In a lasting-machine, the combination of a horizontal slide provided with a forked end, another slide provided with a nail-receiving pocket and arranged to in its movement move the first slide a sufficient distance to turn the upper over upon the last, a pivoted lever, a link connecting said lever and said second slide, a truck mounted upon the end of said lever, and a cam arranged to engage with said truck and transmit motion through it to said slides.

13. In a lasting-machine, the combination of a grooved horizontal slide provided with a forked end, another slide mounted in said groove and provided with a nail-receiving pocket and adapted in its movement to move the first slide a predetermined distance, a pivoted lever in two parts, one of which is adjustably secured to the other about the same pivot, a bar connecting one part of said lever with said second slide, a truck mounted upon the other part of said lever, and a cam arranged to engage with said truck and transmit motion through it to said slides.

14. In a lasting-machine, the combination of a horizontal slide provided with a forked end, another slide provided with a nail-receiving pocket and adapted in its movement to move the first slide a predetermined distance, a yielding connection between the two slides to prevent a too sudden contact, and means for reciprocating the nail-carrying slide.

15. In a lasting-machine, the combination, with a horizontally-reciprocating bar or frame, a pair of pincher-jaws carried thereby, means having provision for reciprocating said bar or frame and the pinchers, means having provision for opening and closing said pincher-jaws, and a horizontally-reciprocating fork-ended bar for pressing the upper down upon the inner sole, of a wire-feeding mechanism, a device for cutting the wire into the required lengths, a gripping mechanism for holding the portion thus cut, a bending mechanism for forming the cut-off portion into a staple, a horizontally-sliding bar provided with a pocket to receive said staple, a driving mechanism, and means having provision for moving said slide with its staple from the receiving-point to a position beneath the driving mechanism, and vice versa.

16. In a lasting machine, the combination, with a horizontally-reciprocating bar or frame, a pair of pincher-jaws carried thereby, means

having provision for reciprocating said bar or frame and the pinchers, means having provision for opening and closing said pincher-jaws, and a horizontally-reciprocating fork-ended bar for pressing the upper down upon the inner sole, of a wire-feeding mechanism, a device for cutting the wire mechanism for adjusting the position of said cutting device to provide for cutting nails of different lengths, fingers to seize said cut-off portion, mechanism for bending the cut-off portion into a staple, a driving mechanism, a sliding bar provided with a pocket to receive the staple, and means having provision for moving said slide with its staple from the receiving-point to a position beneath the driving mechanism.

17. In a lasting-machine, the combination, with a horizontally-reciprocating bar-frame, a pair of pincher-jaws carried thereby, means having provision for reciprocating said bar and pinchers, means having provision for opening and closing said pincher-jaws, and a horizontally-reciprocating bar for pressing the upper down upon the inner sole, of a wire-feeding mechanism, mechanism for automatically regulating the length of wire fed, a wire-cutting device, and mechanism for automatically adjusting the position of said wire-cutting device to regulate the lengths of the nails or fastenings.

18. In a lasting-machine, the combination of a pair of nail-receiving jaws, mechanism for closing said jaws, a reciprocating slide provided with a nail-receiving pocket, and mechanism for lifting said jaws to deliver said nail into said pocket.

19. In a lasting-machine, the combination of a nail-delivering device, a vertically-reciprocating bar, a pair of jaws attached to said bar and adapted to receive said nail, a spring for closing said jaws, a horizontally-reciprocating slide provided with a nail or fastener receiving pocket, and mechanism for releasing the grip upon said fastener when in the upward movement of said bar the nail has been delivered into said pocket.

20. In a lasting-machine, the combination of a horizontally-reciprocating slide, mechanism for controlling the movement of said slide, a cutter secured to said slide, two feed-rolls also secured to said slide, a disk secured to the shaft of one of said feed-rolls, a cylinder loosely mounted upon said shaft and inclosing said disk, a tangential notch or recess cut in the inner perimeter of said cylinder, a friction-roll in said recess between said disk and the inner perimeter of said cylinder and adapted to serve as a means of connecting said cylinder and disk and compelling them to move together in one direction and to disconnect them when the cylinder is moved in the opposite direction, and mechanism for imparting to said cylinder an intermittently-oscillating movement about its shaft to a greater or less distance.

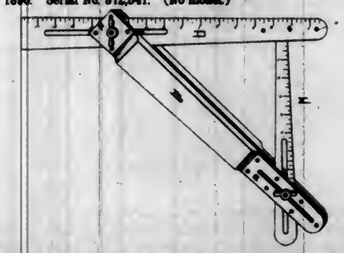
21. In a lasting-machine, the combination of a pair of feed-rolls, a disk secured to the shaft of one of said feed-rolls, a cylinder loosely mounted upon said shaft and surrounding said disk, a tangential notch or recess cut in the inner perimeter of said cylinder, a friction-roll interposed between said disk and said cylinder, a crank-pin set in the outer face of said cylinder, a horizontally-arranged lever provided with a longitudinal slot, a sliding block fitted to said slot, a rod connecting said block and said crank-pin, mechanism for moving said block in said slot a predetermined but variable distance, and a cam for vibrating said slotted lever.

22. In a lasting-machine, the combination of a horizontally-reciprocating slide, a pair of feed-rolls mounted on shafts carried by said slide, a disk secured to the shaft of one of said feed-rolls, a cylinder loosely mounted upon said shaft and surrounding said disk, a tangential notch or recess cut in the interior perimeter of said cylinder, a friction-roll interposed between said disk and said cylinder, a crank-pin adjustably set in said cylinder, a horizontally-arranged lever provided with a longitudinal slot, a cam for vibrating said lever, a sliding block mounted in the slot of said lever, a fulcrum-pin mounted in said block, a rod connecting said fulcrum-pin and the crank-pin in said cylinder, a vertically-arranged lever mounted on a fixed fulcrum and connected to said horizontal slide and provided in its upper end with a longitudinal slot, a second sliding block fitted to the slot in said vertical lever and mounted on said fulcrum-pin, a cutting device secured to said horizontally-reciprocating slide, a sleeve pivoted to the upper end of said vertically-arranged lever and provided with a downwardly-projecting arm, a spring for keeping said sleeve in its elevated position, a revolving segmental block or lug, a stop to limit the movement of said sleeve and said slotted arm in one direction, means for depressing said arm into the path of said revolving segmental block or lug to cause said slotted lever to be moved in the opposite direction, and a stop to limit the movement of said lever in said opposite direction.

23. In a lasting-machine, the combination of a wire feeding and controlling mechanism, a wire-cutting mechanism, a pivoted horizontally-arranged lever provided with a longitudinal slot, a track mounted thereon, a cam for moving said lever, a horizontally-reciprocating center-carrying slide, a vertically-arranged lever pivoted to a fixed support and to said slide and slotted at its upper end, two sliding blocks mounted in the slots in said two levers, a pin connecting said blocks, a rod connecting said pin with the wire feeding and controlling device, a sleeve pivoted to said vertically-arranged lever and provided with a downwardly-projecting arm, a revolving segment or lug adapted to come in contact with said arm and move it outward, a stop to limit the inward movement of said arm, a spring to keep said vertically-arranged lever normally in its innermost position, a spring for keeping said sleeve normally in an elevated position, a rod mounted in said sleeve, a latch constructed and arranged to shut down in front of said rod and hold it in its retracted position when said vertical lever has been moved outward by said revolving segment or lug, a spring to keep said latch normally in a raised position, a suitable treadle mechanism, and a rod connecting said treadle mechanism and said latch.

24. In a lasting-machine, the combination of a nearly-vertical lever for controlling the cutting devices, a nearly-horizontal lever for controlling the wire-feeding devices, a universal joint connecting said levers to enforce united action, a sleeve pivoted to said vertical lever and provided with a downwardly-projecting arm, a revolving segment or lug adapted to come in contact with and move said arm outwardly, a rod adjustably mounted in said sleeve to limit the length of the longer nails or fastenings, an adjustable stop to limit the length of the shorter nails, a vertically-arranged spring-supported rod forming a saddle for said adjustable sleeve-rod, a spring for normally holding said sleeve in its inner position, a pivoted spring-raised latch-lever adapted to shut down by the end of said adjustable sleeve-rod to hold it in its retracted position, a suitable treadle mechanism, and a rod connecting said treadle mechanism with said latch.

25. In a lasting-machine, the combination of a horizontally-reciprocating pincher-carrying bar or frame, a pair of pincher-jaws carried by said frame, a vertically-reciprocating block carried by said bar or frame, a multiple-armed lever mounted on said block and constructed and arranged to control the action of said pinchers, a pair of pins for operating said lever also carried by said block, an adjustable stop or abutment mounted on the frame of the machine-head and constructed and arranged to be normally held in a position intermediate between the path of said pins as they are moved to the rear, a treadle mechanism, and suitable connections between said treadle mechanism and said abutment whereby said stop or abutment may be moved into the path of either one or the other of said pins at the will of the operator.



26. In a lasting-machine, the combination, with a pair of horizontally reciprocating pinchers, the vertically-sliding block F^6, the four-armed lever F^9, and the cam-block F^8, both carried by said sliding block F^6, the two pins f f, the springs f' f', and the three-armed or T-shaped lever F^{11}, of a main treadle-lever, a spring to lift said lever, a foot-pad pivoted to said treadle-lever so that it can be moved either in a lateral or vertical direction, an upwardly-projecting arm formed upon said foot-pad and provided with a shoulder on each side thereof, a pair of levers fulcrumed upon the base of the machine and arranged one upon each side of said arm in positions to be engaged and depressed by said shoulders when desired, and rods connecting said levers with the horizontal arms of the lever F^{11} for controlling the operation of the pinchers.

27. In a lasting-machine, the combination of a horizontally-reciprocating bar or frame, a pair of pinchers carried by said bar, a lever, cam, and spring for reciprocating said pincher-bar, a main treadle-lever, a foot-pad secured thereto, a lever pivoted to the under side of said foot-pad, an arm on said lever projecting upward through an opening in said pad, a spring to keep said lever in a normally-raised position, a stand secured to the base of the machine, a spring-raised rod having a bearing for its lower end in said stand and connected at its other end with the lever for controlling the reciprocation of the pincher-carrying bar, and a spring-actuated bell-crank lever, the vertical arm of which in the normal position of said lever forms a stop to prevent the downward movement of said sod, while the lateral arm lies in the path of the lever pivoted to said foot-pad and may be depressed thereby when desired.

28. In a lasting-machine, the combination of a horizontally-reciprocating bar or frame, a pair of pincher-jaws carried by said bar, the vertically-sliding block F^6, the four-armed lever F^9, and the cam-block F^8, both carried by said sliding block F^6, the pins f f, the springs f' f', the three-armed or T-shaped lever F^{11}, a lever, cam, and spring for reciprocating said pincher-carrying bar, a wire feeding and cutting mechanism, a main treadle-lever, a foot-pad pivoted thereto, so that it may be oscillated either laterally or vertically and provided with an upwardly-projecting arm having a shoulder upon each side thereof and an overhanging lip, a lever on each side of said arm constructed and arranged to be acted upon and depressed independently by said shoulders to control the operation of the pincher opening and closing mechanism, a lever constructed and arranged to be acted upon by said overhanging lip to control the wire feeding and cutting devices, a lever pivoted to the under side of said foot-pad, a spring for raising the movable end of said lever, and a bell-crank lever adapted to be depressed by said last lever to control the movement of the pincher-carrying bar.

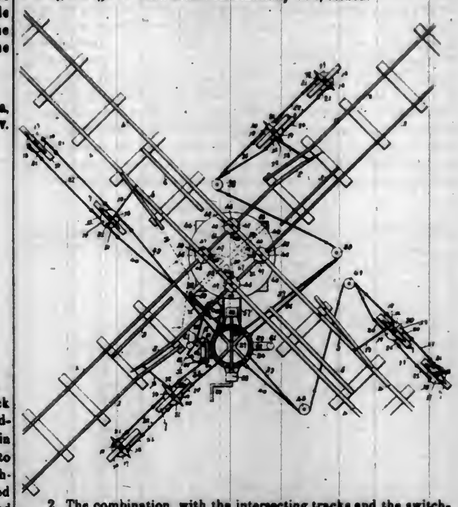
29. In a lasting-machine, the combination of the shaft B^3, the cam O^3, mounted on said shaft, the horizontally-reciprocating rod E, a pincher-carrying bar or frame mounted on and movable horizontally with said rod, a two-armed lever mounted on and movable about said rod and adapted to be acted upon when in its normal position by said cam to reciprocate said rod and pincher-carrying bar or frame, a rod pivoted by one end to and pendent from the free end of the horizontal arm of said lever, a spring on said pendent rod tending to force it downward and vibrate said lever, a main treadle-lever for operating the clutch or shipping mechanism for starting and stopping the operations of the main shaft, and a lever constructed and arranged to serve as a stop and support for holding said pendent lever and the first-named two-armed lever in their normal positions and adapted to be moved from beneath said pendent rod by the operator's foot, while depressing said main treadle-lever, thereby causing a suspension of the reciprocation of the pincher-carrying bar and the operation of the pinchers.

482,350. STAIR-BUILDER'S TOOL. William T. Gasherie, Omaha, Nebr., assignor of one-half to Wilson T. Graham, same place. Filed Nov. 24, 1890. Serial No. 372,541. (No model.)

Claim.—1. In a stair-builder's tool, the combination of a stock provided at one end with a fixed and at the other with a sliding binding-post, said fixed post supporting and holding an adjustable main blade, said blade being graduated and tapering from a square base to a round end and adapted to form the tread and nosing of a pitch-board, and a slotted graduated auxiliary blade tapering from a rounded to a square end and adjustable upon said sliding binding-post and adapted to form the riser of a pitch-board, all arranged to operate substantially as and for the purpose set forth.

2. As an improved article of manufacture, a stair-builder's tool comprising the two-part stock A, having a fixed and a sliding binding-post adapted to accommodate the graduated and adjustable blades D and E, as shown, said stock and blades being adjustable and adapted to form, in combination, respectively, the base-line, tread, nosing, and riser of a pitch-board, each of said instrumentalities being independently adjustable to any desired measurement, substantially as and for the purpose set forth.

482,351. DARNING-LAST. Sarah H. Garwood, Southsea, England. Filed Jan. 11, 1892. Serial No. 417,714. (No model.) Patented in England June 23, 1890, No. 9,713.



Claim.—1. A darning-last consisting of a plate recessed upon each of its edges and partially-rotatable bars mounted in said recesses upon all sides of the last for independent movement and carrying a plurality of pins, substantially as set forth.

2. A darning-last consisting of a plate recessed upon each of its edges with means of support, partially-rotatable bars mounted in said recesses and carrying pins, and springs in said recesses acting upon said bars to hold them in their normal position, substantially as set forth.

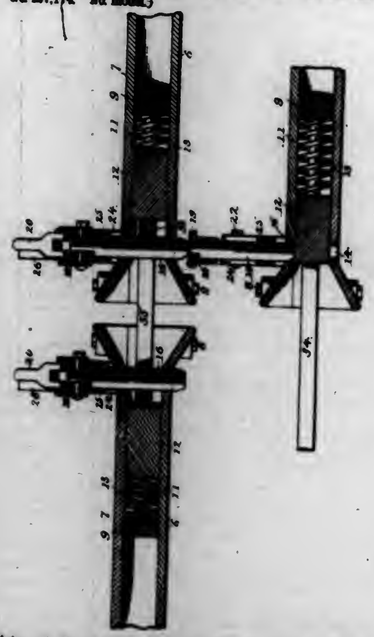
482,352. RAILROAD-CROSSING. Reba B. Gibson, Cadillac, Mich., assignor of one-fourth to Harry Wood, same place. Filed Nov. 26, 1891. Serial No. 413,494. (No model.)

Claim.—1. In a railroad-crossing, the combination, with the intersecting tracks, of signal-stands located at the side of each track, target-masts journaled in the stands and terminating at their upper ends in signal-targets, disks mounted on the shafts, pins located upon the disks at diametrically-opposite sides of the shafts, a power-frame, a vertical shaft journaled therein, a gear on the shaft, upper and lower disks on the shaft, a transverse operating crank-shaft, a gear mounted thereon, links loosely pivoted at their centers at diametrically-opposite sides of the upper and lower disks of the power, and cables, links, and rods leading from the opposite ends of the links to the pins of the disks of those signal-targets located at the sides of the tracks disposed at a right angle to each other, substantially as specified.

2. The combination, with the intersecting tracks and the switch-rails thereof, of the switch-stands located opposite the switch-rails of the tracks, the switch-masts in the stands, the targets or signals at the upper ends thereof, the disks upon the masts, the switch-rods loosely connected to the switch-rails and to the disks, the power-frame, the vertical shaft therein, the gear at the upper end of the shaft, the transverse shaft terminating in a crank and having a gear for operating the main gear, the upper and lower disks on the gear-carrying shaft, pairs of links pivoted at diametrically-opposite sides of each of the disks of the power-shaft, and cables leading from the ends of one pair of links to the disks upon the switch-stands of the south and north bound tracks and from the other pair to those of the east and west bound tracks, and suitable pulleys located between the tracks, substantially as specified.

3. The combination, with the four intersecting tracks and the switches thereof, of the switch and signal stands located at the side of each track, each comprising a mast terminating at its upper end in a signal and a disk below the same, pitmen connecting the disks of the switch-masts with the switches, links pivoted at diametrically-opposite sides of the disks of each of the masts, rods connecting the links, a power-frame, a power mechanism mounted in the frame and adapted to rotate, and cables leading from the ends of the links of the switch-stands to said rotatable power mechanism, substantially as specified.

4. The combination, with the four intersecting tracks and their switches, of the switch and signal stands, the masts for the same, the disks on the masts, switch-rods connecting the disks of the switch-stands with the switches, links pivoted to diametrically-opposite sides of the switch-stand disks, links pivoted at their ends to the disks of the signal-masts, rods connecting the two links, a power-frame, a vertical shaft mounted therein, means for operating the shaft, upper and lower disks mounted on said shaft, pairs of links pivotally connected between their ends to diametrically-opposite sides of the upper and lower disks, cables leading from the opposite ends of the links of the upper disk to the links of the switch-disks of tracks running in one direction, and similar cables similarly connecting the remaining lower disk to the pair of angularly-disposed tracks, substantially as specified.



5. The combination, with the four intersecting tracks, of the frame located at said intersection, the vertical shafts mounted in the frame beneath the intersections of the rails, the short shifting rails located at the upper ends of the shafts, sprocket-wheels mounted on the shafts, a sprocket-chain embracing the same, a second sprocket-wheel mounted upon one of the shafts, a power-frame, a winding-shaft therein, means for operating the same, a sprocket thereon, and a sprocket-chain encircling said wheel and connecting with the second sprocket-wheel of the shifting-rail-carrying shaft, substantially as specified.

6. The combination, with the intersecting rails and the intermediate frame, of the vertical shafts beneath the rails, the disks at the up-

per ends of the shafts, the short shifting rails on the disks and notches formed in the disks, mechanism for simultaneously operating the shifting rails, the rock-shaft journaled in the frame intermediate to the pairs of disks and provided with rock-arms adapted to interlock with the notches of the disks, and means for operating said rock-shaft, substantially as specified.

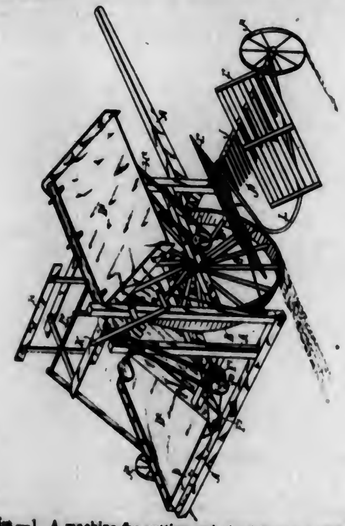
7. The combination, with the intersecting rails and the intermediate frame, of the vertical shafts beneath the rails, the disks at the upper ends of the shafts, the short shifting rails on the disks and notches formed in the disks, mechanism for simultaneously operating the shifting rails, the rock-shaft journaled in the frame intermediate to the pairs of disks and provided with rock-arms adapted to interlock with the notches of the disks, a frame having a curved notched locking-plate, a shaft journaled in the frame and terminating at its upper end in a crank having a pivoted gravity-handle for locking with the plate, a sprocket on the lower end of the shaft, a crank on the rock-shaft, a sprocket located between the crank of the rock-shaft and that of the vertical shaft, a pitman connecting the same with the crank of the rock-shaft, and a sprocket-chain connecting the sprocket carrying the pitman with that of the vertical shaft, substantially as specified.

482,353. CAR-COUPLING. CHRISTIAN H. GOHL, Saginaw, Mich., assignor of one-half to Hans Rost, same place. Filed Mar. 31, 1892. Serial No. 427,174. (No model.)

Claim.—1. In a car-coupler, the combination, with the main body portion having the pin apertures, of the pin, the block for supporting the pin, the link, the lever for raising the pin, and the lock or catch for locking the lever in its lower position, so as to sustain the pin independently of the block, substantially as described.

2. In a car-coupler, the combination, with the main body portion having the pin-apertures, of the pin, the block for supporting the pin, the springs, the link, the lever for raising the pin, and the lock or catch for locking the lever in its upper position, so as to prevent disengagement from the link, or in its lower position so as to sustain the pin independently of the block, substantially as described.

3. In a car-coupler, the combination, with the main body portion having the pin-apertures, of the pin, the block for supporting the pin, the link and the lever for raising the pin, the pin being loosely connected at its upper end to the lever, and the lever having a limited longitudinal movement upon its fulcrum, substantially as described.

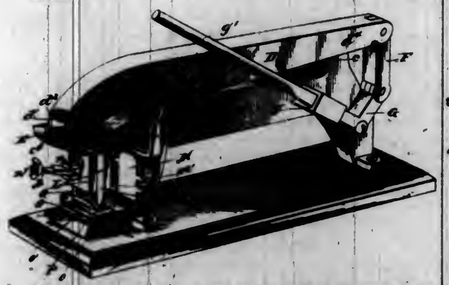


4. In a car-coupler, the combination, with the pin-locking lever having a lateral or sidewise movement and provided upon its upper and lower edges with retaining recesses, of the catch-bar having projections adapted to engage within said recesses, substantially as described.

482,354. SEPARATOR. AUGUST A. GOUBERT, Brooklyn, N. Y. Filed Mar. 2, 1892. Serial No. 423,035. (No model.)

Claim.—A centrifugal steam-separator provided with wings or plates projecting from the interior surface of the well-chamber at an acute angle therewith and to the course of the steam or water, substantially as described.

482,355. CORN CUTTING AND SHOCKING MACHINE. GEORGE D. HAWORTH, Ackworth, Iowa. Filed Feb. 26, 1892. Serial No. 423,027. (No model.)



Claim.—1. A machine for cutting and shocking corn, consisting of the frame, cutter-bar, endless carrier, and reel, constructed and adapted to operate substantially in the manner set forth, in combination with a shocking device comprising a frame adapted to receive and form the stalks into a compact bundle or shock and having the forward part of the frame upon which the butts rest adapted to be inclined downward and the rear end of the frame adapted to be elevated, substantially in the manner set forth, for the purposes stated.

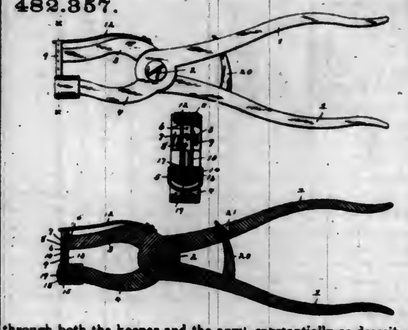
2. A corn shocking device adapted to be connected with a machine adapted for cutting corn, comprising an axle with a wheel on its outer end, a frame composed of rods or fingers connected with said axle and provided with means whereby it may be inclined downwardly, and another frame connected with the said axle, adapted to contain a plurality of cornstalks and provided with means whereby it may be raised, substantially in the manner set forth, for the purposes stated.

3. An improved corn-shocking device adapted to be connected with a machine adapted for cutting corn, comprising an axle adapted to be mounted in a part of the frame of a corn-cutting machine, a plurality of fingers or rods fixed to the said axle, a crank-arm fixed to the said axle, a rope attached to the said crank-arm and to a lever provided with a detent device, a frame attached to the said axle and adapted to support a number of cornstalks, and a rope attached to the said frame and to a lever, substantially as and for the purposes stated.

482,356. PUNCHING AND SHEARING MACHINE. FRANK M. HELFRICH, Hebron, Nebr. Filed Jan. 12, 1892. Serial No. 417,867. (No model.)

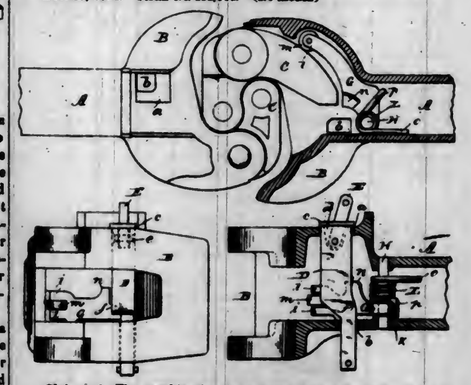
Claim.—1. In a machine of the class described, the combination of the stationary shear-blade having a circular pivot-groove near one end and an upwardly-extending guide lug near the opposite end, the movable shear member provided with a circular pivot ring or flange working and fitting snugly within said groove and with an extended lever portion, a pivot-bolt passing through said members at their point of pivot, an offstanding angle-bracket receiving one end of said pivot-bolt and secured to the stationary shear member, a bell-crank lever pivoted at its angle to said stationary member near one end, a toggle-forming link pivoted directly to the lever end of said movable shear member and to one arm of said bell-crank, and an operating-lever connected to the other arm of said bell crank, substantially as set forth.

2. In a punching and shearing machine, the combination, with a stationary shear member provided with vertical parallel punch-guide lugs, of the movable shear member pivotally connected to said shear member, a reciprocating punch detachably connected with the pivoted shear member and moving between said guide-lugs, a swinging cap-plate adapted to be swung against said guide-lugs to inclose the punch therein and away from the same to allow for the removal of the punch, and a clamping device arranged at one end of said stationary shear member and adapted to engage one edge of said cap-plate to hold the same closed, substantially as set forth.



3. In a punching and shearing machine, the combination of a stationary shear member provided with a vertical recess, parallel guide-lugs projecting beyond both sides of each recess and a die-bed located directly beneath the lower ends of said lugs, the pivoted shear member, a punch-carrying plate or arm loosely connected to one end of said pivoted shear member and working in said vertical recess and between said lugs, a reciprocating punch detachably connected to said plate or arm between said lugs, a hinged cap-plate inclosing the punch between said lugs, and operating mechanism, substantially as set forth.

4. In a punching and shearing machine, the combination of a stationary shear member provided with parallel guide-lugs and a die-bed located beneath the lower ends of the same, the pivoted shear member, a reciprocating punch detachably connected with one end of the pivoted member and working between said guide-lugs, a hinged cap-plate hinged to one of said lugs and provided with projecting securing-lugs at its free edge and inclosing the punch within said lugs, a hinged or swinging clamping-bolt pivoted at one end to said stationary member and adapted to be swung and clamped between the securing-lugs of said plate to hold the same closed, and operating mechanism, substantially as set forth.



482,357. STAPLING IMPLEMENT. GILBERT HAY, Fayetta, Mo., assignor of one-half to Henry Rose, same place. Filed May 9, 1892. Serial No. 432,287. (No model.)

Claim.—In a stapling device of the character set forth, the combination of an upper jaw carrying a plunger overlapping an extension of said jaw, a spring-actuated feeding-tube engaging said plunger and movable thereover, a lower jaw longer than the said upper jaw and provided with a recess in the front end thereof, an anvil removably mounted in said recess of the lower jaw, a keeper of similar form to and adapted to hold the said anvil in position, and a screw passed through both the keeper and the anvil, substantially as described.

482,357.

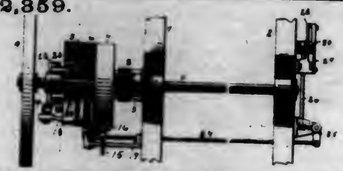
482,358. CAR-COUPLING. JAMES A. HINSON, Chicago, Ill. Filed Nov. 13, 1891. Serial No. 411,801. (No model.)

Claim.—1. The combination, in an automatic car-coupler, of the knuckle, a vertically-movable latch, and means both for supporting said latch in its raised position and for swinging said knuckle on its pivots or bearings, substantially as described.

2. The combination, in an automatic car-coupler having a swinging knuckle, of a vertically-movable latch provided with a shoulder on its side and a horizontal arm pivoted within the draw-head and adapted to enter beneath said shoulder and support said latch and to swing said knuckle outwardly when said latch is raised, substantially as described.

3. The combination, in an automatic car-coupler having a swinging knuckle, of a vertically-movable latch, an arm pivoted within the draw-head, and means for holding said arm yieldingly in contact with said latch, substantially as described.

4. The combination, in an automatic car-coupler having a swinging knuckle, of a vertically movable latch, a friction-roller, and means for holding said roller in yielding contact with said knuckle and adapted to support said latch when raised, substantially as described.



5. The combination, in an automatic car-coupler having a swinging knuckle, of a vertically-movable latch, an arm pivotally secured in rear of the latch and carrying a friction-roller in its free end, and a spring arranged to press against said arm, substantially as described.

6. The combination, in an automatic car-coupler having a swinging knuckle, of a vertically-movable latch, a curved horizontal arm pivotally secured in the draw-head, carrying a roller at its free end and having a vertical projection formed thereon near its pivotal point, and a spiral spring surrounding the pivot of the arm and exerting its strength against said arm, substantially as described.

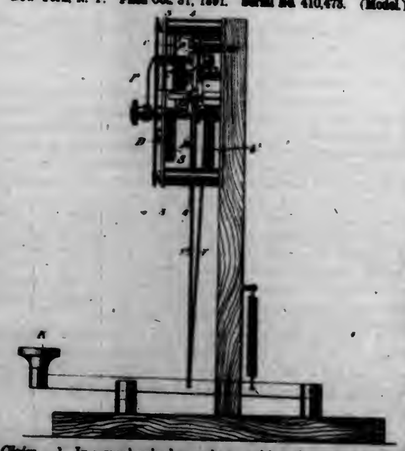
7. The combination, in an automatic car-coupler, of a vertically-movable latch having a cavity with inclined end walls formed in its upper end and a link or bar pivoted at one end within said cavity for connecting the uncoupling-chain with said latch, substantially as described.

482,359. STOPPING AND REVERSING MECHANISM FOR PRINTING-PRESSES. WINFIELD S. HOBBS, Taunton, Mass., assignor to the Campbell Printing Press and Manufacturing Company, New York, N. Y. Filed Apr. 28, 1892. Serial No. 431,026. (No model.)

482,359.

Claim.—1. The combination, in a driving mechanism for printing-presses, of the tight pulley and a loose pulley, a clutch arranged to operate from said loose pulley, whereby if the clutch is in operation the loose pulley may transmit motion to the machine, another loose pulley of the same diameter as the tight pulley, belts for driving the two loose pulleys, and means for throwing the belt from the loose pulley of the same diameter as the tight pulley onto the tight pulley and at the same time disengaging the clutch, and vice versa, substantially as described.

2. In a driving mechanism for printing-presses, the combination of a tight pulley having one member of a friction-clutch, a loose pulley having the other member of the friction-clutch, another loose pulley, of the same diameter as the tight pulley, belts for driving the two loose pulleys, and means for moving the belt from the loose pulley of the same diameter as the tight pulley onto the tight pulley and for disengaging the friction-clutch at the same time, and vice versa, substantially as described.



3. The combination of the shaft 4, tight pulley 6, having one member of a friction-clutch, loose pulley 5, having the other member of the friction-clutch, loose pulley 7, counter-shaft pulleys 11 and 12, of different sizes, belts between the counter-shaft pulleys and the loose-pulleys, whereby loose pulleys 5 and 7 will be revolved at different speeds, and means for moving the belt from pulley 7 onto pulley 6 and for disengaging the friction-clutch, and vice versa, substantially as described.

482,360. SHIELD FOR CURLING-IRONS. THOMAS IRRGANGER, Jr., Brooklyn, N. Y. Filed Apr. 26, 1892. Serial No. 430,465. (No model.)

Claim.—A shield for curling-irons, consisting of a tube having an open end and a head upon the opposite end, forming a closure, with a slot extending from the open end longitudinally of the shield to near the closed end, substantially as described.

482,361. COUNTER FOR TYPE-WRITERS. FRANCIS W. JOHNS, New York, N. Y. Filed Oct. 31, 1891. Serial No. 410,473. (Model.)

Claim.—1. In a mechanical counting-machine, the retaining-pawl p', notched at n, the releasing-arm a', arranged to interlock with pawl p' at n, and the releasing-pin s', in combination with the actuating-key K, the connecting-rod r, the actuating-arm a, and pawl p, the ratchet-wheel R, and spring S, all substantially as set forth.

2. In a mechanical counting-machine, the combination of releasing-arm a' and retaining-pawl p' with the ratchet-wheel R, pins s', and spring S, all substantially as set forth, and for the purpose of automatically releasing ratchet-wheel R.

3. In a mechanical counting-machine, the combination of releasing-key K', rod r', and forked arm a' with retaining-pawl p', ratchet-wheel R, releasing-pins s', and spring S, all substantially as set forth.

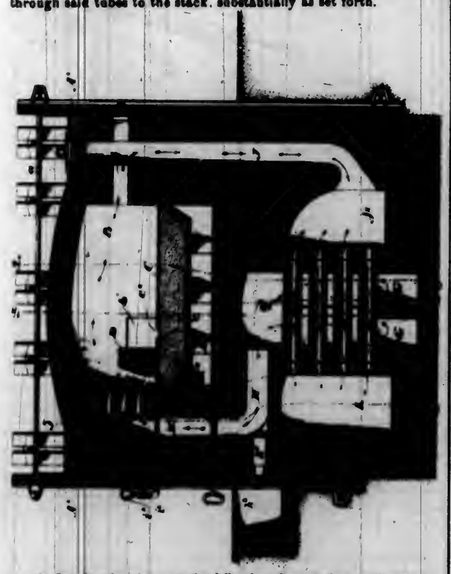
4. In a mechanical counting-machine, the combination of the pneumatic cushion C and plunger v with stop-arm a^3, ratchet-wheel R, and spring S, all substantially as set forth, and for the purpose of checking the momentum of ratchet-wheel R when it is released and returning to zero.

5. In a mechanical counting-machine, the combination of retaining-pawl p', having a notch n, with releasing-arm a', ratchet-wheel R, pins s and s', and spring S, all substantially as set forth.

6. A mechanical counting-machine consisting of the actuating-key K, actuating-arm a, connected to key K by means of rod r, pawl p, fastened to arm a and arranged to be pressed against wheel R, the ratchet-wheel R, arranged to be rotated step by step with the pointer P, retaining-pawl p', arranged to hold wheel R in place, the releasing-arm a', arranged to be pressed against pawl p', spring S, arranged to return wheel R to the zero-point when not held by pawl p', and pneumatic cushion C, arranged as a stop for wheel R, all as set forth and shown.

482,362. ILLUMINATING DEVICE FOR STAGE SCENERY AND FOR OTHER PURPOSES. WILLIAM JORDAN and EDWARD BROADBRIDGE, Jr., Brighton, England. Filed Nov. 21, 1891. Serial No. 413,314. (No model.) Patented in England Feb. 10, 1891, No. 2,999.

Claim.—1. In a device of the character described, the combination, with a succession of ribs or bars of varying diameters and pieces of translucent material between said ribs, of a light within said chamber, a representation of flowers, shrubs, or analogous matters surrounding the same and upon which the light is diffused, and a handle whereby the same may be carried, substantially as set forth.

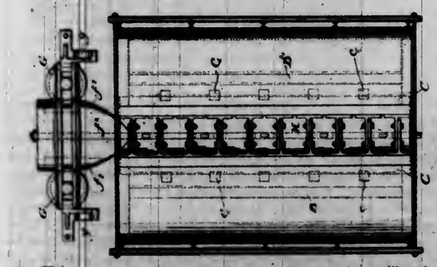


2. In a device of the character described, the combination, with a conical chamber or frame provided with a succession of ribs or bars of varying diameters and pieces of differently-colored translucent material between said ribs, of a light within said chamber, a representation of flowers, shrubs, or analogous matters surrounding the same and upon which the light is diffused from the light.

3. In a device of the character described, the combination, with a conical frame or chamber and a representation of flowers surrounding the same, of means for causing light of different shades to be reflected thereon, substantially as set forth.

482,368. HEATING-FURNACE. PETER KEIL, Jr., Philadelphia, Pa. Filed Dec. 2, 1890. Serial No. 373,289. (No model.)

Claim.—1. In a heating-furnace, the following elements in combination: a combustion-chamber, a pre-heating air-chamber beneath the hearth of the combustion-chamber and in communication with a source of cold-air supply and with a recuperating-chamber, a recuperating-chamber, flues leading from said recuperating-chamber to the combustion-chamber and each having a series of independent ports opening into said combustion-chamber, a series of fuel-burners opening into the combustion-chamber angularly with respect to the direction of discharge of the ports and operating in conjunction with said ports, a series of independent recuperating-tubes traversing the recuperating-chamber, and draft-downtakes from the combustion-chamber which discharge through said tubes to the stack, substantially as set forth.



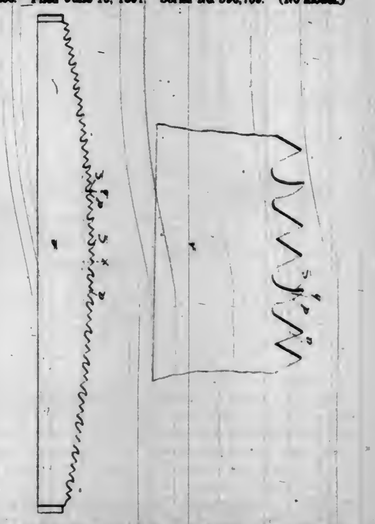
2. In a heating-furnace, the following elements in combination: a combustion-chamber, a pre-heating air-chamber beneath the hearth of the combustion-chamber and in communication with a source of cold-air supply and with a recuperating-chamber, a recuperating-chamber, flues leading from said recuperating-chamber to the combustion-chamber and each having a series of independent ports opening into said combustion-chamber, a series of fuel-burners opening into the combustion-chamber angularly with respect to the direction of discharge of the ports and operating in conjunction with said ports, a series of independent recuperating-tubes traversing the recuperating-chamber and alternated and staggered in the manner set forth, and draft-downtakes from the combustion-chamber which discharge through said tubes to the stack, substantially as set forth.

3. In a heating-furnace, the following elements in combination: a combustion-chamber, a recuperating-chamber, means for supplying air to the recuperating-chamber, flues leading from said chamber and each discharging through a series of valve-controlled ports into the combustion-chamber, valve-controlled fuel-burners likewise discharging into the combustion-chamber and operating in conjunction with said ports, a series of recuperating-tubes traversing the recuperating-chamber, alternated or staggered, as set forth, and discharging to the stack, and draft-downtakes leading from the combustion-chamber and opening into said tubes, substantially as set forth.

4. In a heating-furnace provided with a combustion-chamber, in combination, a recuperating-chamber embodying an air-inlet, a series of recuperating-tubes traversing said recuperating-chamber, staggered or alternated with respect to each other, non-circular in cross section, and disposed with their major transverse axes in substantially horizontal arrangement, a draft-downtake in communication, respectively, with the combustion-chamber and the recuperating-tubes, and a hot-air flue leading from the recuperating-chamber to the combustion-chamber, substantially as set forth.

482,364. APPARATUS FOR MAKING METAL TUBES. PETER KEIL, Jr., Philadelphia, Pa. Filed Feb. 3, 1891. Serial No. 380,102. (No model.)

Claim.—1. An apparatus for the manufacture of metallic tubes from a plurality of skelp, in which are combined the following elements: a double skelp-heating furnace embodying a central vertically extending skelp-heating chamber co-extensive with the length of the furnace structure, and also embodying two lateral combustion-chambers respectively in connection with the upper portion of said skelp-heating chamber, welding-rolls at the delivery end of said furnace, a mandrel-rod extending through the upper portion of said skelp-heating chamber and provided with a mandrel-head in suitable relation to the pass of the rolls and also with supports for sustaining an upper skelp, and skelp-carrying devices arranged within the lower portion of said skelp-heating chamber and adapted to support and carry a lower skelp, substantially as and for the purpose as set forth.



2. A double skelp-heating furnace embodying a central skelp-heating chamber, two lateral combustion chambers connecting with said skelp-heating chamber, and downtakes formed in partitions which form the inner walls of said combustion-chambers and the walls of the lower portion of said skelp-heating chamber, substantially as set forth.

3. In combination with a furnace embodying a central skelp-heating chamber and lateral combustion-chambers, a rolling-mill composed of welding-rolls located at the delivery end of the furnace in alignment with its skelp-heating chamber and provided with a mandrel head, and a mandrel-rod supporting said mandrel-head, extending completely through said skelp-heating chamber of the furnace and provided with skelp-supports, substantially as set forth.

4. A double skelp-heating furnace comprising two lateral combustion-chambers embodying suitable outlets for the products of combustion, and a skelp-heating chamber situated between and as to its respective sides in communication with said combustion-chambers, and as to its intermediate portion in communication with the atmosphere through a longitudinal top opening, substantially as set forth.

482,365. CROSSCUT-SAW. WILLIAM H. H. KEIHR, Rathdrum, Idaho, assignor of three-fourths to Frank O. Hill and Robert S. McCrea, same place. Filed June 18, 1891. Serial No. 396,789. (No model.)

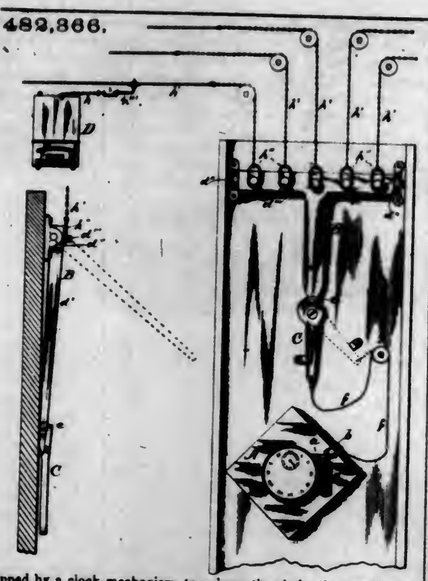
Claim.—As an improved article of manufacture, a saw-blade having cutting-teeth arranged in pairs and a drag-tooth between each pair of cutters, said drag-teeth being disposed in opposite directions from the longitudinal center of the blade and having but one cutting side and the reverse side rounded off or beveled, substantially as specified.

482,366. AUTOMATIC STOCK-FEEDER. WALTER P. KELLOGG, Syracuse, N. Y. Filed May 23, 1892. Serial No. 433,982. (No model.)

Claim.—The combination, with the T-lever provided with studs and journaled in bearings at the ends of its head, of a catch engaging the lower arm thereof and the weight connected to said catch and

482,366.

482,369.



supported on cross-bar b, the block h, attached to the tongue, curved bar e, pivoted to block h, and the rods f and g, connected at their outer ends to the levers $a\,a$ and at their inner ends to the ends of the curved bar e, substantially as described.

482,371. MATCH-SAFE. MARTIN R. LAND, Norfolk, Va. Filed Sept. 30, 1891. Serial No. 407,311. (No model.)

glycerine produced from the waste acids from the remaining part of the spent acids.

482,373. CLOTH-FOLDING MACHINE. SAMUEL T. LOCKWOOD and SAMUEL K. WHITE, Chicago, Ill. Filed Jan. 19, 1889. Serial No. 296,826. (No model.)

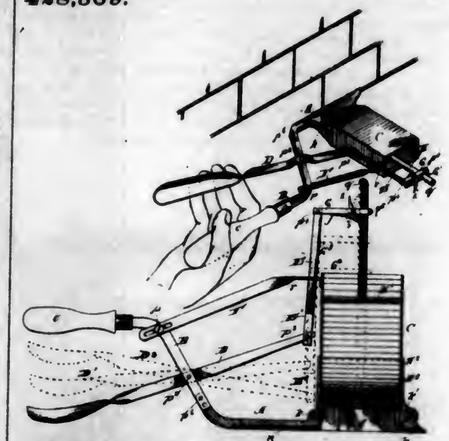
482,866.

tripped by a clock mechanism to release the chains detachably connected to the head of said lever, as set forth.

482,867. COMPOSITION OF MATTER FOR ARTIFICIAL STONE. JOSEPH R KEELING and CHARLES FUCHS, Jr., New York, N. Y., assignors to the Pyrolith Company, of New Jersey. Filed Dec. 21, 1891. Renewed July 20, 1892. Serial No. 440,639. (No specimens.)

Claim.—The herein-described composition of matter for the manufacture of artificial stone, which consists of a basic cement of chloride and oxide of magnesium, sand or analogous filling material, a solution of asphaltum, and a solution of albumen and caseine.

482,868. PORTABLE VESSEL. ARTHUR C. KIMBER, New York, N. Y. Filed Nov. 10, 1890. Serial No. 370,956. (No model.)

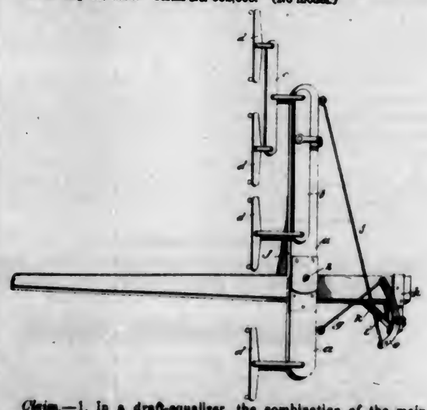


Claim.—1. A vessel having a frame composed of sections of slats or bars, each slat or bar pivoted at its end to the end of its contiguous slat or bar in a continuous loop or circle, so that when spread open such frame forms continuous sides, in combination with a rubber or other waterproof or impermeable cloth, substantially as set forth.

2. A frame for a bath-tub or other portable vessel, consisting of an even number or series of slats hinged together end to end and an additional slat connected to the free ends of the end slats of the series by hinges, the additional slat being equal in length to the aggregate thickness of the even number of slats, substantially as described.

3. A frame for a bath-tub or other portable vessel, consisting of an even number or series of slats hinged together end to end and an additional slat connected to the free end of the end slats of the series by hinges, the additional slat being equal in length to the aggregate thickness of the even number of slats, in combination with an impermeable cloth, substantially as described.

498,869. POINTING MECHANISM FOR MASONRY. HENRY B. KERR, Sioux City, Iowa. Filed May 4, 1892. Serial No. 431,700. (No model.)

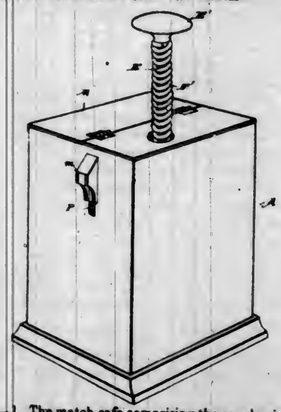


498,869.

Claim.—1. A pointing mechanism for masonry, consisting of a box-like structure secured to a bar which has a slot or groove upon its lower surface, said box having an opening communicating with said groove for the mortar to pass out, a curved arm or handle B, attached to said bar, and a plunger and plunger-rod operated within said box, said plunger-rod being notched, so as to engage a ratchet, and operated by means of a lever and lever-bars, which support said ratchet and act in conjunction with the curved arm or handle B, all as and for the purpose described.

2. The combination, in a pointing mechanism for masonry, of a box-like structure secured to a bar which has a slot or groove upon its lower surface, said box having an opening communicating with said groove for the mortar to pass out, a curved arm or handle B, attached to said bar, and a plunger and notched plunger-rod operating within said box, said plunger-rod engaging with a ratchet and operated by means of a lever and lever-bars, which support said ratchet and act in conjunction with the curved arm B, all substantially as and for the purpose described.

482,870. DRAFT-EQUALIZER. JOHN LAMUTH, Irvington, Iowa. Filed May 22, 1890. Serial No. 352,808. (No model.)



Claim.—1. In a draft-equalizer, the combination of the main tongue, the whiffletrees, the transverse levers *a a*, joined together at their contiguous or meeting ends and pivoted at that point upon the tongue, the rear curved bar *c*, pivotally supported upon the horizontal block *h*, attached to the tongue and projecting outward therefrom on one side thereof, it being firmly supported by means of a brace, a rod *f*, extending from one end of the curved bar *c* to the oppositely-located main lever *a*, and the rod *g*, extending from the other end of the bar *c* to the other of the levers *a*, said rods *f* and *g* being pivotally attached at their ends, all arranged to operate substantially as described.

2. The combination of the tongue, the levers *a a*, joined together and pivoted to the tongue by means of the pivot B, the whiffletrees *d*, the brace *j*, the cross-bar *b*, supported on one lever *a*, the cross-bar *e*,

supported on cross-bar *b*, the block *h*, attached to the tongue, curved bar *c*, pivoted to block *h*, and the rods *f* and *g*, connected at their outer ends to the levers *a a* and at their inner ends to the ends of the curved bar *c*, substantially as described.

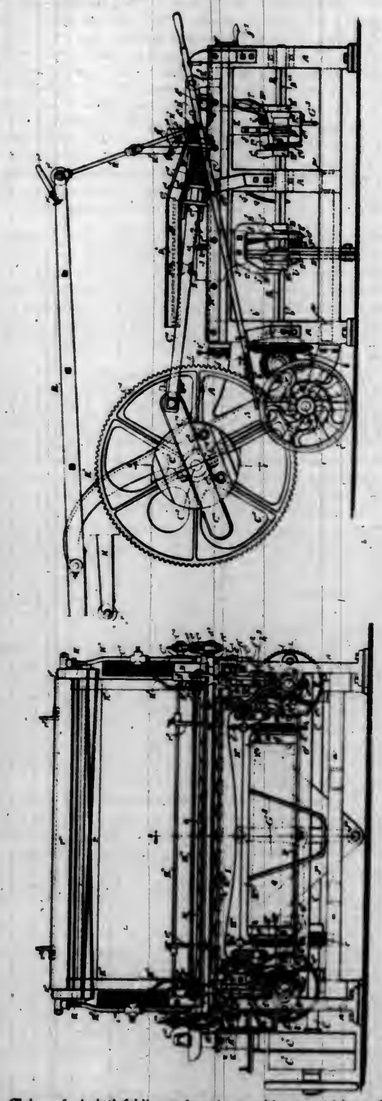
482,871. MATCH-SAFE. MARTIN R. LAND, Norfolk, Va. Filed Sept. 30, 1891. Serial No. 407,311. (No model.)

Claim.—1. The match-safe comprising the case having the match-receptacle at its upper portion, the rear wall of said chamber being inclined downwardly and inwardly to the bottom, the latter terminating a short distance from the front wall and leaving an interval or space thereat, the slide reciprocating vertically in said space, the horizontal trough designed to receive a single match at a time under the action of said slide, the follower reciprocating horizontally in said trough to eject the match therefrom, the operating knob or handle, and the retracting-springs, substantially as specified.

2. The match-safe comprising the case having the match-receptacle at its upper portion at one side thereof, a slide reciprocating vertically through one side portion of said receptacle and designed in its upward movement to carry a single match over the forward wall of said receptacle, the horizontal trough adapted to receive said match in a lengthwise position therein, the follower reciprocating horizontally in said trough and operated by the vertically-reciprocating slide to eject said match, means for igniting said match by its ejection, and the operating-knob and retracting-springs, substantially as specified.

3. The combination, with the case or receptacle having the match-receptacle therein, of the slide designed to reciprocate vertically through one side of said chamber, the operating-knob connected to said slide, the match-receiving trough, the slide or follower reciprocating therein and connected with the vertical slide in such a manner as to operate therewith, means for automatically igniting the match as it is ejected, and the retracting-springs, substantially as specified.

482,872. PROCESS OF RECOVERING NITRO-GLYCERINE FROM WASTE ACIDS. JAMES LAWRENCE, Paulsborough, N. J. Filed Apr. 13, 1892. Serial No. 429,049. (No specimens.)



Claim.—1. In the manufacture of nitro-glycerine, the improvement which consists in, first, nitration of the glycerine; second, separation of the nitro-glycerine formed from the waste acids; third, cooling the waste acids to a temperature below the freezing-point of nitro-glycerine and above the freezing-point of the acids.

2. In the manufacture of nitro-glycerine, the improvement which consist in, first, nitration of the glycerine; second, separation of the nitro-glycerine formed from the waste acids; third, cooling the waste acids to a temperature below the freezing-point of nitro-glycerine and above the freezing-point of the acids and agitating said acids during said cooling.

3. In the manufacture of nitro-glycerine, the improvement which consists in, first, nitration of the glycerine; second, separation of the nitro-glycerine formed from the waste acids; third, adding sulphuric acid to the waste acids and cooling the same to a temperature below the freezing-point of nitro-glycerine and above the freezing-point of the acids.

4. In the manufacture of nitro-glycerine, the improvement which consists in, first, nitration of the glycerine; second, separation of the nitro-glycerine formed from the waste acids; third, cooling the waste acids to a temperature below the freezing-point of nitro-glycerine and above the freezing-point of the acids and removing the nitro-glycerine produced from the waste acids from the remaining part of the spent acids.

482,873. CLOTH-FOLDING MACHINE. SAMUEL T. LOCKWOOD and SAMUEL K. WHITE, Chicago, Ill. Filed Jan. 19, 1889. Serial No. 296,826. (No model.)

Claim.—1. A cloth folding and cutting machine comprising a cloth-clamp for holding the folded edges of the cloth, cloth-cutting mechanism operating to sever the cloth transversely, and a reciprocating cloth-carrier operating to carry the folds of cloth alternately to the cloth-clamp and cutting mechanism, substantially as described.

2. A cloth folding and cutting machine comprising clamping-plates for holding the folded edges of the cloth, a cloth-cutting mechanism, and a reciprocating cloth-carrier consisting of a carrying-blade constructed to carry the cloth to and insert it between the clamping-plates and a folding-bar constructed to carry the cloth to the cutting mechanism, said cutting mechanism being constructed to sever the cloth along the fold held by the said folding-bar, substantially as described.

3. The combination of clamping-plates constructed to hold the

folded edge of the cloth, a reciprocating carrying-blade for carrying the cloth to the said clamp-plates, a reciprocating folding-bar provided with a knife-edge, a series of cutting-rollers acting upon the knife-edge to sever the cloth, and means for supporting and actuating said rollers, said folding-bar being constructed to carry the cloth to and into contact with the said rollers, substantially as described.

4. The combination of a reciprocating carrying-blade and two clamp-plates, one of which is movable toward and from the other and one of which is provided with notches or spaces, means for actuating the movable clamp-plate, a series of movable clamp-fingers acting upon the opposing clamp-plate through the said spaces or notches, and means for actuating said fingers, substantially as described.

5. A folding-machine comprising two clamp-plates constructed to hold the folded edge of the cloth, a carrying-blade, a folding-bar provided with a knife-edge and two creasing-plates, a series of bodily-movable grooved rollers acting in connection with said knife-edge, and means for supporting and actuating said rollers and creasing-plates to sever and crease the cloth, said folding-bar being constructed to carry the cloth to and into contact with the rollers, substantially as described.

6. The combination of two clamp-plates constructed to hold the folded edge of the cloth, a horizontally and vertically reciprocating carrying-blade for carrying the cloth to the clamp-plates, a horizontally-reciprocating folding-bar provided with a knife-edge, a plurality of horizontally-movable rollers acting against said knife-edge, and means for sustaining and actuating said rollers, said folding-bar being constructed to carry the cloth to and into contact with the rollers, substantially as described.

7. The combination, with the machine-frame, of a cloth-clamp constructed to hold the folded edge of the cloth, a cutting mechanism for severing the cloth transversely, a reciprocating cloth-carrier consisting of a carrying-blade operating to carry the cloth to and into the cloth-clamp and a folding-bar constructed to carry the cloth to the cutting-off mechanism, and separate frames severally supporting said cloth-clamp and cutting mechanism, said frames having sliding connection with the machine-frame, substantially as described.

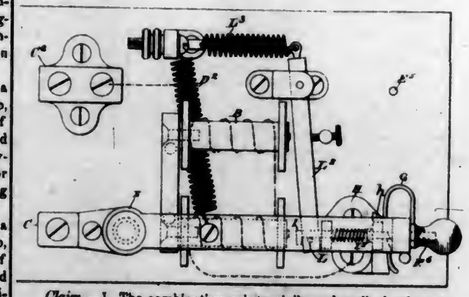
8. The combination, with the machine-frame, of a cloth-clamp, a reciprocating carrying-blade for carrying the cloth to the cloth-clamp, a reciprocating folding-bar provided with a knife edge, a plurality of rollers acting upon said knife-edge, said folding-bar being constructed to carry the cloth to and into contact with the rollers, a longitudinally-sliding bar sustaining and giving motion to the said rollers, means for actuating said sliding bar, and yielding blocks mounted in said sliding bar and immediately supporting the said rollers.

9. The combination, with the machine-frame, of a cloth-clamp, a reciprocating carrying-blade for carrying the cloth to the cloth-clamp, a reciprocating folding-bar provided with a knife-edge, a plurality of rollers acting upon said knife-edge, said folding-bar being constructed to carry the cloth to and into contact with the said rollers, a longitudinally-sliding bar sustaining said rollers, and means for actuating said bar, comprising a spring acting to throw said bar in one direction and a cam connected with said bar and acting to move the latter in the opposite direction, substantially as described.

10. The combination of a cloth-clamp for holding the folded edges of the cloth, cloth-cutting mechanism operating to sever the cloth transversely, a reciprocating cloth-carrier consisting of a carrying-blade constructed to carry the cloth to the cloth-clamp and a folding-bar constructed to carry the cloth to the cutting mechanism, and a second cloth-clamp located adjacent to the cutting mechanism and constructed to grip the cut-off edge of the cloth above the folding-bar, substantially as described.

11. The combination, with a cloth-clamp, of a reciprocating carrying-blade for carrying the cloth to the clamping device, a reciprocating folding-bar, a cutting mechanism comprising a knife-edge on the bar and a series of rollers acting against the knife-edge, said folding-bar being constructed to carry the cloth to the rollers, means for supporting and actuating said rollers, a stationary clamp-plate located above the rollers, a vertically-movable clamp-plate located in front of the rollers and acting upon said stationary plate, and means for actuating said clamp-plate, substantially as described.

12. The combination of a cloth-clamp for holding the folded edges of the cloth, cloth-cutting mechanism operating to sever the cloth transversely, a reciprocating cloth-carrier consisting of a carrying-blade acting to carry the cloth to and into the cloth-clamp and a folding-bar having a flat top surface and operating to carry the cloth to the cutting mechanism, a stationary clamp-plate located above the cutting mechanism, a series of spring-fingers acting upon the top surface of the said bar, a vertically-movable clamp-plate located in front of the cutting mechanism and acting against said clamp-plate, and means for actuating said movable clamp-plate, substantially as described.



13. The combination, with a cloth-clamp, of a carrying-blade, a folding-bar having a knife-edge operating to carry the cloth to said cloth-clamp, a series of rollers acting against said knife-edge, said folding-bar being constructed to carry the cloth to and against said rollers, means for sustaining and actuating said rollers, a stationary clamp-plate located above the rollers and folding bar, a vertically-movable clamp-plate located in front of the rollers, a pivotally-supported oscillating blade acting upon the cloth beneath the folding-bar to free the same from said folding-bar, and means for actuating said clamp-plate and oscillating blade, substantially as described.

14. The combination, with front and rear cloth-clamps and a reciprocating cloth-carrier, of a horizontally-arranged cloth-rack pivotally supported at one end and having its opposite or free end located over and movable toward and from the cloth-carrier and means for actuating said rack, substantially as described.

15. The combination of two clamp-plates constructed to hold the folded edges of the cloth, a carrying-blade, a folding-bar provided with a knife-edge and with two creasing-plates, a series of bodily-movable rollers having grooves at their ends, which grooves are formed by yielding disks attached to the ends of the rollers, and means for sustaining and actuating said rollers, substantially as described.

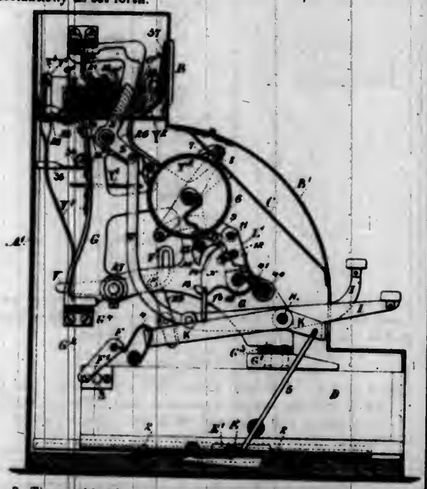
16. The combination of cloth-clamps arranged at different elevations at opposite ends of the machine, a folding-bar moving in a horizontal plane and adapted to carry the cloth to one of said cloth-clamps, and a carrying-blade constructed to carry the cloth to the other of said cloth clamps, having both a horizontal and vertical movement, means for giving a horizontal reciprocatory movement to said folding-bar, and means for giving a combined horizontal and vertical reciprocatory motion to the said carrying-blade, substantially as described.

482,374. AUTOMATIC ELECTRIC CUT-OUT. CYPRIEN O. MAILLOUX, New York, N. Y. Filed Sept. 9, 1890. Serial No. 364,422. (No model.)

Claim.—1. The combination, substantially as described, of a cut-out switch, a releasing detent or catch therefor, an electro-magnet whose armature is adapted to engage said catch after it has begun its movement under the influence of the magnet, and means for adjusting the relative position of the parts of the armature and detent which engage when the armature is moved forward, whereby the point at which the armature shall encounter the resistance of the catch in its forward movement may be determined or adjusted.

2. The combination, substantially as described, of the switch-lever, the sliding detent or catch I, the spring I^3, acting on the same, an armature-lever L^2, and a pin and connecting-hook between the same and the catch, as and for the purpose described.

3. The combination, substantially as described, of the switch-lever D, the contact-spring G, secured to the end thereof, a conducting-block secured to the base and having a vertical extension with which said spring makes contact, a sliding detent mounted on said extension and adapted to engage with the lever to hold it in circuit-closing position, and an electro-magnet and armature for actuating said detent, as and for the purpose described.



4. The combination, substantially as described, of a switch-lever D, mounted on a terminal block or binding-post of the apparatus, electro-magnet B, armature-lever L^2, sliding catch I, and the spring G carried by the switch-lever and adapted to make connection with a vertical contact-face upon a conducting-block secured to the base-plate of the apparatus, as and for the purpose described.

5. The combination, substantially as described, with the switch, of the catch or detent therefor, an armature adapted to engage the catch in its forward movement toward the pole of the magnet, and an adjustable stop I^3 upon the catch for determining its position with relation to the armature, as and for the purpose described.

482,375. CASH REGISTER AND INDICATOR. HERBERT R. MARSHALL, Brooklyn, N. Y., assignor to himself and William Burtis, New Rochelle, N. J. Filed Jan. 26, 1892. Serial No. 419,100. (No model.)

Claim.—1. The combination, in a registering apparatus, of flexible number-plates adapted to lie closely against one another and number-slides connected with the respective number-plates, key-levers and connections between the number-slides, and the key-levers for moving one number-slide and its flexible number-plate at a time into view, substantially as set forth.

2. The combination, with the flexible number-plates, of crank-plates with which the respective number-plates are connected, key-levers, and connections between the key-levers and the crank-plates for moving the same and bringing one flexible number-plate into view, substantially as set forth.

3. The combination, in a registering mechanism with the case and indicating-window, of three sets of flexible number-plates, two sets of number-slides connected with two of the sets of flexible number-plates, and mechanism for moving such number-slides toward and from the window to expose or retract the flexible numbers, and plates with which the third and intermediate set of flexible number-plates is connected, and mechanism for moving such plates and numbers up and down behind the window, substantially as specified.

4. The combination, with the key-levers, of a rocker-frame actuated by either key-lever, number plates and slides with which the number-plates are respectively connected, levers for moving the number-slides, each lever being provided with a tooth, a pawl-plate for engaging the tooth when the number-slide is projected, connections between the number-slide levers and the key-levers, and connections between the pawl-plate and the rocker-frame, whereby the pawl-plate is disconnected from the tooth when either key-lever is depressed, substantially as set forth.

5. The combination, with the flexible number-plates, of crank-plates with which the respective number-plates are connected, teeth or projections upon the crank-plates, a pawl-plate for engaging the tooth of the crank plate when the number-plate is projected into view, a rocker-frame acted upon by either key-lever, and a connection between the rocker-frame and the pawl-plate for liberating the crank-plates and number-plates upon the depression of either key, and springs for returning the number-plates to their normal positions, substantially as set forth.

6. The combination, with three sets of key-levers in a registering apparatus, of three sets of flexible number-plates, number-slides and actuating-levers for two of the sets of number-plates, crank-plates for the third set of number-plates, teeth and pawl-plates for holding the projected number-plates, a rocker-frame actuated by the key-levers and connections from such rocker-plate for withdrawing the pawl-plates, and springs for returning the flexible number-plates and their connected parts to their normal positions, substantially as set forth.

7. The combination, in a registering mechanism, of key-levers, a rocker-frame, number-plates arranged in three groups, a holding-tooth for each number-plate and connections from the respective key-levers for moving the number-plates, three pawl-plates for retaining the respective number-plates that are moved into view, the lever V and connection to the rocker-frame, the link V', connected to the lever V, and lever connections from the link to the respective pawl-plates for simultaneously disconnecting such pawl-plates from the respective teeth that hold the number-plates, substantially as set forth.

8. The combination, with the key-levers and indicating number-plates, of a computing apparatus having a ratchet-wheel, a pawl and lever for moving the same, arms connected with the pawl-lever, a supporting-shaft for such arms, sectors upon such shaft and connections from the same to the key-levers, there being ratchet-teeth and pawl-shifters upon each sector, and double-ended spring-pawls brought into action by the pawl-shifters and engaging the teeth upon the sectors to prevent such sectors or their connected levers being returned to their normal positions until after the respective key-levers have been fully depressed, substantially as set forth.

9. The combination, with the key-levers and the computing apparatus, of sectors and connections to the respective key-levers and rotary tumblers for engaging the projections upon the sectors to prevent more than one key in a section being depressed until the previously-depressed key in the same section has been restored to its normal position, substantially as set forth.

10. The combination, in a registering apparatus, with the key-levers and cash-drawer, of a holding-latch below the drawer, a rocker-frame beneath the key-levers, a push-pin from the same for unlatching the cash-drawer, a cross-shaft and pusher-levers thereon, and a spring for giving a parallel motion to the cash-drawer in opening the same, substantially as set forth.

11. The combination, in a registering apparatus having an inclosing case and indicating-window, of a blank behind such window, having ciphers and a period, flexible number-plates in groups, one group for each set of numbers, with the ends of the flexible number-plates lying close together adjacent to the blank behind the indicating-window, and mechanism, substantially as specified, for giving motion to the flexible number-plates and projecting them into view between the indicating-window and the stationary blank, substantially as set forth.

482,376. CARTRIDGE-HOLDER FOR MAGAZINE-GUNS. PAUL MAUSER, Oberndorf-on-the-Neckar, Germany, assignor to the Waffenfabrik Mauser, same place. Filed June 8, 1892. Serial No. 435,905. (No model.)

Claim.—1. A cartridge-holder consisting of a metallic frame having a back *a*, provided with a spring *f*, and having longitudinal flanges of convenient width for embracing a cartridge, which are folded or doubled on themselves and have shoulders for engaging the base of a cartridge to retain it in the holder, substantially as set forth.

2. A cartridge-holder consisting of a metallic frame having a back *a*, provided with a spring *f*, and having longitudinal flanges of convenient width having their edges *c* folded inwardly on themselves and constructed at their inner edges as shoulders for engaging the base of a cartridge to retain it in the holder, substantially as set forth.

3. A cartridge-holder consisting of a metallic frame having a back *a*, provided with a spring *f*, and having longitudinal flanges of convenient width having their edges *c* folded inwardly on themselves and their edges *d* bent laterally from their edges *c* and constructed to engage the base of a cartridge to retain it in the holder.

482,377. ARTIFICIAL TOOTH. JOHN W. MOFFITT, Philadelphia, Pa., assignor to Peter McGill, Lambertville, N. J. Filed Nov. 18, 1891. Serial No. 412,261. (No model.)

Claim.—1. The combination, with an artificial tooth provided with a transverse perforation and with a lateral groove or grooves extending rearwardly therefrom, of a wire extending through said perforation and projecting rearward of the tooth, the sides of the wire being engaged with said groove or grooves, substantially as described.

2. The described artificial tooth provided with the transverse perforation and with the groove extending rearwardly from the ends of said perforation, the latter and the groove being adapted to receive a wire, substantially as described.

482,378. AUTOMATIC BRAKE. THOMAS A. MCCANDLESS, Irving, Kans. Filed Apr. 9, 1892. Serial No. 428,594. (No model.)

Claim.—1. In a brake, the combination, with a running-gear, of a brake-bar provided at its ends with arms forming extensions of the brake-bar and hinged to the same at their inner ends and at their upper edges and adapted to swing upward, the springs secured to the upper face of the brake-bar and engaging the upper faces of the arms to force the latter downward, and the clips arranged beneath the arms and having rectangular portions to receive the same and provided at their front ends with upwardly-inclined guiding portions, substantially as described.

(6) O. G.—95

482,378.

482,380.

formation on its forward end, a car-coupling device formed on or fixed thereto, a vertical bore extended therethrough, and a horizontal bore intersecting it, an air-conducting pipe or hose in the lower end of the said vertical bore, a valve-stem in the upper end of the said vertical bore, a bore extending upwardly from the lower end of the said valve-stem and terminating at its side in alignment with the said horizontal bore, and means for automatically turning the said stem in the bore, so as to cut off or establish a continuity of air-conducting passages from the said horizontal bore when two mating draw-heads come together.

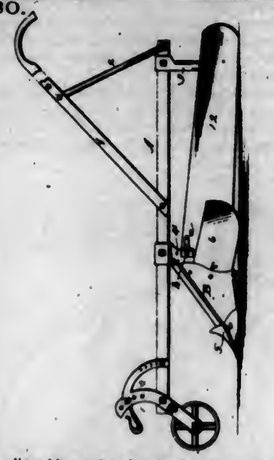
conducting pipe or hose inserted in the lower end of the said vertical bore, a valve-stem in the upper end of the said vertical bore, a bore extending upwardly from the lower end of the valve-stem and terminating at its side in alignment with the said horizontal bore, a spring-actuated pawl secured to the top of the said valve-stem, whereby its bore is normally retained out of alignment with said horizontal bore and which is adapted to engage parts of a mating draw-head and bring the said bores into alignment when brought into contact therewith, a concentrically-bored connecting-plate in the side face of the draw head, mounted therein in such a manner as to be capable of a limited lateral movement relative to the draw-head, and yielding pressure devices normally holding the same outwardly from the draw-head

482,878.

2. In a brake, the combination, with a running-gear having a longitudinally-movable tongue, and an arched plate 22, secured to the tongue and provided with a slot, of a vertical lever having a tongue-opening to receive the tongue and fulcrumed on the pivot of the latter and having its upper end arranged in the slot of said plate 22, a transverse bar provided with keepers, a brake-bar arranged in the keepers and having hinged arms carrying brake-shoes, brake-levers fulcrumed intermediate their ends and having their outer ends connected with the brake-bar, and a connecting-rod connected with the inner ends of the brake-levers and the lower end of the vertical lever, substantially as described.

482,879. FIRE-ALARM. JOHN C. F. MCGRIFF, Los Angeles, Cal. Filed Sept. 1, 1891. Serial No. 404,420. (No model.)

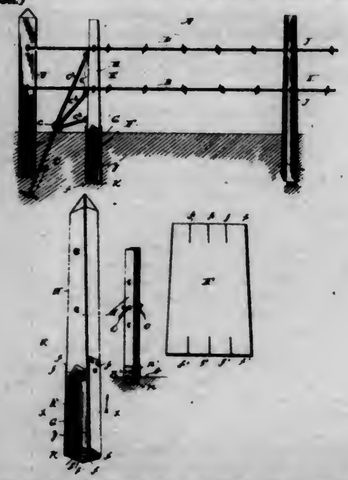
Claim.—1. In a fire-alarm, the combination, with a shell or casing containing an explosive, of a fuse and a fuse-protecting case inclosing the fuse and secured to the shell or casing and projecting outward therefrom, said fuse-protecting case being adapted to be broken by an undue rise in temperature.



2. In combination with the outer shell *a*, provided with the hole *b*, the inner shell provided with a socket *d*, coinciding with the opening *b* and with a fuse-opening L, a fuse B, projecting through the opening, and a fuse-case C, inclosing the projecting end of the fuse and secured within the socket, said fuse-case being adapted to be broken by an undue rise in temperature.

482,880. DOUBLE-MOLD-BOARD PLOW. CHARLES H. PARSH, Locke, N. Y. Filed Apr. 6, 1892. Serial No. 428,087. (No model.)

Claim.—1. In a hiller, the combination, with the runners and beam mounted thereon, of the plow-head and the point secured thereto, wings loosely secured to the plow-head, and mold-boards secured to the runner and adapted to have their rear ends adjusted vertically and laterally, as set forth.

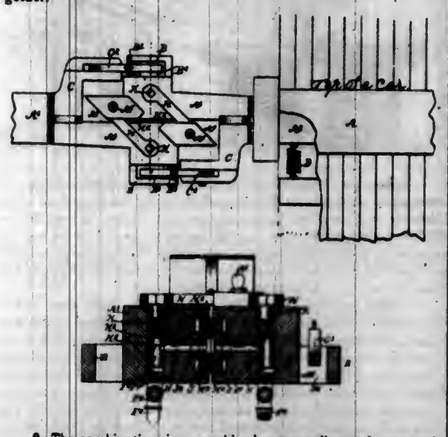


2. In a hiller, the combination, with the runners and the beam mounted thereon, of the plow-head, the point secured thereto, forward

482,880.

wings secured adjustably to the plow-head, and rear wings secured loosely to the forward knee of the runner and adapted to be adjusted at their rear ends laterally and vertically, as set forth.

482,381. COMBINED FENCE POST AND BRACE. PAUL PEARSON, Kearney, Mo., assignor of one-half to Zenas F. Milbourn, same place. Filed Aug. 15, 1890. Renewed Feb. 9, 1892. Serial No. 420,922. (No model.)



Claim.—1. In a fence-post, the combination of the post proper with the base portion consisting of a receptacle to receive ballast, said base portion being formed of a single piece of metal Z-shaped in cross-section, fastening devices formed thereon to secure the post proper thereto, and a bottom to close the lower end of the said receptacle, formed by upturned ends of the sides thereof, substantially as described.

2. In a fence-post, a post proper, a ballast-receptacle at the lower end thereof, formed of a single piece of metal, ears *f*, formed integral with said base-section for receiving the post proper thereto, ears *f'*, formed integral with the lower end of the lower section and bent at right angles to close said end, a series of brace-rods c^3, secured to the post, and an anchor D, provided at its upper end with a device for receiving and holding the brace-rods, substantially as described.

482,382. COMBINED AIR-BRAKE AND CAR-COUPLING. PERRAS PELTON, Persia, Iowa. Filed Apr. 26, 1892. Serial No. 430,905. (No model.)

Claim.—1. The combination, in a combined car-coupling and automatic air-brake hose-coupling, of a draw-bar having an enlarged

formation on its forward end, a car-coupling device formed on or fixed thereto, a vertical bore extended therethrough, and a horizontal bore intersecting it, an air-conducting pipe or hose in the lower end of the said vertical bore, a valve-stem in the upper end of the said vertical bore, a bore extending upwardly from the lower end of the said valve-stem and terminating at its side in alignment with the said horizontal bore, and means for automatically turning the said stem in the bore, so as to cut off or establish a continuity of air-conducting passages from the said horizontal bore when two mating draw-heads come together.

2. The combination, in a combined car-coupling and automatic air-brake hose-coupling, of a draw-bar having an enlarged formation on its forward end, a car-coupling device formed on or fixed thereto, a vertical bore extending therethrough, and a horizontal bore intersecting it and extended toward the face thereof which would contact with a like surface on a mating draw-head, an air-conducting pipe or hose inserted in the lower end of the said vertical bore, a valve-stem in the upper end of the said vertical bore, a bore extending upwardly from the lower end of the said valve-stem and terminating at its side in alignment with the said horizontal bore, and a spring-actuated pawl secured to the top of the said valve-stem, whereby its bore is normally retained out of alignment with the said horizontal bore and which is adapted to engage parts of a mating draw-head and bring the said bores into alignment when brought into contact therewith.

3. The combination, in a combined car-coupling and automatic air-brake hose-coupling, of a draw-bar having an enlarged formation on its forward end, a car-coupling device formed on or fixed thereto, a vertical bore extending therethrough, and a horizontal bore intersecting it and extending toward the side face of the draw-head, an air-conducting bore or pipe inserted in the lower end of the said vertical bore, a valve-stem in the upper end of the said vertical bore, a bore extending upwardly from the lower end of the valve-stem and terminating at its side in alignment with the said horizontal bore, means for automatically turning the said valve-stem in the bore, a concentrically-bored connecting-plate in the side face of the draw-head, mounted therein in such a manner as to be capable of a limited lateral movement relative to the draw head, and yielding pressure devices normally holding the same outwardly from the draw-heads.

4. The combination, in a combined car-coupling and automatic air-brake hose-coupling, of a draw-bar having an enlarged formation on the forward end, a car-coupling device formed on or fixed thereto, a vertical bore extending therethrough, and a horizontal bore intersecting it and extending toward the side face of the draw-head, an air-conducting hose or pipe inserted in the lower end of the said vertical bore, a valve-stem in the upper end of the said vertical bore, a bore extending upwardly from the lower end of the valve-stem and terminating at its side in alignment with the said horizontal bore, means for automatically turning the said valve-stem in the bore, a concentrically-bored connecting-plate in the side face of the draw-head, mounted therein in such a manner as to be capable of a limited lateral movement relative to the draw-head, and yielding pressure devices normally holding the same outwardly from the draw-heads, and yielding pressure devices normally tending to hold the draw-bar toward the side thereof on which the said connecting-plate is located.

5. The combination, in a combined car-coupling and automatic air-brake hose-coupling, of a draw-bar having an enlarged formation on its forward end, a car-coupling device formed on or fixed thereto, a vertical bore extending therethrough, and a horizontal bore intersecting it and extending toward the side face of the draw-head, an air-conducting pipe or hose inserted in the lower end of the said vertical bore, a valve-stem in the upper end of the said vertical bore, a bore extending upwardly from the lower end of the valve-stem and terminating at its side in alignment with the said horizontal bore, a spring-actuated pawl secured to the top of the said valve-stem, whereby its bore is normally retained out of alignment with said horizontal bore and which is adapted to engage parts of a mating draw-head and bring the said bores into alignment when brought into contact therewith, a concentrically-bored connecting-plate in the side face of the draw-head, mounted therein in such a manner as to be capable of a limited lateral movement relative to the draw-head, and yielding pressure devices normally holding the same outwardly from the draw-head.

6. The combination, in an air-brake hose-coupling, of a draw-bar having an enlarged head, a vertical bore in the said head, a horizontal bore intersecting it and extending toward its side, an air-conducting pipe or hose inserted in the lower end of the said vertical bore, a valve-stem inserted in the upper end of the said vertical bore, a bore extending upwardly from the lower end of the valve-stem and terminating in its side in alignment with the said horizontal bore, and means for turning the said stem so as to cut off or establish a continuity of air-conducting passages from the said hose to the side of the draw-head.

7. The combination, in an air-brake hose-coupling, of a draw-bar having an enlarged head, a vertical bore in the said head, a horizontal bore intersecting it and extending toward its side, an air-conducting pipe or hose inserted in the lower end of the said vertical bore, a valve-stem inserted in the upper end of the said vertical bore, a bore extending upwardly from the lower end of the valve-stem and terminating in its side in alignment with the said horizontal bore, and a spring-actuated pawl secured to the top of the said valve-stem and adapted to normally hold the said bores out of alignment with each other and to engage a portion of the mating draw-head and bring the said bores into alignment when brought in contact with a mating draw-head.

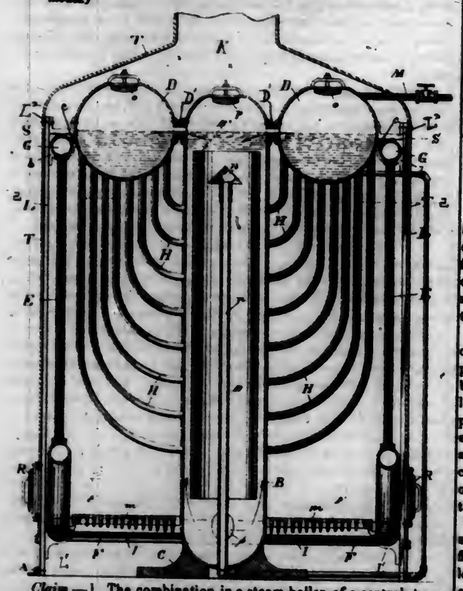
8. The combination, in an automatic air-brake hose-coupling, of a draw-head, an air-conducting pipe or hose inserted in a bore in the said draw-head, which extends to its side, a connection-plate secured to its side, having a concentric bore which communicates with the aforesaid bore, said plate being capable of limited lateral movement relative to the draw-head, and yielding pressure devices normally holding the said plate outwardly from the draw-head.

9. The combination, in an automatic air-brake coupling, of a draw-head, an air-conducting pipe or hose inserted in a bore in the said draw-head, which extends to its side, a connection-plate removably attached to its side and having a concentric bore which communicates with the aforesaid bore, said plates being capable of a limited lateral movement relative to the draw-head, a rubber cushion having a concentric opening placed between the said plate and draw-head, and yielding pressure devices applied to the draw-bar to normally hold it toward its side in which the said connection-plate is located.

10. A combined automatic car-coupling and automatic air-brake hose-coupling comprising a draw-bar, a draw-head divided vertically into two parts, a hook having an inclined forward surface, pivoted to the outer end of one of the ends of the draw-head, and a projection having a wall that extends at right angles to the draw-head, having an inclined forward surface on the other portion of the draw-head, an air-conducting pipe or hose inserted in the said draw-head, and the mechanism, substantially as shown and described, for automatically establishing a continuity of air-conducting passages to a portion thereof which contacts with a like surface on a mating draw-head.

11. A combined automatic car-coupling and automatic air-brake hose-coupling comprising a draw-bar having a draw-head, substantially as described, the coupling device secured therein, as shown, an inclined front surface on the draw-head, extending above the level of the draw-head, a vertical bore in the said draw-head, air conducting pipe or hose inserted therein, a valve-stem having the spring-actuated pawl adapted to engage the said inclined surface of the draw-head, substantially as shown and described, a connecting-plate secured to the side of the draw-head, as set forth, and the link-cavity and intersecting pin-bore in the forward end of the draw-head, substantially as shown and described, to operate in the manner set forth.

482,883. CLOTHES-PIN. WILLIAM L. PIKE, Groton, N. Y. Filed Apr. 23, 1892. Serial No. 430,332. (No model.)



Claim.—1. A clothes-pin constructed from a single piece of wire bent to form loops constituting angularly-diverging gripping-jaws and a spring-arm carrying a head normally extending substantially across the space between said jaws.

2. A clothes-pin constructed from a single piece of wire bent to

form loops constituting angularly-diverging gripping-jaws and a spring-arm carrying a head normally extending angularly upward and substantially across the space between said jaws.

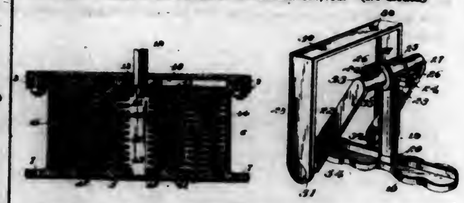
482,384. STEAM-BOILER. MICHAEL H. FLEMERTY, Baltimore, Md., assignor of fifty-one one-hundredths to Washington Bowie and Elijah J. Bond, same place. Filed Dec. 26, 1891. Serial No. 416,139. (No model.)

Claim.—1. The combination, in a steam-boiler, of a central steam and water chamber with two or more spheroids arranged around the upper end thereof and forming steam and water chambers and connected to said central chamber by steam and water passages, substantially as set forth.

2. The combination, in a steam-boiler, of a central steam and water chamber with two or more spheroids arranged around the upper end thereof and forming steam and water chambers and connected to said central chamber by steam and water passages and water connections between the said spheroids and the lower end of the said central chamber, substantially as set forth.

3. The combination, in a steam-boiler, of a central steam and water chamber, two or more spheroids connected thereto, a circular water-ring arranged around and outside said spheroids, with a base water-ring and pipes connecting the said water-rings and forming thereby a water-jacket for the furnace, substantially as set forth.

4. The combination, in a steam-boiler, of a central steam and water chamber, two or more spheroids connected thereto, a circular water-ring arranged around and outside said spheroids, a base water-ring arranged around the grate, pipes connecting said water-rings and forming thereby a water-jacket around the furnace, with pipes connecting said base water-ring and the lower end of the central chamber, substantially as set forth.



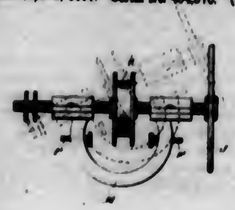
5. The combination, in a steam-boiler, of a central steam and water chamber with two or more spheroids arranged around the upper end thereof and connected to said central chamber and an open-ended cylinder arranged within the said central chamber for promoting the circulation, substantially as set forth.

6. The combination, in a steam-boiler, of a central steam and water chamber, two or more spheroids arranged around the upper end thereof and connected to said central chamber, with a feed-water heater arranged between the spheroids and pipes conveying the water from the feed-water heater to the central chamber, substantially as set forth.

7. The combination, in a steam-boiler, of a central steam and water chamber, two or more spheroids arranged around the upper end thereof and connected to said central chamber, with a series of feed water heaters arranged within the furnace between the spheroids and having fire-tubes therethrough and pipes connecting said feed-water heaters with the said central chamber, substantially as set forth.

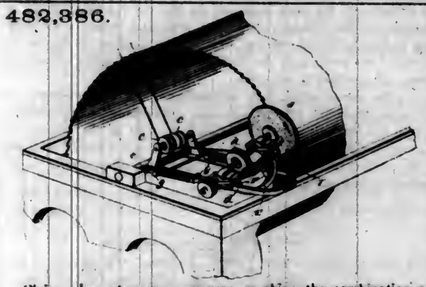
8. A steam-boiler having a vertical central steam and water chamber, a series of spheroids arranged around the upper end thereof and connected to said central chamber, in combination with a water-jacket around the furnace, consisting of vertical water-tubes connected to upper and lower water-rings, said rings being respectively in communication with the spheroids and the lower end of the said central chamber, substantially as set forth.

482,385. SPRING FOR VEHICLES. HARRY R. RAUDENBUSH, Vicksburg, Pa. Filed June 23, 1892. Serial No. 437,752. (No model.)



Claim.—1. The combination, with the vehicle-body and front and rear axles, of the series of intermediate spring-boxes, each of which consists of a metal box having an opening in its top, an intermediate follower-plate, a post extending through the opening in the top and connected to the follower-plate, and sets of double springs coiled in reverse directions and interposed between the follower-plate and bottom of the box, substantially as specified.

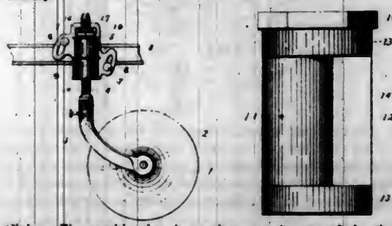
2. The combination, with the body and axle, of the metal box secured to the axle, the superimposed cover, the intermediate follower-plate, the under side of the follower-plate and the upper side of the bottom being provided with a series of vertically-opposite cylindrical lugs and encircling flanges, coiled springs located between the follower-plate and bottom of the box and encircling at their upper and lower ends said lugs, the series of external springs coiled at variance with and encircling the first-mentioned springs and having their ends encompassed by the annular flanges, the post passed through the top of the box and secured to the follower-plate, and connections between the post and body, substantially as specified.



3. The combination, with the vehicle-body and axle, of the intermediate box having corrugated sides, a bottom having circular flanges, opposite end lugs having perforations and cylindrical lugs located in and concentric with the flanges, perforated lugs at the upper edge of the box, a flanged cover fitting the box and provided with an opening-bolt connecting the cover with the upper lug and bolts connecting the lower lug with the axle, an intermediate centrally-perforated follower-plate the under side of which is provided with depending lugs encircled by flanges, sets of inner and outer reversely-coiled springs encircling the lugs of the plate and bottom and encompassed by the flanges of the same, the vertical post passing loosely through an opening in the cover and having its lower end reduced to form a tenon passing through the follower-plate and secured against withdrawal, and a shackle connecting the upper end of the post with the body, substantially as specified.

4. The combination, with the body having the facing-strips, the axles, the side-connecting bars, the transverse bars, and the depending U-shaped hangers secured to the body near the corners thereof and provided near their lower ends with transversely-opposite bearing-openings, of the series of boxes secured to the transverse bars and provided with perforated covers, follower-plates mounted in the boxes, coiled springs interposed between the bottoms of the boxes and the under sides of the follower-plates, posts extending through the openings in the cover and secured at their lower ends to the follower-plates, said posts having their upper ends terminating in transverse heads forming opposite perforated lugs and intermediate bearings, clips surmounting the heads, bolted thereto and completing the bearings, and inverted-U-shaped bails having their transverse cylindrical portions loosely journaled in the bearings and their lower extremities oppositely and laterally disposed to form journal-lugs for engaging with the openings of the inverted-U-shaped hangers, substantially as specified.

482,386. STAVE-SAW GUMMER. AARON SCANABORN, Parsley, W. Va. Filed Sept. 2, 1891. Serial No. 404,570. (No model.)



482,386.

Claim.—In a stave-saw-gumming machine, the combination of the base-plate B, the frame pivoted to the base-plate, the slotted yoke E, secured to the frame by thumb-screws, the slidable mandrel or arbor carrying the grinding-disk, journaled in the yoke, and the pulleys and belt, all arranged and operating substantially as described.

482,387. ATTACHMENT FOR PLOW-COLTERS. JOHN C. F. SCHNOOR, Moline, Ill. Filed June 28, 1892. Serial No. 438,270. (No model.)

Claim.—The combination, in a colter attachment, of the clamp-plate provided with the projection having a vertical circular opening therein, the sleeve adapted and constructed to fit in such opening, such sleeve provided with the vertical circular eccentric opening adapted and constructed to receive the colter-shank, the octagonal projection at the upper end of such sleeve, the horizontal opening at the upper end of said clamp-plate, the threaded eyebolt adapted and constructed to encircle said colter-shank and its end to pass through said horizontal opening, and the nut for securing such eyebolt and colter-shank in the desired position, substantially as described.

482,388. PAD FOR BED-PANS. KATHARINE A. SHAFFER, Harrisburg, Pa. Filed May 9, 1892. Serial No. 432,343. (No specimens.)

Claim.—1. An improved inflatable bed-pan pad provided with hooks which are adapted to engage with the rim about the orifice of a bed-pan, said pad being secured to the bed-pan and folded under the same, thus forming a cushion for the upper and lower surfaces of the pan, substantially as shown and described.

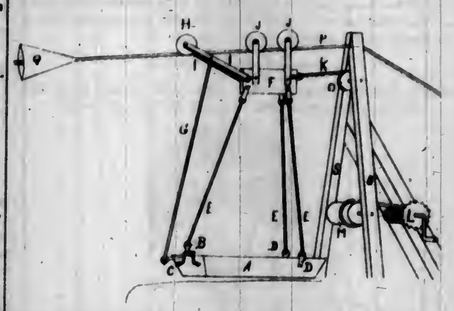
2. The combination, with the bed-pan, of an inflatable pad, one end being depressed by tacking and cut on the arc of a circle, and hooks secured to said curved end adapted to engage with the rim about the orifice of a bed-pan, substantially as shown and described.

3. As an improved article of manufacture, an inflatable bag composed of rubber, provided with hooks and an inflating-tube, and the rivets for securing the sides together, substantially as shown and described.

482,389. VENTILATOR. JOSEPH SKOOG and FRANK SKOOG, Milwaukee, Wis. Filed Feb. 1, 1892. Serial No. 420,671. (No model.)

Claim.—1. In a ventilator, the combination, with a plate or door provided with vent-holes, of a bell-shaped covering therefor provided with depending lugs bearing upon the plate, exit-openings for the foul air being formed between the non-contacting edge of the covering and the top of the plate, substantially as set forth.

2. In a ventilator, the combination of a plate or door having vent-holes therein, tubes fitted in said holes and extending above the plate or door, and a covering for each tube free from contact with the upper end thereof, provided with an interior depending annular flange surrounding the upper end of the tube, but free from contact therewith, substantially as set forth.

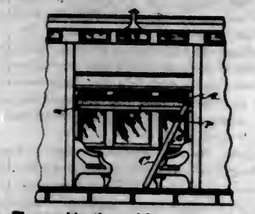


3. In a ventilator, the combination of a plate or door having vent-holes therein, tubes fitted in said vent-holes, each having an externally-tapering upper end and provided with a medial annular flange above the plate or door, said flange having a sigmoidal bend to form an outer annular convexity and an inner annular concavity or groove, and a top or covering for the tube extending over the same and free from contact therewith, provided with a depending internally-tapering flange surrounding the tube, forming an annular space, said flange terminating at a point above the groove, and the edge of the covering supported a slight distance above the top of the plate or door, substantially as set forth.

4. In a ventilator, the combination of a plate or door having a vent-hole therein, a tube inserted in said hole provided with a medial annular flange above the plate or door, said flange having a sigmoidal bend or flexure forming an under outer annular chamber and an inner upper concavity, and a top or cover supported above the tube, so as to leave a free air-space to the top thereof, substantially as set forth.

5. In a ventilator, the combination of a plate or door having vent-holes therein, tubes fitted in said vent-holes, a covering for each tube provided with exit-ports for the passage of the foul air to the external atmosphere, yokes beneath the plate or door provided with upwardly-extending arms, the ends thereof bearing against the under surface of said plate or door, and screws passing through the tubes and having their opposite ends engaging, respectively, the covers and yokes, substantially as set forth.

6. In a ventilator, the combination, with a plate or door having vent-holes therein, of tubes inserted in said vent-holes, each tube provided with a medial annular convex flange, said convexity forming an under annular chamber, and a top or cover supported above the tube, so as to leave a free air-space to the top thereof, substantially as set forth.



482,390. SELF-ACTING DUMPING APPARATUS. JAMES C. SMITH and CHARLES LARIMER, Topeka, Kans. Filed May 26, 1892. Serial No. 434,400. (No model.)

Claim.—1. In a dumping apparatus, a platform suspended under an elevated inclined cable, said platform having eye-joints on each side near one end and a loop hinged in the middle of the other end, in combination with a hook engaging said loop, a trolley on said inclined cable, two ropes connecting one end of the trolley with the eye-joints on the platform and secured therein, a rope connecting the other end of the trolley with the stem of the hook, a pulley on the inclined cable connected to the trolley by a pair of lever-arms pivoted to said trolley, a rope extending from said lever-arms to one end of the hook, a reverse incline rigidly secured to the inclined cable at place of dump, and suitable power connected by rope to the trolley to return the platform to its place after dumping, all substantially as described.

2. In a dumping apparatus, the receptacle A, in combination with the lever-lock attachment B, loop C, eye-joints D D, wire ropes E E E, trolley F, wire rope G, pulley H, pair of lever-arms I I, wire rope K, windlass L, drum M, pulley O, elevated inclined wire cable P, reverse incline Q, posts R R, and posts S S, all substantially as described.

482,391. FOLDING STEP FOR CAR-BERTHS. HARRY C. STANLEY, New York, N. Y. Filed Nov. 21, 1891. Serial No. 412,640. (No model.)

Claim.—1. The combination, with a car or state-room berth, of a ladder pivoted by one end to rock into a plane parallel with the rails of the berth and adapted to fold toward the berth's front rail when elevated, substantially as described.

2. The combination, with a berth-frame, of a folding ladder secured by its upper end to the upper end of the berth and means to elevate the ladder and retain it parallel with the front rail of said berth-frame, substantially as described.

3. The combination, with a berth-frame, of a ladder composed of two channeled side bars and jointed step-pieces adapted to lie in the channels of the bars and a device which elevates and normally retains the ladder in a plane parallel with the front rail of the berth-frame, substantially as described.

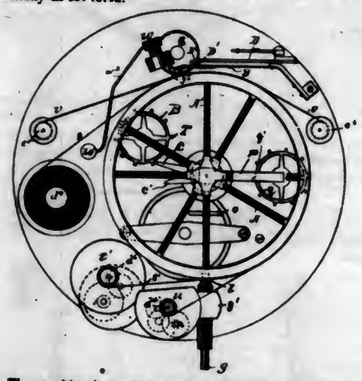
4. The combination, with a berth-frame having its front rail slotted, of a folding ladder which incloses its steps when folded and is loosely held in connection with the frame near one end and adapted to occupy the slot of the frame-rail when in a folded condition, substantially as described.

5. The combination, with a rectangular berth-frame, a slide-bar loosely secured on the top bar of the frame, and a torsional spring thereon, of a folding ladder having its top cross-bar rule-jointed to the end of the slide-bar and a side bar thereof engaged by one end of the torsion-spring, substantially as described.

6. The combination, with a rectangular berth-frame having its front cross-bar longitudinally and laterally slotted, a slide-bar loosely secured on the inner side of the top cross-piece of the berth-frame, so as to be adapted to slide longitudinally, an extension-piece rule-jointed on one end of the slide-bar, a torsion-spring on said bar, and a guide-bar loosely engaged by one end of the torsion-spring, of a ladder comprising two channeled side bars and a series of step-pieces jointed at their ends within the channels of the side bars, the extension-piece of the slide-bar being joined at one end to the outer side bar of the ladder and the inner side bar thereof connected with the remaining end of the torsion-spring, substantially as described.

482,392. CUSHION FELLY AND TIRE. CHARLES STEIN, Meadville, Pa. Filed Dec. 2, 1891. Serial No. 413,795. (No model.)

Claim.—1. The combination, with the felly having side sockets and having a central bent portion shaped to fit against the main part thereof, of a tire adapted to fit in the sockets of the fellies, substantially as described.



2. The combination, with the felly having side sockets and the central bend, the middle portion of the bend bearing against the body portion of the felly, of the hollow tire having a concaved inner portion and having shoulders to fit in the sockets of the felly, substantially as described.

3. The combination, with the spring-acting felly having retaining-sockets, of the hollow tire adapted to be seated in the sockets, the tire having a concave inner side to give it a double cushion action, substantially as described.

482,393. SPEED AND WHISTLE RECORDER FOR LOCOMOTIVE-ENGINES. BENJAMIN F. STOCKTON, South Bend, Ind. Filed Aug. 17, 1891. Serial No. 402,894. (No model.)

Claim.—1. The combination, with a clock-train and two wheels, one actuated by the clock-train and the other by the travel of the locomotive, of two ribbons, one passing over each wheel, a marking-point resting over both ribbons, and a device actuated at regular intervals by the clock-train for forcing the marking-point toward the ribbon, substantially as set forth.

2. The combination, with a clock-train and two ribbons, one moved longitudinally by the clock-train and suitable feeding mechanism and the other by devices actuated by an axle of the locomotive, of a marking-point resting over both ribbons and a device actuated by the clock-train for forcing said marking-point toward the ribbons, substantially as set forth.

3. The combination, with a clock-train and two wheels, one actuated by the clock-train and the other by the travel of the locomotive, of two ribbons, one passing over each wheel, a marking-point adapted to make an impression on both ribbons, and a device connecting such marking-point and the whistle-actuating devices, substantially as set forth.

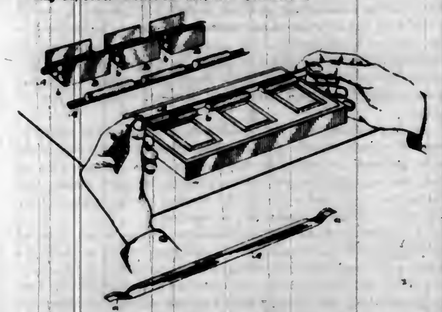
4. The combination, with a clock-train and two ribbons, one actuated by the clock-train and the other by devices connecting it with a car-axle, of a device actuated by the whistle-operating devices for forcing the marking-point toward the ribbons and making impressions thereon, substantially as set forth.

5. The combination, with a wheel having characters on its periphery, devices for actuating said wheel by the travel of the locomotive, a second wheel having characters on its periphery, and a clock-train for actuating said latter wheel, of a ribbon passing over each wheel and a marking-point adapted to strike the ribbons intermittingly and impress thereon the characters immediately below the marking-point, substantially as set forth.

6. The combination, with a wheel actuated by the travel of the locomotive, a time-train, and a wheel actuated by the time-train, both wheels having characters on their peripheries, and ribbons resting on said wheels and adapted to move therewith, of a roller for holding a portion of one ribbon continuously in contact with the periphery of its wheel and an intermittingly-actuated marking-point adapted to force both ribbons into contact with their respective wheels, substantially as set forth.

7. The combination, with a clock-train and two ribbons, one actuated by the travel of the locomotive and the other by the clock-train, of devices for marking the distance traveled on one ribbon and devices for marking intervals of time on both ribbons.

8. The combination, with a clock-train and two wheels, one actuated by the travel of the locomotive and provided with characters, each character representing a mile or fraction of a mile, and the second wheel actuated by the clock-train and provided with characters each representing a fraction of an hour, of a ribbon for each wheel, and means for impressing on one ribbon the characters representing a mile or fraction thereof, and devices for making impressions on both ribbons at regular intervals of time, substantially as set forth.



9. The combination, with a clock-train, two wheels, one actuated by the travel of the locomotive and the other by the clock-train, and a ribbon passing over each wheel, of devices for making impressions on both ribbons at regular intervals of time and devices for making impressions on both ribbons every time the whistle is opened and closed, substantially as set forth.

10. The combination, with a clock-train and two independent ribbons, one moved by the travel of the locomotive and the other by the clock train, of devices for marking on one ribbon characters representing the miles and fractions of a mile traveled and devices for marking characters on both ribbons at regular intervals of time, substantially as set forth.

11. The combination, with a clock-train and two independent ribbons, one actuated by the travel of the locomotive and the other by the clock-train, of devices for marking on one ribbon characters representing miles and fractions of miles traveled and devices for imprinting characters on both ribbons, each of the latter characters representing a fraction of an hour.

12. The combination, with a clock-train and two ribbons free to move at unequal speeds, one ribbon actuated by the travel of the locomotive and the other by the clock-train, of means for imprinting on one ribbon characters each representing the fraction of a mile, devices actuated by the clock-work for imprinting on both ribbons characters each representing a fraction of an hour, and a device connected to the whistle blowing mechanism and adapted to make impressions on both ribbons every time the whistle is opened and closed, substantially as set forth.

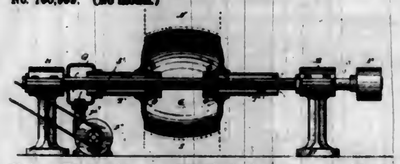
482,394. CORE-SETTER. JAMES D. STORIE, Oshawa, Canada. Filed July 16, 1891. Serial No. 399,968. (No model.)

Claim.—1. The combination, in a core-setter, of a bin or bins constructed to contain two or more series of cores in alignment and an elongated receptacle adapted for insertion in said bin or bins to receive a core from each series, substantially as described.

2. The herein-described method of molding, consisting in arranging two or more series of cores in alignment and at distances apart corresponding to the distance between the respective core-prints they are intended to fill and moving a core from each series at one operation and depositing these cores in the core-prints, the relative positions of the cores being maintained throughout the operation, substantially as described.

482,395. BURR AND SHIVE EXTRACTOR FOR CARDING-MACHINES. WILLIAM SULLIVAN, Cherry Valley, Mass. Filed Feb. 23, 1892. Serial No. 423,407. (No model.)

Brief.—The burrs are removed by a comb having a longitudinal, vertical, and a lateral adjustment.



Claim.—In a carding-machine, the combination, with a frame, of two brackets secured to the inner side thereof underneath the licker-in or tumbler roll, each bracket consisting of two wide flat arms arranged at right angles to each other, one of which arms forms the base of the bracket and said arms being each provided with a slot and occupying a vertical plane when secured to the frame, the slot in the base being longitudinal, whereby the bracket may be adjusted horizontally relatively to the roll, and the slot in the other arm being transverse or vertical, and one arm of each of said brackets projecting toward the corresponding arm of the opposite bracket, and a bar secured to the projecting portions of said brackets, having a comb upon its upper edge and provided with a longitudinal slot at each end, whereby said bar when secured to the brackets occupies a vertical position and is adjustable longitudinally and vertically thereon, substantially as set forth.

482,396. ART OF MANUFACTURING SHEET-IRON. BENJAMIN TALBOT, Chattanooga, Tenn. Filed Mar. 26, 1892. Serial No. 426,497. (No specimens.)

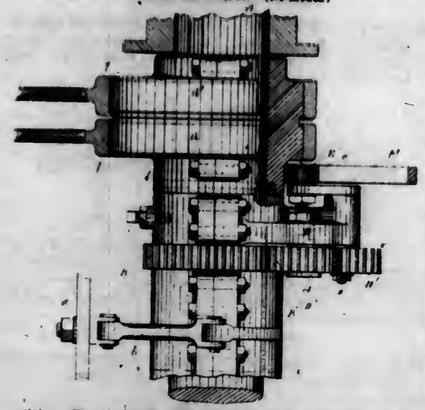
Claim.—1. That improvement in the art of manufacturing continuous sheets of metal which consists in pouring molten cast-iron into the space between two rolls revolving toward each other and solidifying the iron by their cooling action and subsequently decarburizing the continuous sheet thus produced.

2. That improvement in the art of manufacturing decarburized sheets of metal which consists in pouring pure molten carbide of iron into the space between two rolls revolving toward each other and solidifying the iron by their cooling action and subsequently decarburizing the sheets of metal thus produced.

482,397. VENTILATING-ARMATURE FOR DYNAMO-ELECTRIC MACHINES. ELIHU THOMSON, Lynn, Mass., assignor to the Thomson-Houston Electric Company, of Connecticut. Filed Apr. 2, 1885. Serial No. 160,998. (No model.)

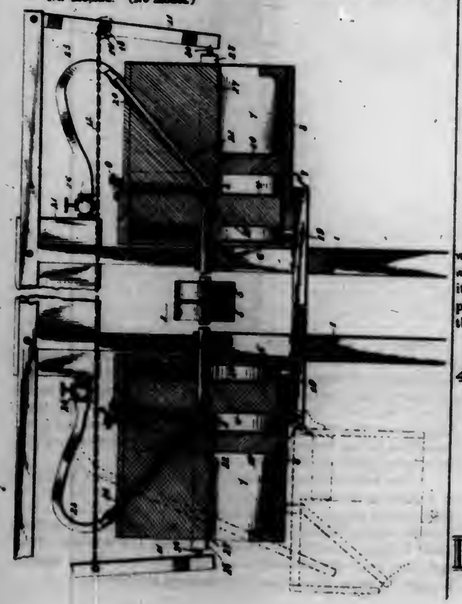
Claim.—The combination, with the hollow armature, of the tubular extensions T T', encircling the armature-shaft at opposite ends of the armature, a box or casing Q in which the end of one extension revolves, a pipe P', connected with said box, and a blower F, as and for the purpose described.

482,398. WAGON-BODY. GEORGE F. THOMPSON, Minneapolis, Minn. Filed Nov. 7, 1891. Serial No. 411,143. (No model.)



Claim.—1. The combination, in a wagon-body, of the sill and a panel, with a bolt secured in said sill and having its head standing slightly above the same, the metal post having the slotted base adapted to be forced into engagement with said bolt, said post arranged on the inside of said panel, the inwardly-extending leg or foot of said post, means for securing the same upon the sill, the side legs of said post, and screws passing through said legs into the panel to secure the same, substantially as described.

2. The combination, in a wagon-body, of the sills and sides thereof, with the hollow metal posts, said posts provided with the feet 14, adapted to be screwed to the sills, and with the internal shoulders and the bolts passing through the sill beneath each post and having their heads engaging the internal shoulders thereof, and side lugs 12 on each post, the same provided with screw-holes and screws passing through the same into the panel, substantially as described.



3. The combination, with the sill 2 and the panel 4, of the rib 5, the hollow metal post 7, provided with the shoulder 8 to engage the under side of the rib 5 and with the lug 10 to engage the inner face of said rib 5, a bolt passing through the panel and said rib and secured by a nut engaging the inside face of the lug 10, a shoulder 19, having a slot 20, provided in the base of the post, a bolt 16, extending down through the sill, its upper end engaging said shoulder 19, a nut on the lower end of the bolt for securing the same, and side lugs 12 on the post, through which screws are inserted into the panel to secure said panel, substantially as described

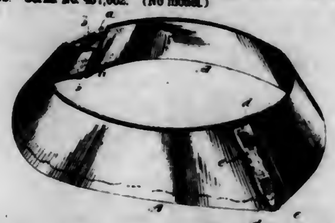
482,399. VALVE-GEAR. CARL R. TIDBLAD, Jamaica Plain, Mass. Filed Jan. 6, 1892. Serial No. 417,109. (No model.)

Claim.—The improved valve-gear as described, consisting, in combination with a rotating shaft and a stationary gear arranged on said shaft, of an arm secured to the latter and having a pinion meshing in the stationary gear, and a crank connected to said pinion and adapted to actuate an arm loosely journaled on the rotary shaft and connected to one or more eccentrics, substantially as and for the purpose set forth.

482,400. GRINDER. JOSEPH R. TRAWICK, Spear, N. C., assignor of three-fourths to Henry R. Jones and Thomas R. Vance, same place, and George H. Zimmerman, Cranberry, N. C. Filed Feb. 29, 1892. Serial No. 423,222. (No model.)

Claim.—1. In a grinding-mill, the combination of a hopper composed of a cylindrical stationary section provided with a discharge-opening and a hinged section, a shaft extending within the stationary section, a grinding-disk carried by the shaft and fitting snugly within the stationary section and having its periphery arranged close to the section, said grinding-disk being arranged between the discharge-opening and the hinged section, a water-supply pipe and a plunger arranged in the hinged section, substantially as described.

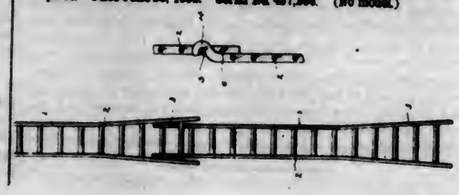
2. In a grinding-mill, the combination of a hopper having a stationary section provided with a discharge-opening and having a hinged section, the shaft, a grinding disk carried by the shaft and provided with a central recess, an inclined water-pipe mounted in the hinged section and having its inner end arranged in the recess of the grinding-disk, and a plunger arranged in the hinged section, substantially as described.



3. In a grinding-mill, the combination of a hopper composed of a stationary section provided with a discharge-opening, and a hinged section having a depending partition, a shaft, a grinding-disk carried by the shaft and arranged in the stationary section, an inclined water-pipe mounted on the partition and arranged to direct water upon the grinding-disk, and a plunger arranged in the hinged section and provided in its head with an opening to receive the partition and having bars arranged on opposite sides of the partition, substantially as described.

4. In a grinding-mill, the combination of a frame, the oppositely-disposed hoppers, a shaft, grinding-disks arranged on the ends of the shafts, plungers mounted in the hoppers, the levers fulcrumed on the frame and engaging the plungers to advance the same, a chain connecting the levers, and a windlass for winding up the chain and advancing the plungers, substantially as described.

5. In a grinding-mill, the combination of a frame, a tank mounted on the frame, a hopper composed of a stationary section and a hinged section, a grinding-disk mounted in the stationary section, a water-pipe mounted on the hinged section and arranged to discharge water from the grinding-disk and provided with a flexible section extending from the hopper to the tank and permitting the stationary section to be swung downward, substantially as described.

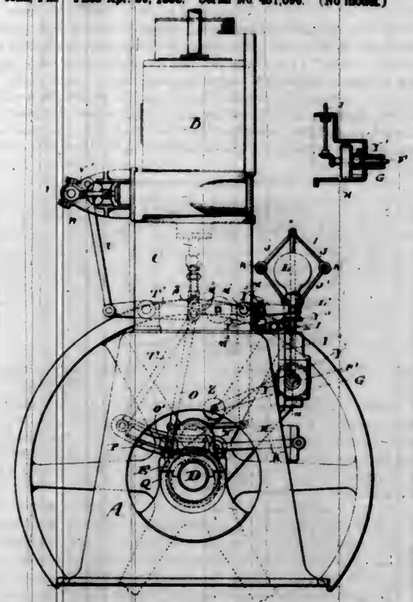


6. In a grinding-mill, the combination of a frame, hoppers mounted on opposite sides of the frame, a shaft, grinding-disks mounted on the ends of the shaft and arranged within the hoppers, plungers mounted in the hoppers, levers fulcrumed on the frame and engaging the plungers, a chain connecting the levers, and a windlass mounted on one of the levers and comprising a shaft, ratchet-wheels, and the detachable operating-levers engaging the ratchet-wheels and having adjustable weights, substantially as described.

482,401. BELT. JOSEPH TYNAN, Cohoes, N. Y. Filed June 22, 1892. Serial No. 437,602. (No model.)

Claim.—As an improved article of manufacture, a belt for the waist formed of a single piece of material having a downward and outward inclination to conform to the shape of the body at the waist, with its ends provided with securing means, a vertically-disposed stiffening-piece at the rear of the belt, and a similarly-disposed piece secured to the belt over said stiffening-piece, substantially as shown and described.

482,402. TOY EXTENSION-LADDER. RICHARD A. BOOTH, Bridgeport, Conn., assignor to the Ives, Blakeslee & Williams Company, same place. Filed June 20, 1892. Serial No. 437,366. (No model.)



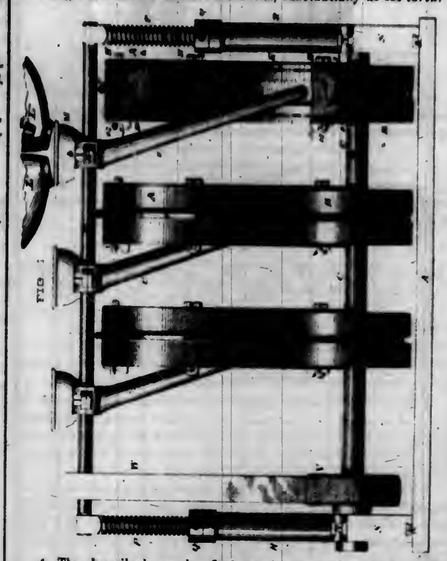
Claim.—A toy fire-ladder section consisting of side pieces and rounds, the lower ends of the side pieces inclining outward and the lower rounds being longest and the upper ends of the side pieces being curved forward and then recurved backward to form hook-shaped connecting devices having sockets on the inner sides of the side pieces to receive a round of another section of the ladder, and said sockets being deep enough so that when one round is engaged the round next below it will lie upon the outer side of said side pieces below the curves, substantially as shown and described.

482,403. INSECTICIDE. JOSEPH J. CARTER, Alvin, assignor to A. C. Hill and W. W. Maxwell, Travis County, Tex. Filed June 13, 1892. Serial No. 436,550. (No specimens.)

Claim.—The herein-described compound for the purpose described, consisting of sodium chloride, slaked lime, flour of sulphur, and bicarbonate of soda, substantially as specified.

482,404. SAFETY ATTACHMENT FOR ENGINE-GOVERNORS. FRANCIS W. DEAN, Cambridge, Mass., assignor to James H. Gamble, Daytona, Fla. Filed Apr. 20, 1892. Serial No. 431,096. (No model.)

Claim.—1. In combination with a steam-engine having mechanism for actuating its admission-valve, a governor arranged to act upon said mechanism to vary the throw of the valve, a belt operated by a rotating part of the engine and arranged to operate the governor, and a lever Y, arranged to act on the governor mechanism to diminish the throw of the valve, said lever being normally supported out of operation by the belt aforesaid and arranged, as described, to act on the governor mechanism only in case the belt breaks.



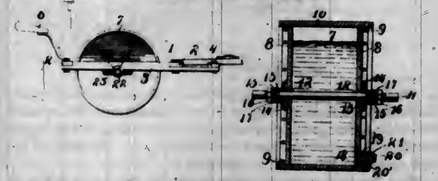
2. In combination with a steam-engine having mechanism for actuating its admission-valve, a governor arranged to act on said mechanism to vary the throw of the valve, a belt driven by a rotating part of the engine and arranged to drive the governor, a lever Y, pivotally supported at one end and supported on the belt at its other end, a lever M, forming part of the connection from the governor to the valve-actuating mechanism, and a lifter Y, arranged below said lever M and connected to lever Y, as described, and so as to raise lifting-lever M when the belt-supported end of lever Y falls.

482,405. APPARATUS FOR CASTING CYLINDRICAL BODIES. WILLIAM C. FARNUM, Chicago, Ill. Filed Feb. 9, 1888. Serial No. 263,436. (No model.)

Claim.—1. The combination of the annular flask inclosing annular cover-plates and inclosed annular mold, with space between said mold and flask, and yielding links and keys for uniting said side plate, mold, and flask and binding the parts of the combination together, substantially as specified.

2. The combination, with the revolving annular flask and inclosed mold, of a tubular runner having a funnel-shaped top attached to a removable bar supported by suitable standards, substantially as specified.

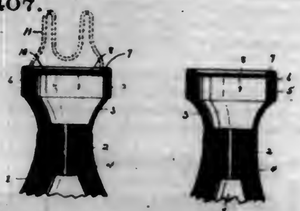
3. The combination, with a gang of revolving molds, of a corresponding gang of runners, each being attached by an adjusting-clamp to a common movable bar, and standards for supporting the same, said bar being removable from said standards, substantially as set forth.



4. The described annular flask, having circumferential guiding groove or rib and carrying a concentric annular mold, in combination with a single pair of supporting-rollers, each ribbed or grooved to cooperate with the corresponding devices on the flask, by the revolution of one or both of which the flask is rotated independently of the other driving connections, substantially as described, and for the purposes set forth.

5. The combination, with a rotating annular flask carrying a mold, of two supporting-rolls, one or both of which may be drivers, and a suitable device connected with the bearings of said rolls, whereby they may be distended or brought together to accommodate flasks of different diameters, substantially as specified.

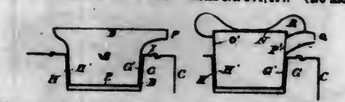
6. A gang of runners mounted on a single horizontal bar and vertically-adjustable supports for carrying said bar, in combination with a like gang of revolving molds and flasks mounted on a corresponding series of supporting and driving rolls, substantially in the manner described, and for the purposes set forth.



482,406. LAND-ROLLER. EDWARD GRIESDORFER, Pittsfield, Ill. Filed Feb. 15, 1892. Serial No. 421,589. (No model.)

Claim.—As an improvement in land-rollers, the herein-described roller, comprising a hollow cylindrical drum closed at its ends by heads having central apertures, flanged collars surrounding said apertures, a shaft passing through the latter and provided near its free or bearing ends with screw-threads, binding-nuts meshing with said threads, and a packing interposed between the flanged collars and the nuts, substantially as and for the purpose set forth.

482,407. CONVERTIBLE ATOMIZER AND SPRAYER. JOHN E. MAGEE, Toledo, Ohio. Filed Jan. 27, 1892. Serial No. 419,396. (No model.)



482,407.

Claim.—1. In combination, a compressible bulb, a top portion secured thereon having a plurality of foraminous diaphragms, and an intermediate removable fabric packing.

2. In a convertible atomizer and sprayer, a compressible bulb, a top portion secured thereon having a cup-shaped portion, and a flanged ring upon the same, in combination with an upper and lower foraminous diaphragm and an intermediate removable fabric packing, and a douche removably secured within the flange of the ring.

482,408. FAUCET AND BUNG. RIVERIUS MARSH, New Brunswick, N. J. Filed Nov. 14, 1890. Serial No. 371,417. (No model.)

Claim.—1. A faucet composed of a removable tapering shell or plug of sheet metal, with a spouted top and a solid bottom and an outer tapering and closely-fitting shell, also of sheet metal, attached to the can to receive the removable plug, both shells having discharge-orifices and vent-holes, substantially as herein set forth.

2. A faucet composed of a fixed outside shell and a rotatable inside shell, in combination with a horizontal shell upon the rotatable shell and a hollow rotatable plug or shell within the latter, each shell aforesaid being suitably provided with venting or discharge orifices, all as set forth.

3. A faucet having a rotatable inside shell of sheet metal provided with discharge-orifices and vent-holes, in combination with and closely fitting into a corresponding and spouted outside shell, also of sheet metal, with coinciding orifices and holes, substantially as set forth.

4. A faucet having a removable and rotatable sheet-metal plug with a closed bottom, in combination with a corresponding outer shell having its lower end cut at an incline, and a projecting wire in the plug engaging beneath the incline of the outer shell for holding the plug in place, substantially as herein set forth.

5. A faucet composed of an outer conical shell of sheet metal provided with venting and discharge orifices and a conical rotatable shell closely fitting the outer conical shell and provided with corresponding venting and discharge orifices, substantially as set forth.

482,409. PENCIL-CLASP. ERNEST W. MILDRUM, Berlin, assignor of one-half to William Honlen, Hartford, Conn. Filed Feb. 13, 1892. Serial No. 421,454. (No model.)

Claim.—1. A clasp consisting of three or more members bent into substantially the form of a figure 8, the alternate members crossing each other at the point corresponding to the crossing in that figure, whereby one of the openings is contracted by the expansion of the other opening, substantially as described.

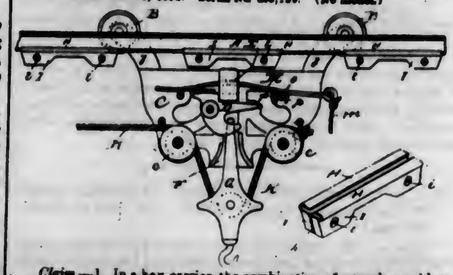
2. A pencil-clasp having substantially the form of a figure 8, adapted to encircle and interlace a pencil and a compass-leg in its respective openings corresponding to those in that figure, whereby the clasp is tightened upon both the pencil and the compass-leg when one of them is tapering and is forced into its seat in the clasp, all substantially as described.

482,410. MANGLE. CARL A. OYBROE, Chicago, Ill. Filed Dec. 23, 1891. Serial No. 415,906. (No model.)

Claim.—1. In a mangle, a frame having standards, in combination with rollers rotatably secured in the standards of the frame, a roller of less diameter also rotatably secured in the standards of the frame, a handle detachably secured to such roller, the periphery of the first-named rollers in contact with the periphery of the second-named and smaller roller, a spring supporting the journal-bearings of the under roller, and a cam having a handle secured thereto, such cam being adapted to be pressed against the center of the spring, and thereby the first-named rollers pressed against the smaller roller and the articles contained thereon, whereby upon removing the pressure of the cam upon the spring the smaller roller will roll from the frame and by turning such cam against the spring pressure can be brought to bear upon the smaller roller when in the frame and the articles contained thereon as the same are rotated, substantially as described.

2. In a mangle, a frame having rollers D, G, and H journaled therein, one of said rollers (D) having protruding journals, a handle detachably secured to one of the journals, the under roller being vertically adjustable, a spring M, supporting said roller, a cam acting on the center of the spring for controlling the position of said under roller, and the standards of the frame, supporting said rollers D, G, and H, having L-shaped slots, whereby said roller D will roll out of said slot when pressure on the spring is removed by lowering the cam, substantially as described.

482,411. CARRIER-TRACK. JOSEPH R. PORTER, Ottawa, Ill. Filed Jan. 23, 1892. Serial No. 419,580. (No model.)



Claim.—1. The combination, in a carrier-track and with abutting rails thereof, of a coupling-piece B, having straight-edged vertical webs or plates *b*, extending down to and adapted to bear upon the base-flanges of the rails, and devices for drawing the rails upwardly, so that said flanges will bear against the lower edges of said webs, substantially as specified.

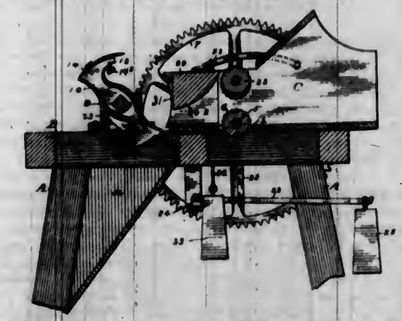
2. The combination, in a carrier-track and with abutting rails thereof, of a coupling-piece B, having straight-edged vertical webs or plates *b*, adapted to bear upon the base-flanges of the rails, bolts F, adapted to grasp the head of the rails and extended upwardly through the piece B, and nuts G above the piece B, substantially as specified.

3. As a means for suspending a hay-carrier track, the combination of the hangers having oppositely-turned non-pivoted jaws adapted to grasp the track, adapted to bear against each other at a point above said jaws, and having openings at their upper ends and the suspending-loop passing through said openings and provided with a crotch or bend for holding the hangers together, substantially as set forth.

482,412. HAY-CARRIER AND TRACK. JOSEPH R. PORTER, Ottawa, Ill. Filed Feb. 29, 1892. Serial No. 423,139. (No model.)

Claim.—1. In a hay-carrier, the combination of a track provided with a series of positive shoulders or stops, a carriage mounted on said track and adapted to travel thereon past said stops, hoisting devices

mounted on said carriage, a vertically-sliding bolt or catch E on and movable with said carriage and adapted to engage any of said stops, an operating device or cord connected with said catch and independent of the hoisting devices, and a support for said catch, operated by the hoisting devices, whereby the carriage is released by the hoisting of the load and may be caused to pass the intermediate stops of the said series or to engage any one of said stops and be locked in place at will irrespective of the hoisting devices, substantially as set forth.



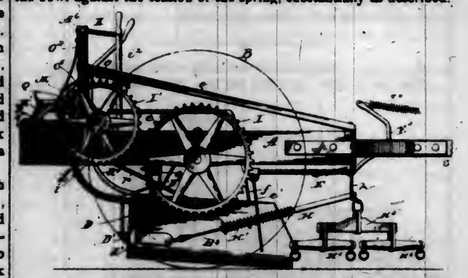
2. In a hay-carrier, the combination of a track provided with shoulders or stops, a carriage mounted and adapted to travel thereon, a hoisting-rope supported by said carriage, a fall-block G, carried and operated by the rope, a hook on the carriage, adapted to engage and support the fall-block, a catch E, engaging the hook to sustain and lock it in its supporting position and movable away from said hook and into the path of the said stops on the track, and means, such as a cord, for operating the catch, substantially as set forth.

3. In a hay-carrier, the combination of a track provided with shoulders or stops, a carriage mounted and adapted to travel thereon, a hoisting-rope supported by said carriage, a fall-block G, carried and operated by the rope, a hook on the carriage, adapted in one position to engage and support the fall-block and in another position to support a catch, the said catch or bolt adapted to engage the said hook to sustain and lock it in its first-mentioned position and movable away from said hook and into the path of the said stop on the track, and means, such as a cord, for operating the catch, substantially as set forth.

4. In a hay-carrier, the combination, with a track provided with stops, of a carriage thereon, a hoisting-rope and fall-block on the carriage, a hook adapted to support said fall-block, a vertically-movable catch for engaging said hook or said stops on the track, a lever connected with the catch, and means, such as a cord, for operating the lever, substantially as set forth.

5. In a hay-carrier, the combination, with the track, consisting of a rail having lateral base-flanges, a carriage having wheels running on the said flanges, hoisting devices on the carriage, a movable catch mounted on the carriage, and a stop for said catch, consisting of thin plates H, adapted to clamp said wheel-supporting track-flanges and permit the free passage of the wheels and having vertical downwardly-extending flanges A, rigid stop-plates I, situated outside of the latter flanges, and means for forcing the stop-plates together to cause the plates H to clamp the rail, substantially as set forth.

482,413. STRAW-CUTTER. JULIUS RAATZ, Manistee, Mich. Filed Dec. 5, 1891. Serial No. 414,164. (No model.)



Claim.—In a straw-cutter, the combination, with the straw-box, the rotating knife-wheel, and the feed-rollers, of the ball 28, having its arms pivotally secured to the sides of the straw-box, the presser-block 29, arranged between the feed-rollers and the knife-wheel and rigidly secured to the cross-bar of said ball, and the weighted ball 32, pivotally suspended from the forward end of the ball 28, substantially as and for the purpose specified.

482,414. WHEELED SCRAPER. CHARLES RATH, Mobeetie, Tex. Filed Jan. 20, 1891. Serial No. 378,461. (No model.)

Claim.—1. In a scraper, the combination, with the frame and ground-wheel, of the vertically-movable scraper-bowl with means, substantially as described, for raising the same, and a lowering mechanism for said bowl driven by the ground-wheel for lowering the bowl against the power exerted by the raising mechanism, substantially as described.

2. In a scraper, the combination, with the frame and ground-wheel, of the vertically-movable scraper-bowl, mechanism, substantially as described, for elevating the same, and the crank-shaft connected to the bowl for positively lowering the same driven by the ground-wheel, substantially as described.

3. In a scraper, the combination, with the frame and ground-wheel, of the vertically-movable scraper-bowl, a spring for elevating the same, and a crank-shaft driven by the ground-wheel for lowering the bowl against the tension of the spring, substantially as described.

4. In a scraper, the combination, with the frame and ground-wheel, of the vertically-movable scraper-bowl, the spring for elevating the bowl, and connections between the bowl and ground-wheel for lowering the same against the tension of the spring, substantially as described.

5. In a scraper, the combination, with the frame and ground-wheel, of the vertically-movable scraper-bowl, the spring for elevating the same, the crank-arms for lowering the bowl against the tension of the spring, flexible connections and the winding-drums driven by the ground-wheel for operating the crank-arms, substantially as described.

6. In a scraper, the combination, with the frame, ground-wheels, and the vertically-movable scraper-bowl, of the spring for elevating the same, connections between the scraper-bowl and ground-wheel for lowering the same against the tension of said spring, and the clutch interposed in said connections, whereby the bowl may be permitted to return to an elevated position under the influence of the spring, substantially as described.

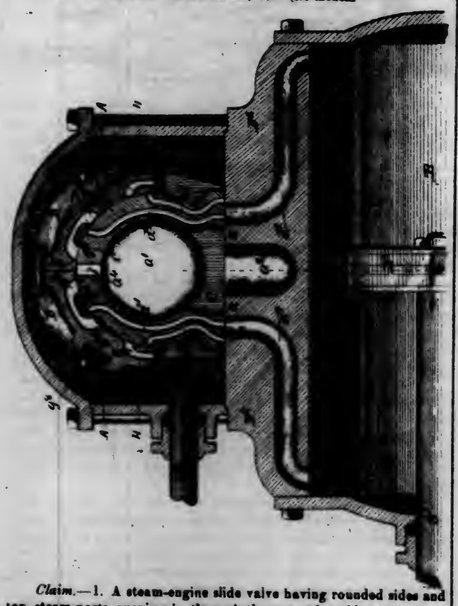
7. In a scraper, the combination, with the frame and ground-wheels, of the vertically-movable scraper-bowl, mechanism, substantially as described, for automatically elevating the same, an arm connected to the bowl for depressing the same, a winding-drum connected to said arm, and a shifting-gear connection between said winding-drum and ground-wheel, substantially as described.

8. In a scraper, the combination, with the frame, ground-wheels, vertically-movable scraper-bowl, and mechanism, substantially as described, for elevating the same, of the arm connected to the bowl, the winding-drum connected to the crank-arms, the gear-wheel on the ground-wheel, and the shifting-gear meshing therewith and connected to the drum-shaft, substantially as described.

9. In a scraper, the combination, with the frame, ground-wheels, vertically-movable scraper-bowl, and mechanism for raising the same, substantially as described, of the arm connected to said bowl for depressing the same, the winding-drum connected to said arm, the gear-wheel on the ground-wheel, the shifting-gear on the drum-shaft, adapted to mesh with said first-mentioned gear, and the spring-pawl for holding said shifting-gear and drums against the power of the elevating mechanism, substantially as described.

10. In a scraper, the combination, with the frame and ground-wheels, the vertically-movable scraper-bowl, and mechanism, substantially as described, for elevating the same, of the arm connected to the bowl, the winding-drum, the gear on the ground-wheel, shifting-gear, and the crank-shaft in which said shifting-gear is mounted, having the operating-handle, substantially as described.

11. In a scraper, the combination, with the vertically-movable scraper-bowl, mechanism, substantially as described, for elevating the same, of the ground-wheels, and connections between said bowl and ground-wheel for depressing the bowl against the power of the elevating mechanism, and a brake for retarding the upward movement of the bowl, substantially as described.



12. In a scraper, the combination, with the vertically-movable scraper-bowl, mechanism, substantially as described, for elevating the bowl, and the ground-wheel, of a gear on the ground-wheels, a shifting-gear adapted to mesh with the gear on the ground-wheel to lower the bowl, mechanism connecting said shifting-gear and bowl, a pawl for arresting said shifting-gear, a brake, and an operating-handle connected to said pawl and brake, whereby when the handle is moved to release the pawl the brake is applied, and vice versa, substantially as described.

13. In a scraper, the combination, with the frame, ground-wheels, scraper-bowl hung in horizontal bearings in the frame, and mechanism for depressing the bowl from the ground-wheel, as described, of the

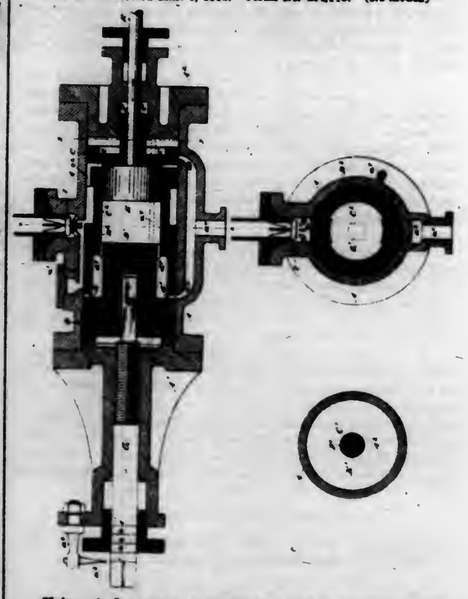
draft-links connected to the bowl below its pivotal point and passing through guides at the front end of the frame, substantially as described.

14. In a scraper, the combination, with the frame, ground-wheels, scraper-bowl hung in horizontal bearings in the frame, and mechanism for depressing said bowl, substantially as described, of the spring draft-links connected to the bowl below its pivotal point and passing through guides at the front of the frame, substantially as described.

482,415. STEAM-ENGINE VALVE. EMIL L. SAUER, Chicago, Ill. Filed Dec. 21, 1891. Serial No. 415,766. (No model.)

Claim.—1. A steam-engine slide valve having rounded sides and top, steam-ports opening in through the respective sides at a point about midway between the top and bottom and extending down through the wall and out at the under side, exhaust-ports opening in higher up with reference to the steam-ports and extending down parallel therewith, and an exhaust-port through the top of said valve and communicating with the chamber therein, in combination with a cut-off valve seated on the slide-valve and covering the steam and exhaust ports and provided with ports corresponding thereto and adapted to have a rotary movement simultaneously with the reciprocating movement of the slide-valve, whereby the different steam and exhaust ports are alternately brought into coincident relation, substantially as set forth.

2. In a steam-engine valve of the character described, the combination, with a reciprocating slide-valve having a rounded top and sides, of a cut-off valve concavo-convex in form and seated upon and corresponding to the exterior surface of the slide-valve and adapted to have a reciprocating rotary movement simultaneously with the movement of said slide-valve, substantially as set forth.



3. The combination, with a slide-valve having exterior rounded top and sides and provided with steam and exhaust ports in its walls on each side of the central exhaust-chamber and an exhaust-port opening downwardly through the top into said chamber, of a cut-off valve seated upon the slide-valve and provided with steam and exhaust ports corresponding to those in the slide-valve, whereby the steam first enters through the cut-off, is exhausted back through the slide or main valve into the cut-off or rotary valve, and finally returned through the slide-valve into the central exhaust-chamber, substantially as set forth.

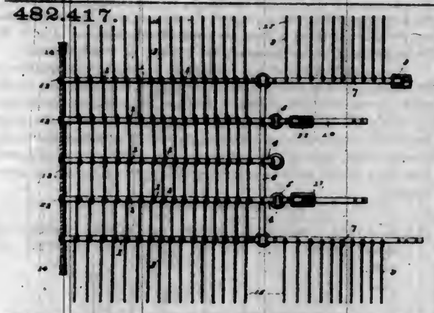
4. The combination, with a slide and rotary cut-off valve, of companion spiders located at the respective ends of said valves and consisting of a number of arms and a hub and connected to the slide-valve by pivot-bolts inserted through the hub part, the ends of the outside arms being rigidly secured to the rotary valve and the central arm having a bifurcated end, and tap-bolts rigidly inserted in the walls of the inclosing steam-chest and projecting into said forked end of the central arm, whereby a reciprocating rotary movement is imparted to the cut-off valve by the movement of the slide-valve, substantially as set forth.

5. In a steam-engine valve, the combination, with a valve-yoke, of the companion track-rails recessed in the east part below the valve-seat and beveled on their respective sides from the top downwardly and the spool-shaped friction-rollers interposed loosely between said yoke and track-rails, substantially as set forth.

6. The combination, with a slide-valve, of a valve-yoke provided with recesses in the upper edge and vertical lugs, as described, and tap-bolts inserted in said valve and having the head ends resting in said recesses, substantially as set forth.

482,416. PUMP. ALFRED SIEBERT, New York, N. Y. Filed May 7, 1891. Renewed Mar. 8, 1892. Serial No. 424,115. (No model.)

Claim.—1. In a pump, in combination with an external cylinder A, having suitable ports and an internal piston and piston-rod with suitable operating means for the latter, an internal cylinder made in two separate parts C D, with provisions, as internal screw-threads in one part and external screw-threads in the other part, engaged together, as shown, for changing the length of the internal cylinder, and thereby varying the quantity of liquid pumped at each stroke, as herein specified.



2. In a pump, in combination with an external cylinder A, having suitable ports and an internal piston with suitable operating means, an internal cylinder made in two separate parts C D, with provisions, as internal screw-threads in one part and external screw-threads in the other part, engaged together, as shown, for changing the length of the internal cylinder, and provisions, as the feather engaging the piston-rod with one of the parts of the internal cylinder, for holding such part against being revolved, and provisions, as the revoluble rod having the squared end engaged in a corresponding socket in the other part of the internal cylinder, for revolving such part relatively to the other by operating on the outside of the pump, substantially as herein specified.

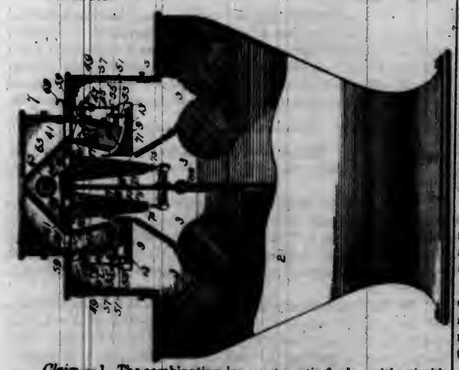
3. The pump described, having the external cylinder A, piston B, and piston-rod *b*, in combination with each other and with the internal cylinder made in two parts C and D, engaged together by screw-threads, the part C being held against rotation and the other part D being capable of being rotated, and with the screw-threaded rod G engaged with the part D, as shown, so as to control its revolution, but leave it free to move axially, the rod G being graduated, as shown, and with an index H, adapted to show by inspection on the outside the condition of the internal cylinder and therefore the quantity which the pump is delivering at each stroke, all substantially as herein specified.

482,417. FLY-NET. GEORGE SOLLENBERGER, Mechanicsburg, Pa. Filed May 17, 1892. Serial No. 433,344. (No model.)

Claim.—In a fly-net, the combination of a central bar and a pair of parallel bars on each side of and parallel with said central bar, said bars being constructed of leather and having loops in the opposite ends

482,417.

of the same, rings secured in the front loop of each of the bars, lashes of textile fabric connected to said bars and having metal end coverings, breast-straps supporting lashes and secured to the rings of the outermost bars farthest from the central bar, said breast-straps being united at the center when joined, and straps 10, secured to the rings connected to the front ends of the bars next to the central bar and adapted to be secured to the neck-strap or adjacent upper part of harness, substantially as described.



482,418. VEHICLE-WHEEL HUB. LORENS SWENSON, Cresco, Iowa, assignor of two-thirds to Will Patterson, same place. Filed Mar. 16, 1892. Serial No. 425,145. (No model.)

Claim.—1. The combination, with the spindle, of the thimble at the inner end, the thimble at the outer end, the sleeve or box carrying the spoke-sockets, the shell-sections on opposite sides of the socket and secured to the opposite end of the sleeve or box, and a nut for retaining the hub on the spindle, substantially as specified.

2. The combination, with a hub, of the spindle, shouldered as described, the sleeve on the inner end of the spindle, also shouldered and provided with the channels on its outer side near its inner end, the sleeve on the outer end of the spindle, having a flange at its outer end, and a nut on said spindle, substantially as and for the purpose specified.

482,419. AUTOMATIC FEEDER FOR ROLLER-MILLS. JOSEPH L. WILLFORD, Minneapolis, Minn. Filed Oct. 17, 1891. Serial No. 409,021. (No model.)

Claim.—1. The combination, in an automatic feeder, with suitable shoes and pivoted hangers supporting said shoes, of a spring connecting said hangers, an operating-rod connected to said spring, a spring-fulcrum connected with said rod, an operating-shaft, and an eccentric upon said shaft also connected with said rod, substantially as described.

2. The combination, with the independent vibrating shoes and their supporting-hangers, of springs connecting said hangers, an operating-rod, and an eccentric for moving said rod.

3. The combination, with the vibrating shoes and their supporting-hangers, of suitable springs connecting said hangers, rods connected with said springs, springs forming fulcrums for said rods, and eccentrics for operating said rods, whereby a balanced motion for said shoes is provided.

4. The combination, with the feed-shoes, of the hangers connected to said shoes and provided with the knife-edge bearings 17, the arms 21, formed integrally therewith, and the spring 31, connecting said arms, substantially as described.

5. The combination, with the vibrating shoe, of the hangers connected therewith and provided with the knife-edge bearings 17, the arms 21, formed integrally therewith, the spring 31, connected to said arm, and the operating-rod connected to said spring, substantially as described.

6. The combination, with the vibrating shoe and the hopper, of the swinging valve arranged between said hopper and said shoe, through which the material from said hopper passes, and a gate connecting with said swinging valve and arranged to be raised or lowered by the movement of said valve, substantially as described.

7. The combination, with a vibrating shoe and hopper, of the swinging valve arranged between said hopper and shoe and arranged to receive the material from said hopper and means for balancing said valve, substantially as described.

8. The combination, with the vibrating shoe, of the hinged valve arranged above said shoe and having an adjustable gate at its lower end and means for counterbalancing said valve, substantially as described.

9. The combination, with the vibrating shoe having a curved upper surface, of the pivoted valve arranged above said shoe and having a curved lower end.

10. In an automatic feeder, a valve consisting of a receptacle open at its upper and lower ends and mounted upon a suitable pivot, and the shoe arranged beneath and in proximity to the lower end of said valve, whereby the lower end of said valve swings over said shoe as the supply of material varies, and a gate connected with said valve and arranged to be raised and lowered by the movement of said valve, substantially as described.

11. In an automatic feeder, a valve having open upper and lower ends and mounted upon a pivotal support, a counterbalance-weight connected with said valve, a shoe arranged beneath the lower end of said valve and over which said lower end of the valve is moved as the supply of material to said valve is varied, and a gate connected with said valve and arranged to be raised and lowered by the movement of said valve, substantially as described.

12. In an automatic feeder, the combination, with a vibrating shoe, of a swinging valve arranged above said shoe, a pivoted gate arranged above said shoe, and a connection between said gate and said valve, whereby said gate is automatically raised or lowered by the movement of said valve.

13. The combination, with the feeder and rolls, of a suction-fan, the pockets arranged within the casing, means for distending said pockets, and the knockers arranged to operate upon said pockets, substantially as described.

14. The combination, with the feeder and rolls and the casings 2 and 5, of the air-chamber 65, arranged above said casing 2, the fans connected with said air-chamber, openings 68 between said air-chamber and said casing, pockets arranged in said casing and covering said openings, spring-controlled devices for distending said pockets, and means for jarring said pockets, substantially as described.

15. The combination, with the feeder and rolls and the casing 5, of the air-chamber 65, arranged above said casing and connected therewith by suitable openings, valves 67 for closing said openings, suction-fans connected with said air-chamber, pockets arranged over said openings 68, spring-controlled devices for distending said pockets, and suitable knockers for jarring the material that adheres to said pockets, substantially as described.

16. The combination, in an automatic feeder, with a vibrating shoe, of hangers supporting said shoe, a draft-bar operating said shoe springs arranged between said shaft and said hangers, and a suction-fan arranged upon the shaft by which said shoe is operated and arranged to create a suction through the casing in which the shoe is located.

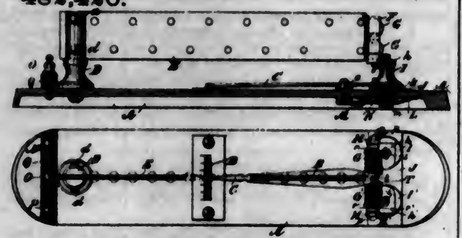
17. The combination, in an automatic feeder, with the vibrating shoe and the shaft provided with eccentrics connected through suitable springs with said shoe for operating the same, of the suction-fans mounted on said eccentric-shaft and arranged to create a suction through the casing in which the shoe is located.

482,420. ADJUSTABLE THERMOSTAT. MELVIN D. COMPTON, Newark, N. J. Filed Nov. 21, 1891. Serial No. 412,067. (No model.)

482,420.

ing a suitable index, and a ring-coil P, and provisions for dividing the current and conveying it from one point in such ring-coil in both directions around to the opposite point thereon, as herein specified.

4. In combination with a rudder and provisions, substantially as described, for transmitting electric currents varied according as the rudder is turned in one position or another, an indicating device having a ring-coil P, and provisions for dividing the current and conveying it from one point in such ring-coil in both directions around to the opposite point therein, and having a freely-revolving coil delicately mounted within to serve as an index and conveying a current, as herein specified.



482,423.

outlet, and an escape-pipe connected to said relief-valve, and a separator with which said escape-pipe communicates.

4. The combination, with a suitable fan, of a relief-valve connecting with the exit-opening in said fan and provided with a suitable outlet, two or more pipes leading from said outlet, valves arranged in said outlet, an escape-opening for said relief-valve, a separator with which said escape-pipe communicates, and a connection between said separator and the intake-pipe of said fan.

5. The combination, with a suitable fan, of a relief-valve connecting with the exit-opening in said fan, an air-escape pipe connected to said

482,420.

Claim.—1. In an electrical system, a thermostatic expansible piece forming a terminal of an electric circuit, contact-pieces forming corresponding terminals on either side thereof, the said contact-pieces forming the cores or poles of electro-magnets and being located each in a separate branch circuit, and the said electro-magnet being located, respectively, in the same branch circuits, the said expansible piece having or carrying an armature common to the two magnets, as and for the purpose set forth.

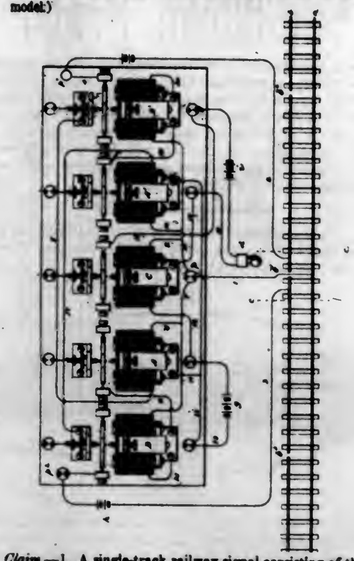
2. The combination, with an electro-magnetic motor and a pair of branch circuits connected therewith, of a thermostat adapted to close one branch or the other on an increase or decrease of the temperature, the said thermostat consisting of an expansible piece forming the terminal of the main circuit and carrying an armature which is located between the poles or cores of a pair of electro magnets, one on each side of the said armature, the said magnets, with their cores or poles, being located in different branches, as set forth.

3. In a thermostat, a pair of adjustable electro-magnets located on opposite sides of the expansible portion, in combination with an armature attached to or forming a part of the said expansible portion, as set forth.

4. In a thermostat, an adjustable frame or plate carrying insulated posts, a pair of electro-magnets, one on each post, the said electro-magnets being adjustable with reference to the posts, all in combination with a thermostatic piece having or carrying an armature between the said electro-magnets, as set forth.

5. In a thermostat, a frame or plate carrying a pair of insulated posts, an electro-magnet adjustably supported on each post, a thermostatic piece having or carrying an armature between the said magnets, in combination with a scale and a pointer co-operating therewith, the said pointer engaging with the said plate or frame in such a manner as to move it when turned, as and for the purpose set forth.

482,421. RUDDER-INDICATOR. CHARLES CORY, New York, N. Y. Filed Nov. 24, 1891. Serial No. 412,942. (No model.)



Claim.—1. In combination with an electro-magnet and indicator at any required place in the ship, a series of commutator-bars arranged in the arc of a circle, supported on a ring capable of being easily detached when required, with a series of wires connecting each commutator-bar to the indicating mechanism independently of the other wires in the series, a brush arranged to move in a corresponding circular path, also supported on a ring capable of being easily detached when required, with suitable electrical connections, and means for causing the rings carrying the brush and commutators to move one relatively to the other as the rudder is turned, and with electric connections to a battery or equivalent source of electric current, all arranged for joint operation as herein specified.

2. In a rudder-indicator, two series of commutator-bars and brushes, each brush moved upon its commutator by the turning of the rudder and arranged one series to control the positive and the other the negative current, in combination with each other and with a source of electric current, electrical connections connecting each commutator-bar to the indicating mechanism independently of the other connections, and an indicating mechanism having an electro-magnet controlled by such current, all arranged for joint operation substantially as herein specified.

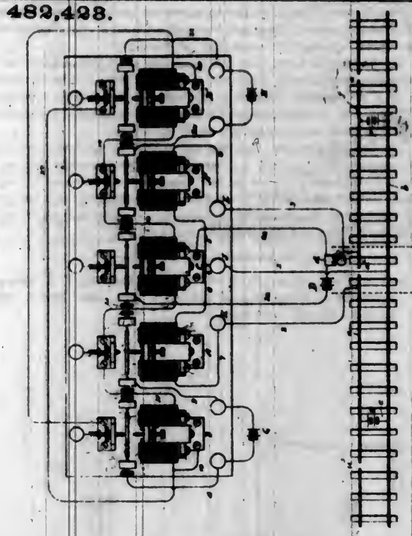
3. In combination with a rudder and provisions, substantially as described, for transmitting electric currents varied according as the rudder is turned in one position or another, an indicating device having a suitable index, and a ring-coil P, and provisions for dividing the current and conveying it from one point in such ring-coil in both directions around to the opposite point thereon, as herein specified.

4. In combination with a rudder and provisions, substantially as described, for transmitting electric currents varied according as the rudder is turned in one position or another, an indicating device having a ring-coil P, and provisions for dividing the current and conveying it from one point in such ring-coil in both directions around to the opposite point therein, and having a freely-revolving coil delicately mounted within to serve as an index and conveying a current, as herein specified.

482,422. RAILWAY-CROSSING PROTECTOR. ROBERT J. M. DARLEY, Columbus, Ohio. Filed Mar. 2, 1892. Serial No. 423,447. (No model.)

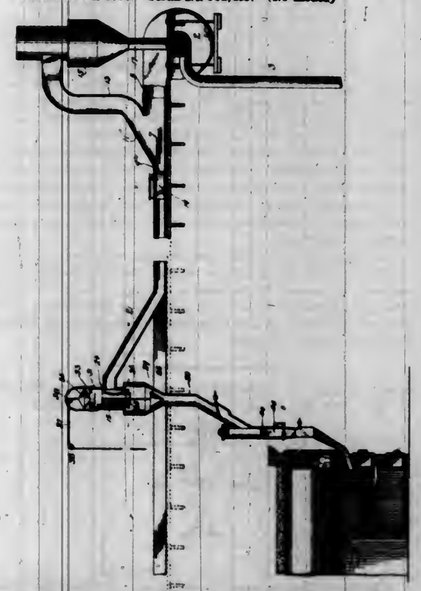
Claim.—1. A single-track railway-signal consisting of the combination of an alarm or gate, two sets of relays respectively operating said alarm or gate for trains coming in both directions, and two other relays controlling said two sets of relays, respectively, to make them inoperative when a train has passed the alarm or gate, substantially as described.

2. The combination, with an alarm or gate for highway-crossings of railroads, of a relay, as C, operating the alarm or gate, two other relays, as A A', each controlling the first relay, a fourth relay, as B, controlling the circuit of one of the said two relays A A', and two insulated sections of track in circuit, respectively, with the relays A A', one of the sections being in circuit with the said fourth relay B, for the purpose set forth.



3. The combination, with two insulated track-sections extending in opposite directions from a crossing, two relays, as A A', in circuit with the respective sections, an alarm-relay, as C, controlled by said two relays, and two other relays, as B' B, controlling the circuits, respectively, of said two relays A A', the relays B' B also being included in circuit with the respective track-sections, for the purpose set forth.

482,423. RAILWAY-CROSSING PROTECTOR. ROBERT J. M. DARLEY, Columbus, Ohio. Filed Apr. 20, 1892. Serial No. 429,577. (No model.)



Claim.—1. The combination, with an alarm or gate for highway-crossings of railroads, of a relay, as C, operating the alarm or gate, two other relays, as A A', each controlling the first relay, and two other relays, as B B', each controlling the other and the alarm-relay C, and two insulated sections of track in circuit, respectively, with the relays A A'.

2. The combination, with an alarm or gate for highway-crossings of railroads, of a relay, as C, operating the alarm or gate, two other relays, as A A', each controlling the first relay, and two other relays, as B B', each controlling the other and the alarm-relay C, and two insulated sections of track in circuit, respectively, with the relays A A', and batteries connected between the rails, whereby the wheels and axles of trains will operate as alarm or gate, in the manner described.

482,423.

482,424. FUEL-FEEDER. HENRY L. DAY, Minneapolis, Minn. Filed Feb. 24, 1891. Serial No. 382,405. (No model.)

Claim.—1. The combination, with a suitable fan, of a blast-pipe connected with said fan, a relief-valve connected with said pipe and provided with a suitable fuel-discharge outlet, an air-escape pipe connected with said relief-valve, and a separator arranged to receive the air from said air-escape pipe, substantially as described.

2. The combination, with a suitable fan, of a blast-pipe connected with said fan, a relief-valve connected with said pipe and provided with suitable outlet-openings, an air-escape pipe connected with said relief-valve, and a separator arranged to receive the air from said escape-pipe and to return the material from said separator to the inlet side of said fan, substantially as described.

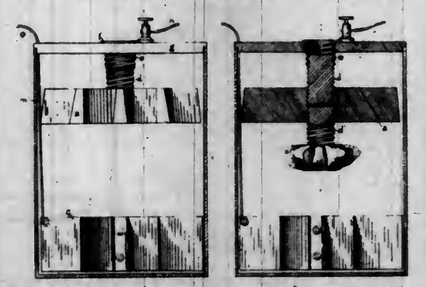
3. The combination, with a suitable fan, of a relief-valve connecting with the exit opening in said fan and provided with a suitable outlet, valves arranged in said outlet, two or more pipes leading from said outlet, and an escape-pipe connected to said relief-valve, and a separator with which said escape-pipe communicates.

4. The combination, with a suitable fan, of a relief-valve connecting with the exit-opening in said fan and provided with a suitable outlet, two or more pipes leading from said outlet, valves arranged in said outlet, an escape-opening for said relief-valve, a separator with which said escape-pipe communicates, and a connection between said separator and the intake-pipe of said fan.

5. The combination, with a suitable fan, of a relief-valve connecting with the exit-opening in said fan, an air-escape pipe connected to said relief-valve, a fuel-outlet from said relief-valve, and a fuel-pipe leading from said fuel-outlet to a suitable furnace, substantially as described.

6. The combination, with a suitable fan, of an outlet-pipe connected therewith, a relief-valve connected with said outlet, a separator connected with the intake-pipe of said fan, an air-escape pipe extending from said relief-valve to said separator, pipes extending from said relief-valve, valves for regulating the passing of the material from said relief-valve to said pipes, a separator with which one of said pipes communicates, and a pipe extending from said separator to the furnace, substantially as described.

7. The combination, with a separator provided with a chamber 24 and with a chamber 25 with which said chamber 24 communicates by a series of inclined flights, of a central tube 26 in said separator and an adjustable cover regulating the escape of air through said tube, substantially as described.



8. The combination, with the separator having the conical chamber 25, of the cone 39, arranged in the outlet-opening of said separator, and the adjustable cover 35, arranged over the air-escape outlet of said separator, substantially as described.

9. The combination, with the separator provided with a suitable opening for the escape of the air from said separator, of the conical cover 35 and means for adjusting said cover for the purpose of regulating the escape of the air from said separator.

10. The combination, with the separator provided with the conical lower end, of the cone 39, arranged in the opening in said chamber and provided with the wings 41.

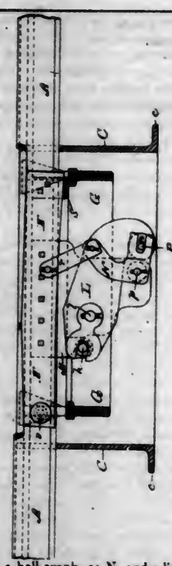
11. The combination, with the feeder-pipe 30, of the branch pipes 32, the relief-valve 42, arranged between said feeder-pipe and said branch pipes and provided with the expansion-chamber 44, projecting in opposite directions, and the pivoted valve-plate 46, substantially as described.

482,425. GALVANIC BATTERY. THOMAS T. ECKERT, New York, N. Y. Filed May 16, 1892. Serial No. 433,117. (No model.)

Claim.—1. In a galvanic battery, a zinc electrode formed of zinc plates having screw-perforations and separate zinc screws alternately arranged, as and for the purpose described.

2. In a galvanic battery, a zinc electrode formed of zinc plates having screw-perforations and separate zinc screws alternately arranged and applied and a cross-bar to which the electrode is suspended by one of said screws.

3. In a galvanic battery, a zinc electrode formed of perforated zinc plates and separate zinc pins or screws, said pins or screws being employed to fasten adjoining plates together and to suspend the composite electrode from a cross-bar or other support above the cell.

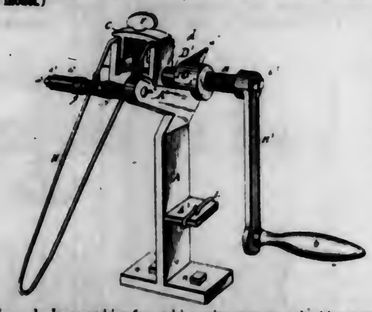


4. In a galvanic battery, a perforated zinc plate and a separate pin or screw of the same material, substantially as described.

482,426. STREET-RAILWAY SWITCH. TOM L. JOHNSON, Cleveland, Ohio. Filed Nov. 16, 1889. Serial No. 330,995. (No model.)

Claim.—1. In an automatic switch, a rocking frame, as G, provided with an auxiliary pivot-web, as H, and a pivot, as A, substantially as set forth.

2. In an automatic switch, in combination with a vertical lifting-



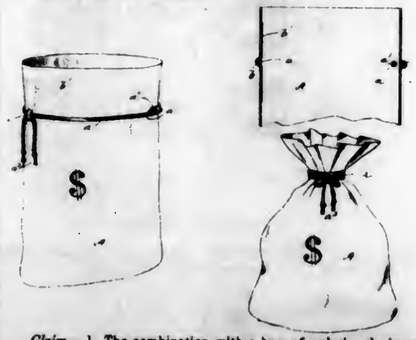
482,426.

plate, as F, a lever, as L, a bell-crank, as N, and a link, as *r*, substantially as set forth.

3. In an automatic switch composed of rails having vertical webs, in combination with a lifting switch-plate hinged to said vertical webs and a supporting-plate, as M, connected to the webs of said rails for supporting mechanism to operate said switch-piece, substantially as set forth.

482,427. MACHINE FOR MAKING WIRE SPRINGS AND COUPLINGS. SEBASTIAN KOHR, Louisville, Ky., assignor of one-half to Samuel F. Harian, same place. Filed May 14, 1892. Serial No. 433,010. (No model.)

Claim.—1. In a machine for making wire springs, a double screw-vise having a sleeve-base with an opening through it square in cross-section, adapted to slip over a squared shaft, two jaw-pieces rectangular as to their sides and top rising perpendicularly from the base in parallel planes, each provided with a groove along its top edge, and a top jaw or cross-head covering the tops of the base jaw-pieces and provided with two downwardly-projecting parallel guide-plates fitting inside and close to the base jaw-pieces, in combination with a vise-clamping screw passing perpendicularly through the cross-head or top jaw into a screw-threaded hole in the sleeve-base and having a coil-spring surrounding its shaft between the top jaw and base, substantially as described.



2. A machine for making wire springs and couplings, having a frame consisting of a standard A, base *a a*, journal-box A', arm A^3, guide a', and die-plate A^5, and a stud-post a^3, projecting horizontally from the inner face of the arm A^3, carrying a sleeve-roller G, provided with guide-beadings *g*, in combination with a shaft B, journaled in the box A', provided with a crank and handle at its outer end, and having its inner end squared and carrying a double screw-vise C, constructed and arranged substantially as set forth, and for the purposes specified.

3. The combination, with the frame, the shaft journaled therein, and means for rotating said shaft, of a vise secured to said shaft and rotating therewith, said vise having a grooved top and sloping bottom, and sleeves projecting from said vise and adjacent to the sloping bottom thereof, substantially as shown and described.

4. The combination, with the frame, the shaft journaled therein, means for rotating said shaft, and the roller-sleeve G, having beads *g g*, of a vise located adjacent to said sleeve and rotatable with said shaft, said vise having a grooved top and sloping bottom, and sleeves projecting from said sloping bottom of the vise.

5. The combination, with the vise consisting of a base, two side jaws, a removable top jaw, and sleeves projecting laterally from said side jaws, said side jaws having their tops grooved and their bottoms sloped toward said sleeves, a clamping-screw engaging said top jaw and the base of the vise, and a coil-spring encircling said screw, of a supporting frame and means for rotating said vise.

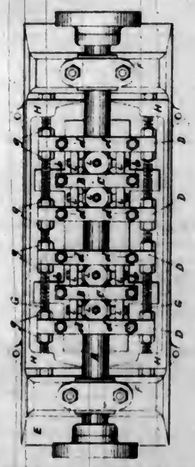
482,428. BAG. FRANK W. LAWRENCE, Saratoga, N. Y., assignor of one-half to Henry H. Lawrence, same place. Filed May 2, 1892. Serial No. 431,408. (No model.)

Claim.—1. The combination, with a bag, of a closing device consisting of a cord or tape secured at its middle point to a point on the bag, with its free ends passing freely around the bag and through an eye in the bag located at a point diametrically opposite the point to which the cord is secured, substantially as described.

2. The combination, with a bag, of a closing device consisting of a cord or tape secured at its middle point to a point on the bag by a knot in the cord inclosing the material of the bag, the free ends of the cord passing freely around the bag and through an eye in the bag located at a point opposite the point to which the cord is secured, substantially as described.

3. The combination, with a bag provided with an eye formed by a loop of tape on the outside of the bag, its ends passing through punctures and secured to the inside of the bag, of a cord or tape secured at its middle point to a point on the bag opposite said eye, the free ends of the cord passing in opposite directions through the said eye, for the purpose set forth.

482,429. HAT-VENTILATOR. WILLIAM P. O'CONNOR, Milwaukee, Wis. Filed May 26, 1890. Serial No. 353,044. (No model.)

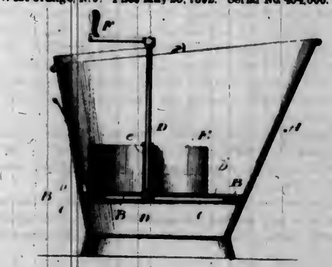


Claim.—1. The combination, with a hat, of a ventilator consisting of two or more oppositely and outwardly opening leaves, each cut from and hinged at one side in an opening in the crown and adapted to be closed flush therewith, a disk or flange attached to the inside of the crown, projecting inside of the edges of said opening to constitute a seat for said sections or leaves, and means for holding said sections or leaves open more or less, as desired, said leaves serving, when open, as deflectors to direct air into and permit its unobstructed passage out of the hat, substantially as and for the purposes set forth.

2. The combination, with a hat, of a ventilator consisting of two or more outwardly-opening leaves cut from and hinged in the crown of the hat, a reinforcing-disk attached to the inside of the crown and projecting inside of the edges of the openings in the crown and serving as a seat for said leaves when they are closed, and one or more sections cut from said disk corresponding with and a little smaller than said leaves to which they are attached, and means for holding said leaves open more or less, as desired, substantially as and for the purposes set forth.

3. The combination, with a hat, of a ventilator consisting of one or more leaves hinged in an opening or openings formed in the crown, so as to open outwardly, an adjusting-screw having a suitable bearing attached to the inside of the crown, and a nut with which said screw engages, provided with an arm or arms connected with said leaf or leaves, so as to open and close the same by the turning of said screw in opposite directions, substantially as and for the purposes set forth.

482,430. ANTIFRICTION THRUST-BEARING. GEORGE WILKIN and FREDERICK EDWARDS, Southampton, England. Filed May 3, 1892. Serial No. 431,695. (No model.) Patented in England Sept. 11, 1890, No. 14,317.

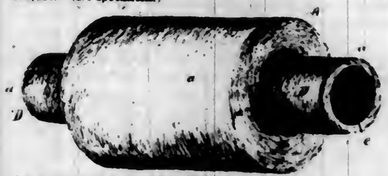


Claim.—1. In combination, the frame, the shaft journaled therein, the plate B, fixed to the shaft, the plate D, fixed to the frame, the collar K, loose on the shaft and comprising the central hub part, and the journals extending radially about the said hub and free at their outer ends, the removable nuts on the said journals, and the antifriction-rollers held removably on said journals by the said nuts, the said plates B and D having grooves in which the rollers travel, said grooves being arranged to hold the rollers out of contact with the nuts, substantially as described.

2. In combination, the frame, the shaft, the plate D about the shaft, fixed to the frame, the collar loose on the shaft and carrying antifriction-rollers, the plate B on the shaft, and the means for holding the said plate B rigidly to the shaft, consisting of the collar C, fixed on the shaft and having notches, the key to extend through the said notches and along the surface of the shaft, the said plate B being formed in sections adapted to fit between the collars and having a key-seat to fit over the key, substantially as described.

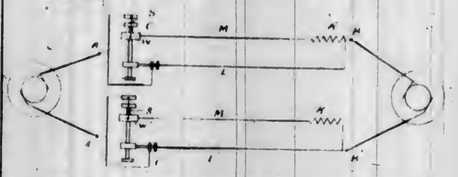
3. In combination, the shaft, the frame, the plate B on the shaft, the loose collar having the antifriction-rollers, the plate D, formed in sections and having the openings 20 between said sections, the bolts *d* for securing the two sections together, and the screws G, passing through the openings 20 and connecting the plate D to the frame, substantially as described.

482,431. COAL-SCUTTLE SCREEN. HORACE ST. J. ANDREWS, West Orange, N. J. Filed May 23, 1892. Serial No. 434,066. (No model.)



Claim.—1. A sifting device for use with coal-scuttles, comprising a screen or sieve to be fixedly attached to the scuttle and an oscillatory cylinder to rest upon said sieve and carrying a vertical plate, substantially as shown and described.

2. A sifting device comprising a screen or sieve, the pintle rising from its center, and the oscillatory cylinder pivoted on said pintle and having a diametrically-extending plate, substantially as specified.



3. In combination with a coal-scuttle, a sifting device comprising a plate supported above the bottom of the scuttle and having its front portion imperforate and its remainder perforate and the oscillatory cylinder having the plate or partition to move the material over the perforate portion, said cylinder being removably mounted upon the screening-plate, substantially as shown and described.

482,432. MUFF. CHARLES C. ASHBAUGH, Detroit, Mich., assignor to Walter Buhl & Co., same place. Filed May 14, 1892. Serial No. 433,017. (No specimens.)

Claim.—As a new article of manufacture, a muff comprising a filling and an external covering for the body thereof and the ends, the said covering being extended beyond the edges of the hand-openings in the ends of the muff to form a tubular wristlet adapted to be folded inwardly into the interior of the muff and reversibly unfolded to extend the same, substantially as described.

482,433. SAFETY DEVICE FOR ELECTRIC CIRCUITS. LLEWELYN B. ATKINSON, London, England. Filed Sept. 12, 1891. Serial No. 405,486. (No model.)

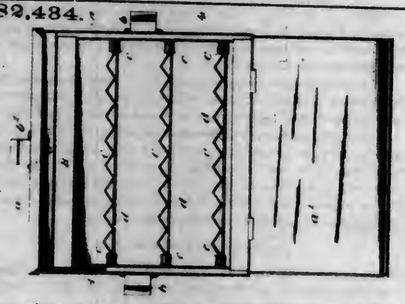
Claim.—1. In a system of distributing electric currents, the combination of a main outgoing and return conductor having in circuit with the outgoing conductor an automatic covered or protected circuit-breaker close to the generator, a subsidiary conductor connected as a shunt from each extremity of the said outgoing and return conductors, and a covered or protected fuse in circuit with the said subsidiary conductor controlling the circuit-breaker on the main conductor, disconnecting both circuits from and at specially covered or protected points close to the source of electric supply should the main cable be broken, substantially as set forth.

2. A compound electric conductor consisting of a main conductor of stranded wires taking the longitudinal tension of the cable and containing a protected automatic cut-out in its circuit, in combination with the subsidiary closely-coiled conductor of single or multiple parallel wires adapted to readily extend its coils under longitudinal tension without breaking, connected as a long shunt to the main conductor and having a protected fuse in its circuit and surrounding or surrounded by and insulated from the said main conductor, substantially as set forth.

3. The combination, with a main outgoing and return conductor and a subsidiary conductor connected as a shunt from each extremity of the said outgoing and return conductors, of a resistance in the said subsidiary conductor at the end farthest from the generator and a covered or protected fuse at the end nearest to the generator, substantially as set forth.

482,434. CAKE-BOX. ELLA E. BAILEY, Baltimore, Md. Filed Jan. 26, 1892. Serial No. 419,258. (No model.)

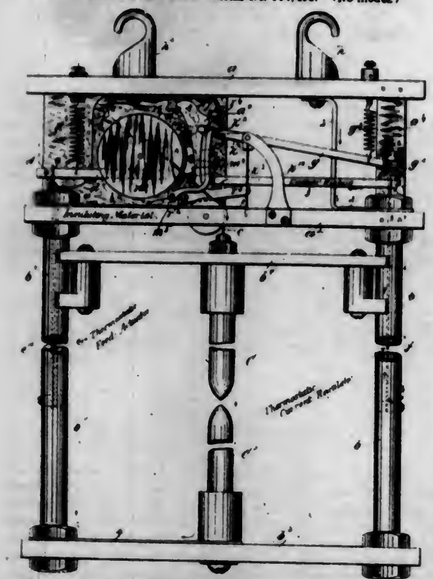
Claim.—A cake-box consisting of a box or outer casing having a hinged top or lid for obtaining access to the top shelf, a drop front flap or door for obtaining access to the lower shelves, a removable skeleton frame, and foraminous embossed shelves supported and movable in brackets in the skeleton frame, whereby a convenient receptacle for edibles is provided, the same are prevented from becoming soft and



482,434.

482,436.

482,488. PROCESS OF REDUCING ZINC. CHRISTOPHER JAMES, Swansea, England. Filed Dec. 23, 1891. Serial No. 416,269. (No specimens.) Patented in England July 7, 1891, No. 11,563; in Belgium Aug. 17, 1891, No. 93,763; in Spain Sept. 23, 1891, No. 12,373, and in France Nov. 16, 1891, No. 216,113.



Claim.—A process for the treatment of sulphide-zinc ores, consisting of partially calcining the ore, discontinuing the calcination when a portion of the ore is brought to the condition of a sulphate, melting the partially-calcined ore in a reverberatory or suitable furnace, and collecting the volatilised zinc by condensation in a chamber distinct

482,484.

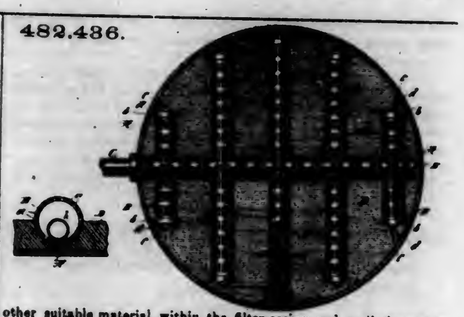
moldy, and the shelves containing the same may be readily removed, substantially as described.

482,485. ELECTRIC-ARC LAMP. HENRY H. CUTLER, Waltham, Mass. Filed June 26, 1891. Serial No. 397,493. (No model.)

Claim.—1. The combination of the carbons of an electric-arc lamp with a feed-actuator and a circuit-controller governing the application of current thereto and a thermal feed-regulator responsive to changes in length of the arc and operating the said circuit-controller for the feed-actuator, substantially as described.

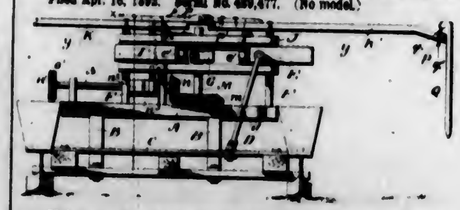
2. The combination of the feed-pawl and its actuating-pawl carrier with a pawl-controller governing the engagement of the said pawl and a regulator responsive to change in length of the arc co-operating with the said pawl-controller, substantially as and for the purpose described.

3. The combination, with the carbons of an arc lamp, of a feed-actuator comprising a thermostatic device connected in circuit and responsive to the heat produced by the current therein, a circuit-controller governing the application of current to the said thermostatic actuator, and a regulator responsive to changes in length of arc operating the said circuit-controller, substantially as described.



4. The combination, with the carbons of an electric-arc lamp, of the feed-actuator whose motive power is the current supplied to the lamp and a regulator comprising a thermostatic instrument also operated by the current supplied to the lamp and responsive to changes in current produced by changes in length of the arc, said regulator governing the application of motive current to the actuator, substantially as and for the purpose described.

482,486. FILTER. WILLIAM M. DOUGLAS, Elizabeth, N. J. Filed Apr. 19, 1889. Serial No. 307,812. (No model.)



Claim.—1. In a filter, the combination of a bed of cement or other suitable material within the filter-casing, a discharge or washing pipe embedded therein and provided with openings upon its exposed portions, substantially as described.

2. In a filter, the combination of a bed of cement or other suitable material within the filter-casing, a discharge or washing pipe embedded therein and provided with openings upon its exposed portions, and a second perforated pipe within said pipe, substantially as described.

482,486.

482,487. CHECK-ROW PLANTER. STORM B. SARE, Narka, Kans. Filed Apr. 16, 1892. Serial No. 429,477. (No model.)

Claim.—1. In a check-row planter, the combination of shaft M, adapted to be actuated from a drive-wheel of the machine, a trip on the said shaft, a reciprocating bar having one side cut away to form abutting shoulders for the said trip to engage with, a seed-slide, a lever connecting the seed-slide with the said reciprocating bar and having a slot midway of its ends, and a pin adjustably connected with the frame of the machine and adapted to enter the slot in said lever, substantially as described.

2. In a check-row corn-planter, the combination of the standards F, a reciprocating bar slotted at its ends to receive the said standards and having its middle portion cut away and provided with rollers at the ends of said cut-away portions, a lever having an adjustable fulcrum and adapted to connect the seed-slide with said reciprocating bar, shaft M, operated from a drive-wheel of the planter, and a trip on the said shaft to engage with the said rollers and actuate the said reciprocating bar, substantially as described.

3. In a check-row planter, the combination of shaft M, adapted to be operated from a drive-wheel of the planter, the reciprocating bar E, having connection with and adapted to drive the seed-slide, and a trip adjustable in its length secured to the said shaft M to operate and vary the throw of the said bar, substantially as described.

4. In a check-row corn-planter, the combination, with a pivoted arm K, a hook to engage with the said arm and retain it in a normal position, and a reciprocating bar to operate the seed-slide, of a dog carried by the said hook to hold the latter in an operative position, a block carrying a roller, and a cam on the said reciprocating bar to engage with the said roller and release the dog, substantially as and for the purpose described.

5. In a check-row corn-planter, the combination of shaft N, shaft M, operated from shaft N, a clutch to throw the machine in and out of gear, a hook having engagement with and adapted to gear and ungear the said clutch, a dog and a block carried by the said hook, a lever to independently operate the hook and the said block, an arm adapted to carry the marker and be held in a normal position by the said hook, and a reciprocating bar having a cam to engage with the said roller on the block to liberate the hook and the said arm, substantially as described.

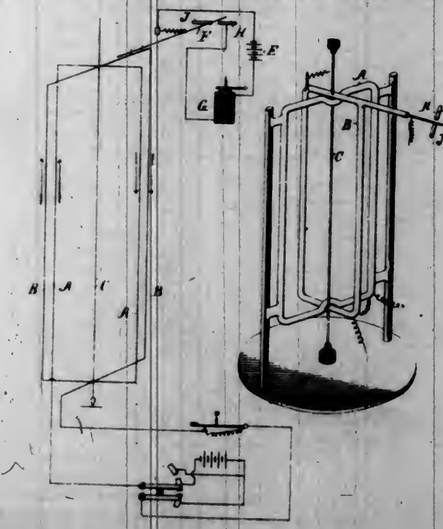
6. In a planter, the combination, with an arm and means for actuating the same, of a marking-pin having a head portion and provided with a forked plate to embrace the sides of the said arm and retain the pin in place, substantially as described.

7. In a planter, the combination, with two arms extending in opposite directions and pivoted between their ends, of an adjustable hinge connection uniting the inner ends of the said arms, substantially as set forth.

482,488. PROCESS OF REDUCING ZINC. CHRISTOPHER JAMES, Swansea, England. Filed Dec. 28, 1891. Serial No. 416,209. (No specimens.) Patented in England July 7, 1891, No. 11,563; in Belgium Aug. 17, 1891, No. 95,763; in Spain Sept. 23, 1891, No. 12,373, and in France Nov. 16, 1891, No. 216,113.

Claim.—A process for the treatment of sulphide-zinc ores, consisting of partially calcining the ore, discontinuing the calcination when a portion of the ore is brought to the condition of a sulphate, melting the partially-calcined ore in a reverberatory or suitable furnace, and collecting the volatilized zinc by condensation in a chamber distinct from the furnace, substantially as described.

482,489. PNEUMATIC SEWERAGE SYSTEM. CHARLES T. LIEBNER, Berlin, Germany. Filed Feb. 17, 1887. Serial No. 227,983. (No model.) Patented in Germany Nov. 11, 1886, No. 40,488.



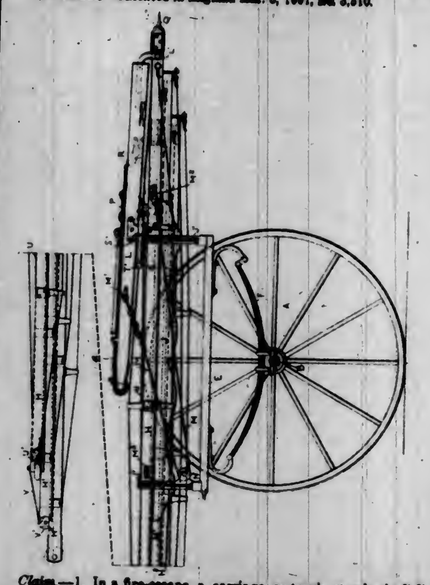
Claim.—1. A sewerage system consisting of district-reservoirs, district-pipes leading thereto, house-pipes leading to the district-pipes, with traps interposed between the house and district pipes, discharge-pipes M between the district-reservoirs and the receiving-station, valved passages from the district-reservoir to the open air, valves for shutting off drainage communication to the district-reservoirs and opening communication to the receiving-station, and a suction-pump at the receiving-station, receiving-reservoirs connecting with the discharge-pipes M, and a collecting-tank in connection with the reservoirs, substantially as described.

2. In a sewerage system, a district-pipe, a house-pipe *b*, a vacuum-pump for forming a vacuum in the district-pipes *a*, and traps interposed between the district-pipes and house-pipes, said traps being of varying heights relatively to their distance from the suction-power, substantially as described.

3. In a sewerage system, a district-reservoir, district-pipes leading thereto, a discharge-pipe M from said reservoir, an air-valve in said reservoir, a valve E, controlling the discharge of the contents of the reservoir, a vacuum-pump in connection with the pipe, and an air-inlet on the opposite side of the valve E, substantially as described.

4. In a sewerage system, a collecting-tank for receiving the sewerage material, a rotating screw Q, a casing surrounding said screw, a vertical partition D between the casing and the walls of the tank, and a horizontal partition with a space between it and the bottom of the tank and a discharge.

482,440. TELEGRAPH-RELAY. WILLIAM MAYER, Jr., New York, N. Y. Filed July 18, 1891. Serial No. 399,914. (No model.)



Claim.—1. In a telegraph system, the combination of a main-line conductor, ironless rectangular coils, a rotary arbor carrying one of the coils, the other coil being stationary and both coils being in series with each other and in circuit with the said main-line conductor, two opposite sides of the one coil being at an angle with two opposite sides of the other coil in proximity to said arbor, while the remaining sides of the coils are all parallel to one another, an independent or local line conductor, and a circuit-closer in circuit therewith and controlled by that coil which is carried on said arbor.

2. In a telegraph system, the combination of a main-line conductor, relatively-movable coils in series with each other and in circuit with the main-line conductor, two portions of each coil being at an angle to two portions of the other and the remaining portions of each coil being parallel to one another, an independent or local line conductor, and a circuit-closer in circuit therewith and controlled by that coil which is movable.

3. A telegraph-relay consisting of the combination of relatively-movable rectangular coils, which are free from iron and whose four longest sides are parallel to one another, and a circuit-closer carried by one of the coils, for the purpose set forth.

482,441. FIRE-ESCAPE AND SCALING-LADDER. GEORGE W. MELVIN, Deptford, England. Filed June 9, 1888. Serial No. 435,376. (No model.) Patented in England Mar. 3, 1891, No. 3,810.

Claim.—1. In a fire-escape, a carriage or truck, standards J' J', extending upwardly therefrom, a ladder or ladders supported by said standards, a lever L, hinged to one end of the main ladder, and operating-ropes M M, attached to the lever L and extending directly to and over pulleys on the front of the carriage and thence to the main ladder, substantially as described.

2. In combination with the ladders, the supporting-frame and the overhanging pivoted part W under spring tension, substantially as described.

3. In a fire-escape or scaling-ladder, the combination of projections S S on the lever L L with the standards J' J' on the carriage, substantially as and for the purpose set forth.

4. In a fire-escape, the combination of the carriage or truck, the standards J' J' thereon, the ladder H, supported by said standards, the lever L, provided with operating-ropes M M, extending from said lever to the ladder over pulleys on the carriage, and the additional studs M^2 M^2, substantially as described.

5. In a fire-escape or scaling-ladder, the combination, with the standards J' and the ladder, of pivoted fingers W, provided with springs X for the purpose of enabling the ladders to be readily removed from the carriage, substantially as set forth.

482,442. MUSICAL NOTATION. JOHN W. ROSEBORO, Belchertville, Tex. Filed May 18, 1891. Serial No. 393,261. (No model.)

Claim.—1. The improved music-sheet having the four staffs

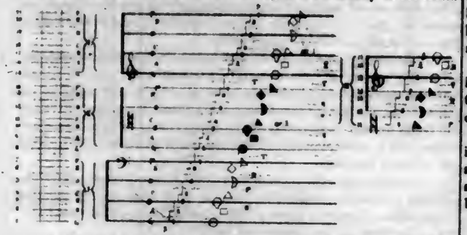
graphically indicated, as described, the first in broad heavy lines, the next in light lines, the third in double lines, and the fourth in two light and two double lines, each having spaces of unequal width and dotted lines therein, substantially as specified.

2. The improved music-sheet having the repeat character, consisting of the cross-lines and dots, arranged substantially as set forth.

of guide-sheaves for the hauling-rope, the upper pair of said guide sheaves having flanges on their inner faces and the lower pair having flanges on their outer faces, substantially as described.

6. In a conveying device, the combination, with a divided hauling-rope having supports for a hoisting-rope, of guide-sheaves separated by a space corresponding to that which separates the branches of the hauling-rope, a hoisting-rope, and a guide-pulley for the hoisting-rope, located in a place between the hauling-rope guide-sheaves, substantially as described.

coupling-pin hole thereof, a shoulder or offset in one of the grooves, and a coupling-pin having one or more studs or splines coinciding with said grooves, the shoulder specified being adapted to hold the pin by its projecting stud up for the passage of the link and to liberate it by the shock of coupling.



2. In a car-coupler of the class specified, the combination of a draw-head substantially as described, a locking-block pivoted at its forward upper portion on a transverse pin in the draw-head and adapted to swing down to locking position by its gravity alone, means, substantially as described, for liberating the same, a pivoted knuckle

sections coupling the reversing-arms and the flexible covering, substantially as set forth.

5. The combination of a reversible seat-back, reversing-arms connected thereto with the capacity of relative revolutionary movement, a roller connected to the reversing-arms, a flexible covering or upholstering connected at its ends to the seat-back, and a connection coupling the roller and the covering, substantially as set forth

graphically indicated, as described, the first in broad heavy lines, the next in light lines, the third in double lines, and the fourth in two light and two double lines, each having spaces of unequal width and dotted lines therein, substantially as specified.

2. The improved music-sheet having the repeat character, consisting of the cross-lines and dots, arranged substantially as set forth.

3. The improved music-sheet having annotated staffs, as described, the first in broad heavy lines, the second in light lines, the third in double lines, and the fourth in two light and two double lines, each having spaces of unequal width and dotted lines in the spaces parallel to the ledger-lines, the fourth being inclosed in the brace connecting the two lower lines of the treble-staff and the two upper lines of the tenor-staff, substantially as specified.

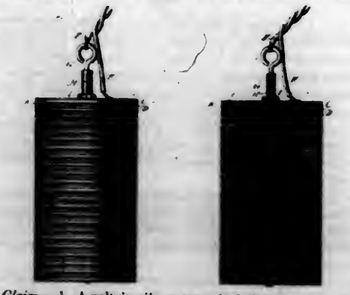
482,443. CONVEYING AND HOISTING DEVICE. EDMUND G. SPILSBURY, Trenton, N. J., assignor to the Trenton Iron Company, same place. Filed Apr. 19, 1892. Serial No. 429,732. (No model.)

Claim.—1. In a conveying device, the combination, with a traveling carriage, of a hauling-rope for said carriage and a hoisting-rope supported by the hauling-rope, and thereby being prevented from sagging, substantially as described.

2. In a conveying device, the combination, with a traveling carriage, of a hoisting-rope, a divided hauling-rope having its branches separated from each other by an intervening space, and supports suspended between the branches to prevent sagging of the hoisting-rope, substantially as described.

3. In a conveying device, the combination, with a traveling carriage, of a hoisting-rope, a divided hauling-rope having its branches separated from each other by an intervening space, and supporting-rollers suspended between the branches to prevent sagging of the hoisting-rope, substantially as described.

4. In a conveying device, the combination, with a traveling carriage, of a hoisting-rope, a divided hauling-rope having its branches separated from each other by an intervening space, clips secured to the branches, and supporting-rollers mounted between said clips, said rollers preventing the sagging of the hoisting-rope, substantially as described.



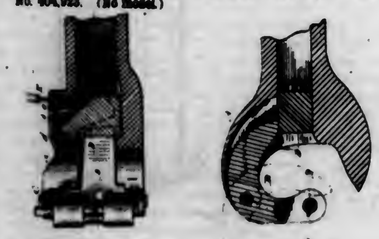
5. In a conveying device the combination, with a divided hauling-rope having its branches separated by an intervening space, of clips secured to the two branches, said clips having inwardly and downwardly inclined bearings, rollers mounted within said bearings, and two pairs of guide-sheaves for the hauling-rope, the upper pair of said guide-sheaves having flanges on their inner faces and the lower pair having flanges on their outer faces, substantially as described.

6. In a conveying device, the combination, with a divided hauling-rope having supports for a hoisting-rope, of guide-sheaves separated by a space corresponding to that which separates the branches of the hauling-rope, a hoisting-rope, and a guide-pulley for the hoisting-rope, located in a plane between the hauling-rope guide-sheaves, substantially as described.

7. In a conveying device, the combination, with a divided hauling-rope and supports for a hoisting-rope, of a driving-pulley having two independent sets of gripping devices, one for each division or branch of the hauling-rope, substantially as described.

8. In a conveying device, the combination, with a divided hauling-rope, of a driving-pulley provided with face-plates having outlying side flanges and gripping-dogs located within spaces intermediate the side flanges and face-plates, the branches of the hauling-rope passing between the dogs and the face-plates, substantially as described.

482,444. VOLTAIC PILE. WILLIAM E. WASHBURN, Cedar Rapids, Iowa, assignor of two-thirds to F. S. Washburn and F. E. Washburn, same place. Filed June 14, 1892. Serial No. 436,690. (No model.)

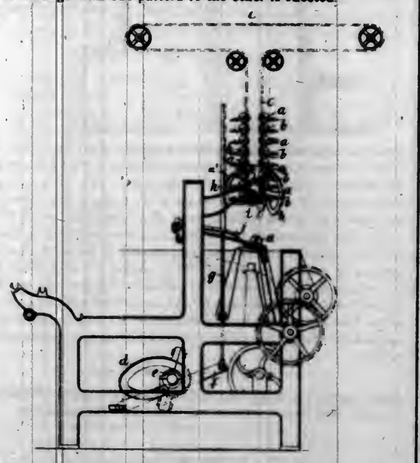


Claim.—1. A voltaic pile composed of alternate layers of positive and negative electric elements and interposed alternately-arranged absorbents and non-conductors, one of said elements having a small portion extending past the insulation and in contact with the opposite element, whereby the pile is adapted to operate by immersion in a suitable exciting-fluid, substantially as described.

2. In a voltaic pile, the combination of positive and negative elements in alternating series, interposed absorbents and non-conductors also in alternating series, with contact-points to connect the elements separated by the non-conductors, and an insulated stem passing through the entire series and having an electrical connection with one of the elements at one end, and means for closing the circuit, substantially as described.

3. The herein-described voltaic pile, composed of disks of copper and zinc, separating disks of porous paper and paraffine arranged in alternating order, as specified, a lip on each of the disks of one element adapted to make a point of contact with the disks of the opposite element, an insulated rod or wire passing through all the disks and connecting electrically with one of the terminal disks corresponding electrically with itself, a clamp-ring to hold the parts together, and circuit-closing means, substantially as described.

482,445. CAR-COUPLING. DYER WILLIAMS, Cedar Rapids, Iowa, assignor to Florence Williams, same place. Filed Sept. 7, 1891. Serial No. 404,923. (No model.)



Claim.—1. In a car-coupler of the class specified, the combination of the knuckle having one or more longitudinal grooves in the coupling-pin hole thereof, a shoulder or offset in one of the grooves, and a coupling-pin having one or more studs or splines coinciding with said grooves, the shoulder specified being adapted to hold the pin by its projecting stud up for the passage of the link and to liberate it by the shock of coupling.

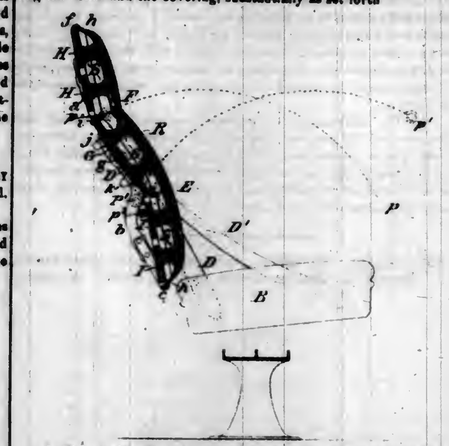
2. In a car-coupler of the class specified, the combination of a draw-head substantially as described, a locking-block pivoted at its forward upper portion on a transverse pin in the draw-head and adapted to swing down to locking position by its gravity alone, means, substantially as described, for liberating the same, a pivoted knuckle with coupling-pin holes provided with one or more internal grooves to receive a stud or spline and with a slight offset in one of said grooves, and a coupling-pin having one or more studs or splines fitting loosely in said groove or grooves, substantially as and for the purpose set forth.

482,446. LOOM FOR WEAVING TUFTED FABRICS. HENRY DIXON, Kidderminster, England. Filed Dec. 30, 1891. Serial No. 416,571. (No model.)

Brief.—For weaving fabrics having end borders two patterns are arranged upon the alternate bars of the chain, which chain is turned two bars at a time. By turning the chain forward or backward one bar the change from one pattern to the other is effected.

Claim.—In a loom for weaving tufted pile fabrics, the combination of a drum or cylinder, an endless chain carried thereby, two sets of bobbins, each set constituting a pattern, one set being carried by the alternate links of the chain and the other set by intermediate links, arms, substantially as described, adapted to take each bobbin, as required, from the chain to pass it through the warp and return it to the chain, means for moving the chain forward two links step by step, and a lever to turn said drum or cylinder to thereby move the chain backward or forward one link to weave from the alternate set of bobbins.

482,447. REVERSIBLE BACK FOR CAR OR OTHER SEATS. MATTHIAS N. FORREST, New York, N. Y. Filed Apr. 4, 1892. Serial No. 427,666. (No model.)



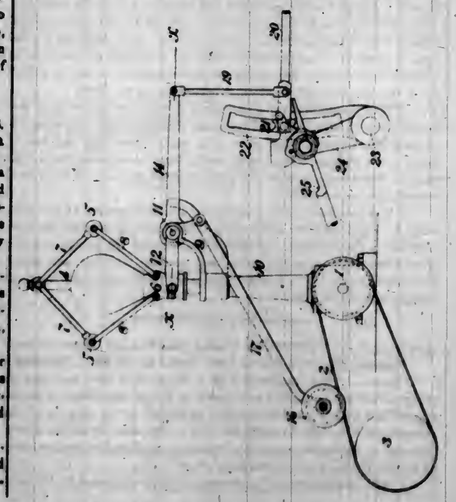
Claim.—1. The combination of a reversible seat-back having a flexible or articulated body, reversing-arms pivotally connected to said seat-back, and transmitting mechanism interposed between the reversing-arms and the flexible body, whereby the form of the surface of the body is changed in and by the reversal of the seat-back, substantially as set forth.

2. The combination of a reversible seat-back, reversing-arms connected thereto, and rotary mechanism connected to the reversing-arms and to the upholstery of the seat-back and acting to extend and depress different portions thereof in and by the reversal of the seat-back, substantially as set forth.

3. The combination of a reversible seat-back having a flexible or articulated body, reversing-arms connected to said seat-back, members connected to and deriving movements of rotation from the reversing-arms, and connections interposed between said rotary members and the flexible or articulated body, substantially as set forth.

4. The combination of a reversible seat-back, reversing-arms connected thereto, a flexible covering adapted to be automatically changed in form in and by the reversal of the seat-back, and intermediate connections coupling the reversing-arms and the flexible covering, substantially as set forth.

5. The combination of a reversible seat-back, reversing-arms connected thereto with the capacity of relative revolutionary movement, a roller connected to the reversing-arms, a flexible covering or upholstering connected at its ends to the seat-back, and a connection coupling the roller and the covering, substantially as set forth



6. The combination of a reversible seat-back provided with flexible or articulated backing and reversing mechanism adapted to effect a change of form of the seat-back in and by its movement during reversal, substantially as set forth.

7. The combination of a reversible seat-back, flexible or articulated backing connected to the seat-back frame at its upper and lower edges and pivoted to it in the middle, and reversing mechanism adapted to effect a change of the form of the back in and by its reversal, substantially as set forth.

8. The combination of a reversible seat-back, backing consisting of a central section and upper and lower sections flexibly connected to the central section and to the seat-back frame, and reversing mechanism whereby the form of the back is changed in and by its reversal, substantially as set forth.

9. The combination of a reversible seat-back provided with flexible or articulated backing or elastic upholstry, reversing-arms connected to the back, and stops which engage with it to change the form of its surface in and by its reversal, substantially as set forth.

482,448. GOVERNOR. JAMES HEMPHILL and JOSEPH FAWELL, Pittsburg, Pa. Filed Feb. 15, 1892. Serial No. 421,943. (No model.)

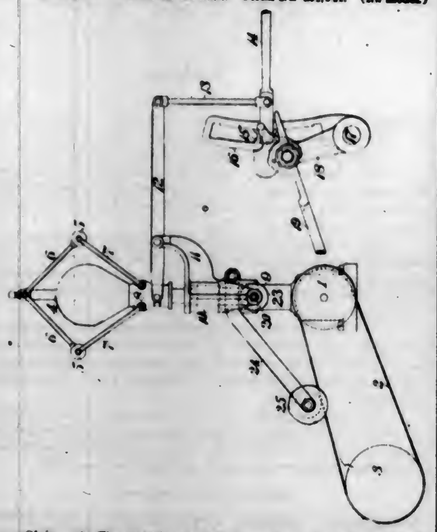
Claim.—1. The combination of a governor, a lever operated by the governor and adapted to regulate the movement of the valve controlling the flow of steam to the cylinder of the engine, said lever being formed in two sections, and a lock for normally holding the sections of said lever in approximate parallelism with each other, substantially as set forth.

2. The combination of a governor, a lever operated by the governor and adapted to regulate the movements of the valve controlling the flow of steam to the cylinder of the engine, said lever being formed in two parts or sections, a lock for holding each sections in approximate parallelism with each other, and means operative on the rupture of the governor-driving belt for unlocking said sections, substantially as set forth.

482,450.

of the sheet being coated in sectional transfer-colorings adapted to be impressed upon another surface when traced by a stylus or pencil, substantially as described.

482,452. SHAKING-GRATE. CHARLIE E. MARX, Cleveland, Ohio. Filed Oct. 26, 1891. Serial No. 409,923. (No model.)



Claim.—1. In a power bottle-corking machine, the combination, with the driving-shaft 1 and its pinion, the crank-shaft M, with its gear-wheel O, the clutch Q, its engaging-key *c*, the disengaging spring-bolt V, and the connected treadle U, the connected vertically-reciprocating cork-plunger and bar E, with its curved slot *h*, and the opening and closing cork-guide F, of the bottle-rest H, with its lifting-lever Y from the treadle U, the adjustable collar *p'* and spring *z*, and its automatic grip-levers 6 and 7, and the releasing-link 8, and pin 10, all arranged to operate substantially as and for the purpose herein set forth.

Claim.—1. The combination of a governor, a lever operated by the governor and adapted to regulate the movement of the valve controlling the flow of steam to the cylinder of the engine, said lever being formed in two sections, and a lock for normally holding the sections of said lever in approximate parallelism with each other, substantially as set forth.

2. The combination of a governor, a lever operated by the governor and adapted to regulate the movements of the valve controlling the flow of steam to the cylinder of the engine, said lever being formed in two parts or sections, a lock for holding such sections in approximate parallelism with each other, and means operative on the rupture of the governor-driving belt for unlocking said sections, substantially as set forth.

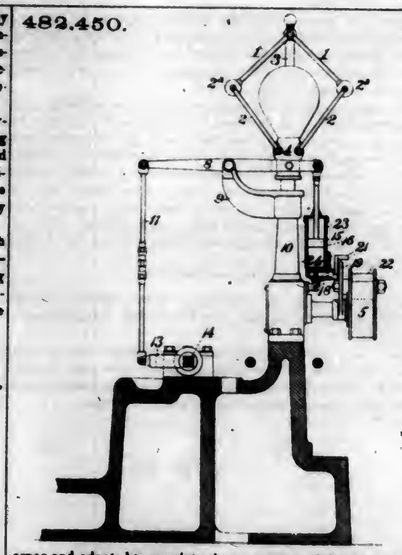
3. The combination of a governor, a pivot-pin connected with the sleeve of said governor and oscillated thereby, said pin being provided with an angular and a rounded portion, a lever normally fitting on said angular portion, and means operative on a rupture of the governor-driving belt for shifting the lever onto the rounded portion of the pivot-pin, substantially as set forth.

482,449. GOVERNOR. JAMES HEMPHILL and JOSEPH FAWELL, Pittsburg, Pa. Filed Feb. 15, 1892. Serial No. 421,641. (No model.)

Claim.—1. The combination of a governor, a lever having its inner end connected to the governor and its outer end to the stem of a valve controlling the flow of steam to the cylinder of an engine through suitable interposed mechanism, and means for so shifting the pivotal support of the lever and thereby lower the outer end of the lever as to shift the valve over the inlet-ports of the cylinder in case of a rupture of the governor-driving belt, substantially as set forth.

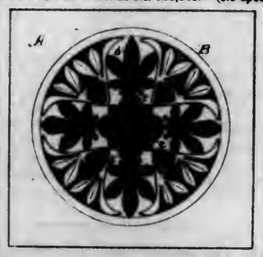
2. The combination of a governor, a lever having its inner end connected to the governor and its outer end connected by suitable interposed mechanism to the stem of a valve controlling the flow of steam to the cylinder of an engine, and means for lowering the pivotal support of the lever in case of a rupture of the governor-driving belt, substantially as set forth.

3. The combination of a governor, a lever operated by the governor for regulating the movements of the valve controlling the flow of steam to the cylinder, a sliding sleeve forming the pivotal support for the lever and supported in normal position by a pin, and means for removing said pin in case of rupture of the governor-driving belt, substantially as set forth.



482,450. GOVERNOR. JAMES HEMPHILL and JOSEPH FAWELL, Pittsburg, Pa. Filed Feb. 15, 1892. Serial No. 421,642. (No model.)

Claim.—1. The combination of a governor, a lever operated by the governor and connected to the stem of the cut-off valve of a steam-engine, and a fluid-pressure cylinder operative on the rupture of the governor-driving belt to shift the lever in the same direction and to the same or a greater extent than would be produced by the governor at an abnormal speed, substantially as set forth.



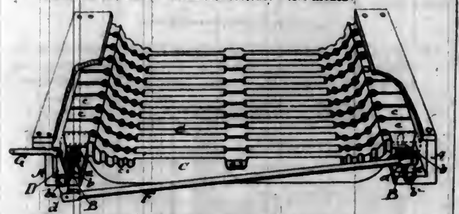
2. The combination of a governor, a lever operated by the governor and adapted to regulate the movement of the valve controlling the flow of steam to the cylinder of an engine, a fluid-pressure cylinder having its piston connected to the lever, and a valve mechanism controlling the flow of fluid-pressure to the cylinder and operative on the rupture of the governor-driving belt, substantially as set forth.

3. The combination of a governor, a lever operated by the governor and adapted to regulate the movements of the valve controlling the flow of steam to the cylinder of an engine, a fluid-pressure cylinder having its piston connected to the lever and provided at or near its ends with outlet-ports, and a valve mechanism controlling the flow of the fluid-pressure to the cylinder and of air from the cylinder and operative on the rupture of the governor-driving belt, substantially as set forth.

482,450.

482,451. TRANSFER-SHEET. FREDERICK KOSTUI, Williamsport, Pa. Filed Nov. 5, 1889. Serial No. 329,375. (No specimens.)

Claim.—1. As a new article of manufacture, the transfer-sheet herein described, comprising a single sheet of translucent paper and a design or pattern impressed or inscribed thereon by ink, which impresses the outlines of the pattern upon another surface when the same is traced by a pencil or stylus following the outlines of the pattern, which are visible on the top surface of the sheet, substantially as described.



2. As a new article of manufacture, a reversible transfer sheet consisting of a sheet of paper and the coincident patterns or designs impressed on the two surfaces of said sheet, substantially as described.

3. As a new article of manufacture, a transfer-sheet having an ink pattern or design impressed thereon, said pattern being variously colored and adapted to be transferred to another surface or sheet when traced by a stylus or pencil, substantially as described.

4. As a new article of manufacture, a reversible sheet having a pattern or design impressed on both surfaces thereof, the pattern on one surface registering with that on the other surface, and both patterns being correspondingly colored in two or more colors, substantially as described.

5. As a new article of manufacture, a transfer-sheet comprising a single sheet of paper and a design or pattern thereon, one of the faces of the sheet being coated in sectional transfer-colorings adapted to be impressed upon another surface when traced by a stylus or pencil, substantially as described.

482,452. SHAKING-GRATE. CHARLES E. MARK, Cleveland, Ohio. Filed Oct. 26, 1891. Serial No. 409,923. (No model.)

Claim.—In a shaking-grate, the angle-plates A, having seats for the rock-shafts, rock-shafts B B, mounted therein and provided with the pins or lugs *b b*, grate-bars C C, having socketed heads *c c*, supported on said pins in reverse order, and means for rocking said shafts oppositely, whereby the grate-bars have imparted to them the reciprocating movements, substantially as and for the purpose specified.

482,453. BENCH-BLOCK FOR DENTISTS, JEWELERS, AND OTHERS. GEORGE W. MELOTTE and CHARLES M. CLIFTON, Ithaca, N. Y.; said Clinton assignor to said Melotte. Filed May 14, 1892. Serial No. 433,094. (No model.)

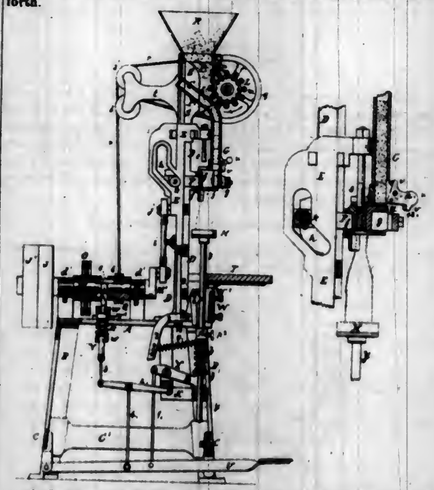
Brief.—Different blocks are adjustably supported upon a single bracket by means of a rotating hub of several arms.

Claim.—1. In combination, the bracket having a hub-supporting stud, the transversely cored-out hub having a bore 6 and adapted to support two or more blocks of different character at an angle to the stud, the plug screwing into the stud and provided with a head fitting said bore, and a spring bearing in said head and on the hub, whereby the hub is held endwise on the stud, substantially as set forth.

2. The combination of the bracket adapted to be attached to a bench or table and provided with a hub-supporting stud and a multiple-armed hub rotatably secured thereon, provided with sockets each having a block, and a lock adapted to hold the hub in any desired one of several situations, substantially as set forth.

3. The combination, with a bracket and with a rotatably-adjustable-and socketed hub, of an anvil supported in one of said sockets and a lock adapted to secure the anvil in different positions when suitably rotated, substantially as set forth.

4. In combination, the bracket having a hub-supporting stud 3, the hub provided with passage 6 to receive the stud and provided, also, with passage 12 to permit the insertion of an anvil-fastening screw-plug 10 and to give access to the said plug for its removal, and a detachable anvil 18, substantially as set forth.



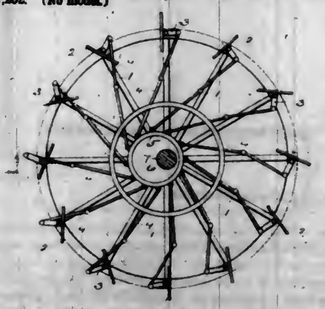
5. The combination of the bracket provided with a pin and with a stud and having a plurality of block-supporting arms and the block-supporting hub fitted to be supported and turned upon said stud and having, also, notches to receive said pin, substantially as set forth.

6. The combination of the bracket provided with a pin and with a stud and having a plurality of block-supporting arms, and the block-supporting hub fitted to be supported and turned upon said stud and having, also, notches to receive said pin, and a spring normally holding the pin in the notch when they are suitably engaged to lock the hub against rotation, substantially as set forth.

7. In combination with the block-supporting stud, the split thimble, the spring tending to spread said thimble situated in a recess in the stud, and said block suitably apertured to embrace the thimble on the stud, substantially as set forth.

482,454. POWER BOTTLE-CORKING MACHINE. DAVID MUELLER, New York, N. Y., assignor to the Bottlers' and Brewers' Machine Manufacturing Company. Filed Feb. 2, 1892. Serial No. 420,080. (No model.)

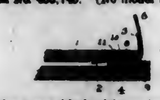
Claim.—1. In a power bottle-corking machine, the combination, with the driving-shaft I and its pinion, the crank-shaft M, with its gear-wheel O, the clutch Q, its engaging-key *c*, the disengaging spring-bolt V, and the connected treadle U, the connected vertically-reciprocating cork-plunger and bar E, with its curved slot *k*, and the opening and closing cork-guide F, of the bottle-rest H, with its lifting-lever Y from the treadle U, the adjustable collar *p'* and spring *z*, and its automatic grip-levers 6 and 7, and the releasing-link 8, and pin 10, all arranged to operate substantially as and for the purpose herein set forth.



2. In a power bottle-corking machine, the combination, with the driving-shaft I, its pinion and belt-pulley, the crank-shaft M, the reciprocating plunger *e*, the opening and closing cork-guide F, and bottle-rest H, of the cork-hopper P, the connected and revolving agitating-drum L, with its projections *m* and guide-bands *n*, the cork-plunger bar E, with its agitating-blade S, and the feed-tube G, with its cut-off pawl *u*, all arranged to operate automatically in feeding each cork for each downstroke of the cork-plunger, substantially as and for the purpose herein described.

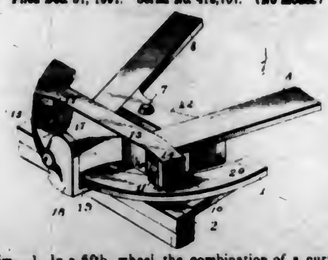
3. In a power bottle-corking machine, the combination, with the driving-shaft I, and the hopper P, the cork-plunger *e*, and cork guide F, with its connected sliding section, of the revolving drum L, with its projections *m*, its grooves *p*, and bands *n*, the feed-tube G, its cut-off pawl *u*, and the reciprocating plate S, substantially as and for the purpose herein stated.

4. In a power bottle-corking machine, the combination, with the cork-plunger *e* and guide-bar E, of the bottle-rest H, its rod *y*, its guide-case W', with the grip-lever 6, the link 8, its pin 10, and the lever 7, the spring *z*, the collars *p'* and *z'*, the lever Y, and treadle U, substantially as and for the purpose herein set forth.



482,455. FEATHERING PADDLE-WHEEL. CHARLES H. MCCREADY, West Bridgewater, Pa. Filed June 23, 1891. Serial No. 397,262. (No model.)

Claim.—The herein-described paddle-wheel for steamboats, comprising the frame having arms, a series of buckets pivoted to the periphery of said frame, short cranks secured to the ends of the journals of said buckets, eccentrics on the shaft of the wheel adjacent to the



bearings thereof and provided with an eccircling strap, and jointed rods, each pivoted at its inner end to said strap and at its outer end to one of said cranks, said eccentric being adapted to enter and lift the buckets vertically into and out of the water, and said buckets being free to oscillate in their bearings, as described.

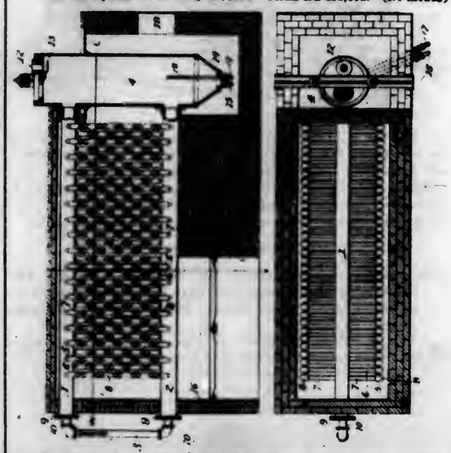
482,456. SHOE. EVAN MCDONALD, Rochester, N. Y. Filed May 20, 1892. Serial No. 433,745. (No model.)

Claim.—The shoe provided with an insole having a portion cut away at its edges, forming a recess below the surface of the sole, and a shoulder, combined with a folded strip of canvas, leather, or other material fastened in the bottom of said recess and with the upper secured to the insole by stitches passing through the upper under the strip at the bottom of said recess and through the insole within the recess, substantially as set forth.

482,457. FIFTH-WHEEL. FRANK MCLAUGHLIN, Baker's Corner, Ind. Filed Dec. 31, 1891. Serial No. 416,707. (No model.)

Claim.—1. In a fifth-wheel, the combination of a curved plate forming a track and designed to be mounted on an axle, the bar 13, provided at its ends with recesses, a casing secured at the front of the bar and receiving the curved plate and composed of a recessed block, a vertically-disposed plate secured to the front of the block and having a horizontal flange extending rearward from the lower end of the vertical plate, and rollers arranged in said recesses and in the casing and mounted on the track, substantially as described.

2. In a fifth-wheel, the combination of a curved plate, the cross-bar 13, provided with forwardly-extending ends arranged at an angle to the body of the cross-bar 13, a casing centrally secured to the bar, and rollers mounted on the curved plate and arranged at the ends of the bar 13 and in the casing, substantially as described.



3. In a fifth-wheel, the combination of a curved plate having a transverse bar and provided with rearwardly-extending arms terminating in a socket, an eyebolt journaled in the socket, the cross-bar 13, a casing centrally secured to the bar, and rollers mounted on the curved plate and arranged at the ends of the bar 13 and in the casing, substantially as described.

482,458. FURNACE. VINCENT J. PARNELL, Farmington, Mo. Filed Apr. 25, 1891. Serial No. 390,510. (No model.)

Claim.—The combination, with a heater having a grate at its front end, an exit-flue leading from the center of its rear end, and a boiler mounted upon the heater and divided into sections by a transverse vertical partition, of a transverse horizontal partition within the heater, extending from a point slightly forward of the center of the mouth of said exit-flue to a point beneath said vertical partition, where it terminates, rods journaled in the sides of the casing and extending across the ends of this horizontal partition, handles on the ends of said rods, an L-shaped damper fixed upon the front rod at the inner terminal of said partition and adapted in both positions to have one wing thereof form a rear wall for the heater fire-box, while the other wing rests flat upon either side of the partition, said L-shaped damper being adapted to divide the currents of heat directly in a line below the vertical partition, and a flat damper fixed upon the rear rod and of a width to strike the rear end of the heater above said mouth, as and for the purpose hereinbefore set forth.

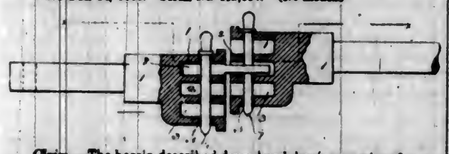
482,459. STEAM-BOILER. JAMES POLLOCK, Wilkes-Barre, Pa., assignor, by mesne assignments, to the Wyoming Boiler Company, Limited, same place. Filed May 13, 1892. Serial No. 433,892. (No model.)

Claim.—1. In a steam-boiler, the combination of the horizontal steam-drum, the horizontal water-drum, the vertical connections 3 4 at the ends of said drums, and the two series of zigzag pipes connecting said drums, substantially as described.

2. In a steam-boiler, the horizontal steam and water drums having their forward ends extending through the front wall of the furnace and provided with removable covering-plates, the vertical pipe 3, communicating with the forward ends of the drums, the enlarged casing 4, with which the rear ends of the drums communicate, and the zigzag pipes arranged in two series and communicating with both of said drums, substantially as described.

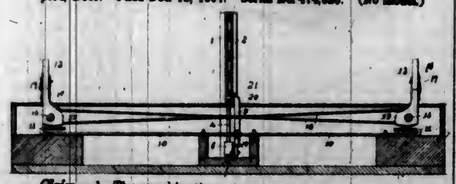
3. The combination, with the horizontal drums, the zigzag tubes connecting said drums, and the vertical pipe 3, extending between the forward ends of said drums, of a vertical casing 4 in communication with the rear ends of the drums, said casing having a steam-outlet at the upper end and a conical bottom and blow-off pipe at its lower end, substantially as described.

4. The combination, with horizontal steam and water drums, of two series of zigzag pipes connecting said drums, an enlarged cylindrical casing connected to the rear ends of said drums, a steam-outlet at the upper end of the casing, a perforated water-inlet pipe near the lower end of the casing, and a blow-off pipe 15 at the bottom of the casing, substantially as described.



482,460. FLOOD-FENCE. JOHN H. POULTER, Arcola, Ill. Filed Dec. 18, 1889. Renewed Feb. 18, 1892. Serial No. 422,035. (No model.)

Claim.—In a flood-fence, the combination, with the swinging panel comprising a cylindrical head linked to suitable posts or supports and having suitable pickets secured therein, of the adjacent fence-panels having short bottom rails and long upper rails, the latter being extended into the path of the swinging head and of the end pickets



of the swinging panel to form a stop for the latter to limit its swinging movement in either direction, substantially as and for the purpose set forth.

482,461. CAR-COUPLING. JOHN A. SAMPLE, Wilkinsburg, Pa. Filed Dec. 14, 1891. Serial No. 415,087. (No model.)

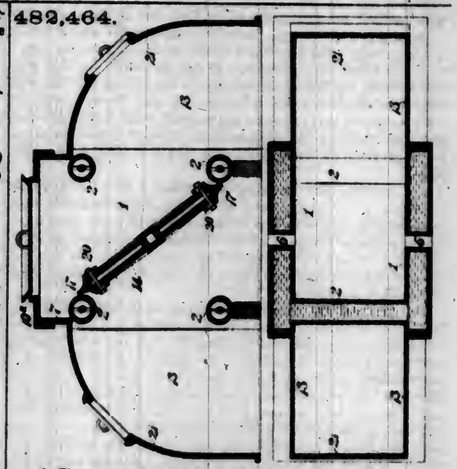
Claim.—The herein-described draw-head, having a series of openings arranged in the front face, the one above the other, and a vertical opening for the pin passing through the said openings, in combination with a link having a rectangular portion adapted to fit into one of the openings, a circular opening through the said rectangular portion, and the reduced end of the said link having an opening for the pin of the other draw-head, and a point formed on the said link, substantially as and for the purpose described.

482,462. AUTOMATIC GATE. RANDOLPH E. SLAWSON, Davenport, Nebr. Filed Dec. 12, 1891. Serial No. 414,889. (No model.)

Claim.—1. The combination of a swinging gate provided with a horizontally-extending arm, a rock-shaft disposed longitudinally of the roadway and provided with an intermediate arm connected with the said arm of the gate and having terminal arms, and levers adapted to be moved by a vehicle-axle and arranged to engage the terminal arms to turn the rock-shaft, substantially as described.

2. The combination of a swinging gate having a depending portion and provided with an arm extending therefrom, a rock-shaft arranged at right angles to the gate and provided at its ends with arms and having a centrally-arranged arm, a rod connecting the central arm of the rock-shaft with the arm of the gate, and cam-levers pivotally mounted above the ends of the rock-shaft and arranged to be operated by a vehicle to depress the arms at the ends of the rock-shaft, substantially as described.

3. The combination of a swinging gate having a depending portion and having an arm extending therefrom, a rock-shaft provided at its ends with arms and having intermediate of its ends an arm 9, connected with the arm of the gate, levers mounted above the ends of the rock-shaft and adapted to depress its terminal arms and provided with outwardly-swinging hinged sections, and connections between the hinged sections of one lever and the body of the other lever, substantially as described.



4. The combination of a swinging gate having a depending portion and provided with an arm extending therefrom, a rock-shaft provided intermediate of its ends with an arm connected with the arm of the gate and having at its ends arms, cam-levers mounted above the ends of the rock-shaft and arranged to depress its arms and provided with outwardly-swinging hinged sections, connections between the hinged section of one lever and the cam of the other lever, and springs for holding the hinged section in alignment with the other portions of the levers, substantially as described.

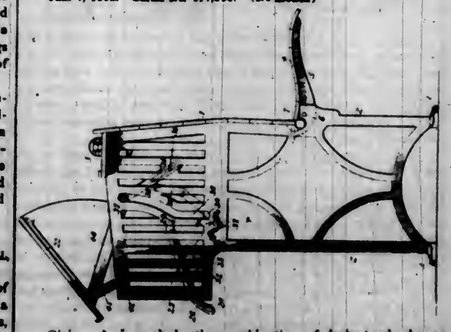
5. The combination of the swinging gates provided with horizontally-extending arms, a rock-shaft disposed longitudinally of the roadway and provided intermediate of its ends with a beveled projection and with an arm connecting with the said arms, said rock-shaft having terminal arms, the axle-operated levers arranged to engage the terminal arms, and a latch mounted on one of the gates and adapted to engage the other and arranged to be engaged by the said beveled projection, substantially as described.

482,463. CASING FOR FURNACE-VALVES. WILLIAM SWINDELL, Pittsburg, Pa. Filed Feb. 1, 1892. Serial No. 419,910. (No model.)

Claim.—1. The combination, in a valve-chamber for furnaces, of hollow side walls or casings, tubes connecting such walls or casings, a valve adapted to seat itself in its several positions against such tubes, and pipes for introducing water into the casing, substantially as set forth.

482,464.

2. The combination, in a valve-chamber for furnaces, of tubes arranged transversely of the chamber and connected to a suitable water-supply and a valve adapted to seat itself in its normal positions against said tubes, substantially as set forth.



3. The combination, in a valve-chamber for furnaces, of hollow side walls or casings provided with suitable water-inlets, tubes connecting such walls or casings, a valve adapted in its normal positions to seat itself against such tubes, and removable hoods or cap-plates fitting between the side walls, substantially as set forth.

482,464. BURGLAR-ALARM. HOMER T. WILSON, Louisville, Ky. Filed Mar. 4, 1892. Serial No. 423,776. (No model.)

Claim.—The herein-described contact device, adapted to be used in connection with a projection on the lower rail of a window-sash or other object, the same consisting of the inner and outer spring contact-plates provided with aligned perforations near one end, an insulating-block interposed between the plates and provided with aligning perforations and at opposite sides with wire-receiving grooves, and screws passed through the aligned perforations of the plates and intermediate insulating-block and adapted to project beyond the same into a window-sill or other object and to clamp the plates, block, and wires, said plates having their ends beyond the block bent and adapted to contact, substantially as set forth.

482,465. SCHOOL-DESK. CYRENIUS S. BARNES, Elba, Nebr. Filed Jan. 7, 1892. Serial No. 417,305. (No model.)

Claim.—1. In a desk, the combination of desk-standards provided with guides, a desk-top, brackets supporting the desk-top and

provided with pins arranged in said guides, arms pivotally connected to the brackets and having a limited movement on the standards, and means for raising and lowering the arms, substantially as described.

2. In a desk, the combination of desk-standards provided with guides, a desk-top, brackets supporting the desk-top and provided with pins arranged in said guides and adapted to move therein, arms pivotally connected to the brackets and provided with longitudinal slots, pins projecting from the standards and arranged in the slots of the arms, and means for raising and lowering the arms, substantially as described.

3. In a desk, the combination of a standard provided with a guide,

connected to said side opening of the dome, a dust-flue vertically disposed and connecting the said vent of the ash-box and of the last-named vent and having a damper therein, a removable collar located in the top opening of the dome and depending above and below the same, a central magazine having its lower end connected to said collar and the upper end thereof secured to the said drum, a smoke-flue spirally arranged within the said drum around the magazine and having the lower end thereof communicating with the vent entering the side of the dome of the fire-pot and the upper end of the same opening into a smoke-pipe passing through the side of the casing and drum, and an air-flue spirally arranged between the upper and lower surfaces of the

Claim.—1. Means for operating cut-offs, comprising, in combination with a suitable belt, a wheel bearing upon said belt, a weight-arm pivotally supported within said wheel and provided with a lug projecting through the wall of said wheel, a spring connected with said arm, and a tripping device arranged to be operated by the lug on said arm, substantially as described.

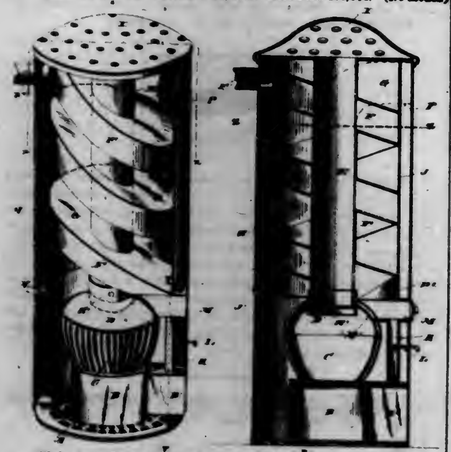
2. The herein-described wheel for operating cut-offs, consisting of the disk 19 and rim 25, said disk being provided with a slot 45, a disk closing the other side of the wheel, the weight-arm pivoted within said disk and provided with a lug 47, projecting through said slot 45, the spring 37, connected with said arm, and means for adjusting said

the same, and mechanism whereby said wheels are driven, substantially as set forth.

4. In a transportation system, a car hung from an upper track and friction drive-wheels bearing and acting against the side of said car, the car being so hung that the action of gravitation will force and hold it against the friction-wheels, and mechanism for driving the wheels, substantially as described.

5. In a transportation system, a car hanging from an upper track and friction drive-wheels bearing against the sides of the car, the car being hung from a point at one side of its center of gravity, so that it

provided with pins arranged in said guides, arms pivotally connected to the brackets and having a limited movement on the standards, and means for raising and lowering the arms, substantially as described.



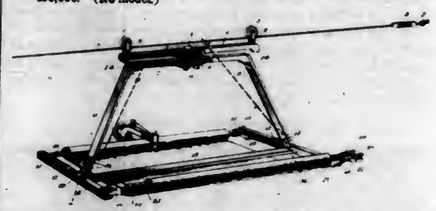
2. In a desk, the combination of desk-standards provided with guides, a desk-top, brackets supporting the desk-top and provided with pins arranged in said guides and adapted to move therein, arms pivotally connected to the brackets and provided with longitudinal slots, pins projecting from the standards and arranged in the slots of the arms, and means for raising and lowering the arms, substantially as described.

3. In a desk, the combination of a standard provided with a guide, a desk-top, a bracket supporting the desk-top and provided with a pin arranged in said guide, an arm pivotally connected to the bracket and having a limited movement on the standard, an L-shaped lever fulcrumed at its angle and having one end connected to said arm, and an operating-lever connected to the other end of the L-shaped lever, substantially as described.

4. In a desk, the combination of standards provided with guides, a desk-top, brackets supporting the desk-top and provided with pins arranged in said guides, arms 34, pivotally connected to the brackets and having a limited movement on the standards, a rod journaled in the standards and provided at one end with an arm 30ª, rigidly connected to it, an L-shaped lever rigidly secured at its angle to the other end of the rod, links connecting the inner ends of the L-shaped lever and the arms 30ª with the arms 34, and an operating-lever connected with the outer end of the L-shaped lever, substantially as described.

5. In a desk, the combination of a standard provided with a guide, a desk-top, a bracket supporting the desk-top and provided with a pin arranged in said guide, an arm pivotally connected to the bracket and having a limited movement on the standard, an L-shaped lever fulcrumed at its angle and having its inner end connected with said arm and provided at its other end with a pin, and an operating-lever fulcrumed on the standard and provided with a longitudinal slot receiving the pin of the L-shaped lever, substantially as described.

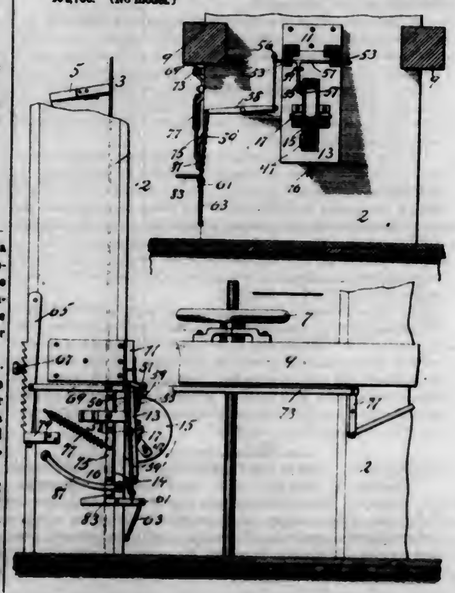
482,466. COMBINED STOVE AND FURNACE. CARL BRANDT, Cedar Falls, Iowa. Filed Mar. 23, 1892. Serial No. 426,111. (No model.)



Claim.—1. In a combined stove and furnace, a fire-pot having a drum mounted thereover, provided with a spirally-arranged smoke-flue connected with said fire-pot and a spiral air-flue between the parts of the said spirally-arranged smoke-flue, said smoke-flue connecting with a smoke-pipe in the side of the stove or furnace and the air-flue opening at its upper end through the top of said stove or furnace, substantially as described.

2. In a combined stove and furnace, the combination of a fire-pot, a drum mounted thereon having a spirally-arranged smoke flue therein connected at its lower end with said fire-pot and at its upper end with an escape-pipe located in the side of the furnace or stove, a spirally-arranged air flue between the parts of said smoke-flue and opening out of the top of said drum, and a chamber or magazine extending centrally through said flues, substantially as described.

3. In a combined stove and furnace, the combination of a casing having a base made with open-work for the passage therethrough of currents of air, an interior drum open at the bottom and having a perforated top and a perforated top fitted over said casing and said drum, an ash-box on said base having a cleaning-vent, a fire-pot above said ash-box having a detachable dome and a top and side opening, a vent connected to said side opening of the dome, a dust-flue vertically disposed and connecting the said vent of the ash-box and of the last-named vent and having a damper therein, a removable collar located in the top opening of the dome and depending above and below the same, a central magazine having its lower end connected to said collar and the upper end thereof secured to the said drum, a smoke-flue spirally arranged within the said drum around the magazine and having the lower end thereof communicating with the vent entering the side of the dome of the fire-pot and the upper end of the same opening into a smoke-pipe passing through the side of the casing and drum, and an air-flue spirally arranged between the upper and lower surfaces of the smoke-flue, substantially as described.



482,467. QUILTING ATTACHMENT FOR SEWING MACHINES. JOHN W. CLAYTON, Chattanooga, Tenn. Filed Apr. 26, 1892. Serial No. 430,696. (No model.)

Claim.—1. In a quilting-frame, the combination of a carriage, a suspending-frame pivotally connected to said carriage, a quilting frame proper connected to said suspending-frame, and set-screws in said suspending-frame adapted to engage the carriage for the purpose of holding the quilting-frame in rigid adjustment for straight-running stitches, substantially as described.

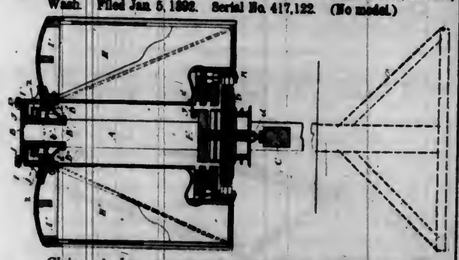
2. In a device of the character set forth, the combination of a carriage, a suspending-frame having an upper beam movably connected to said carriage, obliquely-arranged arms hinged at their upper ends to the ends of said beam and having a series of openings extending through the lower portion of each, a folding quilting-frame supporting rollers and having plates hinged to the centers of the end strips thereof, said plates having a series of openings in their free ends, and removable pins adapted to be inserted through aligned openings of said plates and obliquely arranged arms, substantially as described.

482,468. MEANS FOR OPERATING SAFETY CUT-OFFS FOR GRAIN-ELEVATORS. WILFRED G. COGSWELL, Duluth, Minn., assignor, by direct and mesne assignments, to Herman R. Long, same place, and Charles R. Soule, Grand Haven, Mich. Filed Aug. 31, 1891. Serial No. 404,188. (No model.)

Claim.—1. Means for operating cut-offs, comprising, in combination with a suitable belt, a wheel bearing upon said belt, a weight-arm pivotally supported within said wheel and provided with a lug projecting through the wall of said wheel, a spring connected with said arm, and a tripping device arranged to be operated by the lug on said arm, substantially as described.

2. The herein-described wheel for operating cut-offs, consisting of the disk 19 and rim 25, said disk being provided with a slot 45, a disk closing the other side of the wheel, the weight-arm pivoted within said disk and provided with a lug 47, projecting through said slot 45, the spring 37, connected with said arm, and means for adjusting said spring, as described.

3. The combination, with the elevator-belt, of the wheel arranged in engagement with said belt, an arm arranged within said wheel, a tripping device, and a lug upon said arm adapted to engage said tripping device without engaging it when the wheel is running at its normal speed.



4. The combination, with the elevator leg and belt, of the plate pivotally supported upon said leg, the wheel mounted upon said plate and arranged to engage said belt, a movable arm inclosed within said wheel, a tripping device, and a lug upon said arm projecting through a slot in said wheel and adapted to engage said tripping device when the wheel is running slowly and to pass the same without engagement when the wheel is running at its normal speed.

5. In combination with the elevator-belt, a wheel arranged to be held against the same by gravity, a yieldingly-held weighted arm pivoted within said wheel, a lug upon said arm projecting through the side of the wheel, a pivoted tripping-arm arranged in position to be engaged by the lug on said weighted arm when the wheel is running at a low rate of speed, and a cut-off gate actuated by the tripping of said arm, substantially as described.

6. The combination, with the elevator belt and leg, of a hinged frame on said leg, a wheel journaled in said frame and adapted to engage said belt to be rotated thereby, a weighted arm yieldingly held in said wheel, a pivoted trip-lever to engage said arm, as described, a gate, a rack pivoted on the leg and by means of which the gate is normally supported, a draw-rod 69 in connection with said rack, a spring in connection with said draw-rod, and a latch normally holding the same under tension and adapted to be tripped by said trip-lever, substantially as described.

7. The combination, with the elevator belt and the leg wherein the same is adapted to run, of a frame hinged thereon from its upper edge, a wheel or pulley carried in said frame and held by gravity against said belt, a weighted arm yieldingly held in connection with said wheel, a trip-shaft 51, having a trip-lever 55 to engage said weighted arm, as described, a lever 58, linked to an end 56 of the shaft 51, a latch 61, pivoted on the leg, a spring 63 in connection therewith, a connection between said latch and the lever 58, a lever 75 to be engaged by said latch and pivoted on the leg, the bar 69 in connection therewith, a spring 77, connected with the lever 75, and a rack-bar 65, pivoted on the leg, and a feed-gate having a lug to engage said rack-bar, whereby on the slowing down of said belt said rack 65 is withdrawn and said gate permitted to fall, substantially as described.

482,469. TRANSPORTATION SYSTEM. LOGIAN F. COOK, Tacoma, Wash. Filed Jan. 5, 1892. Serial No. 417,122. (No model.)

Claim.—1. In a transportation system, the combination of cars suspended off of their center of gravity, with horizontal propeller-wheels against which said cars bear, and means for increasing the friction of the cars against their propelling-wheels at the pleasure of the attendant, all substantially as shown and described.

2. In a transportation system, a line of friction drive-wheels driven by suitable mechanism, and an up and a down track, the cars on which are adapted to be driven, the up cars by one side of said wheels and the down cars by the other, combined with cars suspended off their centers of gravity and means for forcing said cars against their drive-wheels when desired, substantially as described.

3. In a transportation system, a car hanging from an upper track and a line of friction drive wheels acting against the said car to move the same, and mechanism whereby said wheels are driven, substantially as set forth.

4. In a transportation system, a car hung from an upper track and friction drive-wheels bearing and acting against the side of said car, the car being so hung that the action of gravitation will force and hold it against the friction-wheels, and mechanism for driving the wheels, substantially as described.

5. In a transportation system, a car hanging from an upper track and friction drive-wheels bearing against the sides of the car, the car being hung from a point at one side of its center of gravity, so that it will tend to swing and bear against said drive-wheels and be driven by them, as described and shown.

6. In a transportation system, a series of columns supporting tracks, antifriction roller-bearings on such tracks, rotating friction drive-wheels supported by said columns, mechanism for rotating said wheels, and cars adapted to bear against said wheels and be moved by them and supported from a beam or bar adapted to travel on said roller-bearings in the track, substantially as described.

7. In a transportation system, a series of columns supporting tracks, friction drive wheels supported by said columns, mechanism for rotating said wheels, a longitudinal fixed brake-beam running from column to column, and a car adapted to take against the drive-wheels, and a brake upon the car, acting against the said brake-beam, substantially as described.

8. In a transportation system, tracks and cars designed to run upon said tracks, in combination with two sets of friction drive-wheels, one set being of smaller diameter than the other, and means whereby the car may be connected to or disconnected from one or the other of said wheels as it is desired to hasten or diminish the speed, substantially as set forth.

9. In a transportation system, tracks and cars designed to run upon said tracks, in combination with a series of shafts, each shaft carrying two or more friction drive-wheels of different diameters, and means whereby the cars may be connected to or disconnected from one or the other of said wheels to increase or diminish its speed, substantially as described.

10. In a transportation system, tracks and cars designed to run upon said tracks, in combination with a series of shafts, each shaft carrying two friction drive-wheels of different diameters, having their surfaces roughened, bearing-faces on said cars against which the wheels act, and mechanism by which the cars may be connected with or disconnected from said wheels, substantially as described.

11. In a transportation system, a line of horizontal friction drive-wheels driven by suitable mechanism, cars adapted to bear against said drive-wheels, and means whereby the cars may be forced laterally away from said wheels in order to stop, substantially as described.

12. In a transportation system, a line of posts or columns carrying a longitudinal brake-beam, a line of friction drive-wheels driven by suitable mechanism, cars adapted to bear against said drive-wheels, a series of wheels mounted upon the car, and means for forcing said wheels against the longitudinal brake-beam on the posts or columns, whereby the car is forced from the drive-wheels, for the purpose hereinbefore described.

13. In a transportation system, a line of friction drive-wheels driven by suitable mechanism, cars adapted to bear against said drive-wheels, posts supporting said drive-wheels, and a longitudinal brake-beam upon said posts, in combination with wheels mounted in a suitable boxing or frame, tracks on which the boxing or frame slides, and toggle-levers connected with said frame and with mechanism for moving them, substantially as described and shown.

14. In a transportation system, a line of friction drive-wheels driven by suitable mechanism, cars adapted to bear against said drive-wheels, posts supporting said drive-wheels, and a longitudinal brake-beam upon said posts, in combination with a series of wheels movable inwardly and outwardly upon the car to bear against the said brake-beam and brakes acting against said wheels, substantially as described.

15. In a transportation system, a line of friction drive-wheels driven by suitable mechanism, cars adapted to bear against said drive-wheels, posts or columns supporting the drive wheels, and a longitudinal brake-beam upon said posts, in combination with a series of wheels mounted in sliding frames or boxes movable inwardly and outwardly upon the car and brakes pivoted at one end to the box or frame and connected at the other to a rod and hand-lever or equivalent mechanism, substantially as described.

16. In a transportation system, a line of friction drive-wheels driven by suitable mechanism, cars adapted to bear against said drive-wheels, posts supporting said drive-wheels, and a longitudinal brake-beam upon said posts, in combination with a series of wheels mounted to move outward and inward against the brake-beam, brakes acting against said wheels, and supplemental or safety brakes acting against the brake-beam, substantially as described and shown.

17. In a transportation system, a line of friction drive-wheels driven by suitable mechanism, cars adapted to bear against the said drive-wheels, posts supporting said drive-wheels, and a longitudinal

brake-beam upon said posts, in combination with mechanism for forcing the car away from the drive-wheels and a brake upon the car movable toward and acting against the said longitudinal brake-beam, substantially as described.

18. In a transportation system, a line of friction drive-wheels driven by suitable mechanism, cars adapted to bear against the said drive-wheels, posts supporting said drive-wheels, and a longitudinal brake-beam upon said posts, in combination with brake-wheels adapted to move against the brake-beam aforesaid, brakes acting against said wheels, and supplemental or safety brakes consisting of blocks movable on anti-friction bearings and rods connected to them to move the same as described.

19. In a transportation system, a series of columns supporting wheel, a clutch on the track structure, acting against said central shaft, latches on the main tracks for holding the switch or turn-table in position, means for connecting and disconnecting said latches, and auxiliary drive-wheels at the ends of the turn-table, connected to the central drive-wheel, substantially as described and shown.

29. The combination, with a switch or turn-table for a transportation system, consisting of a section of the track structure supported by a circular guide or track from a bridging piece or truss spanning the turn-table or switch, a central rotating shaft passing loosely through the track structure, the upper end journaled in the said truss and the lower end journaled in a transverse beam between the columns, a friction drive-wheel on said shaft, auxiliary friction drive wheels at the

482,472. NUT AND BOLT LOCK. THOMAS A. PLANIGAN, Pittsburg, Pa. Filed Apr. 12, 1892. Serial No. 428,998. (No model.)

tions 5 of the bung-faucet and having the perforations 14, the arm 17, pivoted to the collar and having the hub 18 perforated in alignment with the terminals of the yoke, and the removable pin 19 for locking the arm and yoke, substantially as specified.

482,475. BENDING VEHICLE-SHAFTS. ORLANDO A. GOLDSWORTHY, Chicago, Ill. Filed Oct. 5, 1891. Serial No. 407,898. (No model.)

brake-beam upon said posts, in combination with mechanism for forcing the car away from the drive-wheels and a brake upon the car movable toward and acting against the said longitudinal brake-beam, substantially as described.

18. In a transportation system, a line of friction drive-wheels driven by suitable mechanism, cars adapted to bear against the said drive-wheels, posts supporting said drive-wheels, and a longitudinal brake-beam upon said posts, in combination with brake-wheels adapted to move against the brake-beam aforesaid, brakes acting against said wheels, and supplemental or safety brakes consisting of blocks movable on anti-friction bearings and rods connected to them to move the same as described.

19. In a transportation system, a series of columns supporting tracks, a series of shafts supported by the columns, friction drive-wheels of different diameters on the shafts, and means for driving the drive-wheels, in combination with a car, a bearing-face against which the large friction drive-wheel bears and acts, and a movable bearing-face for the small drive-wheels, substantially as described.

20. In a transportation system, a series of columns or posts supporting tracks, drive-wheels of different diameters supported on the columns, and means for rotating the drive-wheels, in combination with a car provided with a bearing-face for the larger drive-wheel and a bearing-face for the small drive-wheel, the last being movable out and in by means of toggle-levers and connecting-rods, as described.

21. In a transportation system, a series of columns or posts supporting tracks, drive-wheels of different diameters supported on the posts, and mechanism for rotating said drive-wheels, in combination with a car provided with a fixed longitudinal bearing-face against which the large drive-wheel bears, and a movable bearing-face formed of a longitudinal beam, transverse slots in said beam, bolts passed through the car-frame and through the said slots to support the said beam, and means for moving said beam to and from the car and against the smaller drive-wheel, substantially as described.

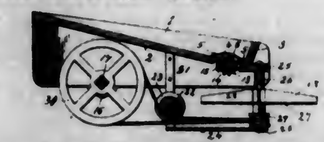
22. In a transportation system, a series of columns supporting tracks, a series of shafts supported by the columns, two or more friction drive-wheels of different diameters upon each of said shafts, means for driving said friction-wheels, and a longitudinal fixed brake-beam from column to column, in combination with a car provided with a series of movable wheels adapted to be moved against the brake-beam to force the car out from the drive-wheels, a brake, a fixed bearing-face for the larger drive-wheels, and an outward and inward movable beam forming a bearing-face for the smaller drive-wheels, all substantially as described and shown.

23. In a transportation system having a line of posts or columns supporting friction drive-wheels, the combination, with an overhead track consisting of a longitudinal partition separating the up and down tracks, outside longitudinal guiding-beams, and antifriction-rollers between the partition and said beams, of a car suspended by means of hangers from a runner traveling upon said rollers, substantially as set forth.

24. In a transportation system having a line of posts or columns supporting friction drive-wheels, the combination, with an overhead track consisting of a longitudinal partition separating the up and down tracks, outside longitudinal guiding-beams, antifriction-rollers between the partition and the last-said beams, and bolts passing through the beams and partition and forming bearings for the antifriction-rollers, of a car suspended by hangers from a runner designed to travel on such rollers, substantially as set forth and shown.

25. In a transportation system having a line of posts or columns supporting friction drive-wheels, the combination, with an overhead track consisting of a series of antifriction-rollers and guide-beams on which a suspended car travels, of a cover-plate over said track, substantially as described, and for the purposes set forth.

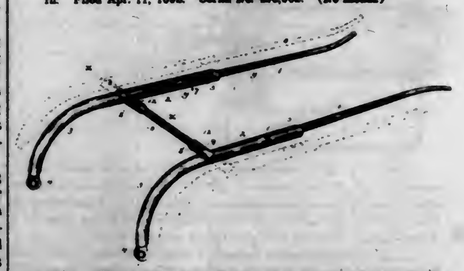
26. A switch or turn-table for transportation systems, consisting of a section of track supported by a circular guide or track and having a longitudinal brake-beam, in combination with a central rotating shaft passing loosely through the tracks and brake-beam and carrying a friction drive-wheel, means for driving said shaft, and a clutch acting between the track structure and the shaft to connect the same, so that the track structure may rotate with the shaft, substantially as described.



27. A switch or turn-table for a transportation system, consisting of a section of the track structure supported by a circular guide or track and having a longitudinal brake-beam, in combination with a central rotating shaft passing loosely through the tracks and brake-beam and carrying a friction drive-wheel, mechanism for driving said wheel, a clutch on the track structure, acting against the central shaft to connect the same, and latches on the main tracks for holding the switch or turn-table in position, substantially as described.

28. A switch or turn-table for a transportation system, consisting of a section of the track structure supported by a circular guide or track and having a longitudinal brake-beam, in combination with a central rotating shaft passing loosely through the tracks and brake-beam and carrying a friction drive-wheel, mechanism for driving said wheel, a clutch on the track structure, acting against said central shaft, latches on the main tracks for holding the switch or turn-table in position, means for connecting and disconnecting said latches, and auxiliary drive-wheels at the ends of the turn-table, connected to the central drive-wheel, substantially as described and shown.

29. The combination, with a switch or turn-table for a transportation system, consisting of a section of the track structure supported by a circular guide or track from a bridging piece or truss spanning the turn-table or switch, a central rotating shaft passing loosely through the track structure, the upper end journaled in the said truss and the lower end journaled in a transverse beam between the columns, a friction drive-wheel on said shaft, auxiliary friction drive wheels at the ends of the turn-table or switch, driven from the central drive-wheel, the shaft of the central drive-wheel passing below the turn-table, and means for driving said shaft from the drive-shafts on the main lines, of a clutch on the track structure, acting against the said central shaft, a system of levers for moving the clutch, latches on the main-track structure for holding the switch or turn-table in position, and means for connecting and disconnecting said latches from the turn-table or switch, as described and shown.



30. In a turn-table or switch consisting of a swinging section of the track structure, a central shaft passing loosely through the track structure and carrying a drive-wheel, and a clutch on the track structure, acting against the central shaft, the combination, with pivoted latches on the main-track structure and flanged seats for said latches on the turn-table or switch structure, the flanges of said seats having outside inclined faces, of vertical pins passing through the said seat, sliding rods carrying said pins, cords passing over pulleys and connected to the rods, and a pull upon said cords, whereby the pins may be raised and the pivoted latches forced upward from their seats, substantially as described and shown.

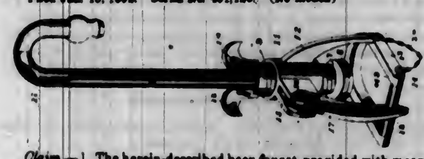
482,470. SEEDER. FRED A. CRANE, Good Hope, Ill. Filed May 31, 1892. Serial No. 435,084. (No model.)

Claim.—The combination, with the opposite side bars 1, the inclined bottom, the end wall for the side bars, and the feed-opening in the bottom, of a shaft journaled in the side bars below the bottom, feed devices mounted on the shaft, a pulley on the outer end of the shaft, a rear drive-shaft having a crank, large and small pulleys on said shaft, a crossed belt connecting the small pulley with the pulley of the feed-shaft, a pair of depending standards located in front of the drive-shaft, a transverse shaft connecting the two, a guide-pulley thereon, a plate extending forward from the lower ends of the standards, a shaft vertically disposed and pivotally supported between the front end of the plate and the bottom of the hopper, the seed-disk mounted on the shaft, the pulley below the disk, and the belt connecting the pulley with the large pulley of the drive-shaft and between the two passed over the guide-pulley, substantially as specified.

482,471. VEHICLE-SHAFT. WILLIAM R. CULLISON, Englewood, Ill. Filed Apr. 11, 1892. Serial No. 428,662. (No model.)

Claim.—The combination of tubular irons having apertures in the front ends thereof and inwardly-projecting transverse tubular arms also having openings in the ends of the same, shafts adjustably fitted in said irons, a cross brace or rod adjustably fitted in said arms, said shafts and cross brace or rod being formed with openings at the ends thereof, and removable pins or bolts connecting said parts, substantially as described.

482,472. NUT AND BOLT LOCK. THOMAS A. FLANIGAN, Pittsburg, Pa. Filed Apr. 12, 1892. Serial No. 428,903. (No model.)



Claim.—A nut-locking device, substantially as described, consisting of a nut having a threaded orifice through one side of the same, a tap-bolt adapted to project through said orifice and lock said nut, a cap adapted to be beat over the head of the said tap-bolt to prevent the same from turning, means for holding said cap in position, and means to prevent the cap from slipping off endwise of said nut, all arranged and combined for service substantially as and for the purpose described.

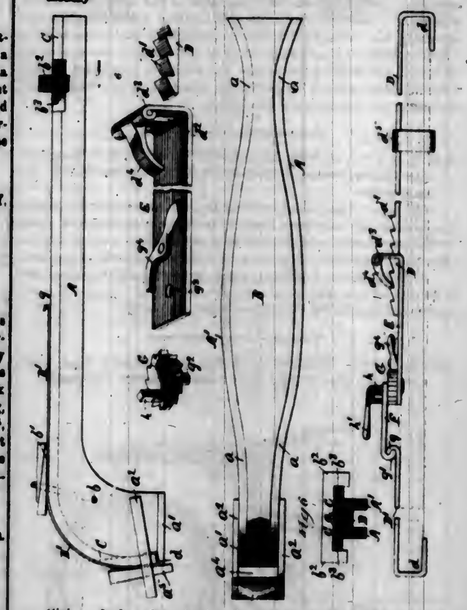
482,473. HOOK AND EYE. HENRY C. FRANK, New York, N. Y. Filed Nov. 11, 1891. Serial No. 411,544. (No model.)

Claim.—In hooks and eyes for dress-fastenings and analogous purposes, the eye described, having a spring-tongue B^3, extending forward under the front of the eye, adapted to grip the hook elastically between the tongue and the eye and formed with an offset B^3 near its mid-length, arranged to receive the bight or main bend of the hook when it is moved backward and to resist any accidental unhooking, in combination with a hook A, having a transverse corrugation A^4, arranged to meet the point of the spring-tongue and to insure that the compression of the parts together shall depress the junction of the hook and eye, and thus increase the security of the fastening, as herein specified.

482,474. BEER-FAUCET. FRANK A. FRENVILLER, Detroit, Mich. Filed Jan. 15, 1892. Serial No. 418,139. (No model.)

Claim.—1. The herein-described beer-faucet, provided with means for attaching the same to a bung-faucet and with an air-tube 21, located near its discharge end, substantially as specified.

2. The herein-described beer-faucet, the same being adapted to be inserted into the end of a bung-faucet and provided in rear of its extremity with a disk 7 and a packing-disk 8, combined with means for clamping the same upon the bung-faucet, substantially as specified.

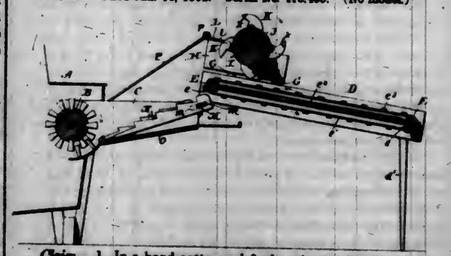


3. The herein-described beer-faucet, the same consisting of a discharge-tube 6, having the packing-disk and washer at its inner end, clamping-yoke mounted on the tube in front of the disk and extending rearwardly beyond the disk, and means for locking the yoke upon a bung-faucet, substantially as specified.

4. The herein-described beer-faucet, adapted at its inner end for connection with a bung-faucet, an externally-threaded sleeve swiveled on the beer-faucet 2, a collar threaded on the sleeve, arms extended from the collar, a yoke connected to the arms and adapted to engage the beer-faucet, and means for locking the yoke and for rotating the sleeve, substantially as specified.

5. The herein-described beer-faucet, the same consisting of a tube adapted at its rear end for connection with a bung-faucet, an externally-threaded sleeve mounted on the tube, a collar threaded on the sleeve and provided with arms and between the same with lugs, a U-shaped yoke adapted to engage the bung-faucet connected with the arms, an arm pivoted between the lugs and provided with a hub perforated in alignment with the terminals of the yoke, and a locking-pin removably passed through the terminals of the yoke and the hub of the arm, substantially as specified.

6. The combination, with the bung-faucet tube having the key 3, threaded portion 4, and reduced portion 5, of the tube 6, the rear end of which is fitted into the threaded portion 4, the disk 7, and the packing-disk 8, interposed between the disk 7 and the end of the bung-faucet, the externally-threaded sleeve 9, mounted on the tube and having thumb lugs 10, the collar 11, and the rearwardly-extending arms 12, the U-shaped yoke 13, adapted to fit the grooved portion 5 of the bung-faucet and having the perforations 14, the arm 17, pivoted to the collar and having the hub 18 perforated in alignment with the terminals of the yoke, and the removable pin 19 for locking the arm and yoke, substantially as specified.



482,475. BENDING VEHICLE-SHAFTS. ORLANDO A. GOLDSWORTHY, Chicago, Ill. Filed Oct. 5, 1891. Serial No. 407,669. (No model.)

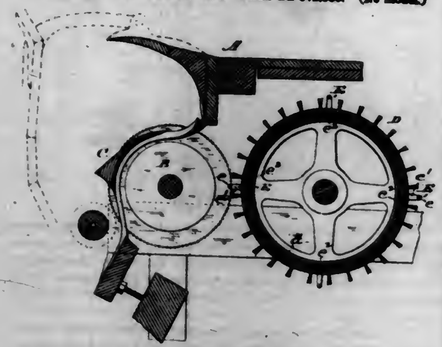
Claim.—1. In a form for bending vehicle-shafts, the combination of the companion side members curved at their rear ends, the central part projecting above said side members, the bottom board a^7, the bars a^9, the cross-bar a^8, the locking-wedges a^6, the elongated link b, the wedge b', the angle-clamp b^3, and the wedges b^4, whereby the object may be rigidly locked in the form, substantially as set forth.

2. In an endwise-clamping mechanism for vehicle-shafts, the combination of the following elements, viz: the strap-plate D, having one end bent around to conform to a shaft-bar and the other end provided with ratchet-teeth, the companion strap-plate D', having a hook on the inner end, the connecting-plate E, having one end upturned and perforated to receive the end of the plate D, the pawl pivoted in said upturned end, the connecting-link E, the eccentric ratchet-wheel G, seated in the plate E, and the connecting-link F, whereby a strong pressure is exerted on both ends of an object clamped therein, substantially as set forth.

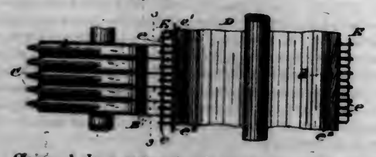
482,476. BAND-CUTTER AND FEEDER. DAVID GWIN, Edgerton, Mo. Filed Jan. 18, 1892. Serial No. 418,495. (No model.)

Claim.—1. In a band-cutter and feeder, the combination, with a thrashing-machine having extended side arms inclosing the feeding-table in front of the cylinder, of an endless-carrier feeder-frame hinged to the outer ends of said arms, a knife-cylinder journaled upon said feeder-frame, a multiple-crank shaft journaled in the outer ends of said side arms, a series of alternately reciprocating and vibrating down-

wardly-inclined notched feeding and spreading bars connected at their upper ends to said crank-shaft, and a vibrating delivering-pan connected at its lower edge in front of the cylinder to one or more of said bars and working thereunder, substantially as set forth.



2. In a band-cutter and feeder, the combination, with a threshing-machine having extended side arms, of an endless-carrier feeder-frame hinged to the outer ends of said feeder-arms, a knife-cylinder journaled upon said feeder-frame, a fender-plate in front of said knife-cylinder, a multiple-crank shaft journaled in the outer ends of said side arms, a series of alternately-reciprocating notched feeding and spreading bars connected at their upper ends to said crank-shaft, a vibrating delivering-pan connected at its lower edge to one or more of said bars and working thereunder, and a hinged float-board hinged to said fender-plate and normally lying directly over said feeding and spreading bars, substantially as set forth.

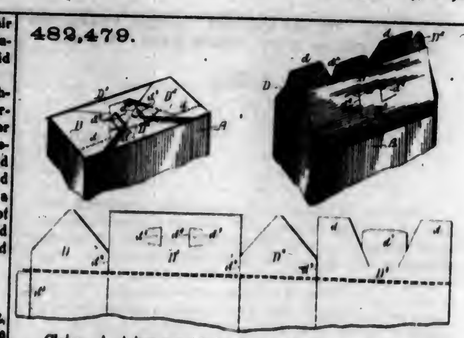


482,477. PROCESS OF BLEACHING. CARL J. H. DE HAEN, Linden, near Hanover, Germany. Filed Mar. 18, 1892. Serial No. 425,454. (No specimens.)

Claim.—1. The process of bleaching, which consists in subjecting the goods to be treated to a bath of peroxide of sodium, and a salt containing an oxide capable of being precipitated by sodium, such as sulphite of magnesia or magnesium-chloride, substantially as specified.

2. The process of bleaching, which consists in subjecting the goods to be treated to a bath of peroxide of sodium and magnesium salts, such as magnesium chloride, substantially as specified.

482,478. BRUSH FOR COTTON-GINS. SOME R. HALL, Little Rock, Ark. Filed Nov. 24, 1890. Serial No. 372,533. (No model.)



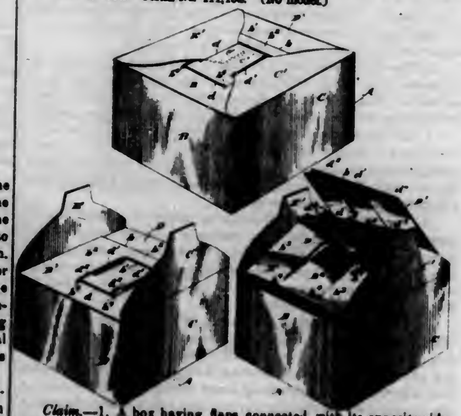
Claim.—1. In a cotton-gin, the saws, the brush-cylinder, the series of longitudinal plates let into the surface of said cylinder, the arms projecting from said plates and alternating with the saws, and the brushes inserted in said arms and extending on each side thereof to engage with the saws, substantially as and for the purpose set forth.

2. The combination, with the saws, of a single rotary cylinder arranged in the rear of the saws and carrying two sets of brushes, one of which sets of brushes projects radially from the cylinder to contact with the peripheries of the saws and the other set of brushes lying parallel with the surface of the saws and operating with the radial brushes to bear against both lateral faces of the saws, substantially as and for the purpose set forth.

3. The combination, with the saws, of a single rotary brush-cylinder arranged in rear of the saws and provided on its surface with two sets of brushes, one of which sets of brushes projects radially beyond the surface of the cylinder and the other set of brushes being parallel with the surface of the cylinder, two of the latter brushes being carried by a common support between a pair of radial brushes and arranged to contact with the lateral faces of the saws opposite to the teeth thereof, substantially as and for the purpose set forth.

482,479. BOX. WARREN R. HOWE and FRANK R. DAVIDSON, Chicago, Ill. Filed Jan. 22, 1891. Serial No. 378,606. (No model.)

482,479.



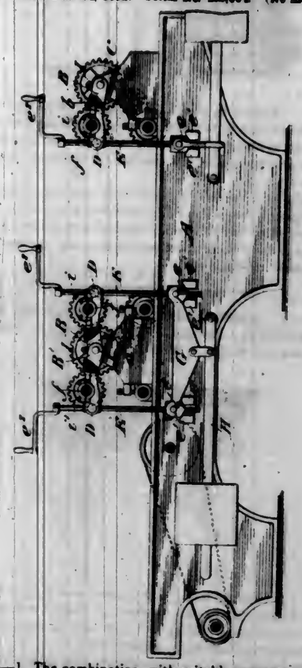
Claim.—1. A box provided with two flaps connected with opposite side walls of the box, one of said flaps being provided with two slits or notches extending inwardly from its outer end to form a tongue and the other with two U-shaped slits forming interior tongues to engage with the side margins of the tongue upon the flap first mentioned when the flaps are folded together, substantially as described.

2. A box provided with two flaps connected with opposite side walls of the box, one of said flaps being provided with two slits or notches extending inwardly from its free edge to form a tongue, which tongue is slitted at each side to form lateral tongues, and the other with two slits in its central part, which form tongues to engage with the tongue upon the flap first mentioned and which are adapted to receive the said lateral tongues for locking the flaps together, substantially as described.

3. A box provided with four flaps connected with its side walls, one of said flaps being provided with slits or notches extending inwardly from its free edge to form a tongue, the flap opposite thereto being provided with interior cuts or slits and the intermediate flaps being provided with narrow ends or projections adapted to enter said interior slits, substantially as described.

4. A box provided with four flaps connected with its side walls, one of said flaps being provided with slits or notches extending inwardly from its free edge to form a tongue, which tongue is slitted to form lateral tongues, the flap opposite thereto being provided with interior cuts or slits adapted to receive the said lateral tongues and the two intermediate flaps being provided with narrow ends or projections adapted for insertion in said interior cuts or slits, substantially as described.

482,480. PAPER BOX. WARREN R. HOWE, Chicago, Ill. Filed Nov. 7, 1891. Serial No. 411,132. (No model.)



Claim.—1. A box having flaps connected with its opposite side walls, the free ends of said flaps having continuous edges and one of said flaps being provided with a U-shaped slit forming a tongue, between which and the body of the flap the free edge of the opposite flap is inserted in folding, the end portions of said slit being located at a distance apart less than the width of the free end of the opposite flap and being arranged transversely to the free edge of said opposite flap, and the said free edge of said opposite flap being adapted to engage the ends of the slit when the box is closed, whereby the side walls to which the flaps are attached are supported against inward pressure, substantially as described.

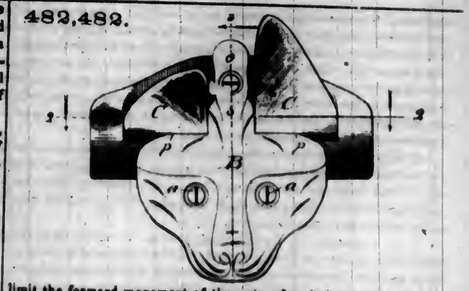
2. A box having flaps connected with its opposite side walls, the edges of the free ends of said flaps being continuous and one of said flaps being provided with a U-shaped slit forming a tongue, between which and the body of the flap the free edge of the opposite flap is inserted in folding, said opposite flap being provided with lateral tongues, between which and the under side of said flap the tongue of the first-named flap may be inserted, substantially as described.

3. A box each of the side walls of which is provided with a flap, one of said flaps having a U-shaped slit forming a tongue, the base of which slit is adjacent to the free end of the flap, an opposite flap adapted to be inserted between the first-named flap and its tongue and provided with parallel slits which lie over said tongue, and two remaining opposite flaps narrowed at their free ends to pass through the U-shaped slit of the first-named flap and enter the slits of the second-named flap, substantially as described.

482,481. PLANING-MACHINE. ALFRED B. HUTCHINSON, Brooklyn, N. Y., assignor to the Glen Cove Machine Company, Limited, same place. Filed Feb. 24, 1892. Serial No. 422,664. (No model.)

Claim.—1. The combination, with suitable supports, of a pair of roller-carrying frames having their ends overlapped and pivotally secured to the supports, leaving a free space between the pivots and in the axial line thereof, substantially as set forth.

2. The combination, with suitable supports, of a roller-carrying frame pivotally secured at its ends to said supports, a master-wheel mounted in axial alignment with the pivots which secure the roller-carrying frame, the feed-roller, and a pinion fixed to rotate therewith in engagement with the master wheel, substantially as set forth.



3. The combination, with suitable supports, of a roller-carrying frame pivotally secured at its ends to said supports, an adjusting-rod swiveled to the free end of said frame, a rocking nut engaged with said rod, and a weight connected with said nut, substantially as set forth

---

482,482. GATE-LATCH. CHARLES M. LAMB, Adrian, Mich. Filed Sept. 16, 1891. Serial No. 406,109. (No model.)

Claim.—1. In a gate-latch, the combination of two plates A and B, internally recessed to form a trunnion-socket and provided with coincident screw-holes for securing them together and to the edge of a gate or post, a trunnion incased between the plates, a plate C, rigid with the trunnion and normally projecting forward and resting upon a shoulder *p*, provided for it on the outer plate, and having an inclined outer edge, whereby it is lifted by the action of the gate in closing and drops by gravity to its normal position when released, and a stop to

482,482.

limit the forward movement of the gate after it has passed the pivotal plate, substantially as described.

2. The combination of the plates C, having inclined outer edges and trunnions *q*, plate A, having sockets for the outer trunnions and recessed to form half the socket for the inner trunnions, an outer plate recessed to form the other half of the socket for the inner trunnions, and means for securing the parts together and to a gate or post, substantially as described.

482,483. JEWELRY. HARRY LEER, New York, N. Y. Filed May 26, 1892. Serial No. 434,406. (No model.)

Claim.—1. In an article of jewelry, the combination, with the boxing, of the stone or setting, a lug or projection thereon to engage in a keeper in the boxing, and a rotary latch thereon to engage in another keeper in the boxing, substantially as specified.

2. In an article of jewelry, the combination, with the boxing having the keepers, of the stone or setting, the plate secured thereto having an integral lug or projection to engage in one of the keepers, and the rotary latch movable into the other of said keepers, substantially as specified.

3. In an article of jewelry, the combination, with the boxing having the keepers, of the stone or setting having the groove, the metal plate seated in said groove, an integral lug on said plate, and the rotary latch seated in a recess in said plate, substantially as specified.

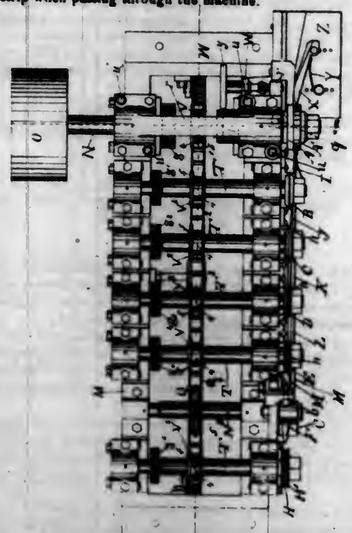
4. In an article of jewelry, the combination, with the boxing having the keepers and a hole in its bottom, of the stone provided with a groove having undercut side walls, a plate seated in the groove and engaged by the side walls, an integral lug or projection on said plate to engage in one of the keepers, and a rotary latch on said plate having the pivot provided with the transverse groove, substantially as specified.

482,484. MACHINE FOR MAKING BOX-BINDING CHANNEL-STRIPS. JOHN G. LETTELIER, Los Angeles, Cal. Filed Mar. 28, 1891. Serial No. 386,535. (No model.)

Claim.—1. In a machine for forming channel-strips for berry-boxes, the combination of the train comprising the rotary shears and a series of rotary channel-formers arranged in pairs graded with increasing depth and decreasing width of channel from the shears rearwardly, and suitable guides arranged to guide the strip from the shears to the formers and from one set of formers to another and having the face of each guide conforming to the shape of the contact-face of the rotary member immediately preceding such guide.

2. The combination of the frame of the machine, the shears, and former-shafts, the rotary shears and formers arranged on the ends of their respective shafts on the outside of the shaft-supporting frame, and suitable gages and guides arranged to hold the strip in position and to discharge the scrap from the machine.

3. The machine for forming channel-strips, comprising the combination of a train consisting of the rotary shears and the series of rotary channel-formers arranged in pairs graded with increasing depth and decreasing width of channel from the shears rearwardly, the spreader-arc, the grooved spreader-roller, and the withdrawing-rollers, and operative mechanism connecting the parts of the train.



4. In a machine for forming channel-strips, the combination of a train of channel-forming rollers, the grooved spreader-roller arranged in line with the channel-rollers, and the spreader-arc arranged to project into the groove of the spreader-roller and into the path of the strip, and operative mechanism connecting the parts of the train.

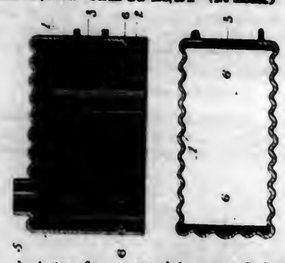
5. The combination of the frame, the shaft provided with one

member of the shears and journaled in the movable journal-piece, so as to prevent axial movement of such shaft in its bearing, such movable journal-piece secured to the frame by set-bolts which pass through bolt-holes in the frame, which are slightly larger than the set-bolts, and the screw parallel with the shaft connecting the journal-piece and the frame, so that when the set-bolts are loosened the journal-piece and its shears-shaft can be moved transverse of the frame to adjust the shears laterally to compensate for their wear.

6. In a machine for forming channel-strips, the combination of the feed-table, the spring feed-guide arranged to press against the edge of the strip, the rotary shears, and the antifriction-roller arranged opposite the spring feed-guide to engage the edge of the strip as the strip passes into the machine.

7. In a machine for forming channel-strips for berry-boxes, the combination of the train comprising the rotary shears and a series of rotary channel-formers arranged in pairs graded with increasing depth of channel from the shears rearwardly, and suitable guides arranged to engage the sides of the strip to prevent lateral or sidewise movement of the strip when passing through the machine.

8. In a machine for forming channel-strips for berry-boxes, the combination of the power-shaft, the series of sprocket-wheels arranged upon one line of channel-former-carrying shafts, the sprocket-chain arranged upon each wheels, the sprocket-chain guide-wheels arranged upon the other line of channel-former-carrying shafts and each provided with a groove of sufficient width and depth to permit the sprockets on the sprocket-wheels to pass therethrough and having their flanges arranged to project down upon each side of such sprockets and bear upon the outer upper faces of the sprocket-chain and so hold the chain firmly down upon the sprocket-wheels, and the leading wheels arranged to hold the chain taut.



9. In a machine for forming channel-strips, the combination of the train comprising a series of rotary channel-formers graded and arranged in pairs with increasing depth and decreasing width of channel from the front end of the machine rearwardly, and suitable means arranged toward the end of the train to widen a portion of one end of the channel of the strip after the channel is formed.

10. In a machine for forming channel-strips, the combination of the train comprising the rotary shears and the series of rotary channel-formers graded and arranged in pairs with increasing depth and decreasing width of channel from the front end of the machine rearwardly, and suitable means arranged toward the rear of the train to widen a portion of one end of the channel of the strip after the channel is formed.

11. In a machine for forming channel-strips, the combination of the train comprising the rotary shears and a series of rotary channel-formers graded and arranged in pairs with increasing depth and decreasing width of channel from the front end of the machine rearwardly, the guides arranged between the rotary shears and the first set of formers and provided with flat smooth opposing faces between which the strip of tin is received as it comes from the rotary shears, and the scrap shield or guide arranged to direct the scrap away from the machine.

12. In a machine for forming channel-strips, the combination of the train comprising the rotary shears and the series of rotary channel-formers graded and arranged in pairs with increasing depth and decreasing width of channel from the front end of the machine rearwardly and having the insertion-rollers provided with side stops arranged at a distance from the extreme outer edge of the insertion roller equal to one-half of the width of the strip to be channeled.

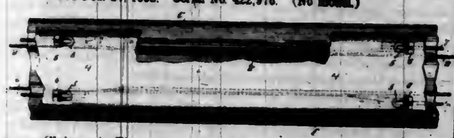
482,485. STOVE FOR HEATING OVENS FOR JAPANNING, ENAMELING, AND GLAZING. THEODORE M. LINCOLN, Hartford, Conn. Filed Feb. 23, 1892. Serial No. 422,454. (No model.)

Claim.—1. A stove for an enamel, japan, or glazing oven or kiln, formed of a single casting in the shape of a continuous arch having a corrugated wall, with integral end walls connected to the arch by circular corners, and having fuel, ash, and smoke openings, substantially as specified.

2. A stove for an enamel, japan, or glazing oven or kiln, formed of a single casting in the shape of a continuous arch having a vertical corrugated wall and end walls with vertical corrugations, connected to the arch by circular corners, and having fuel, ash, and smoke openings, substantially as specified.

482,486. LINE-WIRE-TIGHTENING DEVICE FOR ELECTRIC-LAMP SUPPORTS. CHARLES A. PFLUGER, Chicago, Ill. Filed May 3, 1892. Serial No. 431,684. (No model.)

Claim.—1. In combination with a suspension-support for an electric lamp, a rotary binding-post at which to connect and tighten the line-wire, and means for holding the post against the strain of the tightened line-wire, substantially as described.



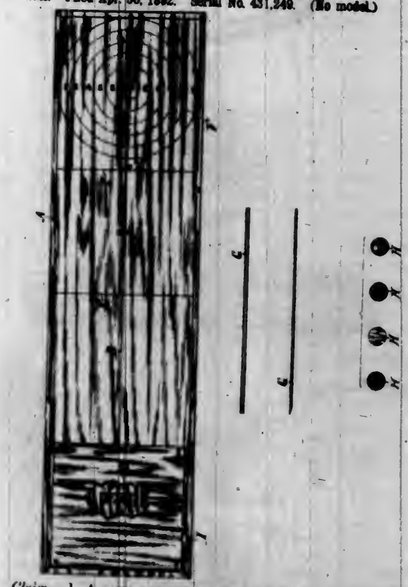
2. In combination with a suspension-support for an electric lamp, a rotary binding-post having a winding-drum provided with an attaching device for the line-wire, and means for holding the post against the strain of the tightened line-wire, substantially as described.

3. In combination with a suspension-support for an electric lamp, a bracket, a rotary binding-post journaled in the bracket and provided with a winding-drum having an attaching device for the line-wire, and a ratchet and a dog to engage the ratchet and hold the post against the strain of the tightened line-wire, substantially as described.

4. In combination with a suspension-support for an electric-arc lamp, brackets B and B', fastened to plates *r* and *r'* on a supporting-board A, rotary binding-posts *p* and *p'*, having winding-drums C C', provided with attaching devices for the line-wire and journaled in the brackets and provided in their protruding ends with eyes at which to suspend the lamp and with attaching means for the wires *m*, and means on the rotary posts for holding them against the strain of the tightened line-wire, substantially as described.

5. A suspension-support for electric-arc lamps, comprising, in combination, a board A, carrying plates *r* and *r'*, and brackets B and B', rotary binding-posts *p* and *p'*, journaled in the brackets and having winding-drums C and C', provided with ratchets *i* and flattened on their protruding end portions and there provided with fastening means for the wires *m*, dogs *k*, eyes *o* in the protruding ends of the posts, attaching means *k'* on the drums for the line-wire, and a suitable switch E, the whole being constructed and arranged to operate substantially as described.

482,487. PNEUMATIC TIRE. LOCIUS J. PHELPS, Passaic, N. J. Filed Feb. 27, 1892. Serial No. 422,976. (No model.)



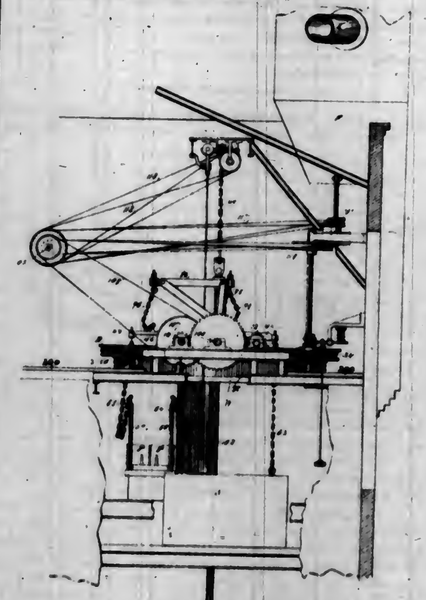
Claim.—1. The combination, with a hollow rim having surfaces inclined upward and outward on each side of the outer face of the rim, of a pneumatic tire secured on the outer side of said rim by wires carried by but loose in the edges of the envelope and lying on the inclined surfaces of the rim and having their ends secured through the outer plate of the rim, substantially as described.

2. The combination, with a rim having surfaces inclined upward and outward on each side of the outer face of the rim, of a pneumatic tire secured on the outer side of said rim by wires carried by but loose in the edges of the envelope and lying on the inclined surfaces of the rim, said wires having their ends secured to the rim by hooks or equivalent means and provided with extensions beyond the hooks for drawing up the wires, substantially as described.

3. The combination, with a rim having surfaces inclined upward and outward on each side of the outer face of the rim, of a pneumatic tire secured on the outer sides of said rim by wires carried by the edges of the envelope and lying on the inclined surfaces of the rim, said wires having their ends secured to the rim by hooks or equivalent means and provided with extensions beyond the hooks for drawing up the wires, substantially as described.

4. A hollow wheel-rim consisting of the plates 3 4, riveted together on the central line and having the edges of the plate 3 sprung within the curved overedges of the plate 4, substantially as described.

482,488. GAME APPARATUS. FREDERICK S. SILLER, Milwaukee, Wis. Filed Apr. 30, 1892. Serial No. 431,249. (No model.)



Claim.—1. A game apparatus comprising a diagram consisting of bordering lines, a vertical line extending a portion of the length of said diagram and crossed at a point nearest its lower end by a short line centering thereon, a transverse line at the upper end of the vertical line, a medial transverse line, and a target at the upper portion of the diagram, with a space between the same and the upper transverse line, the bull's-eye and the concentric circles comprising said target being adapted to receive therein buttons or chips propelled or forced from a designated starting-point, said spaces being also appropriately numbered, and the words "Start," "Out," and "In" being arranged, respectively, below the short line in the space between the medial and upper transverse lines and in the space between the latter and the target, substantially as set forth.

2. A game apparatus comprising a diagram consisting of bordering lines, a vertical line extending a portion of the length of said diagram and crossed at a point nearest its lower end by a short line centering thereon, a transverse line at the upper end of the vertical line, a medial transverse line, a target at the upper portion of the diagram, with a space between the same and the upper transverse line, the bull's-eye and the concentric circles comprising said target being adapted to receive therein buttons or chips propelled or forced from a designated starting-point, said spaces being also appropriately numbered and the words "Start," "Out," and "In" being arranged, respectively, below the short crossed line in the space between the medial and the upper transverse lines and in the space between the latter and the target, and a tally-sheet arranged in the starting-space, substantially as set forth.

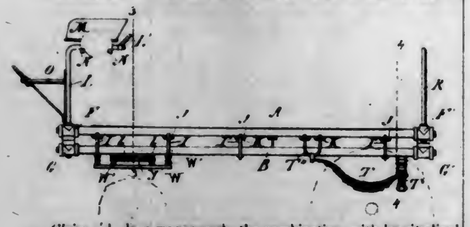
3. A game apparatus comprising a diagram consisting of bordering lines, a vertical line extending a portion of the length of the diagram and crossed at a point nearest its lower end by a short line centering thereon, the space beneath said short line constituting the starting-space, a transverse line at the upper end of the vertical line, a medial transverse line, a target at the upper portion of the diagram, with a space between the same and the upper transverse line, the bull's-eye and concentric circles of said target being appropriately numbered and the words "Start," "Out," and "In" being arranged, respectively, below the short crossed line in the space between the medial and upper transverse lines and in the space between the latter and the target, a series of buttons or chips arranged in sets of different colors, and canes or sticks for forcing said buttons or chips from the starting-space, substantially as set forth.

482,489. APPARATUS FOR PICKLING METAL PLATES. DANIEL M. SOMERS and WILLIAM H. ATKINSON, Brooklyn, N. Y. Filed Aug. 7, 1891. Serial No. 401,967. (No model.)

Claim.—1. In a pickling-machine, the combination, with a series of vats for containing baths for the treatment of metal plates and a moving carriage operating to transport the plates from vat to vat and supporting mechanisms for the manipulation of the plates in the vats, of a guard-plate O, interposed between the vats and said mechanisms to protect the latter from destructive fumes arising from the vats, and a flue for conducting said fumes away, substantially as described.

2. In a pickling-machine, the combination, with a series of vats for containing baths for the treatment of metal plates and a moving carriage operating to transport the plates from vat to vat and supporting mechanisms for the manipulation of the plates in the vats, of the guard-plate O, fixed to the carriage, and a guard plate 200, fixed outside of said carriage, both of which plates are interposed between the vats and said mechanisms to protect the latter from destructive fumes arising from the vats, and a flue for conducting said fumes away, substantially as described.

3. In a pickling-machine, the combination, with a series of vats for containing baths for the treatment of metal plates and a moving carriage operating to transport the plates from vat to vat, supporting mechanisms for the manipulation of the plates in the vats, and provided with means to prevent the passage of the fumes through it, of a flange projecting from the carriage into a liquid seal, substantially as described.



4. In a pickling-machine, the combination, with a series of vats for containing baths for the treatment of metal plates and a movable carriage operating to transport the plates from vat to vat and supporting mechanisms for the manipulation of the plates in the vats, of a flange projecting from the carriage into a liquid seal and a guard plate o, co-operating with said flange and liquid seal to prevent the acid-fumes from passing upward through said carriage, substantially as described.

5. In a pickling-machine, the combination, with a series of vats for containing baths for the treatment of metal plates and a movable carriage operating to transport the plates from vat to vat and supporting mechanisms for the manipulation of the plates in the vats, of a flange projecting from the carriage into a liquid seal, a guard-plate co-operating with said flange and liquid seal, and a guard-plate about said carriage, whereby the passage of the acid-fumes upward through the carriage and about the carriage is prevented, substantially as described.

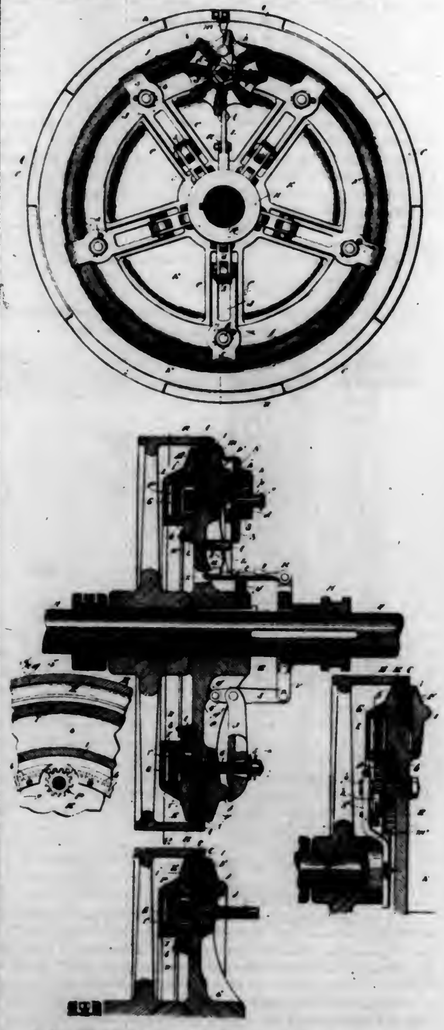
6. In a pickling-machine, the combination, with a series of vats for containing baths for the treatment of metal plates, a moving carriage operating to transport the plates from vat to vat and supporting mechanisms for the manipulation of the plates in the vats, and a flue F for conducting away the fumes from the vat, of a vertical deflector or guide V at the outer side of the vat, substantially as described.

7. In a pickling-machine, the combination of a series of vats for containing baths for the treatment of metal plates, a moving carriage operating to transport the plates from vat to vat and supporting mechanisms for the manipulation of the plates in the vats, and a horizontal deflecting-plate arranged above the vats and about the carriage, substantially as described.

482,490. WAGON-RACK. GEORGE T. STERLING and JOHN BLOOMER, Milwaukee, Wis. Filed Dec. 14, 1891. Serial No. 414,976. (No model.)

Claim.—1. In a wagon-rack, the combination, with longitudinal tubular rails, of a tubular end guard-frame secured to the longitudinal rails by passing through couplings on the extremities of the rails and through the rails therein and being secured thereto by nuts turning on their extremities against the couplings, substantially as described.

2. In a wagon-rack, the combination, with longitudinal tubular rails, of tubular end rails and T-couplings by which the longitudinal rails are secured to the end rails, substantially as described.



3. In a wagon-rack, the combination, with outside tubular longitudinal rails and inner longitudinal tubular rails in a plane below the plane of the outside rails, of tubular end rails and T-couplings whereby the end rails are secured to the extremities of the outside rails, and T-couplings on the end rails and on the inner and lower longitudinal rails, which couplings on the end rails and on the inner and lower longitudinal rails are connected together by a screw, substantially as described.

4. In a wagon-rack, the combination, with parallel longitudinal tubular rails at a distance apart, of a circle of the fifth-wheel and an irregular radial cross-brace having its four arms secured to the circle at their extremities and having medial parts arranged at right angles to the rails resting thereon, which medial parts of all the four arms bear against the rails and are secured thereto by brackets fastened to the rails, which brackets have shoulders or bearings for the arms at right angles to the rails, the arrangement being adapted to greatly strengthen the construction and prevent endwise movement of the members relatively, substantially as described.

482,491. FRICTION-CLUTCH. PETER WEIMER, Schenectady, N. Y. Filed July 22, 1891. Serial No. 400,291. (No model.)

Claim.—1. The combination, with the driving and driven members of a friction-clutch and mechanism for clamping said two members, of tightening mechanism upon one member and operated from the other member when the speed of the driven member is less than that of the driving member and connections engaging said clamping mechanism and operated by said tightening mechanism for operating said clamping mechanism to increase the friction between the two members of the clutch, substantially as described.

2. The combination, with the driving and driven members of a friction-clutch, and mechanism for clamping said two members, and mechanism for shifting said clamping mechanism to and from clamping position, of tightening mechanism upon one member and operated from the other member when the speed of the driven member is less than that of the driving member and connections engaging said clamping mechanism and operated by said tightening mechanism for operating and continuing the clamping movement of said clamping mechanism begun by its shifting mechanism to increase the friction between the two members of the clutch, substantially as described.

3. The combination, with the driving and driven members of a friction-clutch and mechanism for clamping said two members, of tightening mechanism upon one member and operated from the other member when the speed of the driven member is less than that of the driving member, connections engaging said clamping mechanism and operated by said tightening mechanism for operating said clamping mechanism to increase the friction between the two members of the clutch, substantially as described.

and means for rendering said tightening mechanism inoperative when the two members are unclutched, substantially as described.

4. The combination, with the driving and driven members of a friction-clutch and mechanism for clamping said two members, of tightening mechanism upon one member and operated from the other member when the speed of the driven member is less than that of the driving member, connections engaging said clamping mechanism and operated by said tightening mechanism for operating said clamping mechanism to increase the friction between the said two members of the clutch, and means for rendering said tightening mechanism inoperative when the two members are unclutched and for restoring it to operative position when said members are clutched, substantially as described.

5. The combination, with the driving and driven members of a friction-clutch, mechanism for clamping said two members, and mechanism for shifting said clamping mechanism to clamping and unclamping positions, of tightening mechanism upon one member and operated from the other member when the speed of the driven member is less than that of the driving member, connections engaging said clamping mechanism and operated by said tightening mechanism for operating said clamping mechanism to increase the friction between the two members of the clutch, and means for rendering said tightening mechanism inoperative during the first part of the movement to unclamping position of said clamping mechanism, substantially as described.

6. The combination, with the driving and driven members of a friction-clutch, mechanism for clamping said two members, and mechanism for shifting said clamping mechanism to clamping and unclamping positions, of tightening mechanism upon one member and operated from the other member when the speed of the driven member is less than that of the driving member, connections engaging said clamping mechanism and operated by said tightening mechanism for operating said clamping mechanism to increase the friction between the two members of the clutch, and means for rendering said tightening mechanism inoperative during the first part of the movement to unclamping position of said clamping mechanism and for restoring it to operative position during the latter part of the movement to clamping position of said clamping mechanism, substantially as described.

7. The combination, with the driving and driven members of a friction-clutch, mechanism for clamping said two members, and mechanism for shifting said clamping mechanism to clamping and unclamping positions, of tightening mechanism upon one member and operated from the other member when the speed of the driven member is less than that of the driving member, connections engaging said clamping mechanism and operated by said tightening mechanism for operating said clamping mechanism to increase the friction between the two members of the clutch and connections operated by said shifting mechanism and engaging said tightening mechanism for rendering the latter inoperative during the movement to unclamping position of said shifting mechanism, substantially as described.

8. The combination, with the driving and driven members of a friction-clutch, mechanism for clamping said two members, and mechanism for shifting said clamping mechanism to clamping and unclamping positions, of tightening mechanism upon one member and operated from the other member when the speed of the driven member is less than that of the driving member, connections engaging said clamping mechanism and operated by said tightening mechanism for operating said clamping mechanism to increase the friction between the two members of the clutch and connections operated by said shifting mechanism and engaging said tightening mechanism for rendering the latter inoperative during the movement to unclamping position of said shifting mechanism and restoring said tightening mechanism to operative position upon the movement to clamping position of said shifting mechanism, substantially as described.

9. The combination, with the driving and driven members of a friction-clutch and mechanism for clamping said two members, of a pawl-and-ratchet mechanism and connections upon one member and operated from the other member when the speed of the driven member is less than that of the driving member and connections engaging said clamping mechanism and operated by said pawl-and-ratchet mechanism for operating said clamping mechanism to increase the friction between the two members of the clutch, substantially as described.

10. The combination, with the driving and driven members of a friction-clutch and mechanism for clamping said two members, of a pinion and connections upon one member and operated from the other member when the speed of the driven member is less than that of the driving member and connections engaging said clamping mechanism and operated by said pinion for operating said clamping mechanism to increase the friction between the two members of the clutch, substantially as described.

11. The combination, with the driving and driven members of a friction-clutch and mechanism for clamping said two members, of a pinion, a pawl-and-ratchet mechanism upon one member and operated from the other member when the speed of the driven member is less than that of the driving member for rotating said pinion, and connections engaging said clamping mechanism and operated by said pinion for operating said clamping mechanism to increase the friction between the two members of the clutch, substantially as described.

12. The combination, with the driving and driven members of a friction-clutch and mechanism for clamping said two members, of a pinion, a pawl-and-ratchet mechanism upon one member and operated from the other member when the speed of the driven member is less than that of the driving member for rotating said pinion, and gearing engaging said clamping mechanism and operated by said pinion for operating said clamping mechanism to increase the friction between the two members of the clutch, substantially as described.

13. The combination, with the driving and driven members of a friction-clutch and mechanism for clamping said two members, of a pinion, a pawl-and-ratchet mechanism upon one member and operated from the other member when the speed of the driven member is less than that of the driving member for rotating said pinion, and a cog-wheel engaging said clamping mechanism and operated by said pinion for operating said clamping mechanism to increase the friction between the two members of the clutch, substantially as described.

14. The combination, with the driving and driven members of a friction-clutch and mechanism for clamping said two members, of a pinion, a pawl-and-ratchet mechanism upon one member and operated from the other member when the speed of the driven member is less than that of the driving member for rotating said pinion, a cog-wheel engaging the clamping mechanism and operated by said pinion, and a ring threaded on said cog-wheel and connected to said clamping mechanism and movable upon said cog-wheel upon the rotation of the latter for operating said clamping mechanism to increase the friction between the two members of the clutch, substantially as described.

15. The combination, with the driving and driven members of a friction-clutch, mechanism for clamping said two members, and mechanism for shifting said clamping mechanism to clamping and unclamping positions, of tightening mechanism upon one member and operated from the other member when the speed of the driven member is less than that of the driving member, connections engaging said clamping mechanism and operated by said tightening mechanism, a rod operated by and simultaneously with the movement of said shifting mechanism and engaging said tightening mechanism for throwing it into or out of operative position, and a cam for disengaging said rod from said tightening mechanism before the completion of the movement to unclamping position of said shifting mechanism, substantially as described.

16. The combination, with the driving and driven members of a friction-clutch, mechanism for clamping said two members, and mechanism for shifting said clamping mechanism to clamping and unclamping positions, of tightening mechanism upon one member and operated from the other member when the speed of the driven member is less than that of the driving member, connections engaging said clamping mechanism and operated by said tightening mechanism, a rod operated by and simultaneously with the movement of said shifting mechanism and engaging said tightening mechanism for throwing it into or out of operative position, a cam for disengaging said rod from said tightening mechanism before the completion of the movement to unclamping position of said shifting mechanism and holding said rod out of engagement therewith during the fore part of the return or clamping movement of said shifting mechanism, and means for continuing and completing the movement to operative position of said tightening mechanism independently of said shifting mechanism, substantially as described.

17. The combination, with the driving and driven members of a friction-clutch and mechanism for clamping said two members, of tightening mechanism upon one member and operated from the periphery of the other member when the speed of the driven member is less than that of the driving member, and connections engaging said clamping mechanism and operated by said tightening mechanism for operating said clamping mechanism to increase the friction between the two members of the clutch, substantially as described.

18. The combination, with the driving and driven members of a friction-clutch and mechanism for clamping said two members, of a tightening-lever pivoted upon one member and operated from the other member when the speed of the driven member is less than that of the driving member, and connections engaging said clamping mechanism and operated by said tightening-lever for operating said clamping mechanism to increase the friction between the two members of the clutch, substantially as described.

19. The combination, with the driving and driven members of a friction-clutch and mechanism for clamping said two members, of a tightening-lever pivoted upon one member and operated from the periphery of the other member when the speed of the driven member is less than that of the driving member, and connections engaging said clamping mechanism and operated by said tightening-lever for operating said clamping mechanism to increase the friction between the two members of the clutch, substantially as described.

20. The combination, with the clamping mechanism of a friction-clutch, of the cog wheel I upon one member, ring G, threaded upon

said cog-wheel and connected to said clamping mechanism, pinion P, engaging said cog-wheel, and mechanism engaging said pinion and operated from the other member of the clutch for rotating said pinion, substantially as described.

21. The combination, with the clamping mechanism of a friction-clutch, of the cog-wheel I upon one member, ring G, threaded upon said cog wheel and connected to said clamping mechanism, pinion P, engaging said cog-wheel, pawl-and-ratchet mechanism *h d*, and a lever operated from the other member for operating said pawl-and-ratchet mechanism, substantially as described.

22. The combination, with the clamping mechanism of a friction-clutch, of a lever upon one member and operated from the other member, pawl-and-ratchet mechanism *h d*, operated by said lever, and connections between said pawl-and-ratchet mechanism and said clamping mechanism, substantially as described.

23. The combination, with the clamping mechanism of a friction-clutch, of a lever upon one member, finger *m* upon the other member for operating said lever, pawl-and-ratchet mechanism operated by said lever, pinion P, rotated by said pawl-and ratchet mechanism, and connections between said pinion and the clamping mechanism of the clutch, substantially as described.

24. The combination, with the clamping mechanism of a friction-clutch and sleeve H for shifting said clamping mechanism to and from clamping position, of the shaft *p* upon one member of the clutch, sleeve *s*, mounted upon and movable longitudinally of said shaft, lever S, carried by said sleeve and operated from the other member of the clutch, connections between sleeve H and sleeve *s* for moving said lever to and out of operative position upon the movement to clamping and unclamping position, respectively, of the sleeve H, and connections between shaft *p* and the clamping mechanism of the clutch, substantially as described.

25. The combination, with the clamping mechanism of a friction-clutch and sleeve H for shifting said clamping mechanism to and from clamping position, of the shaft *p* upon one member of the clutch, sleeve *s*, mounted upon and movable longitudinally of said shaft, lever L, fulcrumed upon the clutch and engaging said sleeve *s*, lever S, carried by the latter and operated from the other member of the clutch, rod R, connected to sleeve H and engaging lever L for moving lever S to and out of operative position upon the movement to clamping and unclamping position, respectively, of the sleeve H, and connections between shaft *p* and the clamping mechanism of the clutch, substantially as described.

26. The combination, with the clamping mechanism of a friction-clutch and sleeve H for shifting said clamping mechanism to and from clamping position, of the shaft *p* upon one member of the clutch, lever S, movable longitudinally of said shaft and operated from the other member of the clutch, lever L, fulcrumed upon the clutch, connections between said lever and lever S, rod R, connected to sleeve H, lug *t* upon said rod engaging lever L for moving lever S out of operative position upon the movement to unclamping position of the sleeve H, cam *u* upon said rod and means coacting therewith for disengaging lug *t* from lever L before the unclamping movement of sleeve H is completed, and connections between shaft *p* and the clamping mechanism of the clutch, substantially as described.

27. The combination, with the clamping mechanism of a friction-clutch and sleeve H for shifting said clamping mechanism to and from clamping position, of the shaft *p* upon one member of the clutch, sleeve *s*, mounted upon and movable longitudinally of said shaft, lever L, fulcrumed upon the clutch and engaging said sleeve *s*, lever S, carried by the latter and operated from the other member of the clutch, rod R, connected to sleeve H, lug *t* upon said rod engaging lever L for moving lever S out of operative position upon the movement to unclamping position of the sleeve H, cam *u* upon said rod and means coacting therewith for disengaging lug *t* from lever L, before the unclamping movement of sleeve H is completed, and connections between shaft *p* and the clamping mechanism of the clutch, substantially as described.

28. The combination, with the clamping mechanism of a friction-clutch and sleeve H for shifting said clamping mechanism to and from clamping position, of the shaft *p* upon one member of the clutch, sleeve *s*, mounted upon and movable longitudinally of said shaft, lever L, fulcrumed upon the clutch and engaging said sleeve *s*, lever S, carried by the latter and operated from the other member of the clutch, rod R, connected to sleeve H, lug *t* upon said rod engaging one side of lever L for moving lever S out of operative position upon the movement to unclamping position of the sleeve H, cam *u* upon said rod and means coacting therewith for disengaging lug *t* from lever L, before the unclamping movement of sleeve H is completed, means coacting with rod R for bringing said cam into engagement with the opposite side of lever L during the latter part of the return or clamping movement of sleeve H to restore lever S to operative position, and connections between shaft *p* and the clamping mechanism of the clutch, substantially as described.

29. The combination, with the clamping mechanism of a friction-clutch and sleeve H for shifting said clamping mechanism to and from clamping position, of the shaft *p* upon one member of the clutch, sleeve *s*, mounted upon and movable longitudinally of said shaft, lever L, fulcrumed upon the clutch and engaging said sleeve *s*, lever S, carried by the latter and operated from the other member of the clutch, rod R, connected to sleeve H, lug *t* upon said rod engaging one side of lever L for moving lever S out of operative position upon the movement to unclamping position of the sleeve H, cam *u* upon said rod, and means coacting therewith for disengaging lug *t* from lever L before the unclamping movement of sleeve H is completed, means coacting with rod R for bringing said cam into engagement with the opposite side of lever L during the latter part of the return or clamping movement of sleeve H to restore lever S to operative position, spring *z* between cam *u* and lever L, and connections between shaft *p* and the clamping mechanism of the clutch, substantially as described.

30. The combination, with the clamping mechanism of a friction-clutch and sleeve H for shifting said clamping mechanism to and from clamping position, of the shaft *p* upon one member of the clutch, sleeve *s*, mounted upon and movable longitudinally of said shaft, lever L, fulcrumed upon the clutch and engaging said sleeve *s*, lever S, carried by the latter and operated from the other member of the clutch, rod R, connected to sleeve H, lug *t* upon said rod engaging one side of lever L for moving lever S out of operative position upon the movement to unclamping position of the sleeve H, spring *y* for holding said rod normally in position for such engagement, cam *u* upon said rod, and means coacting therewith for disengaging lug *t* from lever L before the unclamping movement of sleeve H is completed, means coacting with rod R for bringing said cam into engagement with the opposite side of lever L during the latter part of the return or clamping movement of sleeve H to restore lever S to operative position, spring *z* between cam *u* and lever L, and connections between shaft *p* and the clamping mechanism of the clutch, substantially as described.

31. The combination, with the clamping mechanism of a friction-clutch, of the disk E, provided with cam *g*, engaging said clamping mechanism in its operative position, and with recess *g'* at the base of the cam for receiving the bearing portions of said clamping mechanism in its inoperative position, substantially as described.

32. The combination, with the toggle mechanism of a clutch, of the ribs *e*, formed in the face of one of the members and embracing the bearing portions of said levers, and cams *g* between said ribs, substantially as described.

33. The combination, with the toggle-levers of a friction-clutch, of the disk E, provided with cams *g*, engaging said toggle-levers in the operative position, and with recesses *g'* at the base of the cam for receiving the bearing portions of said levers in their inoperative positions, substantially as described.

34. The combination, with the disk E, having cams *g* and recesses *g'*, of the levers J, arms 2 3, and the rollers 4 upon the arms 3, substantially as described.

35. The combination, with the driving and driven members of a friction-clutch and a plurality of clamping devices for clamping said two members, of tightening mechanism upon one member and operated from the other member when the speed of the driven member is less than that of the driving member, a friction-adjusting wheel, connections engaging said wheel and operated by said tightening mechanism, and threaded connections between said wheel and all of said clamping devices to increase the friction between the two members of the clutch, substantially as described.

36. The combination, with the driving and driven members of a friction-clutch and a plurality of clamping devices for clamping said two members, of a pinion and connections upon one member and operated from the other member when the speed of the driven member is less than that of the driving member, a friction-adjusting cog-wheel rotated by said pinion, and threaded connections between said cog-wheel and all of said clamping devices for simultaneously operating all of said devices to increase the friction between the two members of the clutch, substantially as described.

37. In a friction-clutch, the combination, with a plurality of clamping devices, of the disk E, cog-wheel I, journaled on said disk, and ring G, connected to said clamping devices and threaded upon and movable axially of said cog-wheel upon the rotation of the latter to adjust said clamping devices, substantially as described.

38. In a friction-clutch, the combination, with a plurality of clamping devices, of the disk E, cog-wheel I, journaled on said disk, ring G, connected to said clamping devices and threaded upon and movable axially of said cog-wheel upon the rotation of the latter to adjust said clamping devices, and pinion P and shaft *p* for rotating said cog-wheel, substantially as described.

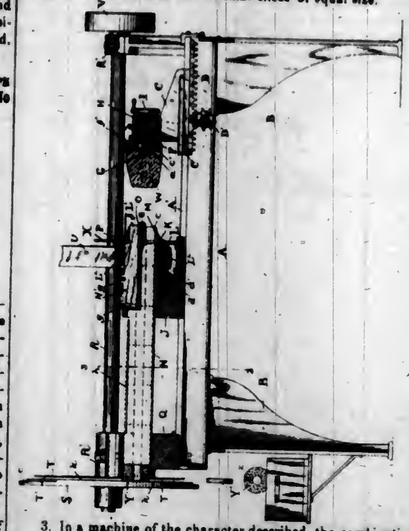
39. In a friction-clutch, the combination, with a plurality of clamping devices, of the disk E, cog-wheel I, journaled on said disk, and ring G, connected to said clamping devices and threaded upon and movable axially of said cog-wheel upon the rotation of the latter to adjust said clamping devices, pinion P and shaft *p* for rotating said cog-wheel, and washer *w*, connected to disk E and engaging cog-wheel I to prevent its movement axially of the clutch, substantially as described.

40. The combination, with pulley B, its plate C, and disk E and ring F, embracing said plate, of the rib *j* upon the outer face of the ring F in line with plate C, cog-wheel I upon the inner face of the disk E and provided with an extension in line with the rib *j*, clamping mechanism connected with said cog-wheel and engaging rib *j*, and means for shifting said cog wheel to clamping and unclamping positions into and out of engagement with rib *j*, substantially as described.

482,492. COMBINED COLLAR AND HAME FASTENER. Joseph C. Wellman, Blair, Nebr. Filed May 2, 1892. Serial No. 431,560. (No model.)

Claim.—1. In a collar-fastener, the combination of part 2, provided at its joint end with a dovetail extension loosely fitted to slide vertically into a corresponding recess in the joint end of part 1, a rabbet across the top of the extreme end of the dovetail extension, a corresponding shoulder across the recess, adapted to impinge on the bottom of the rabbet, that portion of the parts in which the dovetail coupling is located being straight across on its lower face and convex in cross section on its upper face, the nether surface of each part from the coupling portion toward its extreme end concave in cross section, and a horizontal mortise through the dovetail coupling from the concavity in one part to the concavity in the opposite part, adapted to receive the upper fold of a hame-strap, substantially as shown and described.

2. In a combined collar and hame fastener, the combination of parts 1 and 2, separably coupled together and having the concavities 18 and 18' in their nether surfaces and the shoulders 15 and 15', and the combination hooks and nuts 3 and 3', each consisting of a common square nut having an integral extension projecting from one of its edges flush with the nether surface of the nut and bent to form a hook adapted to engage the links in the ends of the hames, the hook extension of less thickness than the nut to form a shoulder corresponding to and adapted to bear against the shoulders 15 and 15', substantially as shown and described.



3. In a combined collar and hame fastener, the combination of part 2 and part 1, separably coupled together, each attached to the lower end or a half of the collar by a pair of screw-bolts 8, the heads seated in countersinks in double washers 9, part 2 having in its nether surface the concavity 18' and the shoulder 15', and the martingale retainer 11 having the perforations 23 23 to loosely receive the screw-bolts and seated in the concavity, one of the screw-bolts provided with a combined nut and hook 3', adapted to engage the link in lower end of hame and bear against the shoulder 15', part 1 having a similar shoulder and combined hook and nut, substantially as shown and described.

4. In a combined collar and hame fastener, the combination of parts 1 and 2, attached to the lower ends of the halves of a collar, part 2 having a dovetail extension fitted loosely to slide vertically into a corresponding recess in part 1, a rabbet across the top of the extreme end of the dovetail extension, a corresponding shoulder across the recess, adapted to impinge on the bottom of the rabbet, a horizontal mortise through the dovetail extension and walls of the recess, adapted to receive a locking-key, part 2 having the concavity 18' and the shoulder 15', the martingale-retainer 11, seated in the concavity, the combined nut and hook 3', adapted to bear against the shoulder 15' and engage the link in lower end of hame, part 1 having the concavity 18 and the shoulder 15, the combined nut and hook 3, adapted to engage the link 6 and the hame 7 and bear against the shoulder 15, and the leather key 10, one end fixed in the concavity, the other adapted to be inserted through the mortise in the dovetail coupling, substantially as shown and described.

482,493. MACHINE FOR TREATING PINEAPPLES. George W. Zastrow, Baltimore, Md. Filed Apr. 11, 1892. Serial No. 428,582. (No model.)

Claim.—1. In a machine of the character described, the combination of a shear, a cylindrical sizing-cutter through which the article under treatment passes to said slicer, and a carriage for feeding the said article first through the said cylindrical cutter and then to the slicer, whereby the machine will cut the article into circular slices of equal size.

2. In a machine of the character described, the combination of a rotary slicer-disk having a slicing-knife secured to one face, with a space between it and the said disk-face, a cylindrical sizing-cutter through which the article under treatment passes to the slicer-disk, and a carriage for feeding said article first through the said cylindrical cutter and then against the face of the said rotary disk, whereby the machine cuts the article into circular slices of equal size.

3. In a machine of the character described, the combination of a rotary slicer-disk having a recess in one face and a slicing-knife secured on said face and extending over said recess, a cylindrical sizing-cutter through which the article under treatment passes to the slicer, and a carriage for feeding the said article first through the said cylindrical cutter and then against the face of the rotary slicer-disk, the slice cut off by the knife on said disk entering the recess in the latter, for the purpose described.

4. In a machine of the character described, a cylindrical sizing-cutter and a concentric coring-tube, both arranged to act simultaneously on the article under treatment.

5. In a machine of the character described, a cylindrical sizing-cutter and a coring-tube having permanent location concentrically therein.

6. In a machine of the character described, a cylindrical sizing-cutter and a coring tube having permanent location concentrically therein, in combination with a carriage to present the article under treatment to the action of said two cutters.

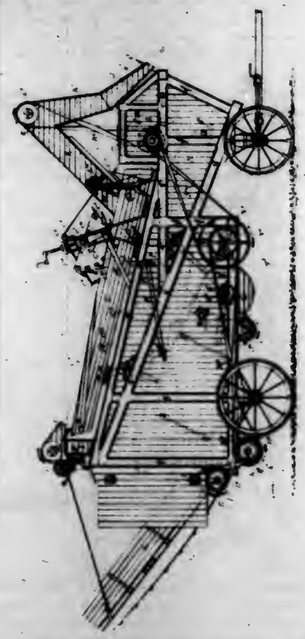
7. In a machine of the character described, a coring-tube having a radial blade attached on its exterior to split the article under treatment at the same time that it is cored by said tube.

8. In a machine of the character described, the combination of a cylindrical sizing-cutter and a radial splitting-blade therein.

9. In a machine of the character described, the combination of a carriage, a cylindrical sizing-cutter, and a radial splitting-blade located in said cylindrical cutter.

10. In a machine of the character described, the combination of a cylindrical rotary sizing cutter and a stationary blade located therein, substantially as and for the purpose described.

11. In a machine of the character described, a cylindrical sizing-cutter, a coring-tube located concentrically therein, and a radial splitting-blade also located in said cylindrical cutter.



12. In a machine of the character described, the combination of a cylindrical sizing-cutter, a coring-tube, a radial splitting-blade, and a carriage to present the article under treatment to the action of all three of said cutters, substantially as described.

13. In a machine of the character described, the combination of a cylindrical sizing-cutter, a coring-tube, a slicer, and a carriage to present the article under treatment to the action of all three of said cutters, substantially as described.

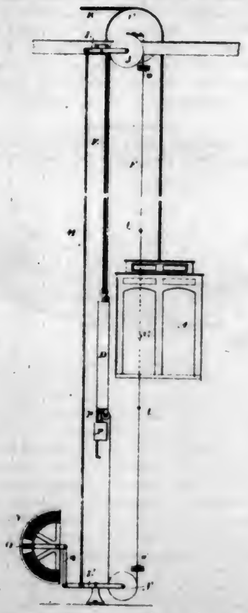
14. In a machine of the character described, the combination of a cylindrical sizing-cutter, a coring-tube, a radial splitting-blade, a slicer, and a carriage to present the article under treatment to the action of all four of said cutters.

15. In a machine of the character described, the combination, with a suitable cutter, of a sliding carriage holding a revoluble cork-screw which projects to receive the article under treatment.

482,494. THRASHING-MACHINE. OLIVER ANDERSON, Racine, Wis., assignor of one-half to Henry F. Herrick, same place. Filed Apr. 17, 1890. Serial No. 348,361. (No model.)

Claim.—1. In a thrashing-machine, the combination, with a thrashing-cylinder and concave, of a straw-conveyer, a bundle-feeder embracing a reciprocating table, rigidly-connected pivoted arms supporting both the straw-conveyer and the said table, and means for actuating said conveyer and table, substantially as described.

2. In a thrashing-machine, the combination, with a thrashing-cylinder and concave, of a straw-conveyer, a bundle-feeder and band-cutter comprising a reciprocating table and an oscillating band-cutter, rigidly-connected pivoted arms supporting both the straw-conveyer and the said table, means connected with one of said arms and giving vibratory motion thereto, and connections between said band-cutter and one of said arms by which oscillatory motion is given to the band-cutter, substantially as described.



3. In a threshing-machine, the combination, with a thrashing-cylinder and concave, of a straw-conveyer, a feeder and band-cutter comprising a reciprocating table, oscillating band-cutter, and an oscillating toothed segment opposed to the cutter, rigidly-connected pivoted arms sustaining both the straw-conveyer and the said table, means connecting one of said arms with the oscillating band-cutter for actuating the latter, means connecting said toothed segment with one of said arms for actuating said segment, and means giving vibratory motion to said arms, substantially as described.

4. The combination, with a thrashing-cylinder and a concave extending over the downwardly-movable side of the cylinder, of a straw-conveyer and an inclined board located beneath the concave pivotally connected with the frame of the machine at its upper end and with the straw-conveyer at its lower end and forming a continuation of the straw-conveyer, substantially as described.

5. In a thrashing-machine frame, the combination, with the supporting-wheels and front and rear axles, of inclined longitudinal frame-pieces extending from the front axle upwardly and rearwardly the entire length of the machine, lower longitudinal frame pieces extending forwardly from the rear axle and terminating in the rear of the front axle, and vertical frame-pieces crossing the inclined frame-pieces at a point at the rear of the front axle and attached to the front ends of the lower longitudinal frame-pieces, forming a space for the forward wheels, substantially as described.

6. In a thrashing-machine, the combination, with a thrashing-cylinder and a concave extending over the downwardly-moving side of the cylinder, of a bundle-feeder delivering the grain to the upwardly-moving side of the cylinder and discharge devices located at the said upwardly-moving side of the cylinder, substantially as described.

482,495. CONTROLLING DEVICE FOR ELEVATORS. NORMAN C. BARRETT, Lynn, Mass., assignor to the Thomson-Houston Electric Company, of Connecticut. Filed Aug. 4, 1890. Serial No. 360,924. (No model.)

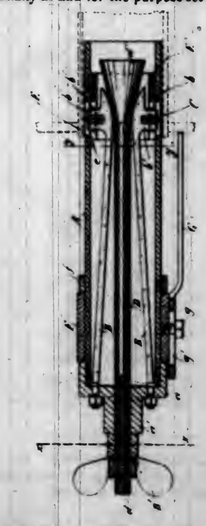
Claim.—1. The combination, with an elevator and counter-weight connected to the car, of a single running cable passing around pulleys located, respectively, at the top and bottom of the hatchway and attached to the counter-weight, so that the drag of the cable comes directly upon the said weight when moving in each direction, and a starting and stopping mechanism for the elevator, actuated by said cable, as set forth.

2. The combination of an elevator-car and counter-weight with the movable pulleys above and below the car, respectively, the running rope for operating the starting and stopping mechanism, passing around said pulleys, and an intermediate connection between the pulleys, whereby movement of the one causes a corresponding movement of the other.

3. The combination of an elevator-car, a counter-weight, and the pulleys above and below the car, one at least carried upon a pivoted lever, with the rope running around said pulleys for operating the starting and stopping mechanism and having its ends attached to the counter-weight as described.

4. The combination of the elevator-car, counter-weight, movable pulleys, and running rope for operating the starting and stopping mechanism, passing around the pulleys and attached to the counter-weight, with the pivoted lever carrying upon one arm one of the said pulleys and having attached to the other arm a connection leading to the second pulley, for the purpose described.

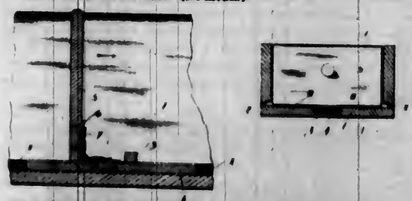
5. The combination of the pivoted lever at the bottom of the hatchway, connected to the starting and stopping mechanism, and the running rope attached to the counter-weight, as described, and operating said lever with the return-rope connected with the running rope at the upper end of the hatchway and to the said lever, for the purpose described.



6. The combination of the single running rope for operating the starting and stopping mechanism, passing around suitable pulleys and attached at both ends to the counter-weight, with a take-up device for taking the slack of the rope, as described.

482,496. TUBE-CUTTER. MARCELLUS C. COPPAGE, Terre Haute, Ind. Filed Jan. 9, 1892. Serial No. 417,467. (No model.)

Claim.—1. In a tube-cutter, the combination, with the revoluble barrel provided with slots and having a cap at one end of it, of the spring-arms rigidly secured at one end to the said cap and having their free ends working in the said slots, the rollers carried by the free ends of the spring-arms and projecting through the said slots, and a retractible feed-spindle provided with a cone adapted to press against the

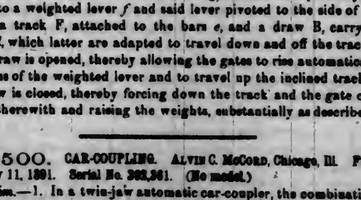


curved ends of the said arms beyond the said rollers and to press the said rollers outwardly, substantially as set forth.

2. In a tube-cutter, the combination, with the revoluble barrel provided with cutting devices and having a cap at one end, of a collar secured to the barrel, a ring journaled on the barrel between the said collar and cap, the guides provided with longitudinal slots, and screws passing through the said slots, and adapted to clamp the guides to the said ring, substantially as and for the purpose set forth.

3. In a tube-cutter, the combination, with the barrel provided with slots, of a cap secured to one end of the barrel and provided with means for revolving it, the spring-arms secured to the cap and provided with double eyes at their free ends, the slotted guide-ring secured to the barrel for the double eyes to engage with, the rollers carried by the double eyes, the feed-spindle provided with a cone for pressing the rollers against the tube, and a nut engaging with the end of the said feed-spindle outside the cap, substantially as and for the purpose set forth.

482,497. FILE. CHARLES W. COX, Oak Park, Ill. Filed Feb. 27, 1892. Serial No. 423,085. (No model.)



Claim.—1. The combination, with a drawer having a groove in the bottom thereof, of a slide fitted into said groove, a board hinged upon said slide and adapted to be tilted toward the front of the drawer, cards fitted into said drawer between the board and the front of the drawer, said cards being adapted to be moved lengthwise of the drawer, and means for locking said board rigidly in fixed engagement with the drawer when such board stands perpendicular and releasing it from engagement with the drawer when the board is tilted forward, substantially as described.

2. The combination, with a drawer having a longitudinal groove in the bottom thereof, of a slide fitted into said groove, board 5, hinged upon said slide, a hinge 6 to permit of the tilting of said board, devices carried by said board adapted to engage the bottom of the drawer when the board is in a vertical position and to be thrown out of engagement with the bottom of the drawer when the board is tilted, and cards 10, movable lengthwise of said drawer, substantially as described.

3. The combination, with a drawer 1, having a groove 3, of a slide 4, fitted into said groove, board 5, mounted upon said slide 4, a hinge 6, secured to said board and to the slide in such manner as to permit of the tilting of said board, pins 8 in the bottom of said board, adapted to engage the bottom of the drawer when the board is in a vertical position and to be thrown out of engagement when the board is tilted, a spring 7, adapted to return the board to a vertical position, and cards 10, movable lengthwise of said frame, substantially as described.

4. The combination, with a frame 1, having grooves 2 along its lower edges and a groove 3 extending lengthwise thereof, of a slide 4, fitted in said groove 3, board 5, mounted upon said slide, a hinge 6, connected to said board and to the slide in such manner as to permit of the tilting of the board, a spring 7, adapted to return the board to a vertical position, pins 8 in the lower edge of said board, adapted to engage the bottom of the drawer when the board is in a vertical position and to be thrown out of engagement with the drawer when the board is tilted, cross-bar 9 upon said slide a short distance from the board 5, and cards 10, having strips 11, said strips having projecting ends 12, adapted to fit into the grooves 2, substantially as described.

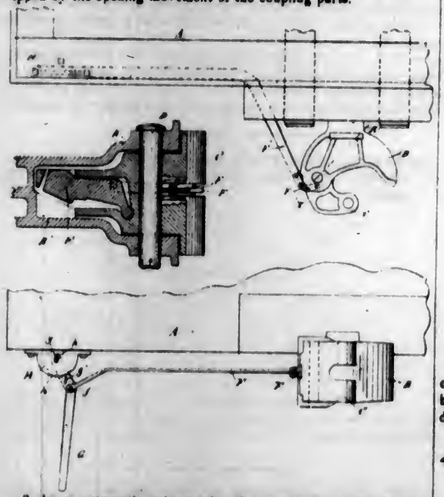
482,498. DUMPING-WAGON. SAMUEL J. FORSGARD, Waco, Tex. Filed May 7, 1890. Renewed July 27, 1892. Serial No. 441,350. (No model.)

Claim.—The combination of a frame, double dumping-boxes swinging upon axles, and a U-shaped dumping-lever, said lever provided with points extending slightly beyond its axis, substantially as described and set forth.

482,499. SAFETY-GATE FOR DRAWBRIDGES. WILLIAM GODDARD, Oshkosh, Wis. Filed Mar. 7, 1892. Serial No. 424,040. (No model.)

Claim.—1. In an automatic bridge-gate opening and closing device, the combination of the vertically-sliding gate C, bars *e*, rigidly attached to the lower end of the gate, said bars being pivotally attached to a weighted lever *f* and said lever being pivoted to the side of the bridge, a track F, attached to the bars *e*, and a draw B, carrying rollers *d*, which latter are adapted to travel down and off the track F as the draw is open, thereby allowing the gate to rise automatically by means of the weighted lever and to travel up the inclined track as the draw is closed, thereby forcing down the track and the gate connected therewith and raising the weights, substantially as described.

2. In an automatic bridge-gate opening and closing device, the combination of the vertically-sliding gate C, bars *e*, rigidly attached to the lower end of said gate, said bars pivotally attached to weighted lever *f*, which latter is pivoted to the side of the bridge, an arched track F, attached to the bars *e*, a draw B, provided with a bar J, carrying rollers or travelers *d*, which are adapted to travel on the arched track F, and an auxiliary roller or traveler *m*, which travels beneath and upon the arched track F, substantially as and for the purpose described.



3. In an automatic bridge-gate opening and closing device, the combination of the vertically-sliding gate C, guideways *c c*, a slot or passage D in the bridge-floor for the passage of said gate, bars *e*, rigidly attached to the lower end of the gate, said bars pivotally attached to a weighted lever *f* and said lever pivoted to the side of the bridge, a track F, attached to the bars *e*, and a draw B, carrying rollers *d*, which latter are adapted to travel down and off the track F as the draw is opened, thereby allowing the gates to rise automatically by means of the weighted lever and to travel up the inclined track as the draw is closed, thereby forcing down the track and the gate connected therewith and raising the weights, substantially as described.

482,500. CAR-COUPLING. ALVIN C. MCCORD, Chicago, Ill. Filed May 11, 1891. Serial No. 392,561. (No model.)

Claim.—1. In a twin-jaw automatic car-coupler, the combination, with the coupling-hook, of an automatic locking device for the coupling-hook, a releasing device for the locking device, and a retaining

device for the releasing device, adapted to be set to hold the locking device in its unlocked position and to be tripped on the opening movement of its coupling parts, substantially as and for the purpose set forth.

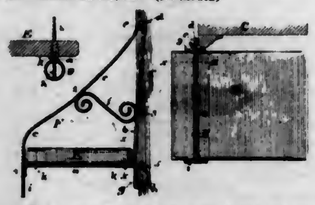
2. In an automatic coupler, the combination, with the coupling parts and an automatic locking device, of a releasing device, a hand-lever for controlling the same, and a retaining device for the lever, adapted to hold the locking device in its unlocked position and be tripped by the opening movement of the coupling parts.

3. In an automatic twin coupler, the combination, with a coupling-hook, of a locking-dog carried by the heel-piece of the coupling-hook, a releasing-rod connected both to the locking-dog and the coupling-hook at some point in advance of its pivot, a hand-lever for operating the rod, and a retaining device for the lever, adapted to hold the dog in its unlocked position when the coupling-hook is closed and be tripped by the rod when the coupling-hook is opened, substantially as described.

4. In an automatic twin coupler, the combination, with a coupling-hook, of a locking-dog carried by the hook, a releasing-rod connected to said dog and also to the hook in advance of its pivot, the slotted and toothed segment-plate, and the hand-lever pivotally connected to the rod, having its fulcrum-pin working in the slot of said plate and having a fixed pawl for engaging said teeth, substantially as and for the purpose set forth.

5. The combination, with the coupler-head B, having locking-lug B', of the recessed coupling-hook C, the pivot-bolt D, the locking-dog E, the sectional jointed releasing device F F', connected to the dog and passing to the exterior of the coupling-hook in advance of its pivot, the segment-plate H, having the slot *h* and teeth *h'*, and the hand-lever G, pivotally connected to the section F' of the releasing-rod and having its fulcrum-pin *g* working in the slot *h*, and a fixed pawl *g'* for engaging with the teeth *h'*, substantially as described.

482,501. CURLING OR CRIMPING IRON. FRANK S. SLEEPER, Duluth, Minn. Filed Oct. 16, 1891. Serial No. 408,870. (No model.)



Claim.—1. As a new article of manufacture, a combined hair curler and crimper comprising two arms, each provided with a semicylindrical curling or crimping portion, one of which approximately entirely closes into the other and which when in contact are parallel, whereby the hair can be either curled or crimped and a single curl made at one operation, substantially as described.

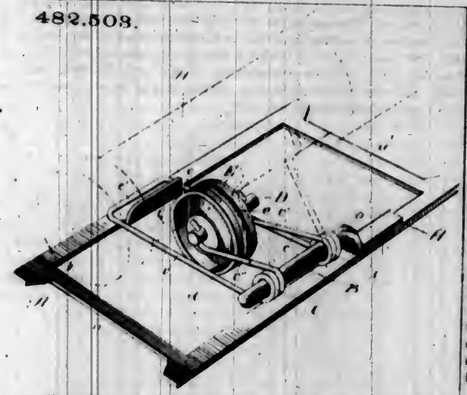
2. As a new article of manufacture, a combined hair curler and crimper comprising two arms, each provided with a single curling or crimping portion, one of which approximately entirely closes into the other and which when in contact are parallel, the said curling or crimping portions having closed guard ends, whereby the hair can be curled or crimped and a single curl made at one operation and the hair waved, without the liability of the curling or crimping portion catching into the hair, substantially as described.

3. As a new article of manufacture, a combined hair curler and crimper comprising two arms, each provided with a single curling or crimping portion, one of which approximately entirely closes into the other and which when in contact are parallel, the said curling or crimping portions having closed guard ends and weighted, whereby the hair can be curled or crimped by one operation and the hair waved without liability of the curling or crimping portions catching into the hair, and the parts brought automatically together, substantially as described.

482,502. HANGING WINDOW-SHELF. WILLIAM A. THOMPSON, Boston, assignor of one-half to Matthias E. Crocker, Malden, Mass. Filed Oct. 8, 1891. Serial No. 408,132. (No model.)

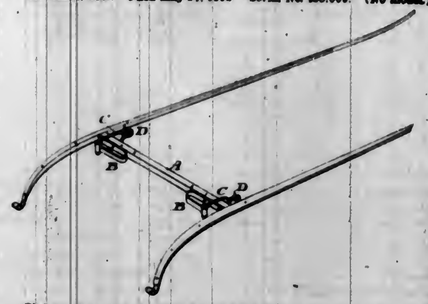
Claim.—1. The combination of the shelf E and the bracket F, composed of the horizontal bar *a*, the slightly-inclined upright *b*, the tie-rod *c*, connecting the front end of the bar *a* and the upper end of the bar *b*, and the parts *g h*, arranged at right angles to each other, said bracket being provided with a loop or eye *d* at its upper end, with its axis parallel to the rear edge of the shelf, the bar *a* being hinged or pivoted to said shelf, substantially as and for the purposes described.

2. The combination of the shelf E and two brackets F, pivoted to said shelf, one near each end, and each provided with a loop or eye at its upper end, with its axis parallel to the rear edge of the shelf and adapted to engage a screw or stud set in the edge or surface of the casing, which is at right angles to the wall of the building, and also provided with the members *g* and *h*, constructed and arranged to bear, respectively, against the front and edge of the window casing.



482,503. AXLE-LUBRICATOR. WILLIAM H. WARD, Topeka, Kans., assignor of one-half to Josiah P. Lewis, same place. Filed Nov. 16, 1891. Serial No. 412,096. (No model.)

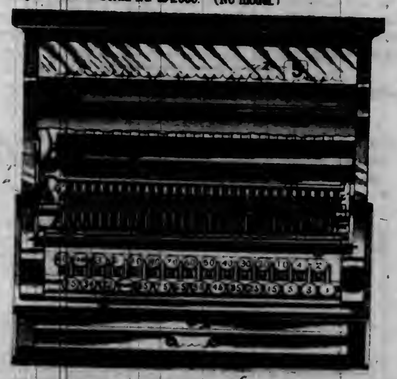
Claim.—1. In a car-axle lubricator comprising a frame, a supporting-spring comprising coils having two sets of arms extending therefrom, one of such arms resting normally in a substantially horizontal position and the other set extending from the coils at an angle to the horizontal arms and adapted to support the lubricating-wheel, substantially as described.



2. A car-axle lubricator comprising a frame, a spindle attached to the frame at one end only, and a supporting-spring comprising coils embracing the spindle, arms for supporting the lubricating-wheel, and arms extending to and resting upon the opposite side of the frame, whereby the spring may be introduced into the axle-box and removed therefrom without disturbing the frame.

3. In a car-axle lubricator, the combination of a frame resting upon the bottom of the journal-box, provided with a spindle and a lug, a supporting-spring comprising coils adapted to pass over the spindle, substantially horizontal arms adapted to rest upon the frame and engage with the lug, angularly-placed arms, a spindle supported by the latter arms, and a lubricating-wheel revolving upon such spindle, substantially as described.

482,503.



482,504. SPRING DRAFT ATTACHMENT. ROBERT BOETTLER, Cleveland, Ohio. Filed May 31, 1892. Serial No. 435,069. (No model.)

Claim.—A spring tug attachment for thills, consisting of U-shaped springs B B, one arm of each spring secured to rear side of cross bar A of the thills, and U-shaped yokes C C, embracing said cross-arm and pivotally attached to the free ends of the springs B B and provided with hooks D D, whose points stand upright, substantially as described, and for the purpose set forth.

482,505. CASH-REGISTER. HUGO COOK, Dayton, Ohio. Filed May 23, 1892. Serial No. 434,000. (No model.)

Claim.—1. The combination of a series of guideways for holding a supply of counters adapted to travel through them by gravity, a pair of detents for each guideway, co-operating with the counters therein to release them one by one, and a series of operating-keys representing different values projecting between the guideways and arranged to bear against and co-operate with the detents, substantially as described.

2. The combination of a series of guideways containing a supply of counters adapted to travel through them by gravity, a pair of spring-detents for each guideway, co-operating with the counters therein to release them one by one, and a series of operating-keys representing different values projecting between the guideways and co-operating with the detents, substantially as described.

3. The combination of a series of guideways, a hopper for holding a supply of counters communicating with the guideways at their upper ends, a pair of detents for each guideway, co-operating with the counters therein to release them one by one, and a series of operating-keys representing different values projecting between the guideways and co-operating with the detents, substantially as described.

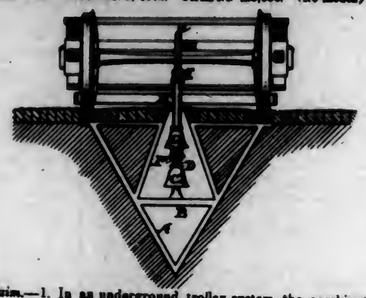
4. The combination of a series of guideways for holding a supply of counters adapted to travel through them by gravity, a pair of detents for each guideway, co-operating with the counters therein to release them one by one, a series of operating-keys projecting between the guideways and co-operating with the detents, and a receptacle communicating with the delivery ends of the guideways and having a series of divisions for receiving and keeping separate the counters delivered to it from the different guideways, substantially as described.

5. The combination of a series of guideways, a hopper for holding a supply of counters, communicating with the guideways at their upper ends, a receptacle communicating with the guideways at their lower ends and having a series of divisions for receiving and keeping separate the counters delivered to it from the different guideways, a pair of detents for each guideway, co-operating with the counters therein to release them one by one, and a series of operating-keys representing different values projecting between the guideways and co-operating with the detents, substantially as described.

6. The combination of a series of guideways, a hopper for holding a supply of counters, communicating with the guideways at their upper ends, a pair of detents for each guideway, co-operating with the counters therein to release them therefrom one by one, a series of operating-keys representing different values projecting between the guideways and co-operating with the detents, and a receptacle communicating with the lower ends of the guideways and having a series of divisions for receiving and keeping separate the counters delivered to it from the respective guideways, substantially as described.

7. The combination, in a cash register and indicator, of a series of guideways for holding a supply of counters adapted to travel through them by gravity, a series of operating-keys representing different values and projecting between the guideways, a series of indicators adapted to be brought into view by the operations of said keys to indicate their respective values, means co-operating with the keys and with the counters in the guideways to release one counter in each guideway upon the operation of the key corresponding to such guideway, and a receptacle having a series of divisions for receiving and keeping separate the counters delivered to it from the different guideways, whereby upon the operation of any key an indicator representing its value is exposed to view and a counter deposited in the proper receptacle to preserve a record thereof.

8. The combination, in a cash register and indicator, of a series of guideways to hold a supply of counters adapted to travel through them by gravity, a pair of detents for each guideway, co-operating with the counters therein to release them one by one, a series of operating-keys representing different values and co-operating with the detents, a receptacle communicating with the guideways and provided with divisions for receiving and keeping separate the counters delivered to it from the different guideways, a money-drawer, and a lock therefor released by the operation of any key of the series, whereby upon operating any key of the series to open the money-drawer a registry of such operation is made by the deposition of a counter in the proper receptacle.

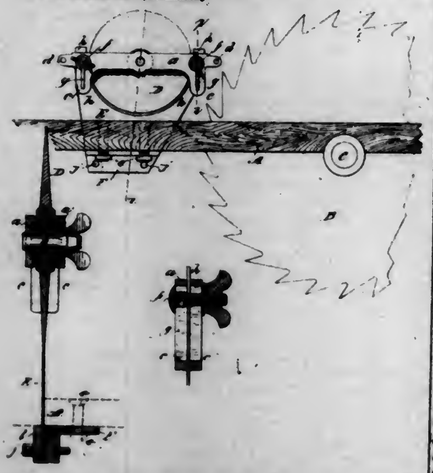


9. The combination of the tubes F', the spring-detents L' M', adapted to enter openings therein, and the keys G, projecting between the tubes and co-operating with the detents, substantially as described.

10. The combination of the hopper H', the tubes F', communicating therewith, the spring-detents L' M', adapted to enter openings therein, and the keys G, projecting between the guideways and co-operating with the detents, substantially as described.

11. The combination of the tubes F', the detents L' M', adapted to enter openings therein, the keys G, projecting between the tubes and co-operating with the detents, and the receptacle E, communicating with the lower ends of the tubes and provided with the troughs K' for receiving and keeping separate the counters delivered to it from the different tubes F', substantially as described.

12. The combination of the hopper H', the tubes F', communicating therewith at their upper ends, the receptacle E, communicating with the tubes at their lower ends and provided with the troughs K', the detents L' M', and the keys G', projecting between the tubes F' and co-operating with the detents, substantially as described.

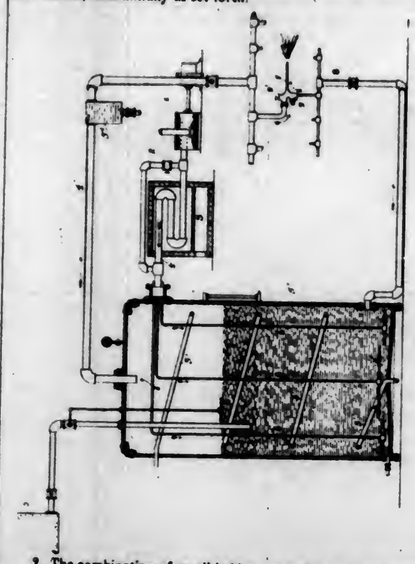


482,506. UNDERGROUND TROLLEY. JOSEPH FISHER, Cleveland, Ohio. Filed Mar. 9, 1892. Serial No. 423,994. (No model.)

Claim.—1. In an underground trolley system, the combination, with the depending trolley-arm E, having a trolley-wheel F, and the electric conductor D, of the antifriction-sleeve H, fitted loosely on the trolley-arm for protecting the arm from wear in the slot, substantially as and for the purpose set forth.

2. In an underground trolley system, the combination of conduit A, insulators C C, supports B B, electric conductor D, trolley-arm E, trolley-wheel F, shield G, antifriction-sleeve H, and depending clearers J J, constructed to operate substantially as described.

482,507. KERF-SPREADER. JOSEPH M. FOSTER, Boston, Mass., assignor of one-half to Robert Bruce, same place. Filed Aug. 6, 1891. Serial No. 401,884. (No model.)



Claim.—1. In a kerf-spreader, the combination of standard E, formed of thin metal and secured to the table, so as to extend up through the kerf of the saw, and the disk D, diminished in thickness at its periphery and supported by said standard above the piece to be sawed and so as to extend down into the kerf thereof, substantially as specified.

2. In a kerf-spreader, the combination of the thin-metal standard adapted to be arranged in the line of the plane of the saw and to be secured to the table below the plane thereof, the bar *a*, secured to said standard, and the disk D, pivoted in said bar above the piece being sawed and so as to extend down into the kerf thereof, substantially as specified.

3. In a kerf-spreader, the combination, with standard E, adapted to be secured to the table, of the bar *a*, supporting the disk D above the piece to be sawed and provided with the slots *g*, whereby said disk may be vertically adjusted according to the thickness of the piece to be sawed, substantially as specified.

482,508. APPARATUS FOR BURNING OIL. GEORGE H. HARVEY, Pittsburg, Pa., assignor of three-fourths to James Getty, Jr., same place, and George D. Rayaud and Gustav P. Perreaud, New York, N. Y. Filed Feb. 6, 1891. Renewed July 24, 1892. Serial No. 441,040. (No model.)

Claim.—1. The combination of an oil-holder, an air-forcing device, an air-conduit for conveying air to the oil-holder, means for mechanically distributing the air in the oil, a burner, and conduits connecting the upper and lower parts, respectively, of the oil-holder with the burner, whereby carbureted air and residual oil may be conveyed to said burner, substantially as set forth.

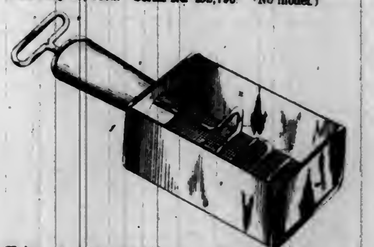
2. The combination of an oil-holder, an air-forcing device, an air-conduit for conveying air to the oil-holder, a heater for heating the air, means for mechanically distributing the air in the oil, a burner, and conduits connecting the upper and lower parts, respectively, of the air-holder with the burner, whereby carbureted air and residual oil may be conveyed to said burner, substantially as set forth.

3. The combination of an oil-holder, an air-forcing device, an air-conduit for conveying air to the oil-holder, means for mechanically distributing the air in the oil, a burner, and conduits connecting the upper and lower parts, respectively, of the oil-holder with the burner, whereby carbureted air and residual oil may be conveyed to said burner, and an independent regulating-valve in the oil-conduit, substantially as set forth.

4. The combination of an oil-holder, an air-forcing device, an air-conduit for conveying air to the oil-holder, means for mechanically distributing the air in the oil, a burner, and conduits connecting the upper and lower parts, respectively, of the oil-holder with the burner, whereby carbureted air and residual oil may be conveyed to said burner, and independent regulating-valves in the oil and vapor conduits, respectively, located at the burner and adapted to positively close either wholly or partially the oil and vapor passages, substantially as set forth.

482,509. WITHDRAWN.

482,510. PLOW STANDARD AND ATTACHMENT. WILLIAM T. STAPLER, Harmony Grove, Ga. Filed Nov. 28, 1891. Serial No. 413,499. (No model.)



Claim.—1. The plow-standard constructed substantially as described, comprising a pair of metallic plates placed edgewise and separated above their lower ends the greater portion of their length, said plates being bent abruptly inward near their lower ends and extending thence downwardly face to face and rigidly secured together, so as to form a narrow centrally-disposed heel-piece or runner integral with the standard proper, whereby a firm support for the blade is afforded and friction and wear upon the sides of the standard back of the blade are prevented, substantially as described.

2. The combination, with the plow-handle, of the non-rotating washer and clip consisting of a flat metallic plate having its ends arranged at right angles to the central portion thereof and having a square or polygonal opening through said central portion, and the fastening-bolt having a correspondingly-shaped shank adapted to fit said opening, whereby wearing and splitting of the timber are prevented and the fastening-bolt, nut, and washer are each secured against rotation, substantially as described.

3. In combination with the beam, the independently-adjustable handles, and means, substantially as described, whereby either or both handles may be adjusted and secured in the desired position, said handles being flexibly connected together, so as to permit of their independent adjustment for the purpose of raising or lowering either handle independently of the other, substantially as described.

4. In combination with the plow-beam, the independently-adjustable handles having the elongated slots at their lower ends, the non-rotating washers, and clips arranged to embrace the handles and span said slots, and the fastening-bolts connecting the handles through said slots and clips, so as to adjustably connect and bind the handles, beam, and clip together, substantially as described.

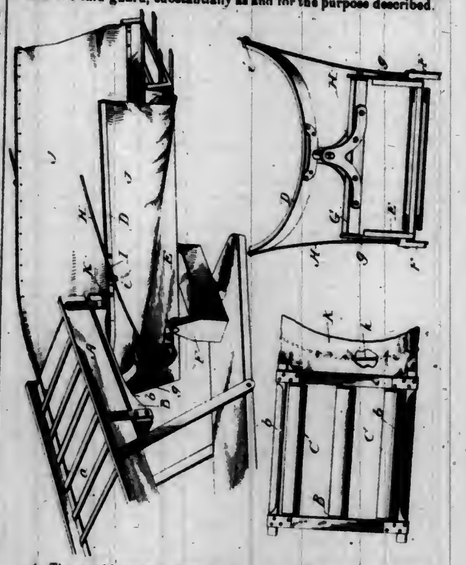
482,511. HAND-SIFTER. JOSHUA R. STORIE, Travisville, Tenn. Filed May 12, 1892. Serial No. 432,795. (No model.)

Claim.—A sifter consisting of a receptacle having a wire-gauze bottom and provided with a hollow handle extending longitudinally of the receptacle and an agitator arranged on the wire-gauze bottom and provided with a stem arranged within the handle and adapted to reciprocate in the same and extended beyond its outer end and provided with a handle, substantially as described.

482,512. STRINGING PIANOS. CHARLES S. WEBER, San José, Cal. Filed Feb. 2, 1892. Serial No. 420,113. (No model.)

Claim.—1. In a stringed musical instrument, the combination, with a metal plate having a pin-hole, of a tuning-pin inserted in the said pin-hole and bent from a normal position to create a frictional binding of the said pin in the pin-hole, substantially as set forth.

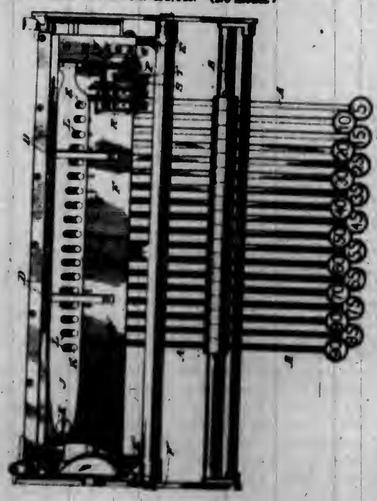
2. In a stringed musical instrument, the combination, with a metal plate having a pin-opening and a tuning-pin inserted in the said opening, of a set-screw constructed to bear laterally on the said tuning-pin to bend the same from a normal position, substantially as and for the purpose described.



3. In a stringed musical instrument, the combination, with a metal plate having a pin-opening and a tuning-pin inserted in the said opening, of a set-screw constructed to bear laterally on the said tuning-pin and a shoe interposed between the said set-screw and the tuning-pin, substantially as specified.

482,513. STRAW-STACKER. LORENZO D. WELLS, Morrisonville, Ill. Filed Feb. 4, 1892. Serial No. 420,308. (No model.)

Claim.—1. The combination, with the carriers A and E, of the bow D, having pivotal connection with the carrier E and adapted to tilt vertically and laterally, a flexible guard depending from and supported by the bow, and spring-arms for yieldingly supporting the outer ends of the said bow, substantially as and for the purpose described.



2. The combination, with the carriers A and E, of the bow D, having pivotal connection with the carrier E and adapted to tilt vertically and laterally, a flexible guard depending from and supported by the bow, and spring-arms for yieldingly supporting the outer ends of the said bow, substantially as and for the purpose described.

3. The combination, with the carriers A and E, of the bow D, having pivotal connection with the carrier E and adapted to tilt vertically and laterally, a flexible guard depending from and supported by the bow, and spring-arms for yieldingly supporting the outer ends of the said bow, and an apron depending from the carrier A and extending within the said guard, substantially as and for the purpose described.

4. The combination, with the carriers A and E, the carrier E being adapted to tilt vertically and laterally, and the roller-frame B, pendent from the carrier A, of the bar G, journaled at its ends on the carrier E, the bow D, pivotally connected with the bar G, spring arms H for supporting the bow D, the flexible guard J, depending from and supported by the bow D, and the apron K, stiffened by bow *k*, depending from carrier A, substantially as described.

482,514. CASH-REGISTER. ALLEN I. BLANCHARD, Chicago, Ill., assignor to the National Cash Register Company, Dayton, Ohio. Filed May 10, 1892. Serial No. 432,440. (No model.)

Claim.—1. In a machine such as described, the combination of a movable bar or plate provided with a series of slots and a series of cams arranged to reciprocate through said slots, so as to move the bar different distances, and each adapted to entirely fill the length of its co-operating slot when moved through it for the purpose of positively arresting the bar when it has been moved the proper distance.

2. In a machine such as described, the combination of a movable bar or plate provided with a series of slots and a series of graduated cams arranged to reciprocate through said slots, so as to move the bar different distances, and each adapted to entirely fill the length of its co operating slot when moved through it for the purpose of positively arresting the bar when it has been moved the proper distance.

13. In a machine such as described, the combination of a horizontal guide-plate provided with a series of slots of different lengths, a swinging bar resting thereon and provided with a series of coincident slots of corresponding lengths, a series of vertically-guided rods carrying cams of different widths corresponding to the lengths of the respective slots in the movable bar and guide-plate and adapted to pass through said slots, and a series of key-levers representing different values for lifting the respective rods, substantially as and for the purpose described.

14. In a registering-machine, the combination of a series of keys representing different values, a registering-bar adapted to be moved different distances by the operations of

connecting with both of said chambers, a single valve which connects said supply-pipe with both of said branch pipes and is adapted to control the inflow of water into either or both of said chambers, said valve being also adapted to control the inflow of water into one of said chambers and a simultaneous outflow of contaminated water from the other chamber, a passage connecting the discharge end of said chambers directly together, a passage connecting the discharge end of either of said chambers with the inlet end of the other chamber, a third or purifying chamber, a passage connecting the discharge end of the second chamber with the inlet of the third chamber, and suitable

482,517. CASH-REGISTER. THOMAS CARNEY, Dayton, Ohio, assignor to the National Cash Register Company, same place. Filed May 23, 1892. Serial No. 434,001. (No model.)

Claim.—1. In a machine such as described, the combination of a movable bar or plate provided with a series of slots and a series of cams arranged to reciprocate through said slots, so as to move the bar different distances, and each adapted to entirely fill the length of its co-operating slot when moved through it for the purpose of positively arresting the bar when it has been moved the proper distance.

2. In a machine such as described, the combination of a movable bar or plate provided with a series of slots and a series of graduated cams arranged to reciprocate through said slots, so as to move the bar different distances, and each adapted to entirely fill the length of its co operating slot when moved through it for the purpose of positively arresting the bar when it has been moved the proper distance.

3. In a machine such as described, the combination of a horizontally-movable bar or plate provided with a series of slots and a series of vertically-guided cams arranged to reciprocate through said slots and move the bar different distances and each adapted to entirely fill the length of its co-operating slot when moved through it for the purpose of positively arresting the bar when it has been moved the proper distance.

4. In a machine such as described, the combination of a horizontally-movable bar or plate provided with a series of slots and a series of vertically-guided graduated cams arranged to reciprocate through said slots and move the bar different distances and each adapted to entirely fill the length of its co-operating slot when moved through it for the purpose of positively arresting the bar when it has been moved the proper distance.

5. In a machine such as described, the combination of a movable bar containing a series of slots of different lengths, a series of cams of different widths corresponding to the lengths of the respective slots in the bar and movable in defined paths through said slots, and suitable means for moving the respective cams through the slots in the bar, substantially as and for the purpose described.

6. In a machine such as described, the combination of a movable bar provided with a series of slots of different lengths, a series of cams of different widths corresponding to the lengths of the respective slots in the bar and movable in defined paths through said slots, and a series of key-levers representing different values and co-operating with the series of cams to move them through the slots in the bar, substantially as and for the purpose described.

7. In a machine such as described, the combination of a horizontally-movable bar provided with a series of slots of different lengths, a series of vertically-guided rods carrying cams of different widths corresponding to the lengths of the respective slots in the bar and adapted to pass through said slots, and a series of keys of different values for lifting the respective rods and moving the cams through the slots in the bar, substantially as and for the purpose described.

8. In a machine such as described, the combination of a series of key-levers representing different values, a series of vertically-guided rods arranged to be lifted by the rear ends of said levers and provided with cams of varying widths, and a movable bar arranged above the series of cams and provided with a series of slots of different lengths corresponding to the widths of the respective cams, through which slots said cams are adapted to pass when the front ends of the key-levers are depressed substantially as and for the purpose described.

9. In a machine such as described, the combination of a pivoted bar arranged to swing in a horizontal plane and provided with a series of slots of different lengths, a series of cams of different widths corresponding to the lengths of the respective slots and movable in defined paths through the same, and a series of keys representing different values for moving the different cams through the slots in the bar, substantially as and for the purpose described.

10. In a machine such as described, the combination of a horizontally-swinging bar provided with a series of slots of different lengths, a series of vertically-guided rods carrying cams of different widths corresponding to the lengths of the respective slots in the bar and adapted to pass through said slots, and a series of key-levers representing different values for lifting the respective rods and moving the cams through the slots in the bar, substantially as and for the purpose described.

11. In a machine such as described, the combination of a movable bar provided with a series of slots of different lengths, a fixed guide-plate provided with coincident slots of corresponding lengths, a series of cams of different widths corresponding to the lengths of the respective slots in the guide-plate and movable bar and adapted to pass through said slots and move the bar different distances, and a series of keys for operating the cams, substantially as and for the purpose described.

12. In a machine such as described, the combination of a horizontally-movable bar provided with a series of slots of different lengths, a fixed guide-plate provided with coincident slots of corresponding lengths, a series of vertically-guided rods carrying cams of different widths corresponding to the lengths of the respective slots in the movable bar and guide-plate and adapted to pass through said slots, and a series of key-levers representing different values for lifting their respective rods, substantially as and for the purpose described.

13. In a machine such as described, the combination of a horizontal guide-plate provided with a series of slots of different lengths, a swinging bar resting thereon and provided with a series of coincident slots of corresponding lengths, a series of vertically-guided rods carrying cams of different widths corresponding to the lengths of the respective slots in the movable bar and guide-plate and adapted to pass through said slots, and a series of key-levers representing different values for lifting the respective rods, substantially as and for the purpose described.

14. In a registering-machine, the combination of a series of keys representing different values, a registering-bar adapted to be moved different distances by the operations of different keys, a rack moving with the bar, a pinion meshing with the rack, a registering-wheel, a clutch between the pinion and registering-wheel, and a shifter actuated at the completion of the positive stroke of a key to break the clutch between the pinion and registering-wheel and permit the latter to remain stationary while the pinion returns to normal position, substantially as described.

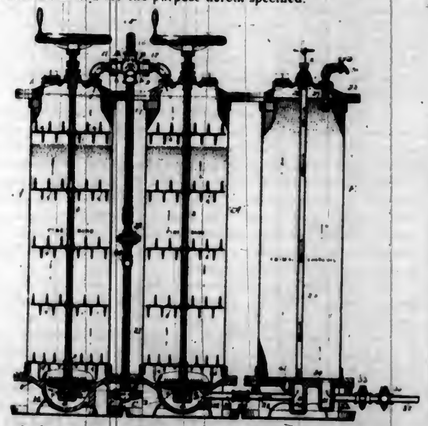
15. In a registering-machine, the combination of a slotted registering-bar, a series of cams of different widths adapted to pass through the slots and move the bar different degrees, a series of keys for operating the cams, a rack moving with the registering-bar, a pinion meshing with the rack, a registering-wheel, a clutch between said wheel and pinion, a vibrating bar common to all of the keys, and a shifter for the clutch actuated by said bar to break the clutch at the completion of the positive stroke of an operated key, substantially as and for the purpose described.

16. In a registering-machine, the combination of a series of keys representing different values, a registering-bar adapted to be moved different distances by the operations of different keys, a rack moving with the bar, a pinion meshing with the rack, a registering-wheel, a clutch between the pinion and the wheel, a shifter for the clutch, and a lock operated by the shifter to lock the registering-wheel simultaneously with the breaking of the clutch between the pinion and wheel.

17. In a registering-machine, the combination of the slotted guide-plate F, the swinging bar J, moving upon said plate and provided with slots L of different lengths, the key-levers A, and the rods E, carried by the rear ends of the said levers and provided with cam-plates H of different widths corresponding to the different lengths of the slots L in the bar J and adapted to pass through said slots, substantially as and for the purpose described.

18. In a registering-machine, the combination of the shifter X, provided with the lug A′ and spring I′, and the reciprocating plate C′, provided with the cam B′, co-operating with the lug A′, and with the pins G′ H′ co-operating with the spring I′, substantially as described.

19. In a registering machine, the combination of the toothed disk T, the sliding pinion P, a clutch connection between them, the shifter X, provided with the locking-arm O′, co-operating with the disk T and provided also with the spring I′ and the lug A′, and the reciprocating plate C′, provided with the cam B′ and pins G′ H′, co-operating with the lug A′ and spring I′, respectively, substantially as described.



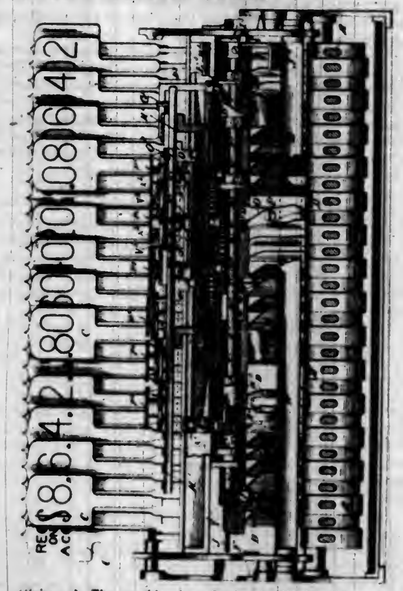
20. In a machine such as described, the combination of a series of operating-keys, a movable bar provided with slots of different lengths, a series of cams of different widths corresponding to the lengths of the respective slots in the movable bar and movable in defined paths through the slots, a vibrating frame common to all of the keys, and a resetting-plate operated by said frame to reset the movable bar upon the release and return of the operated key, substantially as described.

21. The combination of the operating-keys A, the rods E, operated thereby and provided with the cams H, the guide plate F, the slotted bar J, the vibrating frame D′ E′, and the resetting-plate J′, operated by the vibrating frame and co-operating with the bar J, substantially as described.

482,515. APPARATUS FOR PURIFYING WATER. JAMES H. RENWICK, Albany, assignor to the New York Filter Company, New York, N. Y. Filed Aug. 25, 1887. Serial No. 247,814. (No model.)

Claim.—1. In a water-purifying apparatus, the combination of three cylinders, two of which are primary filtering-chambers and the other a chemical purifying-chamber, a valve B for controlling the direction of the inflowing water into the first two chambers, a three-way stop-cock D, connecting the pipes C and 21, a filtered-water pipe C, connecting with the filtered-water chambers of said primary filtering-chambers and forming a roundabout pipe for conveying the filtered water outside of said chemical purifying-chamber, waste-water pipes 17 and 40, a filtered-water pipe 28, connecting said purifying-chamber with the filtered-water chambers, and a filtered-water outlet-pipe 32, all of said pipes being arranged exteriorly to the apparatus and the pipes 17, 28, 32, and 34 being each provided with a suitable valve for controlling the passage of liquid therethrough, substantially as and for the purpose specified.

2. In a water-purifying apparatus, the combination, with two primary filtering-chambers, of a supply-pipe provided with branches connecting with both of said chambers, a single valve which connects said supply-pipe with both of said branch pipes and is adapted to control the inflow of water into either or both of said chambers, said valve being also adapted to control the inflow of water into one of said chambers and a simultaneous outflow of contaminated water from the other chamber, a passage connecting the discharge end of said chambers directly together, a passage connecting the discharge end of either of said chambers with the inlet end of the other chamber, a third or purifying chamber, a passage connecting the discharge end of the second chamber with the inlet of the third chamber, and suitable valves for controlling the flow of water through said passages, whereby water may be passed either simultaneously or successively downwardly through the first two chambers and then through the third chamber, as and for the purpose herein specified.



3. In a water-purifying apparatus, the combination, with two primary filtering-chambers, of a supply-pipe provided with branches connecting with both of said chambers, a single valve which connects said supply-pipe with both of said branches and is adapted to control the inflow of water into either or both of said chambers and a simultaneous outflow of water from the other chamber, as herein described, a passage connecting the discharge end of said chambers with each other and with an outlet-passage for the filtered water, a passage connecting the discharge end of either one of said chambers with the inlet end of the other, a third or purifying chamber, a passage connecting the discharge end of the second chamber with the inlet end of the third chamber, a passage connecting the discharge end of the third chamber with the outlet-passage for the filtered water, and suitable valves or cocks for controlling the flow of water through said passages and chambers, whereby water may be passed through either or both of the first two chambers and then directly out through said outlet-passage without passing through the third chamber, as and for the purpose herein specified.

482,516. CUT-OFF VALVE FOR ENGINES. OTIS E. BROWN and PELEG STETSON, Brockton, Mass. Filed Jan. 22, 1892. Serial No. 418,941. (No model.)

Claim.—The combination, with the steam or valve chest, of a slide-valve having at each of its opposite ends a steam-port A^3 divided into separated and radiating sections, a cut-off valve for each steam-port of the slide-valve, and having a steam-port F^2 divided into separated and radiating sections corresponding to and fulcrumed to swing on said slide-valve, and thereby have the said separated sections of its steam-ports placed either into or out of register with those of the slide-valve, spring lever catches G G^2, fulcrumed on the slide-valve and at their free ends extended toward each other, radial arms J J^3 of the cut-off valves H H^2, studs on said arms to be engaged by said catches, extensions L L^4 of said arms J J^3 beyond their said studs, and fixed abutments M M^4 of the valve-chest to work on said arms' extensions L L^4, substantially as described, for the purposes and operation specified.

482,517. CASH-REGISTER. THOMAS CARNEY, Dayton, Ohio, assignor to the National Cash Register Company, same place. Filed May 23, 1892. Serial No. 434,001. (No model.)

Claim.—1. The combination of a longitudinally-sliding plate or bar provided with a series of slots extending lengthwise of it and a series of cams arranged to reciprocate through said slots so as to move the plate different distances and each adapted to fill the entire length of its co-operating slot when moved through it to positively arrest the plate when it has been moved the proper distance.

2. The combination of a longitudinally-sliding plate or bar provided with a series of slots extending lengthwise of it and a series of graduated cams arranged to reciprocate through said slots so as to move the plate different distances and each adapted to fill the entire length of its co-operating slot when moved through it to positively arrest the plate when it has been moved the proper distance.

3. The combination of a longitudinally-sliding plate or bar provided with a series of slots extending lengthwise of it and a series of vertically-guided cams arranged to reciprocate through said slots and move the bar different distances and each adapted to fill the entire length of its co-operating slot when moved through it to positively arrest the bar when it has been moved the proper distance.

4. The combination of a longitudinally-sliding plate or bar provided with a series of slots extending lengthwise of it and a series of vertically-guided graduated cams arranged to reciprocate through said slots and move the bar different distances and each adapted to fill the entire length of its co-operating slot when moved through it to positively arrest the bar when it has been moved the proper distance.

5. In a registering-machine, the combination of a longitudinally-sliding registering plate provided with a series of slots of different lengths extending lengthwise thereof and a series of gradnated cams whose widths correspond to the lengths of the respective slots in the sliding plate, said cams being adapted to reciprocate through the slots in said plate so as to move the same different distances proportionate to the widths of the respective cams.

6. In a registering-machine, the combination of a longitudinally-sliding registering plate provided with a series of slots of different lengths, a series of key-levers representing different amounts, and a series of graduated cams whose widths correspond to the lengths of the respective slots in the sliding plate, said cams being adapted to be moved by the key-levers in defined paths through the slots in said plate, for the purpose described.

7. In a registering-machine, the combination of a longitudinally-sliding registering plate provided with a series of slots of different lengths, a series of key-levers representing different amounts, and a series of vertically-guided graduated cam-plates pivoted to the rear ends of said key-levers and adapted to be lifted by them through the slots in the sliding plate, for the purpose described.

8. In a registering-machine, the combination of a series of movable registering plates, each provided with a series of slots of different lengths, a series of sets of cams adapted to reciprocate through the

slots in said plates so as to move the plates different distances, each cam being adapted to fill the entire length of its co-operating slot when moved through it, and thereby positively arrest the plate when it has been moved the proper distance, and a resetting-bar common to and co-operating with all of the plates to reset them when they have been moved by the cams.

9. In a registering-machine, the combination of a series of movable registering plates, each provided with a series of slots of different lengths, a series of sets of graduated cams adapted to reciprocate in defined paths through the slots in said plate, one set of cams for each plate, the widths of the cams in each set corresponding to the lengths of the slots in the plate with which they co-operate, and a resetting bar common to and co-operating with all of the slotted plates to reset them after they have been moved by the cams.

10. In a registering-machine, the combination of a series of longitudinally-sliding registering plates, each provided with a series of slots of different lengths extending lengthwise of the plate, a series of sets of graduated cams, one set for each plate, adapted to reciprocate in defined paths through the slots in said plates and corresponding in widths to the lengths of the slots, and a longitudinally-sliding resetting-bar co-operating with all of the plates to reset them after being moved by the cams.

11. In a registering-machine, the combination of a series of longitudinally-sliding registering plates, each provided with a series of slots of different lengths extending lengthwise of the plate, a series of sets of key-levers, one set for each plate, a series of sets of graduated cams, one set for and operated by the keys of each set and adapted to reciprocate in defined paths through the slots in the plate corresponding to such set, a vibrating frame common to all of the keys of all of the sets and moved by the operation of any key, and a resetting-bar actuated by the vibrating frame and co-operating with all of the registering plates to reset them after they have been moved by the cams.

12. In a registering-machine, the combination of a longitudinally-sliding registering plate provided with a series of slots of different lengths extending lengthwise thereof, a series of graduated cams whose widths correspond to the lengths of the respective slots in the sliding plate, a series of operating-keys for moving the cams in defined paths through the slots in the sliding plate, a rack carried by said plate, a spindle having fast upon it a pinion meshing with the rack and having splined upon it a sliding clutch-collar, a registering-wheel carrying a set of clutch-teeth adapted to co-operate with those on the sliding clutch-collar, and means for moving the clutch-collar into engagement with the clutch-teeth of the registering wheel at the beginning of the strokes of the keys in one direction and disengaging it therefrom at the ends of said strokes.

13. The combination of a rotary shaft, a pinion loose upon said shaft, a pawl movable with the pinion and adapted to engage a notch in the shaft, a second pinion loose on said shaft, and a pawl movable therewith and adapted to engage a notch in the shaft, a reciprocating rack meshing with the first pinion, and a second rack intermediate said first rack and the second pinion, for the purpose described.

14. The combination of a rotary shaft, a sleeve loose thereon and carrying a pinion, and a housing containing a pawl adapted to engage a notch in the shaft, a second sleeve loose upon the shaft and carrying a second pinion, and a housing containing a second pawl, adapted to engage a notch in the shaft, a reciprocating rack meshing with the first pinion, and a second rack meshing with the first rack and with the second pinion, for the purpose described.

15. The combination of a rotary shaft, a pinion loose thereon, a pawl movable with the pinion and adapted to engage a notch in the shaft, a second pinion loose on said shaft, and a pawl movable there with and adapted to engage a notch in the shaft, a series of operating-keys, a vibrating frame common to said keys and moved by the operation of any one of them, a rack carried by said frame and meshing with the first-mentioned pinion, and a second rack intermediate the first rack and the second pinion, substantially as and for the purpose described.

16. The combination of the registering-wheels P' and P², the ratchet R', carried by the wheel P², the sliding plate O², carrying the pawl Q², and the latch T², co-operating with the pawl Q² and with a cam carried by the wheel P', whereby at each complete revolution of the wheel P' the latch is tripped and the pawl Q² set to engage the ratchet of the wheel P² when the plate O² is slid to the left, substantially as and for the purpose described.

17. The combination of the registering-wheels P', P², and P³, the ratchets R', carried by the wheels P² and P³, the sliding plate O², carrying the pawls Q² and R², the former adapted to co-operate with the ratchet of the wheel P² and the latter with the ratchet of the wheel P³, the spring S², the latches T² U², co-operating, respectively, with the pawls Q² R² and with cams carried by the wheels P' and P², and the pins Z² for disengaging the pawls from the ratchets, substantially as and for the purpose described.

18. The combination of the registering-wheels P', P², and P³, the ratchets R', carried by the wheels P² and P³, the sliding plate O², carrying the pawls Q² and R², the former adapted to co-operate with the ratchet of the wheel P² and the latter with the ratchet of the wheel P³, the spring S², the latches T² U², co-operating, respectively, with the pawls Q² R² and with cams carried by the wheels P' P², the revolvable shaft W', and the cams A² B², fast thereon and co-operating with the arm D², depending from the sliding plate O², substantially as described.

19. The combination of the key-levers A, the vertically-guided cam-plates D, carried by their rear ends, and the sliding registering plates provided with longitudinal slots corresponding in length to the widths of the respective cams, substantially as and for the purpose described.

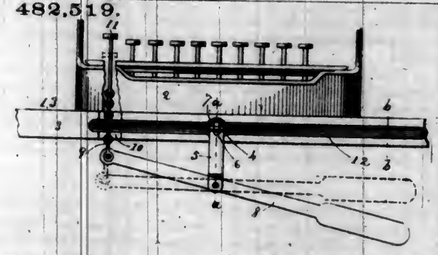
20. The combination of the key-levers A, the vertically-guided cam-plates D, carried by their rear ends, the sliding registering plates provided with slots corresponding in lengths to the widths of the respective cams, the resetting-bar K, co operating with the registering-plates, the vibrating bar T, extending across the keys, and the lever O, co-operating with said bar and with the resetting-bar K, substantially as described.

21. The combination of the key-levers A, the vertically-guided cam-plates D, carried by their rear ends, the sliding registering plates provided with slots corresponding in lengths to the widths of the respective cams, the racks carried by the sliding plates, the spindles K', carrying pinions meshing with said racks, the sliding clutch-collars feathered upon said spindles, the registering-wheels carrying clutch-teeth adapted to co-operate with those on the sliding collars, the swinging plate S' for lifting the clutches, and the revoluble shaft W', carrying a cam co-operating with the plate to lift the same and engage the clutches, substantially as described.

22. The combination of the rotary shaft W', the sleeve C², loose thereon, the pinion B² and housing H², fast on said sleeve, the latter containing the pawl I², adapted to engage the notch J² in the shaft W', the sleeve F², loose on the shaft W', the pinion E² and housing L², fast on said sleeve, the latter containing the pawl M², adapted to engage the notch N² in the shaft W', the reciprocating rack A², meshing with the pinion B², and a second rack D², intermediate the rack A² and pinion E², substantially as and for the purpose described.

23. The combination of the rotary shaft W', the notched disk I², fast thereon, the locking-dog H², co-operating with said disk, the key-levers A, the vibrating frame lifted by said levers, and the bracket J², carried by said frame and co-operating with the dog H², in the manner and for the purpose described.

482,518. NUT-LOCK. WILLIAM COKAYNE, Sedalia, Ind., assignor of one-third to James C. Shafor, same place. Filed May 31, 1892. Serial No. 435,023. (No model.)



Claim.—1. In a nut-lock, the combination, with a plurality of nuts and bolts, of a longitudinally-slotted plate fitting over the said bolts and connecting a pair of the same and a plurality of spring locking-plates movably secured in the slot of the slotted plate at their forward ends and pivotally secured together at their rear or abutting ends in said slot, substantially as described.

2. In a nut-lock, the combination, with the rail A, bolts B B', and nuts C C', of the connecting-plate E, fitting over any two adjacent bolts and having a central longitudinal slot e for the locking-plates, the locking-plates D D', secured in said slot, the rivet-pin 5, joining the rear extremities of said locking-plates, and the rivets e e', holding said locking-plates in said slot, as specified.

482,519. TYPE-WRITING MACHINE. WILLIAM S. EDWARDS, Charleston, W. Va. Filed Apr. 27, 1892. Serial No. 430,819. (No model.)

Claim.—The combination, in an attachment for type-writing machines, of the stand supporting such a machine, provided with the vertical slot in the body of the stand and the socket in the front face of the stand, extending toward the rear and having the flange around the mouth thereof, the standard fitting into said socket and having the hinge at one end thereof, the lever pivoted to said standard having the chain near one end thereof and suitably weighted at the other end,

482,519.

and the shift-key forming part of the ordinary mechanism of the machine and connected to said chain, all substantially as herein described, for the purposes, first, of shifting the operation of the machine from lower to upper case type without use of the hands of the operator, and, secondly, of conveniently stowing the aforesaid standard and lever when not in actual use.

482,520. PORTABLE DENTAL CHAIR. FRANK H. FIELD, New Orleans, La., and CHARLES H. FIELD, Dalton, Ga. Filed June 20, 1891. Serial No. 396,929. (No model.)

Claim.—1. In a dental-chair support, the combination of a base, an upright standard, a sleeve secured on said standard, arms extending laterally from the said sleeve, sockets mounted on said arms, adapted to receive the feet of a chair, and a support for the chair-back, substantially as described.

2. In a dental-chair support, the combination of a base, an upright standard, a sleeve adjustably secured on said standard, arms extending laterally from the said sleeve, the laterally-adjustable sockets mounted on the said arms, adapted to receive the feet of the chairs, varying as to the width between their legs, and a support for the chair-back, substantially as described.

3. In a dental-chair support, the combination of a base, an upright standard, a sleeve adjustably secured on said standard, arms extending laterally from the said sleeve, the rotatable sockets mounted on the said arms, adapted to receive the feet of a chair and to be moved with the same on the tilting of the chair, and an adjustable support for the chair-back, substantially as described.

4. In a dental-chair support, the combination of the base, the upright standard, the sleeve adjustably secured on the said standard, the arms projecting laterally from the sleeve, the rotatable and laterally-adjustable sockets mounted on the said arms to receive the legs of chairs, varying as to the width between their legs, and to move with the legs on tilting the chair, and an adjustable support for the chair-back, substantially as described.

5. In a dental-chair support, the combination of a base, an upright standard, a sleeve adjustable on said standard, the arms carried by the sleeve, the sockets made in sections to be adjustable to chair-legs of variable sizes mounted on said arms, and a support for the chair-back, substantially as described.

6. In a dental-chair support, the combination, with a base-support, of the back-support consisting of a rod and hook secured on its ends, one of the said hooks being adjustable, and the brace-rod hinged at its ends to the supports, substantially as described.

7. In a dental-chair support, the combination of a base-support, the back-support consisting of a rod, a hook secured to the upper end of the rod, the bracket secured to the lower end of the rod, and means for securing the said bracket to the chair-back, and the brace-rod hinged at its ends to the said support, substantially as described.

8. In a dental-chair support, the combination, with a base-support, of a support for the back of the chair, comprising a rod provided with hooks to engage a portion of the chair, at least one of which hooks is vertically adjustable on the rod, a brace-rod hinged at its ends to the said supports, and a hinged connection between said back-support and brace-rod, substantially as and for the purposes set forth.

9. In a dental-chair support, the combination, with a base-support, of a support for the back of the chair, comprising a rod having a slitted sleeve carrying a hook to engage a part of the chair, means for clamping said sleeve to its rod, a brace-rod hinged at its ends to the said supports, and a hinged and detachable connection between said brace-rod and sleeve, substantially as and for the purposes set forth.

10. In a dental-chair support, the combination, with a base-support, of a support for the back of a chair, provided with means for securing a chair thereto, a sectional brace-rod hinged at one end to said back-support and at the other end with the base-support and formed with teeth, a pinion supported by one section of said brace-rod and engaging said rack-teeth, and means for turning said pinion to adjust the length of the brace-rod and lock it to its adjustment, substantially as and for the purposes set forth.

11. In a dental-chair support, the combination, with the chair-back support for the attachment of a chair, of a head-rest bar, an arm hinged at one end to said bar and at the other end to said back-support, a segmental brace attached at one end to said back-support and at the other to said hinged arm, a segmental brace connected at one end to said head-bar and at the other end to said hinged arm, and a clamp for securing said braces in their adjustment to said hinged arm, substantially as and for the purposes set forth.

12. In a dental-chair support, the combination, with the base-support and the standard provided with an adjustable sleeve carrying sockets for the legs of a chair, of an adjustable back-support for the upper part of the chair, the brace-rod hinged at its ends to the said support, and a head-rest supported from said back-support and adjustable both vertically and to the inclination of the chair, substantially as and for the purposes set forth.

13. In a dental chair, the combination, with a base-piece, of a superstructure sliding vertically on said base-piece and having feet to rest upon a floor, a wedge fitting between said base-piece and a portion of the superstructure, and an eccentrically-actuated rod for forcing said wedge between the base-piece and superstructure to raise and lower the feet of the structure from and to the floor, substantially as and for the purposes set forth.

14. In a dental chair, the combination, with a base-piece, of a superstructure sliding vertically on said base-piece and having feet to rest upon a floor, a hollow arm to said superstructure, and an eccentrically-actuated rod working in said arm and carrying a wedge to be forced between the base-piece and the superstructure to raise the superstructure and lift its feet from off the floor to permit the superstructure to be easily revolved, substantially as and for the purposes set forth.

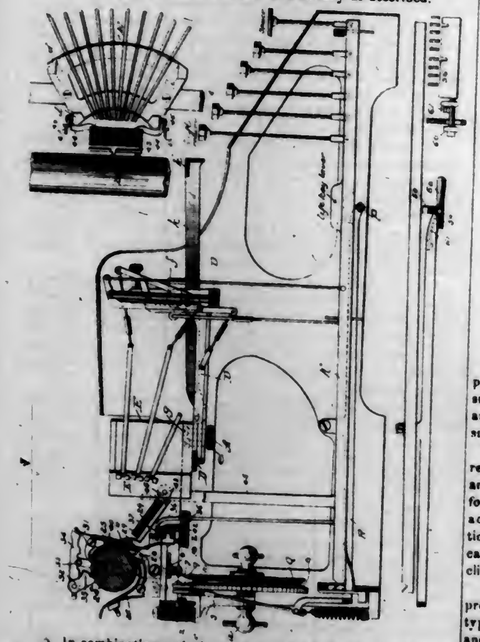
15. In a dental chair, the combination, with a base-piece, of a superstructure sliding vertically on said base-piece and having feet resting upon a floor, a wedge fitting between said base-piece and a portion of the superstructure, and the screw passing through the said portion of the superstructure to form an adjustable bearing for the wedge, substantially as described.

16. In a dental chair, a detachable foot-rest consisting of the bars D', joined at their inner ends to form a guide and clamp, the board carried on the outer ends of the said bars, the suspending-arms pivoted to the said rods and provided with hooks at their upper ends, the segment connected at one end to the said suspending-arms and the free end passing through the guide or clamp formed in the inner ends of the bars D', and the screw for clamping the guide, substantially as described.

17. In a dental chair, a removable arm consisting of the arm proper, the standard hinged to the front end of the arm, and the clamps or collars attached to the lower end of the standard and the rear end of the arm proper for the purpose of securing the arm to the front leg and back post of its respective side, substantially as described

---

482,521. TYPE-WRITING MACHINE. BERNARD GRANVILLE, Dayton, Ohio. Filed May 2, 1891. Serial No. 391,363. (No model.)



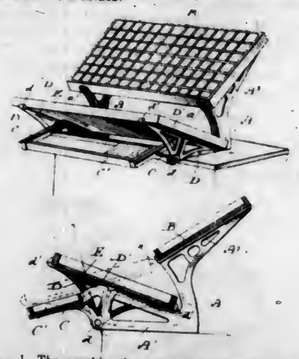
Claim.—1. The ratchet-wheel having a retracting-spring, the paper-carriage connected therewith, a frame arranged to be operated by the key-levers and connected with the push-pawl of the ratchet-wheel, a return-key arranged to act upon the frame, and a retaining-pawl, the parts being combined and arranged to operate substantially as described.

2. In combination, the ratchet-wheel connected to the paper-carriage, a push-pawl engaging said ratchet, a retaining-pawl, and lever mechanism connected to the push-pawl, said pawl being adapted to

engage and operate the retaining-pawl when desired, substantially as described.

3. In combination, the ratchet-wheel connected to the paper-carriage, the frame arranged to be operated by the key-levers and connected to the push-pawl of the ratchet-wheel, a return-key arranged to operate upon the frame, and a retaining-pawl reversed to the push-pawl, the pawls having the construction and relative location as described, whereby the push-pawl, acted upon by the extreme movement of the return-key, raises the retaining-pawl, all substantially as described.

4. In combination with the ratchet-wheel connected to the paper-carriage and the push-pawl connected with the key-levers, the retaining-pawl mounted upon the segment pivoted upon the axis of the wheel and provided with means for adjustment, whereby the pawls may be set to bear snugly against the teeth, substantially as described.

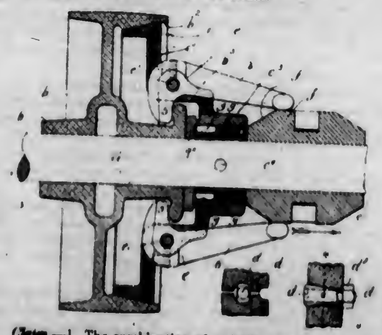


5. In combination with the push-pawl mounted upon a bell-crank lever and connected to a frame, with key-levers adapted to operate

bar having a bearing-face provided with notches, said bar being pivoted to and carried by the pivoted space-frame, substantially as described.

12. In combination with the key-levers and mechanism connected therewith for moving the paper-carriage, a variable-spacing mechanism consisting of a bar on the connecting-frame beneath the key-levers and the mechanism for moving the paper-carriage, the said bar having two bearing-faces, one plain and the other provided with notches, and a lever for turning said bar, substantially as described.

482,522. TYPE-CASE AND GALLEY SUPPORT. JAMES E. HAMILTON and FRANK KAUFMANN, Jr., Two Rivers, Wis., assignors to the Hamilton Manufacturing Company, same place. Filed May 5, 1892. Serial No. 431,881. (No model.)

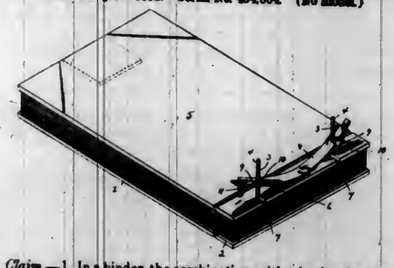


Claim.—1. The combination, with a bracket provided with supports for an upper type-case and with suitable galley supports, of a support for a lower type-case, pivotally engaged with said bracket and adapted to permit said case to normally rest above said galley, substantially as set forth.

2. The combination, with a pair of brackets having upwardly and rearwardly extending arms adapted to support an upper type-case and with forwardly-extending galley-supporting arms, of supports for the lower type-case, pivotally engaged with said brackets and adapted to be vibrated so as to give a rearward or a forward inclination to said lower case, the arrangement being such that when said case is inclined forwardly it will rest above the galley and when inclined rearwardly it will expose the same, substantially as set forth.

3. A type-case and galley support comprising a pair of brackets provided with upwardly and rearwardly inclined supports for an upper type-case, forwardly and downwardly inclined galley-supporting arms and intermediate horizontal base or supporting surfaces, and lower type-case supports engaged with opposite ends thereof and extending below said ends and pivotally engaged with said brackets adjacent to their horizontal supports, said pivoted supports being adapted to be moved so as to give a forward or a rearward inclination to said lower type-case, substantially as set forth.

482,523. CLUTCH. JAMES HARTNESS, Springfield, Vt. Filed Feb. 15, 1892. Serial No. 421,518. (No model.)



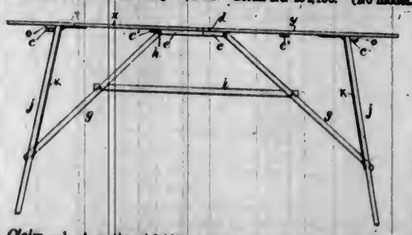
Claim.—1. The combination of a shaft, a loose pulley thereon, a friction-clutch member comprising a hub affixed to the shaft, a divided ring formed to engage a clutch-surface on the pulley and provided with means whereby it may be expanded to compensate for wear, and

independently-movable arms connecting the parts of said ring with the hub, said arms permitting the expansion of the ring, and means for engaging the pulley with said ring, as set forth.

2. The combination of a shaft, a loose pulley thereon having a flanged hub and a friction-surface, a friction-clutch member composed of a divided ring formed to engage the friction-surface of the pulley, means for expanding the ring to compensate for its wear, a hub affixed to the shaft and offset from the said ring, and a series of flexible arms connecting the said hub with the ring, a series of bell-crank levers pivotally connected to said arms and having inwardly-projecting shorter arms engaged with the flange of the pulley-hub and longer arms arranged so that when moved outwardly from the shaft they will cause the shorter arms to engage the pulley with the clutch member, and means for moving said longer arms, as set forth.

3. The combination of a shaft, a loose pulley having an internal clutch-surface, a divided or sectional ring formed to engage said surface, independently-movable arms connecting the parts of said ring with the hub, adjustable wedges interposed between the ends of the sections of the ring, whereby the ring may be expanded to compensate for wear, and means for moving the pulley to engage it with the ring, as set forth.

482,524. TEMPORARY BINDER. LOUIS W. HASSENFLUG, Toledo, Ohio. Filed May 31, 1892. Serial No. 434,884. (No model.)

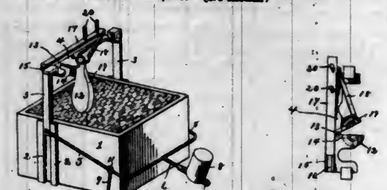


Claim.—1. In a binder, the combination, with a back, of the filing-pins secured thereto, a cover formed with slots adapted to receive the pins, and an upwardly-curved clamping-bar secured to the cover centrally between the pins, said bar having slots near its outer ends to receive the pins, and said bar normally binding upon the pins and holding the cover in position.

2. In a binder, the combination, with a back, of the filing pins, the cover, the clamping-bar secured to the cover and adapted to engage the pins, and the supports for elevating the ends of the clamping-bar.

3. In a binder, a back, a cover, a clamping-bar secured upon the cover, clamping-pins secured to the back and having a compressible section at the upper ends.

4. In a binder, a back formed with flexibly-connected end portions, filing-pins secured in the end portions, a cover having a flexibly-connected end portion having slots coincident with the filing-pins, a clamping-bar secured upon the end portion of the cover centrally of the pins and formed with recesses to receive the filing-pins, and a weight upon the opposite end of the cover.

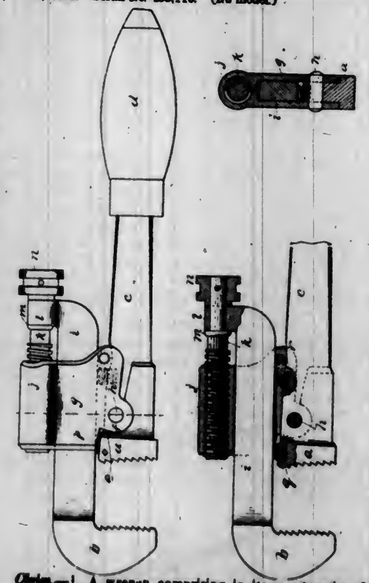


482,525. SECTIONAL-TOP FOLDING TABLE. ROBERT J. NEILL, Elizabeth, N. J. Filed May 24, 1892. Serial No. 434,158. (No model.)

Claim.—1. A sectional folding table having the top provided with hinged legs and divided into the four boards *x*, *x'*, *y*, and *y'*, connected together by the hinges *c*, *c'*, and *d*, as set forth, and the boards being provided at their central junction with the rabbeted stripe *e*, and the rabbeted plate *f*, fitted thereto, substantially as set forth.

2. A sectional folding table consisting in the four boards provided at their central junction with the rabbeted stripe *e*, the plate *f*, fitted thereto, with the pins *h* bearing upon the ends of the stripe *e*, the hinges *c*, mounted upon the cleats *o*, the legs *j*, provided with the hook-rods *l* and braces *k*, and the braces *g*, fitted to the rods *l* and attached to the plate *f* by the removable pins *h*, substantially as herein set forth.

482,526. APPARATUS FOR MECHANICALLY OPERATING PASTE-GLASS MOLDS. MICHAEL J. OWENS, Findlay, Ohio. Filed Dec. 18, 1891. Serial No. 415,476. (No model.)

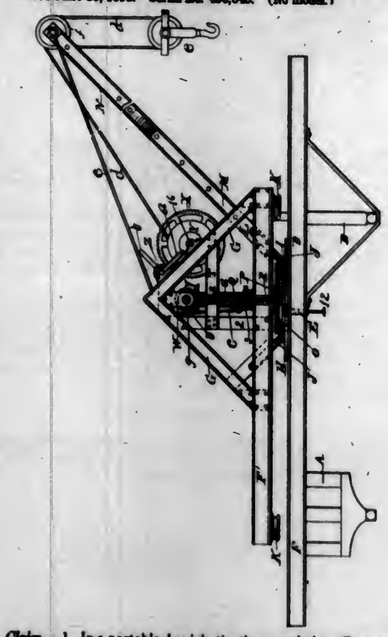


Claim.—1. In an apparatus for mechanically operating paste-molds to open, close, and cool the same, a tank containing a cooling liquid, a two-part mold, and mechanism for opening, closing, and immersing the molds.

2. In an apparatus for mechanically operating glass-paste molds, a tank filled with liquid, a movable frame, a section of mold connected therewith, and a section of mold pivotally connected with a lever pivoted to the frame, said frame being movable to immerse the molds in the liquid.

3. In an apparatus for mechanically operating paste-molds, a tank, a frame vertically movable in relation to the tank, carrying a sectional mold, and means connected thereto to open and close the mold mechanically, and a lever one end of which is pivoted to the frame and the other end carrying a weight to counterbalance the frame, so that the molds are raised above the tank.

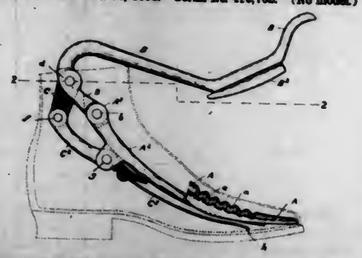
482,527. PIPE-WRENCH. DANIEL R. PORTER, Chelsea, assignor to the Columbian Manufacturing Company, Brockton, Mass. Filed May 16, 1892. Serial No. 433,110. (No model.)



Claim.—1. A wrench comprising in its construction fixed and movable jaws having their shanks arranged parallel with each other, a rocker pivoted on the fixed jaws, a nut forming an integral part of the rocker and extended above the shank of the movable jaw, the last-mentioned shank being provided with an upturned end, and an adjusting-screw having a bearing in said upturned end and threaded into said nut, as set forth.

2. In a wrench, a fixed jaw, a rocker pivoted thereto having a threaded opening, and a channel intermediate the threaded opening and the fixed jaw, a movable jaw working in the channel and having an upturned end, and an adjusting-screw loosely journaled in the said end and engaging the threaded opening in the rocker, as set forth.

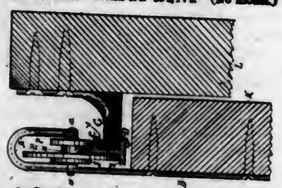
3. In a wrench, a fixed jaw, a rocker pivoted thereto having a threaded opening, and a channel intermediate the threaded opening and the fixed jaw, a movable jaw working in the channel and having an upturned end, an adjusting-screw loosely journaled in the said end and engaging the threaded opening in the rocker, and springs interposed between the rocker and the fixed jaw, as set forth.



482,528. PORTABLE DERRICK. GEORGE W. PATTON, Chicago, Ill., assignor to himself, James H. Shepard, and John Dolese, same place. Filed June 25, 1892. Serial No. 438,045. (No model.)

Claim.—1. In a portable derrick, the three angle-bars F, mounted on the bolsters of a truck, and lateral supports hinged thereto, in combination with a fixed under cross-bar and a slidable stirrup embracing both the bar and the support, as and for the purpose specified.

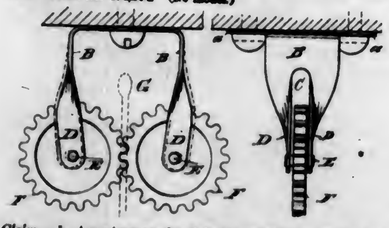
2. The combination of the spar with a rotating truss, a central bed-plate, and a central post-support, rollers interposed between the truss and bed-plate, and a slidable collar 5 on the post, a sliding adjustable ring on the post above the collar, and a supporting rope attached to the collar and to the spar, as and for the purpose specified.



482,529. BOOT OR SHOE CREASER. HENRY P. ROBERTS, Jamestown, N. Y. Filed Dec. 31, 1891. Serial No. 416,702. (No model.)

Claim.—1. A tool for creasing boot or shoe uppers, composed of a grooved block shaped to fit the inner side of the upper and a rearward extension, a lever fulcrumed on said rearward extension of and extending over said grooved block, and a link in two sections jointed end to end and one to said lever and the other to said extension of and extended under said block, substantially as described, and for the purpose specified.

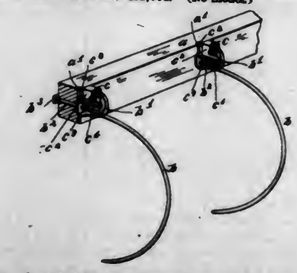
2. A tool for creasing boot or shoe uppers, composed of a grooved block shaped to fit the inner side of the upper and a rearward extension separate from it and the block, adapted to be detachably attached, a lever fulcrumed on said rearward extension of and extending over said grooved block, and a link in two sections jointed end to end and one to said lever and the other to said extension of and extended under said block, substantially as described, for the purposes specified.



482,530. DOOR-HANGER. SAMUEL SHERFFLER, Jr., Joliet, Ill. Filed Aug. 31, 1891. Serial No. 404,174. (No model.)

Claim.—1. In the door-hanger shown and described, the combination of the track D, having the inner flange *c* and the lower flange *y*, and the wheel-treads E and F, the tread E supporting the door on the flange *y*, and the tread F not being in contact with flange *c*, all arranged to operate substantially as and for the purpose set forth.

2. In the door-hanger shown and described, the combination of the track D, having the flanges *c* and *y*, and the bracket G, secured to the track by having said flanges closed thereon, substantially as and for the purpose set forth.



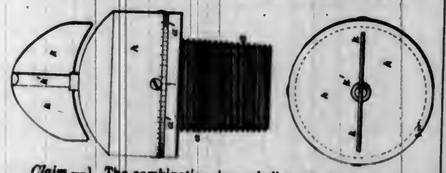
482,531. CLOTHES-HOLDER. GEORGE W. SEAVEY, Chelsea, Mass., assignor of one-half to George D. Emery, same place. Filed May 25, 1892. Serial No. 434,304. (No model.)

Claim.—1. As an improved article of manufacture, the herein-described improved clothes-holder, the same consisting of a resilient blank struck out of a single piece of metal, having a body portion with bifurcated or slotted arms and bent down opposite each other and provided with eyes at their lower ends, and wheels mounted in said eyes and opposing each other with a yielding action.

2. As an improved article of manufacture, the herein-described improved clothes-holder, consisting of a resilient blank struck out of sheet metal and perforated for screw attachment, provided with opposing arms bent down and bifurcated, the ends being perforated and twisted, substantially as shown and described, and wheels mounted between said bifurcated twisted ends and opposing each other with a yielding action.

482,532. HAY-RAKE. JOHN H. THOMAS, Springfield, Ohio. Filed May 11, 1892. Serial No. 432,681. (No model.)

Claim.—1. A holder for rake-teeth, having an open socket with projecting sides and an extended arm projecting from said socket, said arm being provided with a grooved periphery, substantially as and for the purpose specified.



2. A holder for rake-teeth, formed of a single piece and provided with a receiving-socket for the spring-coil and an extended grooved arm adapted to support the tooth by engaging with the coil at a single point, said holder being provided with an opening in line with the lower side of said engaging-arm, substantially as specified.

3. In a hay-rake, the combination, with the rake head and the spring-tooth connected thereto, of a tooth-holder having a socket with projecting sides to receive the spring-coil, and a projecting arm with a grooved periphery adapted to receive and support the projecting end of said rake-tooth at the point where it joins the coil, and means for securing said rake-tooth and holder to said rake-head, substantially as specified.

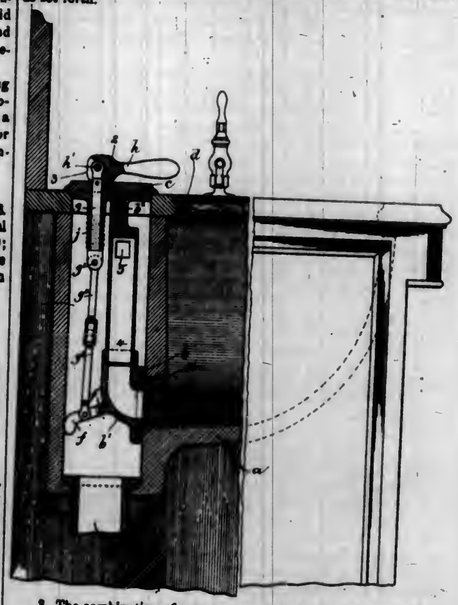
4. The combination, with a rake-head, of a spring-tooth having a coil and an extending screw-threaded portion, a tooth-holder having a socket to receive said coil, and an extending arm adapted to engage and hold said extended portion at the point where it joins said coil, a projecting lug on said holder to engage said rake-head, and means for securing the extended portion of said tooth in said rake-head, substantially as specified.

5. The combination, with a rake-head, of a spring-tooth having a coil and a straight extended portion, a tooth-holder having a projecting arm grooved at its outer periphery to engage said tooth at a single point between said coil and extended portion, and means for securing the extended portion of said tooth in the rake-head, substantially as specified.

482,533. FUSE FOR EXPLOSIVE PROJECTILES OR SHELLS. JAMES C. THOMPSON, Brockley, England. Filed Apr. 25, 1891. Serial No. 390,426. (No model.) Patented in England Oct. 23, 1884, No. 15,150; in Belgium Aug. 31, 1889, No. 87,423; in Italy Oct. 30, 1889; in France Nov. 11, 1889, No. 200,259; in Austria-Hungary Jan. 31, 1890, and in Germany May 7, 1890, No. 51,981, and June 10, 1890, No. 53,366.

Claim.—1. The combination, in a shell or projectile with a detonator or primer and a wheel or disk mounted on a part of the shell and restraining the detonator from action and provided with a slot or cut-away portion which when the wheel is turned through a given angle releases the detonator, of a spindle parallel to the axis of the shell, vanes on the same for preventing its rotation during the flight and rotation of the wheel, and gears intermediate to the spindle and the said wheel or disk, as set forth.

2. The combination, in a fuse, of a slotted toothed wheel, an exploding device held out of action thereby, a spindle provided with vanes for preventing its rotation during the flight of the shell, gears intermediate to the spindle and the toothed wheel, and a stop or arm interposed in the path of movement of the detonator of the exploding device adapted to be withdrawn by the movement of the toothed wheel relatively to the exploding device, as set forth.

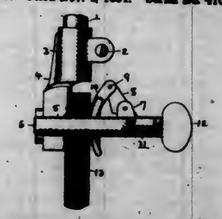


3. The combination, with a shell or projectile, of a spindle parallel to the axis of said shell and provided with vanes for preventing its rotation during the flight of the shell, and a detonator or exploding device adapted to be ignited or operated for exploding the charge in the shell by a predetermined movement of the shell and the spindle relatively to each other, as set forth.

4. In a shell or projectile, the combination of the spindle provided with vanes for preventing its rotation during the flight of the shell, a train of gears carried by the shell and engaging with the spindle, a spring-actuated detonator adapted to be released by said train, and a primer carried by a movable part of the detonator adapted to be thrown forward and exploded by the impact of the wheel upon a body in its path, as set forth.

482,534. OUTLET-VALVE FOR SET BOWLS. JOHN L. THURSTON, Somerville, and FRED B. HOW, Boston, Mass. Filed Nov. 30, 1891. Serial No. 412,903. (No model.)

Claim.—1. The combination, with a water-receptacle *a*, having an outlet-chamber *c*, communicating with the lower portion of the receptacle through one or more outlet-orifices, of a cap or support at the upper end of said chamber, a swinging arm or valve-holder pivoted to said cap and depending therefrom into the chamber, a clapper-valve supported wholly by said arm and arranged to bear on the back of the bowl and close the outlet-orifices therein, and a valve-operating device supported by said cap and adapted to move said arm to force the valve against the back of the receptacle, the said cap, arm, valve, and valve-operating device being adapted to be applied and removed together, as set forth.



2. The combination, with a water-receptacle *a*, having an outlet-chamber *c*, communicating with the lower portion of the receptacle through one or more outlet-orifices, of a cap or support at the upper end of said chamber, a swinging arm or valve-holder pivoted to said cap and depending therefrom into the chamber, a clapper valve secured to the lower portion of said arm and arranged to bear on the back of the receptacle and close the outlet-orifices therein, a rod or plunger fitted to move vertically in said cap and provided at its upper end with an operating device, whereby it may be moved vertically, an arm or strut pivoted at one end to the lower portion of the valve-holder and arranged to bear at its other end against the rear wall of the chamber, and a rod connecting said arm or strut with the plunger, as set forth.

3. The combination of a water-receptacle having an outlet-chamber communicating with the lower portion of the receptacle, a tubular arm pivoted to a support at the upper end of said chamber, said arm having its lower end arranged as an inlet to coincide with the said outlet-orifices and having an outlet above said inlet, an annular valve surrounding said inlet, and means for moving the valve-holder to press said valve against the wall of the receptacle, as set forth.

4. The combination of a cap or plate *c*, formed to be engaged with a fixed support, an arm or valve-holder pivotally connected to said plate and having a valve on its swinging end, an arm pivoted to said holder and arranged to bear at its swinging end on a fixed surface near the valve, and an operating device supported by the plate, whereby said arm may be moved to press its swinging end against said surface, and thereby press the valve against its seat, the said valve-holder, valve, arm, and operating device being supported by the cap or plate and applied and removed therewith, as set forth.

482,535. CLAMP FOR ARC-LAMP CARBONS. ANSON WEBER, Schenectady, assignor to the Edison General Electric Company, New York, N. Y. Filed Nov. 4, 1891. Serial No. 410,894. (No model.)

Claim.—1. The combination, in a carbon-holder, of the main body, the extension therefrom, a link the lower end of which is pivoted to the extension, a clamping-jaw pivoted to the upper end of said link,

and means for pressing the jaw against a carbon in the clamp, substantially as described.

2. The combination, in a carbon-holder, of the main body, the extension therefrom, a link the lower end of which is pivoted to the extension and having a stop to limit its forward movement when there is no carbon in the clamp, a clamping-jaw pivoted to the upper end of said link, but in a line outside of the circumference of a carbon of normal size used in the clamp, and means for pressing the jaw against the carbon in the clamp, substantially as described.

3. The combination of the clamp-body, the movable clamp member, a sleeve on the body, having a screw-hole, and a screw in the same for moving the movable member, said screw having a short screw-threaded section and a smooth section, both within the hole in the sleeve, the screw-threaded part of the screw being always within the sleeve during use of the device, whereby its thread is protected, substantially as described.

4. The combination, in a clamp for arc-light carbons, of the clamp-body having a projecting sleeve bored for the reception of a screw, a screw in said hole having a screw-threaded portion adapted to co-operate with the screw-threaded hole and a smooth portion adapted to enter the screw-hole, and a clamp member moved by said screw, the smooth portion of the screw being of such length that it always projects into the screw-hole during ordinary use of the device, so that the screw-thread will not be exposed, substantially as described.

5. The combination, in a clamp for arc-light carbons, of the clamp-body having a projecting sleeve bored for the reception of a screw, a portion of the hole being screw-threaded and a portion being larger and smooth, whereby a shoulder 14 is formed, a screw in said hole having a screw-threaded portion adapted to co-operate with the screw-threaded hole and a larger smooth portion adapted to enter the smooth portion of the hole, and a clamping-jaw moved by said screw, substantially as described.

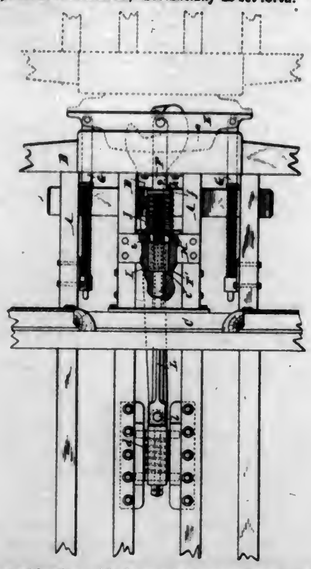
482,586. WALK AND BRIDGE PLANK. ALEXANDER ZAGELMEYER, West Bay City, Mich. Filed Nov. 16, 1891. Serial No. 412,025. (No model.)

Claim.—1. A plank for walks and bridges, having a plane surface on its under side and having the middle portion of its width of a greater thickness than the thickness of its lateral edges, substantially as set forth.

2. The combination, in a walk, of the stringers or sleepers and a series of planks, each plank provided on its under side with a plane surface resting upon the stringers and having on its upper side a surface of convex form transversely, substantially as set forth.

482,587. METHOD OF DISINTEGRATING VEGETABLE SUBSTANCES. HENRY J. BIRD, Hoboken, N. J. Filed Sept. 11, 1891. Serial No. 405,427. (No specimens.)

Claim.—1. The method herein specified of disintegrating vegetable substances and separating the fiber for paper-stock, consisting in subjecting such vegetable material to the action of gastric juices in the presence of sufficient heat to render such gastric juices efficient in the disintegration of the material and washing out the other substances for the separation of the fiber, substantially as set forth.

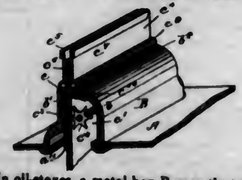


2. The method herein specified of disintegrating vegetable fiber for the production of paper-stock, consisting in subjecting such vegetable fiber to the action of gastric juices and an alkali in the presence of sufficient heat to render such gastric juices efficient and washing the other substances from the fiber, substantially as set forth.

3. The method herein specified for disintegrating and separating the vegetable substances contained in the paunches in slaughtered cattle, consisting in adding thereto an alkali, such as lime, heating the same in a suitable vessel, and subjecting such material to a beating or pulping operation for separating the fibers and washing out the softened materials to obtain paper-stock, substantially as set forth.

482,588. CAR-BUFFER. THOMAS A. RUSSELL, Buffalo, N. Y. Filed Mar. 15, 1892. Serial No. 424,975. (No model.)

Claim.—1. The combination, with the stationary platform of a railway-car, the longitudinally-movable draw-bar, and a buffer or platform extension movable on the stationary platform, of a follower-socket guided on the stationary platform, a spring for projecting the buffer or platform extension bearing with its inner end against the bottom of the follower-socket, and a coupling-bar attached at one end to said socket and at its opposite end to the draw-bar, substantially as set forth.



2. The combination, with the stationary platform of a railway-car and the longitudinally-movable draw-bar, of a buffer or platform extension movable on the main platform, a movable abutment or follower guided on the main platform, a spring for projecting the buffer or platform extension, bearing against said abutment, and a coupling-bar attached at one end to the draw-bar and having its other end movably attached to said abutment and provided with a shoulder bearing against said abutment, substantially as set forth.

3. The combination, with the stationary platform of a railway-car and the longitudinally-movable draw-bar, of a buffer or platform extension movable on the main platform, a movable abutment or follower having a pin or projection, a projecting spring for the buffer or movable platform, bearing against said abutment, and a coupling-bar attached at one end to the draw-bar and having at its other end a longitudinal slot in which the pin of the abutment is arranged, substantially as set forth.

4. The combination, with the stationary platform of a railway-car and the longitudinally-movable draw-bar, of a buffer or platform extension movable on the main platform, a movable abutment or follower having a pin or projection, a projecting spring for the buffer or movable platform, bearing against said abutment, and a coupling-bar attached at one end to the draw-bar and having at its other end a longitudinal slot in which the pin of the abutment is arranged, and a shoulder bearing against the abutment, whereby the latter is caused to move outward with the draw-bar, substantially as set forth.

482,589. OIL-STOVE. WILLIAM M. BOWMAN and ELMER F. SHAW, Plymouth, Mass., assignors to the Plymouth Foundry Company, same place. Filed Apr. 3, 1890. Serial No. 346,402. (No model.)

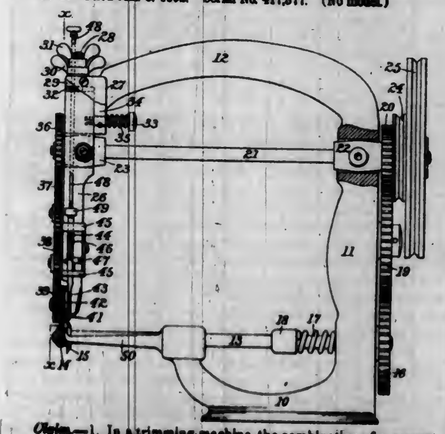
Claim.—1. In oil-stoves, a metal box B upon the top plate of the reservoir or tank of the stove, having a slit or recess through its top for receiving the wick-tube and a chamber or space on one side only for holding the wick-raiser, substantially as described.

2. A burner for oil-stoves, comprising a cast-metal box B, the sides and ends of which are integral, a slit through the top near one side, forming an opening for the reception of the wick-tube, the said wick-tube, and the shaft and wick-raisers contained in said box at one side of the wick only, as and for the purposes described.

3. A burner for oil-stoves, comprising a box of cast metal the sides and ends of which are integral and which has a long opening through its top located nearer one side of the box than the other, a wick-tube inserted in said slit and having one side extending downward into the cavity of the box, and a wick-raiser shaft and raisers thereon on the other side of said downwardly-extending section and in the cavity of said box, as and for the purposes described.

4. In a burner for oil-stoves, the box B, having the integral sides and ends and provided with a long opening through its top near one side of the box, a wick-tube inserted in said opening, made of two pieces, the edges of which overlap, each of which has a rib c' and one of which sections extends downwardly into the cavity of the box and bears against its sides and the other of which sections has its lower edge folded upon the under surface of the top of the box, a wick-raiser shaft in the cavity of said box, and wick-raisers thereon, as and for the purposes described.

482,540. HAND NAILING IMPLEMENT. WILLIAM J. BROWN, Philadelphia, Pa. Filed Jan. 12, 1892. Serial No. 417,783. (No model.)



Claim.—1. The combination, with a containing staple-case and plunger-guide, of a movable plunger or driver-blade longitudinally split or divided at its lower extremity transversely to the crown of the staple, forming two spring members, to enable it to operate with an outwardly-pressing spring-like action within the containing-case, substantially as described.

2. The combination, with a containing staple-case and plunger-guide of flat or flattened oval form, of a plunger of similar conformation provided with an impact head at its upper end and longitudinally split or divided at its lower end transversely to the crown of the staple, forming two spring members, to enable it to operate with an outwardly-pressing spring-like action within the containing-case, substantially as described.

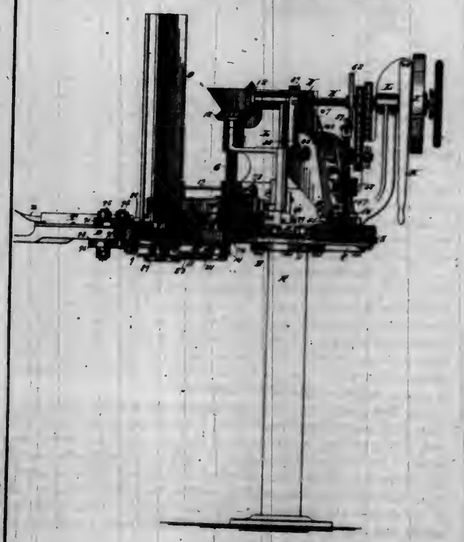
3. The combination, with a containing staple-case and plunger-guide provided with vertical guideways, of a plunger-blade longitudinally split or divided at its lower end transversely to the crown of the staple, forming two spring members, and provided with wings or flanges adapted to fit said vertical guideways of the containing-case, substantially as described.

4. A staple-driver consisting of a staple-case B, having a side opening c, a vertically split or divided plunger or driver A, forming two spring members, the latter having an impact head d and made concave at its base m, substantially as described.

482,541. HAT-TRIMMING MACHINE. LOUIS BULASKY, New York, N. Y. Filed Jan. 8, 1892. Serial No. 417,377. (No model.)

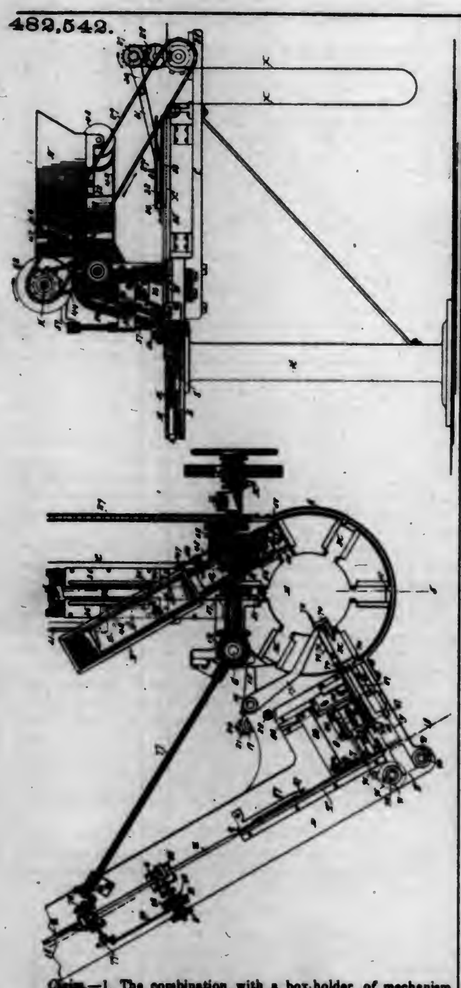
Claim.—1. In a trimming-machine, the combination of a support-ing-frame having an upper horizontal arm, a fixed head carried by said arm, a depending arm guided in said head, a screw engaging the upper end of said depending arm and passing through the top plate of said head and provided with an adjusting-nut, a rotary cutter carried at the lower end of said depending arm, a driving-shaft having a bearing in the upper end of said arm, and a train of gears supported by said arm to drive said cutter from said shaft, substantially as shown and described.

2. In a trimming-machine, the combination of a frame having an upper horizontal arm, a head carried by said arm, a depending arm guided in said head, a screw or bolt passing through an aperture in a vertical wall of said head and engaging said depending arm, a spring interposed between the head of said screw or bolt and said wall, a rotary cutter carried by the lower end of said arm, a train of gears supported by said arm for driving said cutter, and a second cutter to co-operate with said first-named cutter, substantially as shown and described.



3. In a trimming-machine, the combination of a frame having an upper horizontal arm, a head carried by said arm, a depending arm guided in said head, a screw or bolt passing loosely through the top plate of said head and engaging the upper end of said arm and provided with an adjusting-nut, a screw or bolt engaging said depending arm and passing loosely through a vertical wall of said head, a spring acting upon said screw, a cutter carried by the lower end of said depending arm, means to rotate said cutter, and a second cutter to co-operate with said first-named cutter, substantially as shown and described.

4. In a trimming-machine, the combination of a frame having an upper horizontal arm, a head carried by said arm, a depending arm guided in said head, a screw or bolt passing loosely through the top plate of said head and engaging the upper end of said arm and provided with an adjusting-nut, a spring interposed between the upper end of said arm and said top plate, a screw or bolt engaging said depending arm and passing loosely through a vertical wall of said head, a spring acting upon said screw, a cutter carried by the lower end of said depending arm, means to rotate said cutter, and a second cutter to co-operate with said first-named cutter, substantially as shown and described.



5. In a trimming-machine, the combination of a frame having an upper horizontal arm, a head carried by said arm, a vertical arm depending from said head, means for adjusting said arm, a cutter carried by the lower end of said arm, means to rotate said cutter rapidly, a feed-wheel mounted upon the same axis with said cutter, but to rotate freely thereon and independently of said cutter, and a lower feed-wheel and means to rotate it more slowly than the upper cutter, substantially as shown and described.

6. In a trimming-machine, the combination of a frame having an upper horizontal arm, a head carried by said arm, a vertical arm depending from said head, means for adjusting said arm, a stud carried by the lower end of said arm, a sleeve mounted on said stud, a cutter and a gear fixed to said sleeve, a feed-wheel mounted loosely upon said sleeve between said gear and cutter, means to rotate said gear and cutter rapidly, and a lower feed-wheel and means to rotate it more slowly than the upper cutter, substantially as shown and described.

482,542. BOX-FILLING MACHINE. WILLIAM H. BUTLER and WILLIAM R. LANDFEAR, Brooklyn, N. Y.; said Landfear assignor to said Butler. Filed Sept. 25, 1891. Serial No. 406,844. (No model.)

482,542.

Claim.—1. The combination, with a box-holder, of mechanism co-operating with said holder to form and deliver boxes thereto, a box-filling mechanism by which the boxes are filled, and a covering and delivering mechanism by which the filled boxes are delivered from the holder and inserted in tubular covers, substantially as described.

2. The combination, with a box-holder, of mechanism co-operating with said holder to form and deliver boxes thereto, a box-filling mechanism by which the boxes are filled, a covering and delivering mechanism by which the filled boxes are delivered from the holder and inserted in tubular covers, and a sealing mechanism for applying sealing-strips to said boxes, substantially as described.

3. The combination, with an intermittently-moving carrier provided with a plurality of box-holders, of mechanism co-operating with said holder to form and deliver boxes thereto, a box-filling mechanism to which the boxes are advanced from the box-forming mechanism by the carrier and by which they are filled, and covering and delivering mechanism to which the boxes are advanced from the filling mechanism and by which they are delivered from the carrier and inserted in tubular covers, substantially as described.

4. The combination, with an intermittently-moving carrier provided with a plurality of box-holders, of mechanism co-operating with said holders to form and deliver boxes thereto, a box-filling mechanism to which the boxes are advanced from the box-forming mechanism by the carrier and by which they are filled, covering and delivering mechanism to which the boxes are advanced from the filling mechanism and by which they are delivered from the carrier and inserted in tubular covers, and sealing mechanism by which sealing-strips are applied to the boxes, substantially as described.

5. The combination, with an intermittently-moving carrier provided with a plurality of box-holders, of feeding mechanism for advancing a strip of box-blanks to said carrier, mechanism co-operating with said holders to form boxes from said blanks and deliver them to the holders, a box-filling mechanism to which the boxes are advanced from the box-forming mechanism by the carrier and by which they are filled, and covering and delivering mechanism to which the boxes are advanced from the filling mechanism and by which they are delivered from the carrier and inserted in tubular covers, substantially as described.

6. The combination, with an intermittently-moving carrier provided with a plurality of box-holders, of cutting and feeding mechanism for forming a strip of box-blanks, a cutter and box-forming die for severing blanks from said strip and forming boxes in said holders, a box-filling mechanism to which the boxes are advanced from the box-forming mechanism by the carrier and by which they are filled, and covering and delivering mechanism to which the boxes are advanced from the filling mechanism and by which they are delivered from the carrier and inserted in tubular covers, substantially as described.

7. The combination, with an intermittently-moving carrier provided with a plurality of box-holders, of mechanism co-operating with said box-holders to form and deliver boxes thereto, a magazine containing the articles to be packed, to which the boxes are advanced from the box-forming mechanism, feeding and packing mechanism for feeding the articles from the magazine and packing them in the boxes, and a covering and delivering mechanism to which the boxes are advanced from the packing mechanism and by which they are delivered from the carrier and inserted in tubular covers, substantially as described.

8. The combination, with an intermittently-moving carrier provided with a plurality of box-holders, of means coacting with said holders to supply them with boxes, a magazine containing the articles to be packed, to which the boxes are advanced by the carrier, feeding mechanism for feeding the articles from the magazine, a counting and packing mechanism by which the articles are counted and packed in the boxes, and a covering and delivering mechanism to which the boxes are advanced from the packing mechanism and by which they are delivered from the carrier and inserted in tubular covers, substantially as described.

9. The combination, with an intermittently-moving carrier provided with a plurality of holders, of means coacting with said holders to supply them with boxes, a magazine containing the articles to be packed, feeding mechanism for feeding the articles from the magazine, a receiving-chamber having a swinging bottom, to which the articles are delivered from the magazine, a reciprocating plunger by which the articles are removed from the chamber and packed in the boxes, and a covering and delivering mechanism to which the boxes are advanced from the packing mechanism and by which they are delivered from the carrier and inserted in tubular covers, substantially as described.

10. The combination, with an intermittently-moving carrier provided with a plurality of box-holders, of mechanism co-operating with said box-holders to form and deliver boxes thereto, a filling mechanism to which the boxes are advanced from the box-forming mechanism by the carrier and by which they are filled, a plunger for delivering the filled boxes from the carrier, and a cover-magazine and feeding mechanism for delivering tubular covers in the path of the filled boxes as they are delivered by the plunger, substantially as described.

11. The combination, with a holder adapted to receive and hold a box, of box-filling mechanism by which the box is filled, a plunger for delivering the filled box from the holder, a cover-magazine in which the tubular covers are packed flat, and feeding and opening mechanism by which a cover is delivered open in the path of the filled box as it is advanced by the plunger, substantially as described.

12. The combination, with a holder adapted to receive and hold a box, of box-filling mechanism by which the box is filled, a plunger for delivering the filled box from the holder, a vertical cover-magazine in which the covers are packed flat, a plunger by which the bottom cover is removed endwise from the cover-magazine, and a plunger and co-operating devices advancing the cover sidewise into the path of the filled box and opening the cover, substantially as described.

13. The combination, with a holder adapted to receive and hold a box, of box-filling mechanism by which the box is filled, covering and delivering mechanism by which the filled box is delivered from the holder and inserted in a tubular cover, and sealing mechanism by which a sealing-strip is applied to said box, substantially as described.

14. The combination, with a holder adapted to receive and hold a box, of box-filling mechanism by which the box is filled, covering and delivering mechanism by which the filled box is delivered from the holder and inserted in a tubular cover, feeding mechanism by which a pasted web is advanced into the path of the filled box, a cutter for severing a sealing-strip from said web, and means for pressing said strip on said box, substantially as described.

15. The combination, with a holder adapted to receive and hold a box, of box-filling mechanism by which the box is filled, covering and delivering mechanism by which the filled box is delivered from the holder and inserted in a tubular cover, feeding mechanism by which a pasted web is advanced into the path of the filled box, a cutter for severing a sealing-strip from said web, and feeding and pressing rolls to which the boxes are advanced by the delivering mechanism, substantially as described.

16. The combination, with magazine N and feeding-belt 42, of vibrating separator 45 above said belt, substantially as described.

17. The combination, with magazine N, feeding-belt 42, and raceway 54, of spring-supported plates 55 and reciprocating packing-plunger 56, substantially as described.

18. The combination, with spring-supported plates 55, of reciprocating packing-plunger 56 and means for actuating said plunger with a shorter throw at certain strokes, substantially as described.

19. The combination, with a reciprocating packing-plunger and a holder for the material or articles to be packed, of means for actuating said plunger with a shorter throw as successive layers of the material or articles are packed, substantially as described.

20. The combination, with holder M, of a box-delivering plunger 70, having fingers *a* for turning down one end of the box and guide 69 above the path of the box for turning down the opposite end, substantially as described.

21. The combination, with a plunger for advancing a flat tubular cover sidewise, of devices co-operating therewith to open the cover, substantially as described.

22. The combination, with a plunger for advancing a flat tubular cover sidewise, of devices co-operating therewith to open the cover and means for inserting a box in said cover, substantially as described.

23. The combination, with a plunger for advancing a box, of a plunger for advancing a flat tubular cover sidewise into the path of the box and devices co operating with said plunger to open the cover, substantially as described.

24. The combination, with the cover-magazine O, of plunger 63 for removing the bottom cover endwise from the box, plunger 65, advancing the box sidewise, and devices co-operating with said plunger to open the box-cover, substantially as described.

25. The combination, with plunger 65, of bar 67, having spring inclined finger *b*, and bar 68, having a guiding-incline on its lower side, substantially as described.

26. The combination, with plunger 65, of bar 67, having spring inclined finger *b* and overhanging flange 5, and bar 68, having a guiding-incline on its lower side and overhanging flange 6, substantially as described.

27. The combination, with plunger 65, of bar 67, having the inclined spring-pressed finger *b*, substantially as described.

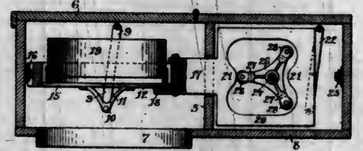
28. The combination, with box filling and covering mechanism, of sealing mechanism for applying a pasted sealing-strip on the end and overlapping the sides of the box, substantially as described.

29. The combination, with box filling and covering mechanism, of feeding mechanism for advancing a pasted strip into the path of the filled and covered box and pressing devices for pressing the strip on the box, substantially as described.

30. The combination, with box filling and covering mechanism, of feeding mechanism for advancing a pasted strip into the path of the filled and covered box and feeding and pressing rolls 91, substantially as described.

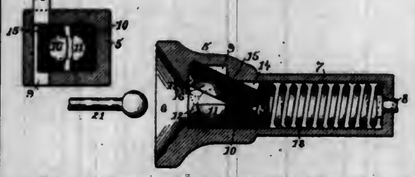
31. The combination, with box-filling mechanism, of covering and delivering mechanism adapted to cover the boxes and deliver a line of boxes, feeding mechanism for advancing a pasted strip into the path of the filled and covered boxes, and feeding and pressing rolls 91, run at a higher speed than the delivering mechanism, substantially as described.

482,548. POCKET CHECK AND BANK BOOK. LEWIS C. BUTLER, West Bay City, and HENRY R. CROPP, Saginaw, Mich.; said Cropp assignor to said Butler. Filed Mar. 20, 1891. Renewed June 20, 1892. Serial No. 437,845. (No model.)



Claim.—A pocket check and bank book provided with a pocket on inside of one of the covers adapted to receive independent checks, an erasive tablet and one or more memorandum-sheets bound together with the cover, and a removable check-memorandum sheet and a removable bank-deposit and balance sheet, substantially as described, and as and for the purpose set forth.

482,544. COMPOSITION OF MATTER FOR WALL DECORATION. GEORGE A. CASSELMAN, Fort Dodge, Iowa. Filed Nov. 23, 1891. Serial No. 412,878. (No specimens.)



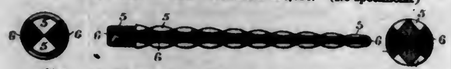
Claim.—The herein-described composition of matter to be used for ornamenting walls, &c., consisting of stucco, calcined plaster, whiting, glue, borax, and corn-starch in about the proportions specified.

482,545. SIFTER. JAMES CHARLESWORTH, Providence, R. I. Filed Apr. 13, 1892. Serial No. 428,947. (No model.)

Claim.—The combination, with the case 5, having an extension 8, an opening in the bottom of the case surrounded by the collar 7, the arms 9 9, pivoted at their upper ends to the sides of the case and having their lower ends connected by the shaft 10, the brackets 11, mounted on said shaft, a frame composed of the sides 12 12, the ends 13 and 14, and the braces 15 15, supported on said brackets, and a sieve 19, supported in said frame, of the member 20, pivotally supported in the extension-case by the arms 22 22 and having the arm 17 extending into the case 5 and secured to end 14 of the sieve-frame, cam-shoulders 21 21, formed around an opening in the member 20, a shaft 24, journaled in bearings in the sides of the extension-case, rotatable by a crank, and a member 26, having arms 27 27, and bearing-rolls 28 28, journaled in the ends of said arms, mounted on said shaft, as described.

482,546. CAR-COUPLING. MILO M. CLARKE, Westerly, R. I. Filed Jan. 6, 1892. Serial No. 417,161. (No model.)

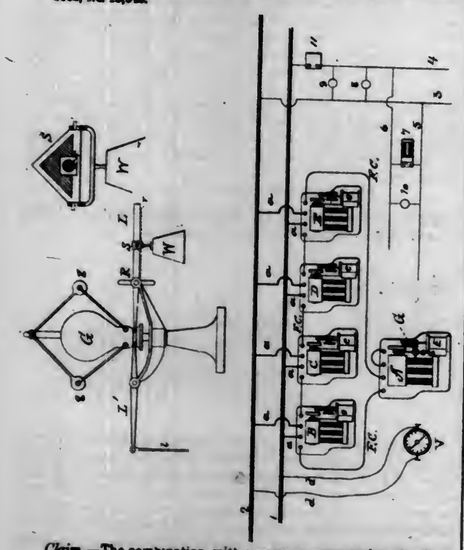
Claim.—1. In a car-coupler, the combination, with a hollow coupler-head having a hollow shank and a bell-shaped mouth and a forward vertical slot adjoining said hollow portion, of two separable spring-operated blocks longitudinally movable in said hollow portion and having cavities in their adjoining surfaces, a connecting-pin having an end adapted to be contained in said cavities, and means adapted to be contained within said vertical slot for locking said blocks together, as described.



2. The combination, with the hollow coupler-head having the mouth 6, hollow shank 7, and vertical slot 9, of the jaw 10, having the cavity 11 and flaring opening 12 at the forward portion and the base 13 and rib 14, the jaw 15, having a central transverse slot engaging the rib 14 of the jaw 10 and the forward cavity 16 and flaring opening 17, a coiled spring 18, contained within the hollow of said base and pressing against the base of the jaw 10, the locking-bar 19, adapted to move in the slot 9, and means for operating the same, and a connecting-pin 21, having a ball end adapted to be engaged by said cavities, as and for the purpose described.

482,547. NECK TIE OR BAND. CHARLES S. COLE, Bridgeport, Conn. Filed Sept. 22, 1891. Serial No. 406,474. (No model.)

Claim.—A scarf or tie provided on its inner side at intervals with soft-rubber pads which in use will come in contact with the collar and prevent said scarf or tie from slipping.

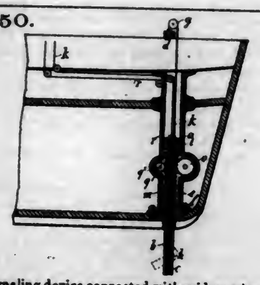


482,548. MOTHER-OF-PEARL ARTICLES AND PROCESS OF MAKING THE SAME. OTTO C. BOHERT and LOUIS COHEN, Providence, R. I. Filed June 15, 1892. Serial No. 436,780. (No specimens.)

Claim.—1. The process for constructing mother-of-pearl articles herein described, consisting in forming a number of lengths having longitudinal angular surfaces, next securing these lengths together on these angular surfaces, and finally ornamenting the outer surface of the article by cutting away portions of the same, as described.

2. A pearl article formed of a number of segmental strips or lengths secured together on their radial surfaces, as described.

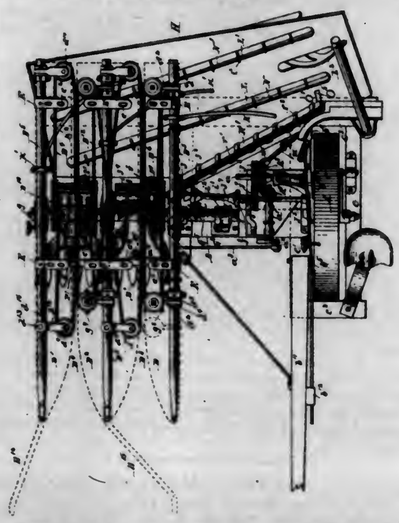
482,549. MEANS FOR CONTROLLING ELECTRIC GENERATION. THOMAS A. EDISON, Menlo Park, N. J., assignor to the Edison Electric Light Company, New York, N. Y. Filed Mar. 12, 1891. Serial No. 384,141. (No model.) Patented in England June 7, 1891, No. 9,483; in Germany July 30, 1891, No. 64,608; in Italy July 30, 1891, No. 13,196; in Belgium Aug. 16, 1891, No. 95,302; in Victoria Sept. 6, 1891, No. 3,078; in India Oct. 13, 1891, No. 323; in New South Wales Oct. 26, 1891; in France Oct. 28, 1891, No. 144,108; in Spain Nov. 2, 1891, No. 1,781; in Austria-Hungary Nov. 13, 1891, No. 31 and No. 1,863; in Queensland Dec. 30, 1891; in New Zealand Jan. 4, 1892, No. 880, and in Canada Nov. 23, 1892, No. 15,846.



Claim.—The combination, with a main or consumption circuit, of one or more magneto-electric machines connected therewith, an exciting-machine supplying the field-circuit of the main machine or machines, means for varying the speed of the exciting-machine independently of the main machine or machines, and a suitable electrical indicator indicating the condition of the main circuit, substantially as and for the purpose set forth.

482,550. SHALLOW-WATER ALARM. HANS BULER, Lehe, near Bremerhaven, Germany. Filed June 3, 1892. Serial No. 435,400. (No model.) Patented in England Oct. 30, 1891, No. 18,719, and in France Nov. 2, 1891, No. 217,186.

Claim.—1. A ship's appliance for automatically signaling when banks or shallow water are encountered, comprising a movable rod passing through the ship's bottom, an articulated member on the lower end of said rod, a spring for holding said member in line with the rod, and a signaling device connected with said articulated member, all combined substantially as set forth.



2. A ship's appliance for automatically signaling when banks or shallow water are encountered, comprising a movable rod passing through the ship's bottom, an articulated member on the lower end of said rod, a signaling device connected with said member, a rack formed on the rod, a pinion engaging said rack, and a second signaling device connected with said pinion, all combined substantially as herein shown and described.

3. A ship's appliance for automatically signaling when banks or shallow water are encountered, comprising a movable rod passing through the ship's bottom, an articulated member on the lower end of said rod, a spring connected with said rod, a flexible connection between the spring and the said member, a signaling device connected with the spring, and a counterbalancing device connected with the spring, all combined substantially as herein shown and described.

4. A ship's appliance for automatically signaling when banks or shallow water are encountered, comprising a movable rod passing through the ship's bottom, an articulated member on the lower end of said rod, a signaling device connected with said member, and a second and independent signaling device and means for operating the same from said rod, substantially as herein shown and described.

482,551. CORN-HARVESTER. GEORGE A. FARRALL, Batavia, N. Y., assignor to the Johnston Harvester Company, same place. Filed May 20, 1890. Serial No. 352,572. (Model.)

Claim.—1. In a gathering and carrying mechanism for harvesters, the combination of a belt having a single carrying portion which bears against one side of the stalk, and a belt having two carrying portions which bear against the opposite side of the stalk above and below the single carrying portion, substantially as set forth.

2. The combination, with a system of gathering and carrying belts, pulleys supporting said belts, and longitudinal bars supporting said pulleys, of rocking standards pivotally connected to said bars, whereby the gathering mechanism may be adjusted lengthwise of the machine, substantially as set forth.

3. The combination, with the system of gathering and carrying belts and the pulleys around which these belts run, of bars supporting the pulleys and provided with brackets, gathering-boards supported on said brackets, friction-rollers attached to said boards and bearing against the belts, and rocking standards pivotally connected with said bars, substantially as set forth.

4. The combination, with the system of gathering and carrying belts, the pulleys supporting said belts, and longitudinal bars adjustably supporting said pulleys, of gathering-boards arranged above said belts and supported on said bars, friction-rollers bearing against the belts and adjustably secured to the gathering-boards, and rocking standards pivotally secured with their upper ends to said bars, substantially as set forth.

5. The combination, with the gathering-frame and the rocking standards pivotally supporting said frame at their upper ends, of a drive-shaft journaled on the lower portions of said standards, drive-pulleys secured to said shaft, transfer-pulleys journaled concentric with the pivotal connection of the standards and gathering-frame, supporting-pulleys mounted on the front and rear portions of the gathering-frame, and belts running over the drive-pulleys, transfer-pulleys, and supporting-pulleys, substantially as set forth.

6. The combination, with the system of gathering-belts, the gathering-frame supporting said belts, and suitable intermediate mechanism whereby motion is transmitted from the main drive or master wheel to said belts, of rocking standards supporting said gathering-frame at their upper ends, a rock-shaft supporting the standards at their lower ends, and suitable mechanism whereby said rock-shaft is actuated in order to tilt the gathering mechanism, substantially as set forth.

7. The combination, with the system of belts, the gathering-frame supporting said belts, and the rocking standards pivotally supporting said frame at their upper ends, of a drive-shaft journaled on the standards and receiving motion from the main drive or master wheel through intermediate mechanism, drive-pulleys mounted on the drive-shaft, around which the gathering-belts pass, and a rock-shaft journaled in bearings on the main frame and supporting the lower end of the standards, substantially as set forth.

8. The combination, with the gathering and carrying frame and the rocking standards supporting said frame, of a rock-shaft supporting the standards, bearings in which said rock-shaft is journaled, and means whereby said bearings are adjusted in order to raise and lower the gathering mechanism, substantially as set forth.

9. The combination, with the gathering and carrying mechanism, the standards supporting said mechanism, and the rock-shaft supporting said standards, of a bearing-arm provided at one end with a bearing in which said rock-shaft is journaled and provided at its opposite end with a serrated face which engages with similar serrations formed on a base-plate secured to the main frame and a pivot-bolt adjustably securing said bearing to said base-plate, whereby the rock-shaft may be raised or lowered, substantially as set forth.

10. The combination, with the gathering and carrying mechanism, of the rocking standards pivotally supporting the carrying mechanism and a guide bar pivotally connecting the carrying mechanism with the main frame, whereby the gathering and carrying mechanism is guided in its longitudinal movement, substantially as set forth.

11. The combination, with the gathering and carrying mechanism, of rocking standards supporting said carrying mechanism and upright shields arranged in front of the standards and having their opposing faces on opposite sides of each stalk-passage converging rearwardly, whereby the standards are protected and the stalks are guided past the same, substantially as set forth.

12. The combination, with the gathering and carrying frame, of standards pivotally supporting said carrying-frame, guide-bars pivotally secured with their upper ends to the front portion of the carrying-frame and pivoted with their lower ends to the front portion of the main frame, and rearwardly-extending shields attached to said guide-bars, substantially as set forth.

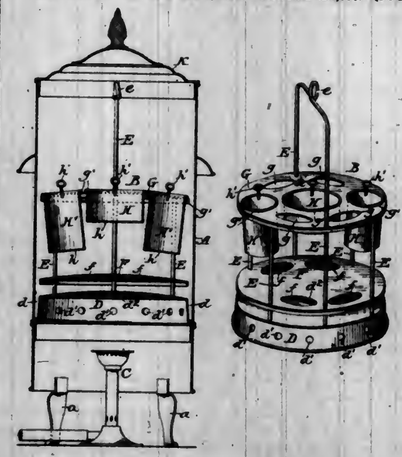
13. The combination, with the gathering and carrying mechanism which grasps the central portion of the stalks, of rollers arranged transversely underneath the carrying mechanism, a belt passing around said rollers, and rocking standards which support the gathering mechanism and said rollers, substantially as set forth.

14. The combination, with the gathering-frame and the gathering-belts supported thereon, of a binder-table which receives the stalks from said gathering-frame and spring guide-arms secured with their upper ends to the rear end of the gathering-frame and pressing with their lower ends against the stalks on the binder-table, substantially as set forth.

15. The combination, with the cutter mechanism, of a forwardly-inclined binder-table, a butter arranged along the lower end of the binder-table in rear of the cutter mechanism, and a gathering and carrying mechanism extending rearwardly over the butter and table, whereby the stalks are carried over the butter and then dropped upon the table and allowed to align themselves against the butter in rear of the cutter mechanism, substantially as set forth.

16. The combination, with the cutter mechanism and a forwardly-inclined binder-table, of an adjustable butter pivoted at one end to the forward end of the binder-table and extending inwardly from said pivotal point along the rear side of the cutter mechanism and nearly parallel thereto, and thence obliquely rearward and upward toward the binder mechanism, and a gathering and carrying mechanism whereby the stalks are carried over the butter, substantially as set forth.

17. The combination, with the cutter mechanism, the forwardly-inclined binder-table which receives the stalks, and the binder mechanism, of a stationary butter arranged along the lower front end of the binder-table in rear of the cutter mechanism, a traveling butter extending from the stationary butter inwardly toward the binder mechanism, and a gathering and carrying mechanism whereby the stalks are carried over the stationary butter, substantially as set forth.



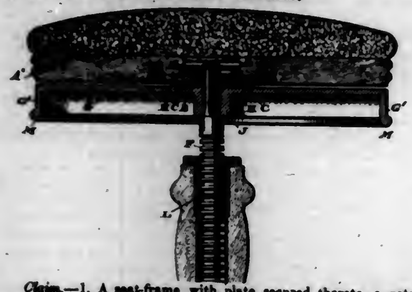
18. The combination, with the cutter mechanism and the forwardly-inclined binder-table of a stationary butter-board arranged transversely upon the binder-table in rear of the cutter mechanism and pivoted on said table with its outer or forward end, a traveling butter-apron pivotally connected at its outer end to the inner end of the butter-board and adjustably supported at its opposite end upon the stubbleward end of the binder-table, and a gathering and carrying mechanism whereby the stalks are carried over the stationary butter-board, substantially as set forth.

19. The combination, with the cutter mechanism, the forwardly-inclined binder-table arranged in rear of said cutter mechanism, the gathering mechanism whereby the stalks are carried from the cutter mechanism to the binder-table, and the binder mechanism arranged on the stubbleward end of the table, of an adjustable butter consisting of a transverse butter-board arranged upon the binder-table in rear of the cutter mechanism and pivoted at its outer end to the forward end of said table and a traveling butter-apron movably attached with its inner end to the inner end of the butter-board and adjustably supported with its opposite end upon the stubbleward end of the table adjacent to the binder mechanism, substantially as set forth.

20. The combination, with the main frame supported on opposite sides by a master-wheel and a grain-wheel and the cutter mechanism arranged upon said frame, of a forwardly-inclined stalk-receiving table arranged with its lower front end in rear of the cutter mechanism and adjacent to the grain-wheel and extending obliquely upwardly from the grain-wheel to the rear side of the master-wheel, a binder mechanism arranged upon the stubbleward end of the table in rear of the master-wheel, a sectional butter having one part arranged transversely along the front edge of the table in rear of the cutter mechanism and the other part extending obliquely rearwardly and upwardly toward the binder mechanism, a carrying-apron whereby the stalks are carried from the grainward end of the table to the binder mechanism, and a gathering and carrying mechanism whereby the stalks are carried over the butter, substantially as set forth.

21. The combination, with the binder-table which receives the stalks, of an endless belt arranged lengthwise underneath said table and having teeth which pass through longitudinal slots formed in said table and a crank-shaft which bears alternately against the under side of the carrying portion of the belt, whereby the teeth of the latter are alternately moved above and below the surface of the table, substantially as set forth.

482,552. DENTAL-TOOL STERILIZER. WILLIAM G. FLANDERS, New York, N. Y. Filed Feb. 9, 1892. Serial No. 430,833. (No model.)



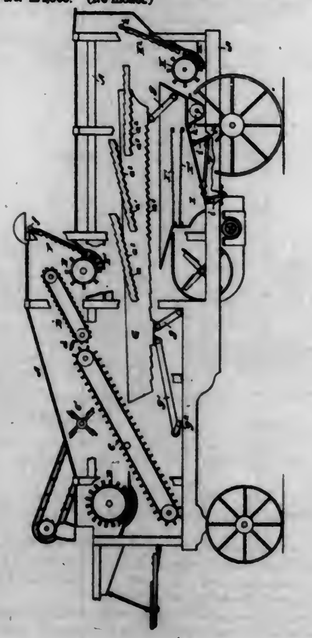
Claim.—1. The combination of a hot-water vessel and a stand for instruments, adapted to be placed therein, said stand being composed of a bottom plate, apertured disk above said plate, and supporting-wires, substantially as shown and described.

2. The combination of a hot-water vessel, a stand for instruments, adapted to be placed therein and having an apertured disk and sup-

porting-wires, and a cup having a perforated bottom supported in the aperture in said disk, substantially as shown and described.

3. The combination of a hot-water vessel, an inverted cup placed centrally within said vessel to leave a space between itself and the walls of the vessel and having its sides and its top perforated, and a stand for supporting instruments above said cup, substantially as shown and described.

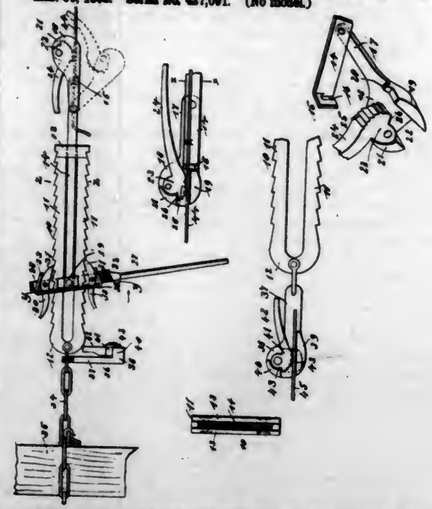
482,553. STOOL. PHILIP H. FUHRMANN, Mahanoy City, Pa. Filed Dec. 12, 1891. Serial No. 414,816. (No model.)



Claim.—1. A seat-frame with plate secured thereto, a rotary screw-stem with cap movable on said plate, a ring secured to said stem and bearing on said plate, and a threaded standard for said stem, said parts being combined substantially as described.

2. A seat-frame having a plate secured thereto with a downwardly-projecting annular rib, a screw-stem having a cap movable on said plate, a ring secured on said stem and having a rib in contact with said rib on the plate, and an interiorly-threaded standard for said stem, said parts being combined substantially as described.

3. A seat-frame having a plate with a downwardly-projecting rib thereon, a screw-stem, and a ring secured to said stem with an upwardly-projecting rib thereon, in combination with a cap connected with the top of said stem and having a depending flange which rests freely on the plate of the seat-frame, and a threaded standard, substantially as described.



482,554. COMBINED THRASHING-MACHINE AND GRAIN-SEPARATOR. JOSEPH GALLAND, Mansfield, Ohio, assignor to the Aultman & Taylor Machinery Company, same place. Filed Mar. 11, 1892. Serial No. 424,565. (No model.)

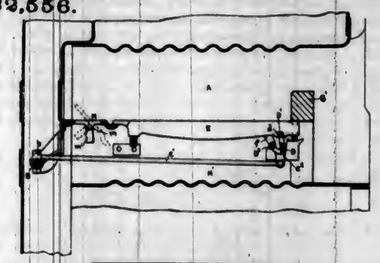
Claim.—1. The combination, in a combined thrashing-machine and grain-separator, of the thrashing-cylinder B, the apron C, beater C', raddle D, forwardly-delivering bruising-cylinder E, with its forwardly-inclined feeder-plate F, and the shaker G, extending forwardly under aprons C D and cylinder E and operating substantially as described.

2. The combination of the thrashing-cylinder B, the apron-carrier C, beaters C' and c, raddle D, forwardly-delivering bruising-cylinder E, with its feeder-plate F and the double-decked shaker G, extending forwardly under raddles C D and cylinder E, and bruising-cylinder K, with its feeder-plate K^2, all arranged and operating substantially as and for the purpose described.

482,555. WIRE-STRETCHER. JUDSON N. HATCHER, Montgomery, Mo., assignor to himself and Robert J. Wilson, same place. Filed Mar. 30, 1892. Serial No. 427,091. (No model.)

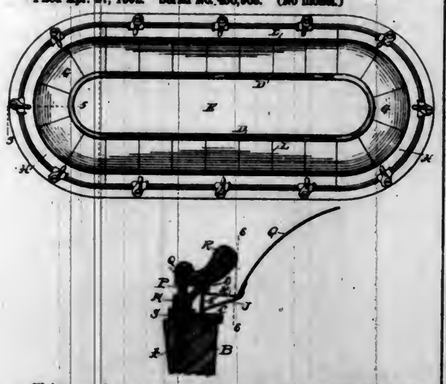
Claim.—1. A wire-stretcher comprising a double ratchet-bar having parallel members toothed on their outer edges, a draw-bar held to slide in the ratchet-bar and having its outer end bent and notched, a wire-clamp pivoted to the outer end of the ratchet-bar, the clamp having a movable and fixed jaw, the latter of which is provided with a lug to enter the notch of the draw-bar, a lever mounted loosely on the ratchet-bar and pivoted to the draw-bar, spring-pressed pawls pivoted in the lever on opposite sides of the ratchet bar, and a fastening device to secure the ratchet-bar to a support, substantially as described.

2. In a wire-stretcher, the combination, with the draw-bar having a notched end and a lever mechanism for operating the same, of the wire-clamp pivoted on the draw-bar, the clamp having a fixed jaw on one side with a lug to enter the notch of the draw-bar, and a cam-lever pivoted adjacent to the jaw and adapted to impinge thereon, substantially as described.



3. In a wire-stretcher, the combination, with the double ratchet-bar having teeth upon its outer edges, the draw-bar held to slide therein, and the recessed lever mounted on the ratchet-bar and pivoted to the draw-bar, of pawls pivoted in the lever on opposite sides of the draw-bar and adapted to engage the teeth of the latter, the said pawls having rearwardly-extending ends which serve as handles, and the spring-rod extending transversely across the ratchet-bar and draw-bar and having its ends bent and held to press upon the pawls, substantially as described.

482,556. GRATE. THOMAS HENDERSON, Liverpool, England. Filed Mar. 13, 1890. Serial No. 343,905. (No model.)



Claim.—1. The combination, with the moving grate-bars of a furnace, of a tilting clinker grate or plate dumping directly into the ash-pit and forming a continuation of the said bars at their ends nearest the furnace-door, said clinker-plate being located adjacent to the latter.

2. The combination, with the movable grate-bars of a furnace, of a tilting clinker grate or plate forming a continuation of said grate-bars and located between them and the furnace-door and adjacent to the latter, said clinker grate or plate having a counter-balance normally holding its surface in the same horizontal plane as the surface of the grate-bars.

482,556.

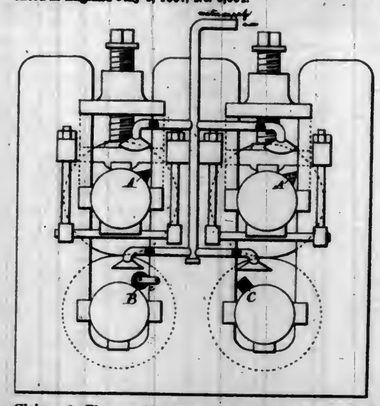
482,557. METALLIC GASKET. FRANCIS H. HILL, Chicago, Ill. Filed Apr. 27, 1892. Serial No. 430,908. (No model.)

Claim.—1. In a metallic casket, the double clamping device composed of two members, the under member having a hooked side portion capable of hooking over the rim of the top of the casket and the upper member having beveled surfaces to force the lower member firmly down upon the rim of the casket, substantially as described.

2. In a metallic casket, the metallic plate top having slitted ends and continuing sides provided with strengthening-ribs and connected at their edges to a vertical rim I, and the vertical rim I, attached to the top and braced vertically, all substantially as specified.

3. In a metallic casket, the vertical rim I, secured rigidly at its upper edge to the metallic top of the casket and braced thereto at its lower edge to be held securely in a vertical position, the hooked clamping device adapted to hook over the upper edge of the rim of the top, the upper member of the clamping device adapted to clamp the under member vertically upon the vertical rim I, and the rubber gasket C, attached to the body of the casket, substantially as specified.

482,558. DENTAL DRILL. LOUIS MAILLARD, Galt, Canada. Filed Mar. 31, 1892. Serial No. 427,230. (No model.)



Claim.—A burr-drill having a series of hook-shaped cutting-edges, two of which are joined in the center and another two terminating in points on opposite sides of the first two, and cutting-edges running between the pointed and continued cutting-edges, substantially as described.

482,559. LUBRICATOR. JOSEPH J. MARTIN, Bellevue, and WILLIAM H. BROWNFIELD, Dayton, assignors of one-third to Louis K. Marty, Newport, Ky. Filed Apr. 9, 1892. Serial No. 428,443. (No model.)

Claim.—The within-described specific construction of loose-pulley journal, which construction includes the cylindrical tube A, having a central bore B and at one end a head C, provided with a continuous annual chamber D, and a filling-hole closed by a stopper E, said chamber being furnished with a pair of ports F F', about in line with the outer periphery of said tube, a series of reverse helical grooves G G' being made externally of said tube and a circumferential groove H being formed in it near the end remote from said head C, the grooves G G' being in communication both with said ports F F' and the groove H, all as herein set forth, and for the purpose explained.

482,560. LUBRICATOR. ARTHUR HIRN, Middlesbrough-on-Tees, England. Filed Dec. 7, 1891. Serial No. 414,230. (No model.) Patented in England July 9, 1887, No. 9,661.

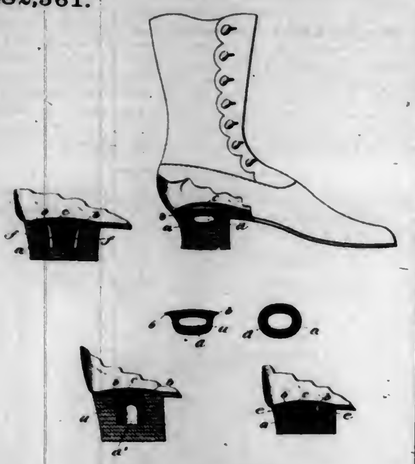
Claim.—1. The combination, with a journal-box and journal therein, of a foraminous metallic envelope within the journal-box and in contact with the journal, a solid lubricant inclosed by the envelope, and means for directing a stream of water upon the envelope and the journal, the perforations or interstices in the envelope being of sufficient size to admit of the free passage of the water, whereby it comes into contact with the lubricant and cools it.

2. The combination, with a journal-box and the journal therein, of a loose envelope of perforated sheet metal within the journal-box bearing upon the journal, a solid lubricant inclosed by the envelope, and means for directing a stream of water upon the envelope, its contents, and the journal.

3. The combination, with a journal-box and the journal therein, of an envelope of wire gauze within said journal-box, a solid lubricant inclosed by said envelope, and means for directing a stream of water upon the envelope, its contents, and the journal.

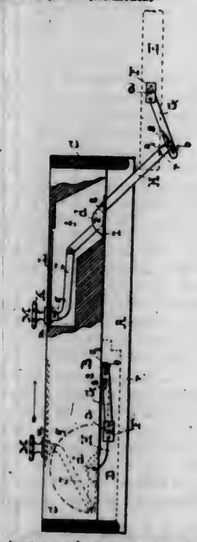
482,561. HEEL. ALLEN R. PARKHOM, Monongahela City, Pa. Filed Apr. 6, 1892. Serial No. 428,029. (No model.)

Claim.—1. A heel for boots or shoes, having a hollow extending below the sole, closed at its bottom and opening at and within the insole, in combination with a rubber plug having its body reduced in thickness between its ends and having an annular convex rim seated upon the insole, whereby it is rendered compressible, substantially as described.



2. A heel for boots or shoes, having an interior hollow extending below its sole, closed at the bottom and opening at and within the insole, in combination with a hollow or chambered rubber plug seated upon the bottom or said heel-hollow and having an annular rim projecting within an opening in the insole, substantially as described.

3. A heel for boots or shoes, having an interior hollow extending below the sole, closed at its bottom and open at and within the insole, in combination with a rubber plug having a closed air-chamber therein, seated upon the bottom of said heel-hollow and having a rim seated within the opening in the insole, substantially as described.



4. As a new article of manufacture, the herein-described cushioned plug for the heels of boots or shoes, consisting of a rubber plug having a closed air-chamber therein and a top rim and adapted for use with a heel having an interior hollow extending below its sole, closed at the bottom and open at the insole, substantially as described.

5. The combination, with the heel of a boot or shoe having an interior hollow, of a rubber plug having a circular top convex bearing-surface seated within an opening in the insole and its body of less diameter seated upon the bottom of said heel-hollow and glued on one or both seats, substantially as described, for the purpose stated.

482,561.

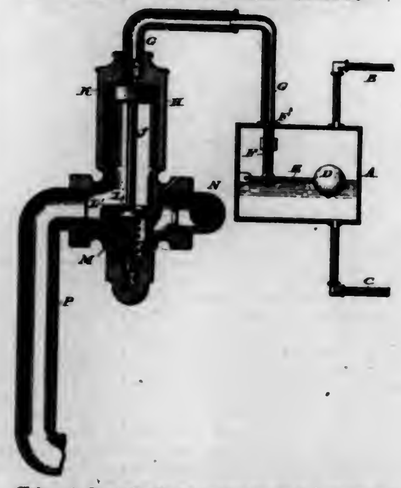
482,562. SHUTTER-WORKER. JAMES S. PATTEN, Baltimore, Md., assignor of three-fourths to Jackson Holland, same place. Filed Oct. 28, 1891. Serial No. 410,144. (No model.)

Claim.—1. In a shutter-worker, the combination of an arm pivoted to the shutter and provided with a slot, a lever having its fulcrum in some stationary part of the sill or sub-sill and loosely connected at one end to the slotted end of the arm, a link hinged to the other end of the said lever, and a handle to move the other extremity of the said link crosswise of the window-frame, substantially as specified.

2. In a shutter-worker, the lever H, having a pin, and the arm G, having a curved notch whereby in the folding of the two parts the pin will enter the notch and lock the two parts, substantially as specified.

482,563. SPINDLE-TIP FOR SPRING SHADE-ROLLERS. JUDSON C. PERKINS and LEWIS R. LEEDS, Meriden, Conn., assignors to the Meriden Curtain Fixture Company, same place. Filed Jan. 13, 1892. Serial No. 417,918. (No model.)

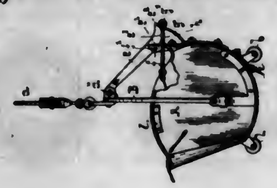
Claim.—1. A spindle-tip for spring-rollers, composed of sheet metal bent and shaped into form, comprising an inner end member substantially cylindrical in contour, a loop-like outer end portion, as specified, and an intermediate enlarged body portion having an opening through it diametrically to permit the engagement with said body portion of the pawl of the roller and to permit the passage of dirt through said opening, all substantially as hereinbefore set forth.



2. A spindle-tip composed of a sheet-metal blank shaped and bent on itself at about its middle lengthwise to form an outer end member adapted to engage with a slotted bracket, an enlarged middle member or portion, as specified, and a hollow inner end portion comprising the end portions of the said blank, all substantially as and for the purposes hereinbefore set forth.

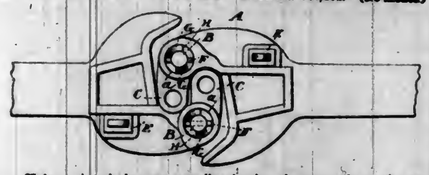
3. The combination, with a spindle-tip composed of a sheet-metal blank shaped and bent on itself at about its middle lengthwise to form an outer end member adapted to engage with a slotted bracket, an enlarged middle member or portion, as specified, and a hollow inner end portion comprising the end portions of the blank, of a washer or confining-collar *k*, all substantially in the manner and for the purposes hereinbefore set forth.

4. A spindle-tip composed of a sheet-metal blank shaped and bent on itself lengthwise to form an outer end member adapted to engage with a slotted bracket, an enlarged middle member or portion, as specified, and a hollow inner end member, all substantially as and for the purposes hereinbefore set forth.



482,564. BOILER-FEED. GEORGE W. SCHILLING, Philadelphia, Pa. Filed Jan. 19, 1892. Serial No. 418,551. (No model.)

Claim.—1. In a boiler-feeder, a valve having the self-closing head L, supply and feed pipes N and P, and a chamber above said head L, said chamber containing the follower K, the latter being adapted to bear against said head and is disconnected therefrom, substantially as described.



2. A gage having steam and water pipes connected therewith and containing a float and a valve connected therewith, in combination with the valve H and intermediate pipe G, the supply and feed pipes N and P, connected with said valve H and the valve-head L, and follower K in said valve, said follower being adapted to engage with said head L and is disconnected therefrom, substantially as described.

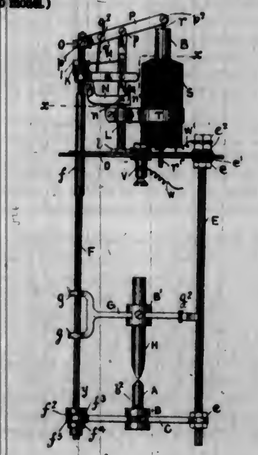
482,565. DEVICE FOR UNLOADING VESSELS, CARS, &c. JOSEPH SOOY, Baltimore, Md. Filed Jan. 23, 1892. Serial No. 419,070. (No model.)

Claim.—A bucket and a bail pivoted thereto and a latch pivoted to the bail, having a notch *f* and a curved surface e^3, combined with a roller attached to the bucket for engagement with said notch, and a plate-spring, also secured to the bucket, adapted to be pulled toward the same and having a cylindrical surface to act upon the curved surface of the latch to lift said latch and release the bucket and allow it to tilt, substantially as set forth.

482,566. CAR-COUPLING. CLAYTON WEEKS and JOHN E. BUSH, Hobart, N. Y. Filed Mar. 30, 1892. Serial No. 427,102. (No model.)

Claim.—A twin-jaw car-coupling having the cross-pin on the upper end of the hook-jaw pintle and the reverse inclines in the upper hinge-eye thereof, as and for the purpose set forth.

482,567. CIGARETTE-MACHINE. VICTOR H. BARBOUR, Washington, D. C. Filed May 13, 1892. Serial No. 432,830. (No model.)



Claim.—1. A group of rolling devices comprising a series of rollers, frames at each end, in which they are mounted, and a shield, stop, or guide at each end of the group to prevent the wrapper from passing through the group between two contiguous rollers, substantially as set forth.

2. A group of rolling devices comprising an uneven number of rollers, frames in which they are supported hinged in the axial line of one of the rollers, and curved stops, shields, or guides secured to each frame for preventing a wrapper from passing through the group of rollers between contiguous rollers at the rear of the group.

3. A group of rolling devices comprising a series of rollers, frames at each end in which they are mounted, and a shield, stop, or guide at each end of the group to prevent the wrapper from passing through the group between contiguous rollers, the distance between the frames being equal to the length of the cigarette to be formed, and the arrangement being such that the filler, which is at first shorter than the completed cigarette, is spread longitudinally against the end frames, whereby smooth-finished ends are given to the cigarette by the rolling devices.

482,568. ELECTRIC-ARC LAMP. HUBERT H. BISLAND and JOHN BURNS, Newcastle-on-Tyne, England. Filed Apr. 20, 1892. Serial No. 429,859. (No model.)

Claim.—1. An arc lamp having a twist-rod, a movable carbon-holder controlled thereby, means for lifting said twist-rod and holder simultaneously, and means for imparting a rotary motion to the twist-rod at a determinate point of its lift, as and for the purpose set forth.

2. An arc lamp having a twist-rod, a movable carbon-holder supported thereon by fixed threads engaging the thread on the twist-rod, means for lifting the twist-rod and holder simultaneously, and means for imparting to the twist-rod a rotary motion at a determinate point of its lift, whereby the pitch of the threads will offset the rise in the twist-rod and keep the carbon-holder in a stationary position.

3. A feed mechanism for arc lamps, comprising a twist-rod having a loose nut and carbon-holder threaded thereon, means for lifting the twist-rod, carbon-holder, and nut simultaneously, and means for retarding and holding the nut at a determinate point in the lift, thereby rotating the twist-rod in a direction opposing the further rise of the carbon-holder.

4. A feed mechanism for arc lamps, comprising a twist-rod, a loose nut and a carbon-holder threaded thereon, an electro-maguet, and connections between the electro-magnet and twist-rod, whereby the latter is raised against the force of gravity, and means for jamming the nut at a determinate point in the lift of the rod, thereby compelling the twist-rod to rotate in the nut and carbon-holder on its further lift and preventing the further rise of the carbon-holder.

5. The combination of the solenoid S, core R, lever P, twist-rod F, upper-carbon-supporting cross-bar G and loose nut K upon the twist-rod, and means whereby when the current is passed through the solenoid S the nut K shall first rise freely with the twist-rod F and there be jammed, whereby the twist-rod F first rises without turning, lifting the carbon-holder and striking the arc, and then rises and turns in the nut K and also in the holder G, leaving said holder stationary after the twist-rod turns.

6. The combination of the solenoid S, the core R, the oscillating lever P, the pivots *p*, the bobbin O, the twist-rod F, and cross-bar G, substantially as and for the purposes described.

7. The combination of the lever P, twist-rod F, friction-plate I, nut K, suspension-rod q', plate Q, and support N, substantially as and for the purposes described.

8. The combination of the lever P, movable plate Q, suspended therefrom, nut K, twist-rod F, support N, friction-plate I, and springs M, substantially as described.

9. The combination of the lever P, carrying the arc-striking mechanism, suspension-rod q', plate Q, and sliding bearing q^2, substantially as described.

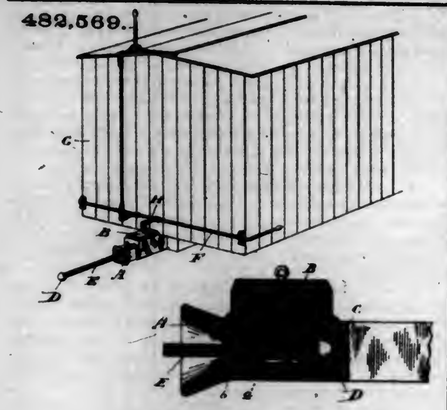
10. The regulated support N, pivoted at *n* and having a regulated screw n', and plate I, arrested by said support, substantially as and for the purposes described.

11. The combination of the friction-plate I, a device M for pressing the same down, support N, lever P, core R, and solenoid S, in combination with the plate Q, rod q', arresting device q^3 and q^4, nut K, and twist-rod F, whereby as the weight of the twist-rod F and its appurtenances draws the core R up the nut K shall be relieved from the pressure friction-bar a trifle before the plate Q strikes the bottom of slot q^4 and arrests the downward course of F and its appurtenances by jamming.

12. The combination of the solenoid S, supported upon standard L by clamp-plate T, core R, oscillating lever P, pivot p^2, with the plate D, and the guide r', whereby the core is kept nearly central in the solenoid S, for the purposes described.

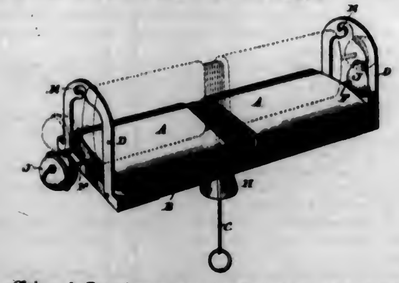
13. The combination of the carbon-carrier B, the supporting-plate C, passing through a slot in the holder B the carbon A, passing through a hole in plate C and in holder B, and the set-screw *b*, whereby the carbon A is tightly held on one side by the holder B and on the other side by the plate C.

14. The combination of the plate C, carbon-holder B, and set-screw *b*, substantially as described.



15. The combination of the twist-rod F, loosely-fitting metallic sleeve f^2, washer and sleeve f^3, and washer f^3, and the nut f^4, whereby the twist-rod F has a bearing in plate C, while free to rise up and down, and is entirely insulated from the plate C.

16. The combination of the carbons A and H with holder B', carried on cross-piece G, supported on a twist-rod F, said twist-rod F being capable of both a twisting motion in its nuts *g* and of a vertical rise-and-fall motion in the mechanism for adjusting the position of the carbon in an arc lamp.

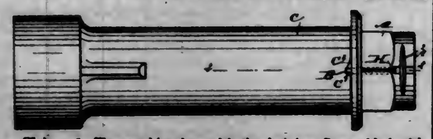


482,569. CAR-COUPLING. JOSEPH H. COLEMAN, Tottenham, Canada. Filed Mar. 7, 1892. Serial No. 424,054. (No model.) Patented in Canada Apr. 4, 1892, No. 38,627.

Claim.—The draw-head A, having recesses *a* and a socket C made in it, in front of which is placed a movable block B, with a hole *b* made through it, in combination with a link E, having the head D formed on it, substantially as and for the purpose specified.

482,569.

482,570. CLAPPER. FRANCISCO R. DE RITEROS, Philadelphia, Pa. Filed Nov. 9, 1891. Serial No. 411,341. (No model.)

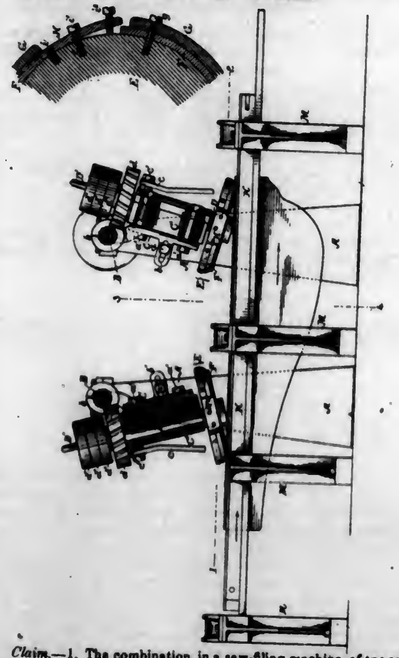


Claim.—1. Two clappers, one placed above the other, in combination with a cord which is connected with one of the clappers so as to rotate the same on the other clapper, said cord passing through the lower clapper, substantially as described.

2. A pair of clappers, one of which has slotted standards and the other of which is rotatable, having journals supported in said standard and an operating-cord, substantially as described.

3. The clapper B, provided with supports D, having open slots E, the rotatable clapper A, having journals F, and an operating-cord C, which is connected with the rotatable clapper and guided in the other clapper, said parts being combined substantially as described.

4. Two clappers, one of which is provided with standards, each having open slots at its upper end, the other clapper having journals adapted to be inserted in said slots, a cord wound around said last-mentioned clapper and passing through an opening in the other one, and a handle on said first clapper, said parts being combined substantially as described.



482,571. HUB-ATTACHING DEVICE. MICHAEL F. DEHEBRER, Brooklyn, N. Y. Filed May 20, 1892. Serial No. 433,676. (No model.)

Claim.—1. The combination, with the hub-box C, provided with a notch C' in its outer end, of the nut screwing into the outer end of the box and provided with a spring-pressed locking-pin B, projecting at its inner end through its flange or shoulder into said notch and having an operating finger-piece to retract it, substantially as set forth.

2. A nut A for hub-boxes, having a threaded inner end, an annular external flange or shoulder, a squared portion outside of the flange, a longitudinal bore A', extending through the flange and the said squared portion, a transverse recess A^3 in the outer side of the nut beyond the outer end of the bore A', and the spring-pressed bolt extending through the said bore with its end B projecting beyond the inner face of the flange and its outer end extending outward at right angles and adapted to enter the transverse recess and hold the bolt retracted, substantially as set forth.

482,572. SAW-FILING MACHINE. THOMAS S. DIXSTON, Philadelphia, Pa., assignor to Henry Disston & Sons, Incorporated, same place. Filed Dec. 7, 1891. Serial No. 414,268. (No model.)

Claim.—1. The combination, in a saw-filing machine, of the saw-carrier, a filing-disk, an inclined shaft carrying the same, a file mounted on said disk and having its cutting-face projecting from the lower side of the disk, with mechanism for rotating said shaft, substantially as specified.

2. The combination, in a saw-filing machine, of the saw-carrier, the file-disk, an inclined shaft carrying the same, a file carried by said disk, having its cutting-face projecting from the lower side of said disk, the axis of said saw-filing disk being in a different vertical plane from that assumed by the teeth of the saw being acted upon, with mechanism for driving said shaft, substantially as specified.

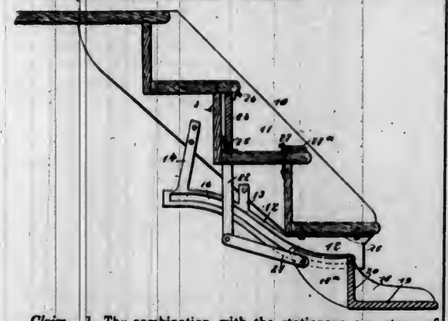
3. The combination of the inclined shaft D, the filing-disk, files carried thereby and projecting from the lower side of the disk, the saw-guides, and feeding-plates on said disk for moving the saw into line with the files, substantially as specified.

4. The combination, in a saw-filing machine, of the disk with semicircular files clamped thereto and having cutting-teeth upon their opposite faces, whereby said files may be reversed when worn, substantially as specified.

5. The combination, in a saw-filing machine, of a semicircular file having two cutting-faces inclined toward a common edge and adapted to act respectively on the front and back of the saw-teeth, the number of cutting-teeth on that face of the file acting on the front of the saw-tooth being greater than the number of cutting-teeth on that face of the file acting on the back of the saw teeth, substantially as specified.

6. The combination of the saw-guides, the file-carrying disk, the semicircular files carried by said disk and having cutting-faces projecting from one side of the disk, with feed-plates in front of said files, and devices for adjusting one end of said feed-plates from and toward the periphery of the file-carrying disk, substantially as specified.

7. The combination, in a saw-filing machine, of the carrier for the saw, a bearing, a shaft adapted to said bearing, a filing-disk carried by said shaft, with weights on the shaft, said shaft having sufficient vertical play to allow for the wearing away of the file and the adjustment of the saw in its carrier, substantially as specified.



8. The combination of the frame, a driving-shaft adapted to bearings therein, a frame C, hung to said shaft and adjustable with relation to the framework, a block C', carried by the frame C, a shaft adapted to said block, a worm-wheel therein adapted to engage with a worm on the driving-shaft, a filing-disk carried by said shaft, and a saw-guide for holding the saw being acted upon, substantially as specified.

9. The combination of the adjustable bearing-block C', the shaft D, a filing-disk carried thereby, the saw-guide, and devices for effecting the vertical adjustment of said shaft, substantially as specified.

10. The combination of the adjustable block C', the shaft D, the filing-disk carried thereby, the saw-guides, a worm-wheel D, mounted on said shaft, a worm engaging therewith, and a cam-lever fulcrumed to said block C' and adapted to act upon the side of the worm-wheel *d*, substantially as specified.

11. The combination of the frame, the shaft B, adapted to bearings therein, an adjustable frame C, hung upon said shaft, slotted extensions *b'* on said frame, adjusting and clamping screws *a*, a block C', adjustably secured in said block C, a shaft D, a filing-disk carried thereby, the saw-guides, a worm-wheel carried by said shaft D, and a worm carried by the shaft B and adapted to engage with said worm-wheel, substantially as specified.

482,573. MOVABLE STEP. FRANK FORSTER, Miwanda, Cal. Filed Jan. 2, 1892. Serial No. 416,835. (No model.)

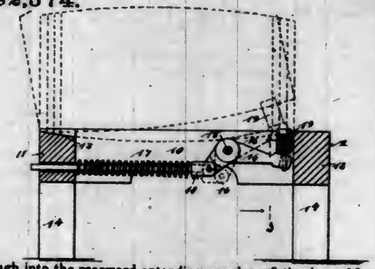
Claim.—1. The combination, with the stationary car-steps, of curved slotted brackets secured to the under side of the steps, a movable step held to slide in the brackets, and a fastening device to secure the step, substantially as described.

2. The combination, with the stationary car-steps, of curved slotted brackets secured to the side pieces of the steps on the under side of the latter, a movable step having studs held to slide in the brackets, and a fastening device to secure the step, substantially as described.

3. The combination, with the car-steps, of curved brackets secured to the under side of the steps, a movable step held to slide in the said brackets, and a plate pivoted on the steps and pivotally connected with the movable step, substantially as described.

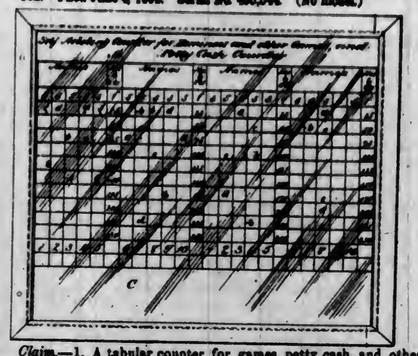
4. The combination, with the stationary car-steps, of slotted brackets secured to the side pieces of the steps on the under side of the latter, a movable step having studs held to slide in the brackets, levers pivotally connected with the steps and extending upward through the stationary steps, said levers being connected by a cross-plate at the top, and fastening devices to hold the plate in a raised or lowered position, substantially as described.

5. The combination, with the stationary car-steps, of slotted brackets secured to the side pieces of the steps on the under side of the latter, a movable step having stops adapted to slide in the brackets, swinging levers extending upward through the stationary steps, said levers being connected at the top by a cross-plate and connected at their lower ends with the movable step by means of connecting-rods, and spring-catches adapted to hold the cross-plate in a raised or lowered position, substantially as described.



482,574. TILTING DEVICE FOR BARRELS OR CASKS. WILLIAM FULLARD, Brooklyn, N. Y. Filed Feb. 15, 1892. Serial No. 421,565. (No model.)

Claim.—1. The combination, with a barrel rack or stand A, of the transverse shaft 15, a bell-crank lever 16 thereon, a longitudinally-sliding rod 18, extending through an aperture in the front end of the rack and pivoted to the downward-projecting member of said lever, a spring 17 on the rod and pressing it inward to raise the rearward-extending member of the lever, and a transverse pillow block 19, carried by the said rearward-extending member, substantially as set forth.



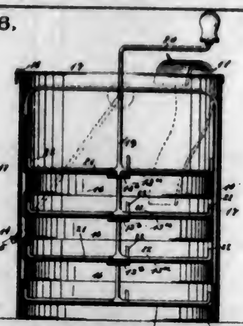
2. The combination, with the barrel rack or stand A, of the transverse shaft 15, a bell-crank lever 16 thereon, a tilting pillow-block 19, having central downward-flaring aperture, a pivot extending therethrough into the rearward-extending member of the lever 16, a longitudinally-sliding rod 18, mounted on the rack and pivoted at its rear end to the depending member of the lever 16, and the spring 17 on the rod and pressing it toward lever 16, substantially as set forth.

3. The combination, with the rack or stand, of a transverse centrally-pivoted vertically and transversely tilting pillow-block and a spring mechanism for forcing the pillow-block upward, substantially as set forth.

482,574.

482,575. GAME-COUNTER. WILLIAM R. HERBERT, Galveston, Tex. Filed June 4, 1892. Serial No. 435,544. (No model.)

Claim.—1. A tabular counter for games, petty cash, and other purposes, consisting of a card, slate, or tablet ruled on its face to form a series of horizontal rows of marking or counting squares, one row below the other and each containing a given number of such squares, and further provided with a perpendicular column arranged by the side of such series of horizontal rows and numbered to form multiples in successive order of and opposite the aggregate counts or marks made in the marking-squares, substantially as herein described.



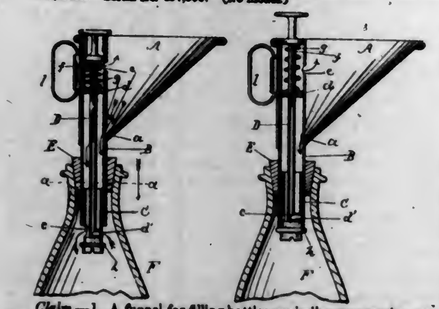
2. A tabular counter in which five is the multiple, consisting of a card, slate, or tablet A, having ruled perpendicular and horizontal lines *b c*, forming horizontal rows of marking or counting squares *d*, one row below the other and each row containing five of such squares, also ruled to form a perpendicular column *f* by the side of each series of horizontal rows of said marking-squares, numbered successively in a downwardly direction opposite the rows of marking-squares with increasing numbers, commencing with twenty-five at top and increasing by twenty-five additional each succeeding row of horizontal squares, essentially as and for the purpose or purposes herein set forth.

3. In a tabular counter in which five is the multiple, made up of two or more series of horizontal rows of five marking-squares each, with a perpendicular column by the side of each of said series, numbered consecutively with increasing numbers, commencing with twenty-five and increasing by twenty-five additional each succeeding row of horizontal squares, the arrangement below each two series of the horizontal rows of marking-squares of a row of figures increasing from one to ten, substantially as and for the purposes specified.

482,576. FLOUR-SIFTER. IDA M. INGRAM, Sedalia, Mo. Filed Jan. 26, 1892. Serial No. 419,276. (No model.)

Claim.—1. A flour-sifter comprising a cylindrical body provided with a sieve in its bottom, a series of connected spaced sieves passed downward into the body and removable collectively therefrom, and a central shaft extending down through the connected sieves and provided with an agitator for each one of the connected sieves and having an agitator on its lower end for the body-sieve, substantially as set forth.

482,576.

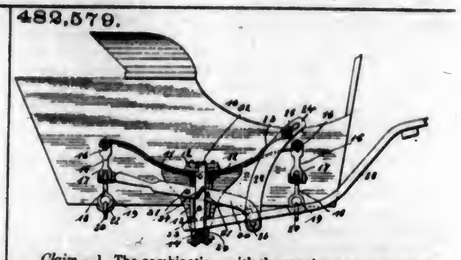


2. The combination, with the sifter-body, of a plurality of sieves arranged one above another within the body, a bail connecting the several sieves and extending to a point adjacent to the body-top, and a revoluble shaft mounted within the body and carrying projecting arms which move above the sieves, substantially as described.

3. The combination of the sifter-body, the removable sieves having a supporting-bail, and a hook secured to the bail and adapted to engage the body-top, substantially as described.

482,577. COMPOSITION OF MATTER FOR THE EXTRACTION OF GOLD AND SILVER FROM ORES. EDWARD D. KENDALL, Brooklyn, N. Y. Filed May 27, 1892. Serial No. 434,528. (No specimens.)

Claim.—The before-described composition of matter, to be used for extracting gold and silver from minerals, tailings, and other matters containing one or both of these metals, consisting of water, one or more soluble ferri-cyanides, and one or more soluble cyanides, prepared and combined as herein stated.

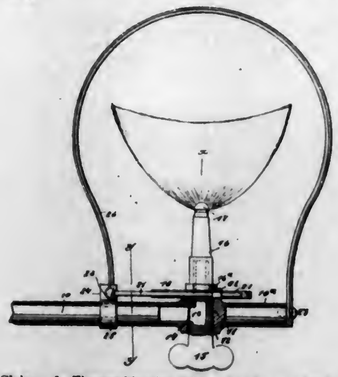


482,578. FUNNEL. KARL KIEFER, Cincinnati, Ohio. Filed June 20, 1892. Serial No. 437,355. (No model.)

Claim.—1. A funnel for filling bottles or similar receptacles, consisting of a section of a cone having a straight back, to which is attached, vertically, tube B, having orifice *a* opening into and communicating with the lower end of the funnel, said tube provided with valve-pipe D, extending the full length thereof, and the disk *d*, having orifice in which said pipe is movable, said orificed disk being permanently adjusted near the upper end of tube B, the pipe D, carrying at its lower extremity valve A, and the open-ended cup C above said valve, integral with said pipe and surrounding it concentrically, having eduction-orifice *c*, all in combination with hollow stem of the valve-pipe, having open-ended branch *d'* and upper aperture *f*, as and for the purpose intended, substantially as described.

2. In a funnel having its body formed of a section of a cone and flat back *w*, vertical tube B, hollow pipe D within the tube, adjusted to move reciprocatingly in vertical directions within said tube, the pipe D, having at its lower end valve A and at its opposite end push-button *h*, spiral spring *g* under the push-button, bearing upwardly against the under surface of said push-button, orificed disk *d*, horizontally adjusted within tube B at the opposite end of the spring, all in combination with lower air-inlet *d'* and upper air-outlet *f*, and valve-cup C, integral with and surrounding the lower end of pipe D, concentric therewith and movable vertically within tube B, substantially as described.

482,579. ROAD-CART. JESSE KIRKALL, New Madrid, Mo. Filed May 10, 1892. Serial No. 432,496. (No model.)



Claim.—1. The combination, with the running-gear and the box freely suspended thereon, of a shaft journaled beneath the box and carried by the running-gear, crank arms secured to the shaft and connected with the box, and a lever mechanism for turning and adjusting the crank-shaft, substantially as described.

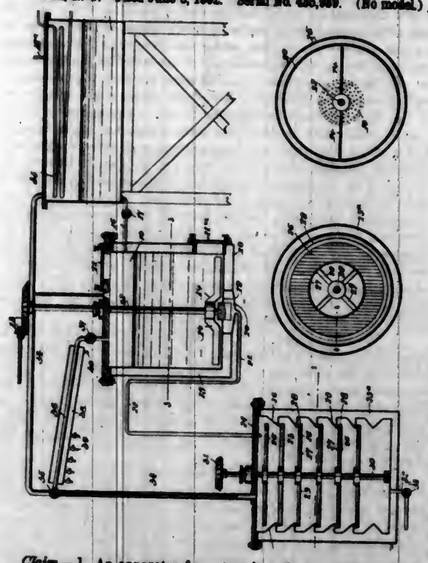
2. The combination, with the running-gear and the box suspended from springs carried by the running-gear, of a shaft journaled beneath the box, crank-arms secured to the shaft and connected with the box-springs, a lever secured to the shaft, and a fastening device to fix the position of the lever, substantially as described.

3. A road-cart comprising the axle, the shafts secured thereto and having a transverse rock-shaft having upwardly-projecting arms slotted at their upper ends and provided with an adjustable operating-lever, the longitudinally-extending springs secured at their middle portions to the axle and having extensions 23 secured to the slotted ends of the said arms, and links supporting the body from the ends of said springs, substantially as set forth.

482,580. GAS-BURNER ATTACHMENT. GEORGE LE VESCONTE, Minneapolis, Minn. Filed Dec. 11, 1891. Serial No. 414,722. (No model.)

Claim.—1. The combination, with a gas-pipe provided with a vertical key and a burner carried by the upper end of the key, of the metallic band secured fixedly at one end to the gas-pipe and curved upward over the burner and downward and operating connections between the lower end of the band and the said key, substantially as set forth.

2. The combination, with the gas-pipe having a burner-controlling revoluble valve mounted therein, of a slide mounted on the gas-pipe, a metallic band extending above the burner, said band having one end fixed to the pipe and the other pivoted to the slide, and a ratchet connection between the slide and valve, whereby the latter will be operated by the movement of the slide, substantially as described.



3. The combination, with the gas-pipe having a revoluble burner-controlling valve mounted therein, of a slide mounted upon the pipe, a band formed of layers of dissimilar metals, having one end secured to the pipe and the other end pivoted to the slide, and a ratchet mechanism connecting the slide and valve and adapted to operate the latter, substantially as described.

4. The combination, with the gas-pipe and the revoluble burner-controlling valve mounted therein, of a slide mounted on the gas-pipe, a ratchet secured to the valve, a toothed spring-pawl secured to the slide and adapted to engage the ratchet-teeth, and a composite metallic band having one end secured to the gas-pipe and the opposite end pivoted to the slide, the said band being arranged adjacent to the burner, substantially as set forth.

5. The combination, with the gas-pipe and the revoluble hollow

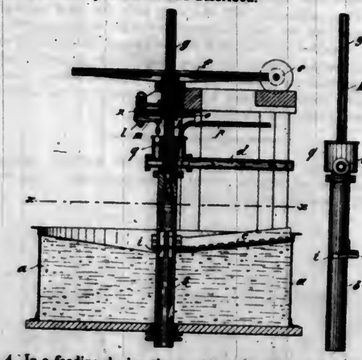
valve mounted transversely therein, said valve having a port adapted to register with the bore of the gas-pipe and carrying the gas-burner, of a ratchet-disk secured to the valve, a slide mounted on the gas-pipe and carrying a toothed spring-pawl adapted to engage the ratchet-disk, and an arched band of dissimilar metals having one end secured to a prolongation of the gas-pipe and the opposite end pivoted to the slide, the said band extending above the gas-burner, substantially as described.

482,581. OIL-EXTRACTING APPARATUS. CHARLES MANN, New York, N. Y. Filed June 8, 1892. Serial No. 436,089. (No model.)

Claim.—1. An apparatus for extracting oils, comprising a steam-jacketed extracting-tank provided with a strainer in its bottom and a rotary stirrer, a steam-jacketed evaporator in a lower plane than the extractor, a pipe connecting the bottom of the extractor with the top of the evaporator, a centrifugal spraying mechanism in the said evaporator, and a vapor-pipe leading from the top of the evaporator into the top of the extractor, whereby the vaporized extracting fluid will be conducted back to the extractor, substantially as set forth.

2. An apparatus for extracting oils, comprising a steam-jacketed extracting-tank provided with a stirring mechanism and a strainer in its bottom, a tank for the extracting fluid provided with a pipe leading into the extractor, a centrifugal steam-jacketed evaporator, a pipe leading from the extractor below its strainer into the upper end of the evaporator, a vapor-pipe leading from the upper end of the evaporator back to the extracting-fluid tank and having a branch pipe leading into the top of the extractor, and valves and cooling devices for said vapor-pipes, substantially as set forth.

3. In an apparatus of the character described, the evaporator comprising a steam-jacketed tank provided in its top with an inlet for the oil and extracting fluid, a centrifugal spraying mechanism in the tank receiving the oil and fluid and spraying it against the heated walls of the tank to vaporize the fluid, a vapor-outlet in the top of the tank, and an oil-outlet in its bottom.



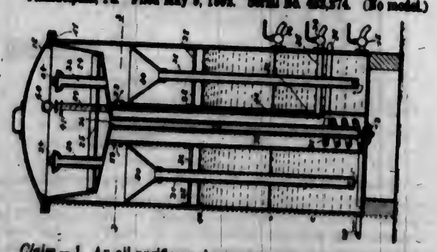
4. In an apparatus of the character described, the evaporator comprising a steam-jacketed tank, the inner wall of which is formed with a series of inwardly-projecting annular ledges 25, a series of horizontal peripherally-perforated sprayers, one projecting under each ledge to receive the oil therefrom and discharge it against the ledge next below, a supply pipe for the oil and fluid discharging upon the top sprayer, a vapor-outlet in the top of the tank, and an oil-outlet in its bottom.

482,582. FEEDING DEVICE FOR ORE-WASHING MACHINES. CARL A. B. MEINECKE, Clausthal, Germany. Filed Oct. 27, 1890. Serial No. 369,470. (No model.) Patented in Germany Aug. 4, 1886, No. 36,067, and in Austria-Hungary Nov. 15, 1886, No. 40,067 and No. 14,179.

Claim.—1. In a feeding device, the combination, with a knife adapted to cut a thin layer of material under treatment, of a watering device moving with the said knife and adapted to dissolve and wash off the cut material, substantially as shown and described.

2. In a feeding device, the combination, with a hollow shaft mounted to turn and to slide and provided with inlet-openings, of a knife secured on the said hollow shaft and adapted to cut a thin layer from the surface of the material, the cut material being free to pass through the said openings into the hollow shaft, substantially as shown and described.

3. In a feeding device, the combination, with a hollow shaft mounted to turn and to slide and provided with inlet-openings, of a knife secured on the said hollow shaft and adapted to cut a thin layer from the surface of the material, the cut material being free to pass through the said openings into the hollow shaft, and a perforated water-pipe arranged above the said knife and mounted to turn with same, substantially as shown and described.



4. In a feeding device, the combination, with a hollow shaft provided with side openings and a screw-shaft secured centrally to the said hollow shaft, of a knife secured on the said hollow shaft and adapted to cut into the material, the cut parts of which are adapted to pass through the openings into the said hollow shaft, a nut engaging the said screw-shaft, and a worm-wheel feathered on the said screw-shaft and adapted to be rotated, substantially as shown and described.

5. In a feeding device, the combination, with a hollow shaft provided with side openings and a screw-shaft secured centrally to the said hollow shaft, of a knife secured on the said hollow shaft and adapted to cut into the material, the cut parts of which are adapted to pass through the openings into the said hollow shaft, a nut engaging the said screw-shaft, a worm-wheel feathered on the said screw-shaft and adapted to be rotated, and means, substantially as described, for locking the said nut in a fixed position and for rotating the same, substantially as shown and described.

6. In a feeding device, the combination, with a hollow shaft provided with side openings and a screw-shaft secured centrally to the said hollow shaft, of a knife secured on the said hollow shaft and adapted to cut into the material, the cut parts of which are adapted to pass through the openings into the said hollow shaft, a nut engaging the said screw-shaft, a worm-wheel feathered on the said screw-shaft and adapted to be rotated, a water-receptacle held on the upper end of the said hollow shaft and connected with the water-supply, and a perforated pipe extending from the said receptacle and arranged in line with and above the said knife, so as to discharge water upon the cut material to dissolve the same and wash it to the openings in the hollow shaft, substantially as shown and described.

482,588. OIL PURIFIER AND RESERVOIR. RUDOLPH MOSS, Philadelphia, Pa. Filed May 9, 1892. Serial No. 432,274. (No model.)

Claim.—1. An oil purifier and reservoir comprising a main tank having a water inlet and outlet in its lower portion, a central well having outlets near the top, a hopper held above the well and having an

outlet-tube extending downward into the well, a steam-coil arranged in the lower portion of the well, and hoppers arranged beneath the well-outlets and having delivery-tubes extending into the lower portion of the tank, substantially as shown and described.

2. An oil purifier and reservoir comprising a main tank having suitable water inlets and outlets in its lower portion, a central vertical well having a steam-coil in its bottom, a hopper held above the well and having an outlet-tube extending into the lower portion of the well, and the pipes 33, arranged vertically within the hopper, their open upper ends being below the top of the hopper and their lower ends opening through the bottom of the same, whereby the pipes are adapted to receive oil from the upper part of the well and deliver it through

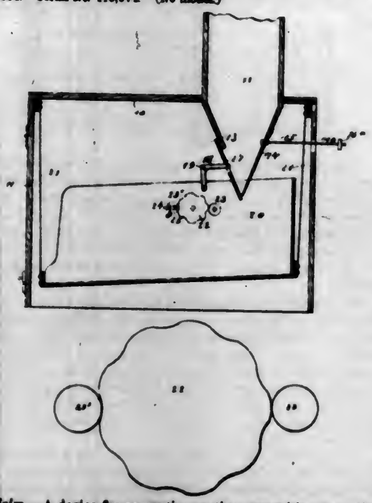
spindles are of less diameter than the diameter of the bridge-apertures and of greater length than the thickness of the bridges and which balance-staff is at the inner terminus of said surfaces or spindles provided with shoulders the diameters of which are greater than the diameter of the bridge-apertures that surround said spindles adjoined to said shoulders between said shoulders and said pivots, of bridges provided with essentially-aligning apertures, which apertures are of slightly-greater diameter than the diameter of said spindles and the thickness of which bridges is slightly less than the length of said spindles, as and for the purpose set forth.

2 The combination, with the ends of the balance-staff of a watch

having therein two sets or series of holes corresponding to similar holes in the walls of the furnace, one set of holes being above the other set and fitted with metallic sockets holding stationary electrodes, in combination with adjustable rods of metal or carbon fitted in the lower set of holes for the purpose of striking the arc when commencing to work the furnace, substantially as hereinbefore described.

482,587. LIGHTING DEVICE. BRADFORD H. PENDLETON, Evanston, Ill. Filed Nov. 19, 1891. Serial No. 412,407. (No model.)

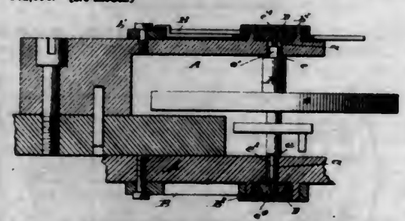
vertical arms or brackets, of a shaft having its bearings in the upper end of said arms, a wire reel mounted upon said shaft, and a guide and bracket pivoted upon the ends of said shaft and straddling the reel and provided with a guide eye or slot, the upper ends of the arms of the reel-carriage being provided with recesses forming shoulders to limit the vertical play of the tension-bracket, substantially as described.



2. The combination, with the bed-plate provided with the guide-channel, as described, of the reel-carriage provided with vertical brackets supporting the reel-shaft and having at their upper ends recesses or stops to limit the motion of the take-up yoke, and the take-up yoke

outlet-tube extending downward into the well, a steam-coil arranged in the lower portion of the well, and hoppers arranged beneath the well-outlets and having delivery-tubes extending into the lower portion of the tank, substantially as shown and described.

2. An oil purifier and reservoir comprising a main tank having suitable water inlets and outlets in its lower portion, a central vertical well having a steam-coil in its bottom, a hopper held above the well and having an outlet-tube extending into the lower portion of the well, and the pipes 33, arranged vertically within the hopper, their open upper ends being below the top of the hopper and their lower ends opening through the bottom of the same, whereby the pipes are adapted to receive oil from the upper part of the well and deliver it through the bottom of the hopper into the main tank, substantially as described.

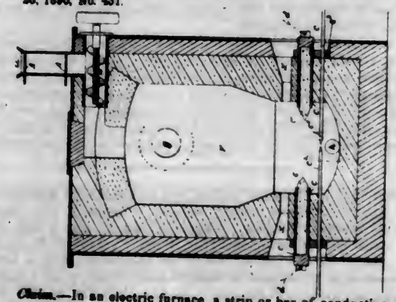


3. The combination, with the main tank, the inner well having outlets near the top, and the hopper arranged above the well and adapted to deliver into the lower portion thereof, of the second set of hoppers arranged beneath the main hopper and adapted to deliver into the bottom portion of the well and pipes extending vertically through the main hopper and adapted to deliver into the second set of hoppers, substantially as described.

482,584. DEVICE FOR CONVERTING MOTION. GEORGE E. MORRISON and WILLIAM A. DYE, Jr., Edgerton, Kans. Filed Nov. 5, 1891. Serial No. 410,974. (No model.)

Claim.—A device for converting motion, comprising a revoluble cam-wheel and rollers journaled on a movable body and arranged on opposite sides of the cam-wheel so as to press against the same, one of the rollers having a sliding bearing, and means, as the spring 20, for holding it against the cam-wheel, substantially as described.

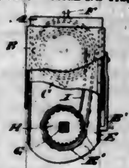
482,585. BEARING FOR BALANCE-STAFFS OF TIMEPIECES. GEORGE NEWTON, New York, N. Y. Filed Nov. 29, 1890. Serial No. 373,006. (No model.)



Claim.—1. The combination, with the ends of the balance-staff of a watch or of a chronometer, which balance staff is provided with a pivot at each of its extremities journaled in jewels, stones, or bearings set in the free ends of reciprocating springs, the other ends of which springs are made fast to any desirable part of the watch or of the chronometer and having a surface or spindle upon the ends of said balance-staff adjoining and at the inner ends of said pivots, which spindles are of less diameter than the diameter of the bridge-apertures and of greater length than the thickness of the bridges and which balance-staff is at the inner terminus of said surfaces or spindles provided with shoulders the diameters of which are greater than the diameter of the bridge-apertures that surround said spindles adjoined to said shoulders between said shoulders and said pivots, of bridges provided with essentially-aligning apertures, which apertures are of slightly-greater diameter than the diameter of said spindles and the thickness of which bridges is slightly less than the length of said spindles, as and for the purpose set forth.

2. The combination, with the ends of the balance-staff of a watch or of a chronometer, which balance-staff is provided with a pivot at each of its extremities journaled in jewels, stones, or bearings set in the free ends of reciprocating springs, the other ends of which springs are made fast to any desirable part of the watch or the chronometer and having a surface or spindle upon the ends of said balance-staff adjoining and at the inner end of said pivots, which spindles are of less diameter than the diameter of the ridge-apertures and of greater length than the thickness of the bridges and which balance-staff is at the inner terminus of said surfaces or spindles provided with shoulders, the diameters of which shoulders are greater than the diameters of the bridge-apertures that surround said spindles adjoined to said shoulders between said shoulders and said pivots, of flanges surrounding the jewel-beds, bridges provided with essentially-aligning apertures, which apertures are of slightly-greater diameter than the diameter of said spindles and the thickness of which bridges is slightly less than the length of said spindles, the distance between the surfaces of said spindles and the inner surfaces of said apertures being practically equal to the distance between the jewel-beds and the inner surfaces of said flanges, substantially as described.

3. The combination, with the balance-bridge provided with an aperture to receive a balance-staff, a spring mounted upon the bridge containing the jewel-bed, and a flange surrounding the bed, of a balance-staff passing through the pivot aperture in the bridge into the jewel of the bed, the space intervening the staff and the walls of the bridge-aperture being essentially the same as the distance intervening the periphery of the jewel-bed and the inner face of the flange, substantially as described.



4. The combination, with the balance staff of a watch or chronometer, provided with a pivot at each of its ends and a reduced portion (surface or spindle) between each of said pivots and the main body of said staff, and a shoulder on each end of said staff at the inner termini of said spindles, of a bridge at each end of said staff, each of which bridges is provided with an aperture through which one of said spindles passes, each of which apertures has a diameter sufficiently larger than said spindle, which passes through it, to permit said spindle to turn freely without touching the surface of said aperture unless when subjected to a severe strain and then to come in contact therewith, the inner surface of each of said bridges being sufficiently near to each of said shoulders at each of the extremities of the main body of said staff to come in contact therewith when said staff may receive a severe end-thrust, otherwise to permit said staff to run freely and without coming in contact with either of said bridges and the distance between the surface of each of said spindles and the surface of each of said apertures being practically equal to the distance between the periphery or edge of each of said jewel-beds and the inner surface of the flange or elevation which surrounds or nearly circumvents it, substantially as set forth.

482,586. ELECTRICAL FURNACE. THOMAS PARKER, Newbridge, England, assignor to the Electric Construction Corporation, Limited, same place. Filed July 5, 1890. Serial No. 357,826. (No model.) Patented in England Oct. 29, 1889, No. 17,060; in France June 23, 1890, No. 206,566; in Germany June 27, 1890, No. 55,700, and in Italy Oct. 23, 1890, No. 431.

Claim.—In an electric furnace, a strip or bar of conducting material on each of two opposite sides of the furnace, each strip or bar having therein two sets or series of holes corresponding to similar holes in the walls of the furnace, one set of holes being above the other set and fitted with metallic sockets holding stationary electrodes, in combination with adjustable rods of metal or carbon fitted in the lower set of holes for the purpose of striking the arc when commencing to work the furnace, substantially as hereinbefore described.

482,587. LIGHTING DEVICE. BRADFORD H. PENDLETON, Evanston, Ill. Filed Nov. 19, 1891. Serial No. 412,407. (No model.)

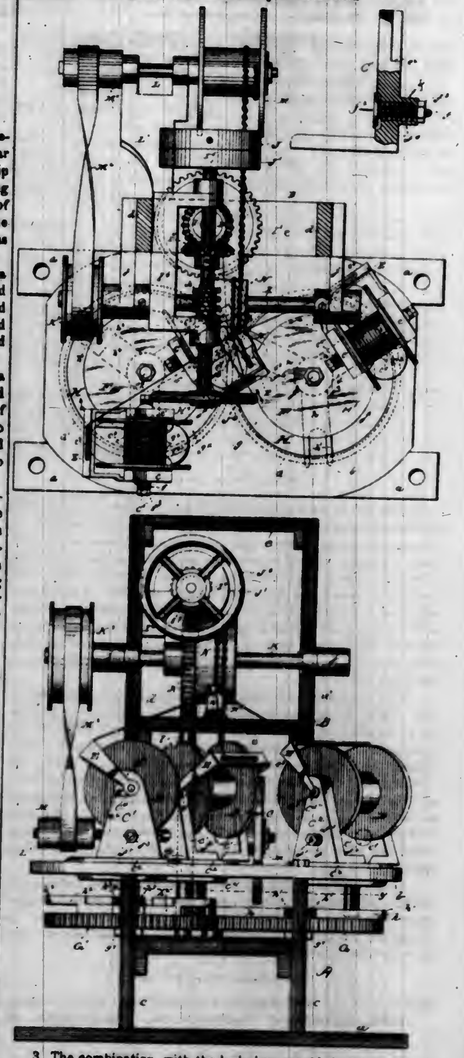
Claim.—1. A lighting device comprising a box adapted to be secured on a lamp or lantern and provided with a scratcher, a circular casing pivoted in the said box, means for locking said casing, a strip arranged in a roll and placed in the said casing, the said strip being provided with igniting-points and passed through a slot in the rim of the casing and over the said rim, and a shaft mounted to turn in the box and adapted to wind up the said igniting-strip, substantially as shown and described.

2. In a lighting device, the combination, with a box having a hinged lid provided with a lug, of a casing mounted to turn in the said box and having in its rim a notch adapted to be engaged by the said lug on the lid, a scratcher fixed on the said box, and a strip provided with igniting-points and arranged in a roll held loosely in the said casing, substantially as shown and described.

3. In a lighting device, the combination, with a box having a scratcher and a hinged lid provided with a lug, of a casing mounted to turn in the said box and having in its rim a slot for the passage of a strip carrying igniting-points, a notch in the edge of the casing to receive the lug on the lid, and a lug held on the said casing and adapted to butt on a lug in the box when the said notch is in position to receive the lid-lug, substantially as shown and described.

4. The combination, with the burner provided with the open-ended tube or sleeve B, provided with a catch B', of the lighting device comprising a box extending through the tube or sleeve, locked thereto by said catch and provided adjacent to the burner-tip with a scratcher, a circular slotted tape-carrying casing pivoted in the upper open end of the box adjacent to the scratcher, means for locking the casing against rotation, and a tape-operating shaft mounted in the lower or outer end of the box exterior to the said tube or sleeve, substantially as set forth.

482,588. PUMP. WILLIAM PETERSON, Geneseo, Minnesota. Filed Apr. 22, 1892. Serial No. 430,230. (No model.)



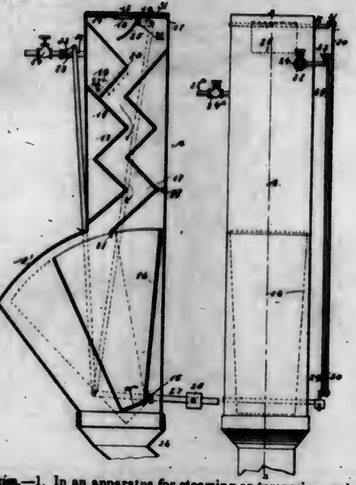
Claim.—In a pump, the combination, with the well-tube, its suction-valve, a tube having sliding movement in the well-tube above the suction-valve and having its lower end provided with a plunger-valve, a second plunger-valve having sliding movement in the sliding tube, and plunger-rods, one connected with the sliding tube and the other with the valve sliding in the tube, of a pump-body in connection with the well-tube above the sliding tube and sliding valve, a standard, a handle fulcrumed upon the standard through the medium of a link and having a connection with one of the plunger-rods, a lower lever comprising a long and a short section pivotally connected, the short section being pivoted to the post or standard and the long section attached to the other plunger-rod, a lever fulcrumed near its center upon the post or standard between the upper and lower levers, a link connection between the fulcrum of the upper lever and its connection with the plunger-rod and one extremity of the intermediate lever, and a second link connecting the opposite extremity of the intermediate lever with the longer member of the lower sectional lever, as and for the purpose set forth.

482,589. MACHINE TO PLAIT WIRE. OTHNIEL PRESTON, Hornellsville, N. Y., assignor of two-thirds to H. C. Preston and O. Preston, Jr., same place. Filed Mar. 7, 1889. Serial No. 302,349. (No model.)

Brief.—The improvements consist in certain specific details pointed out in the claims.

Claim.—1. The combination, with a reel-carriage provided with vertical arms or brackets, of a shaft having its bearings in the upper end of said arms, a wire reel mounted upon said shaft, and a guide and bracket pivoted upon the ends of said shaft and straddling the reel and provided with a guide eye or slot, the upper ends of the arms of the reel-carriage being provided with recesses forming shoulders to limit the vertical play of the tension-bracket, substantially as described.

2. The combination, with the bed-plate provided with the guide-channel, as described, of the reel-carriages provided with vertical brackets supporting the reel-shaft and having at their upper ends recesses or stops to limit the motion of the take-up yoke, and the take-up yoke pivoted to the top of the reel-carriages and straddling the same and provided with a guide-eye, substantially as described.



3. The combination, with the bed-plate provided with the guide-channel, as described, of the reel-carriages provided with vertical brackets supporting the reel-shaft and reel and having at their upper end recesses or stops to limit the motion of the take-up yoke, the take-up yoke provided with a guide-eye and pivoted to the top of and straddling the reel-carriage, and the automatic friction-brake consisting of the spring-surrounded bolt seated in a recess in the brackets of the reel-carriage and adapted to bear against the flange of the reel, substantially as specified.

4. In a wire-braiding machine, the combination, with the reel-car-

rings, the reels mounted therein, the take-up yokes, and the automatic friction-brakes, of the bed plate provided with guide-channels, the intermeshing gearing by which motion is imparted to the reels, the intermediate bracket and guide-eye, the receiving-drum, and the gearing by which it is caused to revolve with a speed corresponding to the delivery from the reels, the whole arranged to give a yielding delivery to and produce an automatically-regulated draft upon the strands during the operation of braiding to compensate for the spring of the wire, substantially as specified.

482,590. DEVICE FOR STEAMING OR TEMPERING GRAIN.

ROLLIN I. ROSMAN, Kingman, Kans. Filed Feb. 2, 1892. Serial No. 420,074. (No model.)

Claim.—1. In an apparatus for steaming or tempering grain, the combination, with a counterbalanced hopper having an opening in its bottom and a passage-way or chute provided with steam-inlets located above the hopper, of a valve located beneath the grain-supply opening of the apparatus, a valved steam-supply pipe, and a connection, substantially as shown and described, between the valve of the steam-supply pipe and the valve at the grain-supply opening, substantially as shown and described, whereby the movement of the hopper in one direction will close the valve of the steam-supply pipe and the valve of the grain-supply and when moved in an opposite direction will open said valves, as set forth.

2. In an apparatus for steaming or tempering grain, the combination, with a casing and a hopper pivoted within said casing and having an attached counterbalanced lever, of a zigzag passage-way or chute provided with steam-inlets located above the hopper, a valve located beneath the grain-inlet of the casing, a steam-pipe leading into the casing and supplying steam to the passage-way, said pipe being provided with a valve, and connecting-rods uniting the counterbalanced lever with the said valves, substantially as shown and described, whereby when the lever is moved in one direction the valves will be closed and when moved in an opposite direction the valves will be opened, as set forth.

3. In an apparatus for steaming or tempering grain, a steam-inlet valve, a valve capable of cutting off the supply of grain, a hopper adapted to receive and deliver grain, and a connection between the hopper and the valves, whereby the latter are automatically operated by the former, as and for the purpose set forth.

482,591. FOOT-RAILING FOR COUNTERS.

GUSTAV A. SOUHLINGER, Mishawaka, Ind. Filed Mar. 18, 1892. Serial No. 425,474. (No model.)

Claim.—1. The combination of a counter with a foot-railing which has arms or brackets B with bent hooks b', in the top of which are holes into which there are inserted rubber bumpers b^2 for the hinged bent knees d^3 of legs d', in combination with the railing to rest on said bent hooks of brackets when raised from the floor in a perpendicular position.

2. The combination of the arms B, the hooks b', and the rubber bumpers b^2, with the hinged fore legs d' to said brackets and with the rail D to said bent knees d^3, all for the purpose as herein set forth.

482,592. FOUNTAIN-PEN.

LAURENT A. SHATTUCK, Bloomsburg, Pa. Filed July 30, 1891. Serial No. 401,162. (No model.)

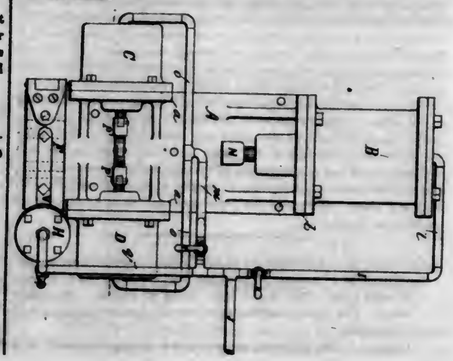
Claim.—1. In a fountain-pen, a point-section or nozzle having a tubular body loosely fitting at its front end and wholly concealable within the handle and a rear end portion, as c', adapted to hold by friction and abutting against a section of a tube held within the reservoir by friction or otherwise, forming a stop, as A', substantially as described.

2. In a fountain-pen, a longitudinally-adjustable point-section or nozzle having a split rear end portion and a tubular body wholly concealable and loosely fitting within the reservoir and holding a feeder and a pen having shoulders abutting against the front end of said point-section, substantially as described.

3. In a fountain-pen, a point-section or nozzle wholly concealable within the reservoir, having one or more auxiliary ink-passages, as c, formed on its external periphery, one or more transverse slots or openings, as c^3, forming communication between said auxiliary passage and the main passage, pen, and feed-bar, substantially as described.

4. In a fountain-pen, in combination, a reservoir A, having stop A' and shoulder a', a nozzle C, having tubular body wholly concealable within the reservoir, an enlarged rear end portion adapted to hold by friction, and an external peripheral groove or grooves c, communicating with transverse slot c^3, a feeder, a pen, and a pen-cap, substantially as described.

5. In a fountain-pen, the combination, with a handle or reservoir having an open end exteriorly curvilineal shaped for a finger-rest, of a point-section, as C, having a tubular body counterbored at its front end, having ink and air stops, as c^3, radial slot c^3, auxiliary passage c, a shouldered pen, a feeder, and a pen-cap, substantially as described.



6. In a fountain-pen, a tubular feeder, as D, having a straight transverse pen-slot conformed to pens of different curves by V-shaped side grooves d^3 d^3, cut in the external periphery in line with said pen-slot and forming auxiliary ink-passages above the pen outside of the main central feed-channel, substantially as described.

7. In a fountain-pen, in combination, a reservoir open at one end, a nozzle having a tubular body fitting within the reservoir and held by two or more rearwardly-diverging arms, a pen, a feeder, and a pen-cap, substantially as described.

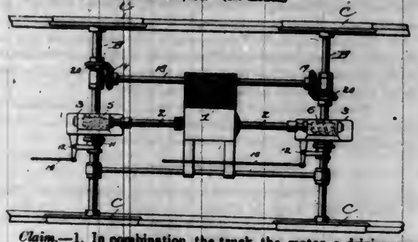
8. In a fountain-pen, a tubular nozzle or point-section held by its rear end within the reservoir and having an opening, as c^3, forward of its rear end for filling without wholly removing said nozzle from the reservoir and a body portion forward of said opening of slightly-less diameter than the bore of the handle to form a loose fit, whereby said point-section may be readily adjusted longitudinally to regulate the flow of ink and to gage the exposure of the pen without removing the pen from its seat, substantially as shown and described.

482,593. MACHINE FOR APPLYING HOSE CONNECTIONS.

ALBERT M. SMITH, Meadville, Pa. Filed Jan. 29, 1892. Serial No. 419,652. (No model.)

Claim.—1. A machine for applying couplings to hose, consisting of a holder for the pipe, a device for forcing the coupling into the pipe, arranged in line with the end of the said pipe, and laterally-arranged compressing means for forcing the band in place about the pipe end and coupling, substantially as described.

2. In combination with a holder for the pipe, a device for forcing the coupling into the same, arranged in line therewith, laterally-arranged compressing devices for the band, a source of power, and connections therefrom to the forcing and compressing devices for operating the same, substantially as described.



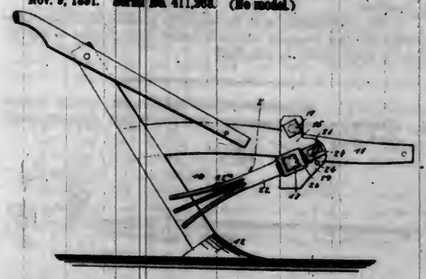
3. In combination with a holder for the pipe, the cylinder B, a piston-rod therein in line with the pipe end and adapted to force the coupling into the same, the cylinders C D, arranged laterally of the position of the coupling, carrying compressing means for operating upon the band M of the coupling, a source of power, a main pipe, and branch pipes extending therefrom to the cylinders and provided with suitable cocks, substantially as described.

4. In combination with a holder for the pipe, the cylinders B, C, and D, and the operating devices carried thereby, arranged, respectively, to insert the coupling and clamp the band upon the same, the cylinder H, the piston carried thereby and adapted to secure the upper part F of the pipe-holder in place, and connections from a source of power to the said cylinders B, C, D, and H, substantially as described.

5. In combination with the pipe-holder, the cylinders C D, the pistons therein, and the fingers A A, pivoted thereto and adapted to operate on the projecting ends of the clamp band M, substantially as described.

482,594. ELECTRIC LOCOMOTIVE.

WILLIAM H. SOLBY and WILLIAM W. PERKINS, Philadelphia, Pa., assignors of three-fifths to James Wolstencroft, William O'Neil, and William H. Yelland, same place. Filed Jan. 7, 1892. Serial No. 417,311. (No model.)



Claim.—1. In combination, the truck, the motor, a driving connection between the front of the said motor shaft and the axle, and a second driving connection between the rear of said shaft and the rear axle, said connections being differential with respect to each other, clutches on the axles, and an idler connection between the axles independent of the motor and its connected mechanism, substantially as described.

2. In combination, the truck, the motor, the driving connections therefrom to the front and rear axles, respectively, the clutches, and the idler connections between the axles, comprising the shaft and the miter-gears, the said shaft being in connection with the motor-frame, substantially as described.

3. In combination, the truck, the motor, the differential worm-gearing between the front and rear ends of said motor-shaft and the front and rear axles, the casings or boxes inclosing said gearing, the friction-clutches, also located within said casings and having sleeves extending through packing-glands thereon to the outside, and means for operating the clutches connected to the projecting sleeves, substantially as described.

482,595. PLOW-FENDER.

GASTON B. SPENCER, Ouachita City, La., assignor to himself and Willie Edwin Hopkins, same place. Filed Nov. 9, 1891. Serial No. 411,968. (No model.)

Claim.—1. The combination, with a clamp having a series of holes and provided with bolts having projecting heads, of a feeder having spring-fingers at one end, a socket at the other end to receive one of the bolt-heads, and an opening at one side of the socket, through which and into one of the holes of the clamp a thumb-screw is adapted to be passed, substantially as described.

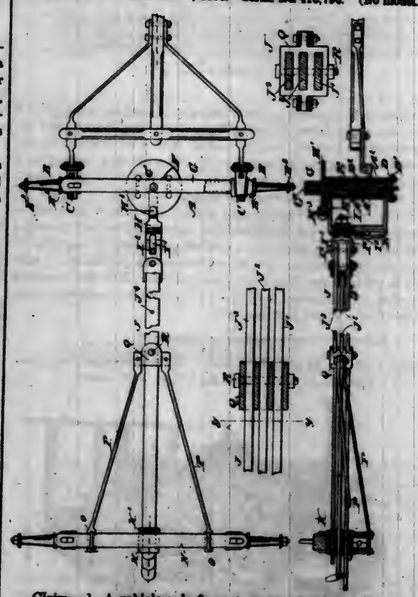
2. A device of the character described, comprising a clamp consisting of two side pieces, one of which is widened and provided with a series of holes, and bolts having squared heads connecting the side pieces, and a feeder having spring-fingers at one end, a socket to fit the bolt-heads, and a slotted end and thumb-screw to facilitate its attachment to the widened side piece of the clamp, substantially as described.

482,596. METHOD OF FINISHING BOOKBINDERS' CLOTH.

THOMAS A. SUTTON and WILLIAM H. SUTTON, Salford, England. Filed Dec. 28, 1891. Serial No. 416,268. (No specimens.)

Brief.—The cloth is subjected to a napping operation before being oiled, glazed, or colored.

Claim.—1. The method herein described of finishing bookbinders' cloth, tracing-cloth, or label-cloth, said mode consisting in first raising a nap or pile upon the woven fabric, then applying to the napped surface a filling or sizing composition, and then glazing the same, substantially as described.



2. The method herein described of finishing bookbinders' cloth, tracing-cloth, or label-cloth, said mode consisting in first raising a nap or pile upon the woven fabric, then applying to the napped surface a filling or sizing composition, and then glazing the same by stiffening and calendering, all substantially as set forth.

3. The method herein described of finishing bookbinders' cloth, tracing-cloth, or label-cloth, said mode consisting in first raising a nap or pile upon the woven fabric, then applying to the napped surface a filling or sizing composition and a coloring-matter, and then glazing the same, substantially as described.

4. The method herein described of finishing bookbinders' cloth, tracing-cloth, or label-cloth, said mode consisting in first raising a nap or pile upon the woven fabric, then applying to the napped surface a filling or sizing composition, then glazing the same, and finally embossing a grain or pattern thereon, all substantially as described.

482,597. VEHICLE RUNNING-GEAR.

JAMES W. TAYLOR, Vermillion, S. D. Filed Nov. 2, 1891. Serial No. 410,796. (No model.)

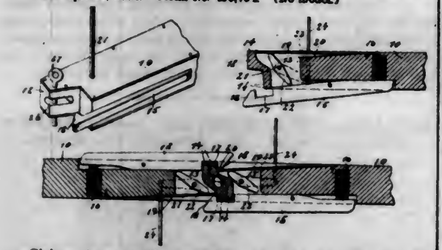
Claim.—1. A vehicle-axle formed of two separate and independent side plates having their ends rounded to form spindles and a top plate fitting upon the side plates, substantially as described.

2. A vehicle provided with an axle comprising separate and independent side plates made of metal and having their ends formed into

heads and spindles and thimbles shrunk on the said spindles and heads, substantially as shown and described.

3. A vehicle provided with an axle comprising separate and independent side plates made of metal and having their ends formed into heads and spindles, thimbles shrunk on the said spindles and heads, and a flanged nut screwing on the outer threaded end of each spindle to abut against the end of the thimble, substantially as shown and described.

4. The combination, with an axle, of a block on the axle, a disk above the block, a clip for securing the disk and block to the axle, a king-bolt passing through the disk, block, and axle, a U-shaped frame having its ends entering recesses in the block and axle and pivoted on the king-bolt, and a flanged guide secured to the frame and engaging the disk, substantially as described.



5. The combination, with a frame pivoted to the front axle and provided with a guideway H', of a fork I', secured to the reach and provided with a bolt I, by which the reach is pivoted to the frame, and the arm I², secured to the bolt I and working in the guideway H', substantially as herein shown and described.

6. In a vehicle, the combination, with a reach-rod made in several parts, of a rear axle, a bearing secured on the said rear axle, and in which is fitted to slide the said reach-rod, a bolster attached to the said rear axle, a bearing supported from the said rear axle and engaging the said reach-rod in front of the rear axle, and a bolt for connecting the last-mentioned bearing with the said reach-rod, substantially as shown and described.

7. In a vehicle, a reach-rod made in several parts, connected with each other at their front ends, a bearing supported upon the rear axle, rods projecting from the rear axle, and a bearing to which the said rods are secured, each bearing being formed with openings for the independent passage of the several parts of the reach-rod, substantially as shown and described.

482,598. CAR-COUPLING. FREEMAN THOMPSON, Dover, N. H.

Filed Apr. 28, 1892. Serial No. 430,754. (No model.)

Claim.—A car-coupling comprising a draw-head having at the end and on one side a forwardly-extending projection, said draw-head being horizontally recessed near the end to form a vertical end lip and provided with a transverse socket in one side containing a spring 16, a locking-arm pivoted on one side of the draw-head, crossing the spring 16 at its rear end, and having a recess near its free end to engage the lips of two couplings a spring-plate rigidly secured at its inner end on the opposite side of the draw-head and having its front end arranged in the rear of the lip, a crank-rod extending vertically through the recess in the draw-head and provided with a handle mechanism at each end, and a double cam secured to the crank-rod within the recess and adapted to press simultaneously upon the locking-arm and spring-plate, substantially as shown and described.

482,599. TRACTION-ENGINE. ISRAEL TOWNSEND, Portsmouth, Va. Filed Dec. 17, 1891. Serial No. 415,393. (No model.)

Claim.—1. The combination, with the driving-wheel, of an endless traction-belt passing around the same and lying in the plane of its lowest contact-line for some distance in front of that line and devices offering yielding resistance to the rising of the belt above that plane.

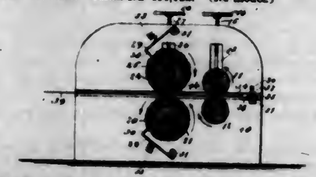
2. The combination, with an engine-driving wheel, of a belt pulley in its plane and normally resting upon the same horizontal plane, a yielding support or bearing for said pulley, and a traction-belt passing around both the drive wheel and pulley.

3. The combination, with the driving-wheel, of the pulley in front thereof, mounted in links swinging upon the axle of the driving-wheel, and a traction-belt passing around both the driving-wheel and pulley.

4. The combination, with the driving-wheel, the links swinging about its axis, and the pulley mounted in the free ends of said links, of the traction-belt passing around both the driving-wheel and pulley and a spring offering yielding resistance to the pulley's swinging upward from its normal position.

5. The combination, with the driving-wheel, of a pulley in the same plane mounted to swing about the wheel's center, an endless traction-belt passing around both wheel and pulley, and a spring offering yielding resistance to lifting the pulley from the plane upon which the driving-wheel rests.

6. The combination, with the driving-wheel, of the pulley in the plane of the same, the pulley-guiding fork having the curved shaft sliding in fixed bearings, the nut resisting the sliding of said shaft in one direction, the spring coiled about the shaft and offering yielding resistance to its sliding in a contrary direction, and a traction-belt passing around both pulley and driving-wheel.



7. The combination, with the driving-wheel, of the pulley in the same plane swinging in links mounted upon the axle of the driving-wheel, the guiding-fork and curved shaft sliding in the fixed bearings, the spring resisting lifting of the pulley from the ground, and a traction-belt passing around both pulley and wheel.

8. The combination, with the pulley, the guiding-fork having the shaft sliding in fixed bearings, and the spring coiled about said shaft below one of said bearings, of the nut working upon said shaft to compress the spring and vary its tension.

9. The combination, with the driving-wheel, links pivoted upon its axle, and a pulley mounted in the free ends of said links, of devices for varying the distance of the pulley from said axle and a traction-belt passing around both the driving-wheel and pulley.

10. The combination of the endless belt, the transverse bars or cleats fixed thereto, and the slightly-projecting steel plates fixed along the front edges of said cleats, substantially as set forth.

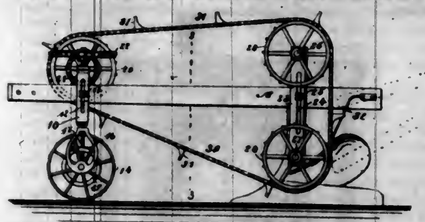
482,600. CASE-CLEANER. PETER TRIPS, Lebanon, Ind. Filed Nov. 11, 1891. Serial No. 411,622. (No model.)

Claim.—1. The combination of the machine-frame having longitudinal grooves on its inner sides, the rollers and brushes mounted transversely in the case and in pairs, and the case-holding device adapted to be slipped into the grooves of the frame, substantially as described.

2. A machine of the character described, comprising a frame having horizontal grooves in its inner wall, a cross-bar held to slide in the groove and having means for attachment to the case, a pair of rollers mounted in the frame, the upper roller being mounted in vertically-adjustable bearings, a pair of revoluble brushes mounted adjacent to the rollers and parallel therewith, the upper brush having vertically-adjustable bearings, scrapers held to impinge upon the brushes, and driving mechanism for revolving the rollers and brushes, substantially as described.

3. The combination, with the revoluble brushes, of spring-pressed toothed scrapers arranged adjacent thereto and adapted to impinge thereon, substantially as described.

482,601. IMPLEMENT FOR CUTTING GLASS. JOHANN URBANEK, Frankfort-on-the-Main, Germany. Filed Apr. 26, 1892. Serial No. 430,987. (No model.)



Claim.—1. In implements for cutting glass, the block *a* and elastically-hinged block *c*, holding the blunt diamond *d'*, in combination with the handle *b*, rigidly fixed to the block *a* and holding the sharp diamond *d'*.

2. The handle *b* and block *a*, rigidly fixed to each other, in combination with the block *c*, hinged at *c⁴* and provided with the spring *d*.

3. The handle *b*, with block *a* rigidly fixed to the handle and holding the sharp diamond *d'*, in combination with the block *c*, hinge *c⁴*, spring *d*, and adjustable screw *g*, holding the blunt diamond *c*.

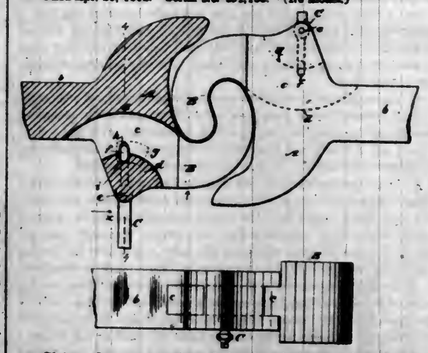
482,602. PLOW ATTACHMENT. CURTIS H. WARRINGTON, West Chester, Pa. Filed June 28, 1892. Serial No. 438,261. (No model.)

Claim.—1. The combination, with a plow-beam, a supporting and driving wheel carried by the beam, a chain-pulley located above the supporting and driving wheel, and a driving connection between the chain-pulley and the driving and supporting wheel, of chain-pulleys located at the opposite side of the beam near its rear, one above and the other below it, and an endless chain belt passing over the chain-pulleys diagonally across the beam, the said belt being provided with carriers, as and for the purpose specified.

2. The combination, with a plow-beam, an adjustable yoke attached to the forward portion of the beam, and a combined driving and supporting wheel carried by the yoke, of a sprocket-wheel journaled at one side of the beam, a driving connection between the sprocket-wheel and the combined driving and supporting wheel, sprocket-wheels adjustably located near the end of the beam upon the opposite side of the forward sprocket-wheel, one of the rear wheels being located above and the other below the beam, an endless chain belt passing diagonally both above and below the beam and over the sprocket-wheels, carriers attached to the outer faces of the belt, and a finger secured to the beam and adapted for engagement with the carriers, as and for the purpose set forth.

3. The combination, with a plow-beam, a combined driving and supporting wheel adjustably attached to the forward portion of the beam, a sprocket-wheel located upon the mold-board side of the share at the top of the beam, and a driving connection between the beam and the sprocket-wheel and supporting and driving wheel, of a supporting-bar adjustably attached to the opposite or landside portion of the plow-beam near its rear, the said supporting-bar being somewhat wedge-shaped or triangular in cross-section, sprocket-wheels journaled upon the supporting-bar, one at the top and the other at the bottom, the upper wheel being at the bottom and the lower wheel opposite the landside of the share, an endless belt passed over the sprocket-wheels and extending diagonally across the top and bottom of the beam, carriers located upon the belt, and a stripping mechanism secured to the beam and adapted for engagement with the carriers, as and for the purpose specified.

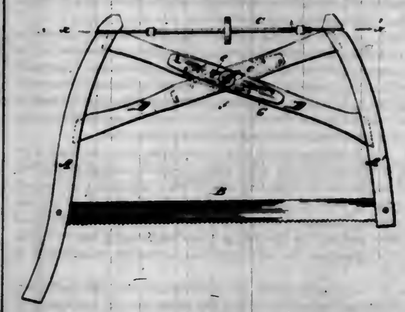
482,603. STAND FOR BEER-GLASSES, &c. EDUARD WEIGEL, Greifenberg, Germany. Filed June 23, 1891. Serial No. 397,210. (No model.)



Claim.—A stand for glasses or other receptacles for liquids, consisting of a liquid-receptacle proper provided with a perforated disk pushed upward by means of a spring and kept in position by a detachable ring, so that the liquid will drop down through the perforated disk into the liquid-receptacle and there be absorbed by a sponge.

482,604. METHOD OF PRODUCING AN IMITATION OF BROCADE OR GOLD CLOTH. FRANZ P. WERNER, Munich, Germany. Filed Apr. 7, 1892. Serial No. 428,233. (No specimens.) Patented in Belgium Nov. 14, 1891, No. 97,197.

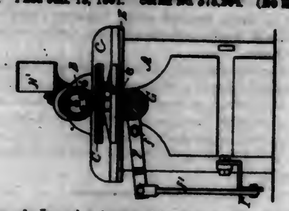
Claim.—1. The method of producing imitations of brocade or gold cloth, consisting in coating a textile fabric, first, with spirituous gelatine; secondly, with a ground consisting of a flour paste mixed with Venetian turpentine and ox-gall; thirdly, with collodion having castor-oil or the described equivalent added thereto; fourthly, with French mixture, to which has been added tenacious varnish; fifthly, with leaf metal, and, finally, with an alcoholic shellac solution, substantially as set forth.



2. As a new article of manufacture, an imitation of brocade or gold cloth, which consists of a textile fabric covered wholly or partially with coatings, first, of spirituous gelatine; second, of a ground composed of flour paste mixed with Venetian turpentine and ox-gall; third, of collodion and castor-oil or the described equivalent; fourth, of French mixture; fifth, of leaf metal, and, finally, of alcoholic shellac solution, substantially as set forth.

482,605. CAR-COUPLING. GEORGE W. WILKINSON, Chicago, Ill. Filed Apr. 29, 1892. Serial No. 431,163. (No model.)

Claim.—In a car-coupler of the description herein referred to, the combination of the movable hook-shaped knuckle part having a notch in its joint or tail portion, the stationary head part slotted to receive said tail portion within or through it, and having a corresponding notch in its portion over or against which said tail portion moves and an opening in its under side facing said notches, and the laterally-projecting lever loosely pivoted to the head part to admit of its being moved upward and backward or forward from the under side of the head part, said lever being provided with a nose or hook at its inner end adapted to engage with the notch in the tail portion of the knuckle part and to engage with or disengage from the notch in the stationary head part of the coupler, substantially as specified.



482,606. BUCKSAW. PETER WOODRUFF, Kansas City, Mo., assignor to himself and James M. Gross, same place. Filed Jan. 25, 1890. Renewed Mar. 8, 1892. Serial No. 424,165. (No model.)

Claim.—1. In a bucksaw, the combination, with the frame composed of the side or end pieces A A' and the centrally interlapping and crossing diagonal braces D D, having slots *c c*, of a clamping set-screw passing through said slots and adjustable from the exterior of the braces for operation in connection with an adjustable stretcher and the saw-blade, substantially as specified.

2. In a bucksaw, the combination of the plates G G, having slots *c c* in them, the diagonal crossing-braces D D, having central reductions *b b* in their adjacent surfaces and slots *c c*, the clamping set screw S, the end frame-pieces A A', and the adjustable stretcher C, for operation in relation with each other and with the saw-blade, essentially as set forth.

482,607. IRONING-MACHINE. FRANK D. ADAMS, Northville, Mich. Filed Jan. 19, 1891. Serial No. 378,264. (No model.)

Claim.—1. In an ironing-machine, the combination, with a frame, of a non-rotatable hollow polishing-iron, means for interiorly heating the iron, a friction-roll below the iron, means for rotating the roll, a traveling support between the iron and roll, actuated by the roll, an ironing-board on the support, normally out of contact with the iron, and levers for forcing the iron and board into engagement, substantially as described.

2. The combination, with a non-revolvable polishing iron, of an ironing-board mounted upon a support, and a friction-roller for actuating the same and pressing the ironing-board into contact with the polishing-iron, and depressions *e* along the middle portions of the guides for said support, substantially as and for the purposes described.

3. In an ironing-machine, the combination, with a frame having bearings at its upper edges, of a cylindrical polishing-iron non-rotatable in operation, adjustably held in said bearings, means for heating the iron interiorly, a reciprocating ironing-table mounted upon the frame, a revolvable friction-roll below the table, and a lever for forcing the polishing-iron and table into engagement, substantially as described.

4. In an ironing-machine, the combination, with a frame having elongated bearings at its upper end, of a polishing-iron immovable in operation adjustably located in said bearings, means for heating the iron interiorly, a reciprocating ironing-table mounted on the frame, a friction-roll below the table, means for actuating the roll, and a lever for forcing the polishing-iron and table into engagement.

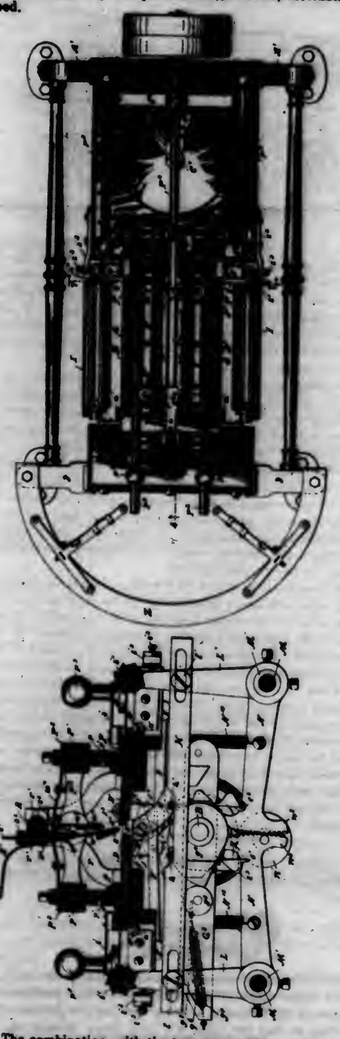
482,608. KNITTING-MACHINE. CHARLES J. APPLETON, New York, N. Y., assignor of two-thirds to Hugo S. Mack and Hibert A. Whittelsey. Filed Dec. 26, 1890. Renewed Aug. 18, 1892. Serial No. 443,364. (No model.)

Brief.—The alternately-raised horizontal needle-bars are raised and the needles reciprocated by improved pattern and Jacquard mechanism. The carrier-arms carry cams which are vertically movable to adapt themselves to the needle-bars. Two yarn-guides are employed, pattern mechanism determining through a swinging tongue-catch their respective periods of operation, pattern mechanism also operating to hold the inactive one positively out of action. Means are provided whereby the active yarn-guide will when moving in either direction lead the knitting-cams. Cloth take-up hook-bars are provided, one for each needle-bar, mechanism operating to move one or both in unison with its or their row or rows of needles.

Claim.—1. In a knitting-machine, the combination, with needle-bars and pattern mechanism for raising the same and lost-motion devices interposed between said mechanism and needle-bars, of Jacquard mechanism for advancing the needles, oscillating sleeves, levers operated by the said pattern mechanism, and means operated by said levers for connecting and disconnecting the Jacquard mechanism to and from their respective sleeves, substantially as described.

2. In a knitting-machine, the combination, with needle-bars arranged in substantially the same plane, of levers connected thereto, pattern mechanism for operating said levers, a lug having an inclined top carried by each of said levers, sliding levers resting at one end upon said lugs, Jacquard mechanism for advancing the needles, and mechanism operated by the sliding levers for bringing into or throwing out of operation the said Jacquard mechanism, substantially as described.

3. In a knitting-machine, the combination, with the needle-bars and pattern mechanism for raising the needle-bars in predetermined order, of a drum and ratchet for operating said mechanism, the sliding bar G^2, having pawl G' and having the inclined slot G^3, into which a fixed pin projects, and mechanism for operating said bar, substantially as described.



4. The combination, with the carrier-arms P' and mechanism for reciprocating them, of cams hinged to said arms and vertically movable in relation thereto, the needles, the needle-bars, and mechanism for raising the inner edges of said needle-bars, substantially as described.

5. The combination, with the carrier-arms P', of the cams P, having lugs provided with vertical slots *p*, the said carrier-arms having pins *p'* entering said slots, the needles, their needle-bars, and mechanism for raising said bars, substantially as described.

6. The combination, with the cams P and their sliding bars P^6, of the cross-bars P^5, the operating-rod P^4, secured thereto at one end and having cross-head P^3 at its other end, way-rods p^2 for the cross-head, and means for operating said cross-head, substantially as described.

7. The combination, with rod P^4, having the hole *u*, and the cross-bar P^5, having groove *u'*, of the head-plate u^2, having guide-pins u^3, and the friction-spring u^4, carried by cross-bar P^5 and resting on the upper guide-pin, substantially as described.

8. The combination, with the two yarn-guides having pins c^3, of the tongue-catch U, pivoted to a reciprocating carrier and having notches u^5 and u^6 in its upper and lower edges, respectively, and means for positively restraining the movements of the yarn-guides when not engaged by the pivoted tongue-catch, substantially as described.

9. The combination, with the two yarn-guides having pins c^3, of the tongue-catch U, pivoted to a reciprocating carrier and having notches u^5 and u^6 and stop-pin u^8, and the spring-bold latch u^7, pivoted to catch U and having a point at one end extending beyond the notch u^6, substantially as described.

10. The combination, with two yarn-guides, a catch for engaging with either of them, and means whereby the catch may be reciprocated, of pattern devices for automatically raising and lowering the catch and locking the yarn-guide not engaged with such catch in one of its extremes of movement and positively holding it in that position, substantially as described.

11. The combination, with the two yarn-guides, one having an upwardly-projecting pin and the other a downwardly-projecting pin, of the vertically-movable plate g^4, having holes g^5 g^6, pattern mechanism for automatically moving said plate, and means for reciprocating either of said guides, substantially as described.

12. The combination, with the two yarn-guides having pins c^3, of the reciprocating hinged tongue-catch U, having notches u^5 u^6, the vertically-movable rod Q, the cross-pins q^3, supported and operated by the rod Q, and means for operating said rod, substantially as described.

13. The combination, with the guide-bar R, having ways *r'* and with the yarn-guides S S' fitted to said ways, the needles *s'*, and the needle-operating cams, of mechanism for moving said yarn-guides along the ways, having an extensible portion, and adjustable stops secured to said ways, against which the yarn-guides abut and are positively held to bring them into proper relation with respect to the cams to insure the laying of the yarn in the hooks of the needles on the return stroke of the appropriate guide before the needles are withdrawn, substantially as described.

14. In a knitting-machine, the combination, with two needle-bars and their needles arranged in substantially the same plane, of mechanism for reciprocating the needles of one or both of the needle-bars, a vertically-movable hook-bar under each needle-bar and having hooks adapted to engage the fabric knitted by the needles, and mechanism for moving one or both of the hook-bars in unison with its or their respective row or rows of needles and retiring it or them from action when its or their respective row or rows of needles are retired therefrom, substantially as described.

15. The combination, with the hook-bar V and a rock-shaft having arms to which the hook-bar is hinged, of a spring v^9, secured to the under side of one arm and extending under the said bar, substantially as described.

16. The combination, with the shaft v^8, hinged hook-bars V, having arms v^9, provided with holes, and the pins v^{10}, passing through said holes, of the spring v^9, coiled around said pins above the said hook-bars, substantially as described.

17. The combination, with the swinging hook-bars having crank-pins *h h'*, of the sliding bar K, having inclines *k k'*, and means for operating said bar, substantially as described.

18. The combination, with the swinging hook-bars having crank-pins *h h'*, of the oscillating arms L L', having pins *l l'*, the bar K, provided with slots through which said pins pass and provided, also, with inclines *k k'* and with cam-surfaces, the shaft B, the disk g^4, and the pins *x x'*, carried by such disk, substantially as described.

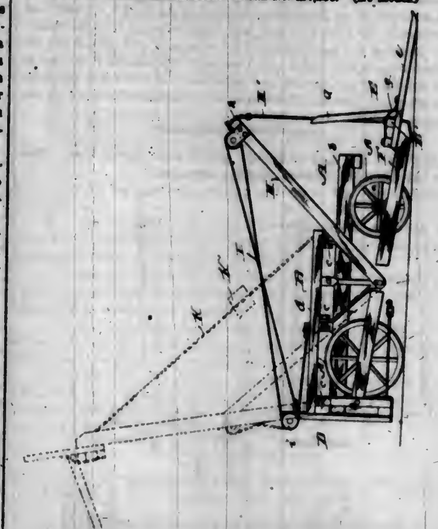
19. The combination, with the hook-bars having crank-pins *h h'*, of the sliding bar K, provided with inclines *k k'* and provided with a plurality of cams on its side, one of said cams being in a different lateral plane from the others, a rotary disk having two pins for engaging the different cams, one of said pins being longer than the other, substantially as described.

20. The combination, with the hook-bars having crank-pins *h h'*, of the sliding bar K, having inclines *k k'* and provided with the cams *y*, *y'*, y^2, and y^3 on its side, and the rotary disk g^4, having pins *x x'*, substantially as described.

482,609. STRAM-MANGLE. FRANK BALDWIN, New York, N. Y. Filed Aug. 1, 1891. Serial No. 401,305. (No model.)

Claim.—A mangle comprising a frame, a plurality of stationary horizontally-aligned irons mounted on the frame with a space between their adjacent edges and having their lower faces convex and forming segments of a common circle, means for heating the irons, an endless belt, the upper run of which lies against the lower convex faces of the irons, and rollers carrying the said belt, substantially as set forth.

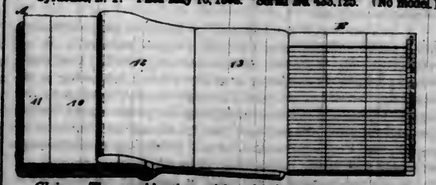
482,610. NUT-LOCK. JOHN BENNER, Elizabethville, Pa. Filed Mar. 19, 1892. Serial No. 426,067. (No model.)



Claim.—1. In a nut-lock comprising a bolt having slots formed at the end, the nut on the bolt, the washer provided with apertured ears adapted to incline the sides of said nut, and a locking-key engaging a slot of the bolt and the apertures of the ears to secure the bolt, substantially as and for the purpose described.

2. In a nut-lock comprising a bolt A, having cross-slots *a* formed in the end, the nut B on the bolt, the washer C, provided with upturned apertured ears *c*, and a pliable wire locking-key D, engaging a slot *a* of the bolt and apertures c^3 of the ears to secure the bolt, substantially as and for the purpose described.

482,610.



482,611. HAY-STACKING MACHINE. PHILIP BERNARD, Jefferson, S. D. Filed Mar. 21, 1892. Serial No. 427,262. (No model.)

Claim.—The combination, with the vehicle or truck, the frame supported thereon, the bars F F, pivoted at their rear ends to said frame, a cross-head E', rigidly secured to the forward portion of the said bars, a series of teeth rigidly secured at their rear ends to said bar, a second cross-head E, to which the teeth are also secured, and a series of vertical fingers G, one pivoted to each tooth in front of said cross-heads, of the levers H H, pivoted at their lower ends, one at each side of the machine below the level of the axles, a flexible connection between each of said levers and the cross-head E, and the double-rigged elevating-cables for operating said levers, substantially as specified.

482,612. INDEX ATTACHMENT FOR BOOKS. WILLIAM D. REVIS, Syracuse, N. Y. Filed May 16, 1892. Serial No. 433,125. (No model.)

Claim.—The combination, with a book having a fly-leaf 10, of stout material, provided along its free edge with a reinforce 11, of the index B and the strip 12, secured at one edge to the leaf 10 between its front and rear edges and at its opposite edge secured to the free edge of one cover 13 of the index, substantially as set forth.

482,618. BUTTER-PASSAGE. JAMES F. BLY, Mayville, N. Y., assignor to Clarence E. Cipperly, same place. Filed May 11, 1892. Renewed Sept. 16, 1892. Serial No. 445,122. (No model.)

482,613.

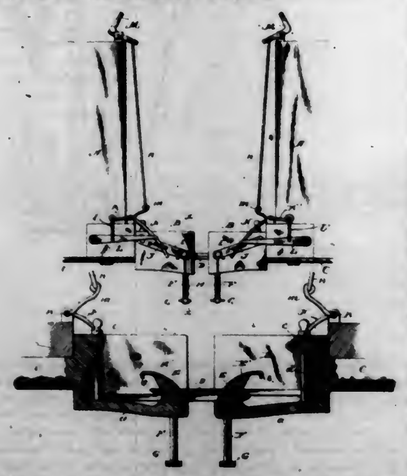
lovers, and a suitable means for rocking the rock-shaft, substantially as specified.

4. In a car-coupler, a link in combination with a draw-head, a rearwardly pitched hook rising from the draw-head at the forward end thereof and having its forward edge beveled, and a curvilinear plate connected to the forward edge of the hook and extending rearwardly of the same, substantially as specified.

482,615. CAR-COUPLING. DAVID BREWER, Emporia, Kans. Filed Apr. 16, 1892. Serial No. 429,450. (No model.)

482,617. TANK-FEEDER. MERRITT BURT and JOHN W. SKILTON, Jacksonville, Fla. Filed Oct. 23, 1891. Serial No. 409,636. (No model.)

in combination with a slide moving vertically in the clamp-frame and having a screw-stem passing through the arms and forming a connection for the same and a screw nut or knob fitting said screw-stem and adapted, when turned up to rigidly fix the arms to the clamp, substantially as shown and described.

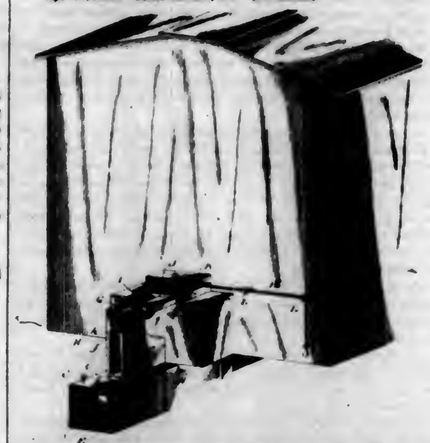


3. A dental cervix-clamp consisting of the flanged and slotted main frame A and the bent arm B, having clutch-points at their lower ends, the clamp-screw for fastening the two together, and the pivotally connected and adjustable arms D D, with means for rigidly connecting the same to the main frame, substantially as shown and described.

482,613.

Claim.—A butter or other package comprising a metal bucket, a protective casing or jacket of non-conductive material surrounding the same and of less depth than the depth of the bucket, a metal hoop surrounding the bottom of said jacket and clamping it to the bucket and covering the space between the bottom of said jacket and the bottom edge of the bucket, and a series of clips secured at one end to the bottom of the bucket and extending outwardly and upwardly therefrom and embracing the metal hoop, substantially as and for the purpose set forth.

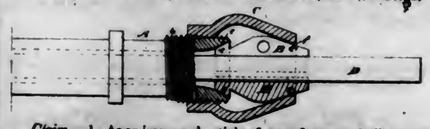
482,614. CAR-COUPLING. JOHN H. BRAUN, Roslyn, Wash. Filed Apr. 20, 1892. Serial No. 429,890. (No model.)



Claim.—1. In a car-coupler, the combination, with a draw-head, a rearwardly-pitched hook rising from the longitudinal center of the bottom of the draw-head at the forward end thereof and having its forward edge beveled to form a downward projection, and a vertically-disposed pin taking through the draw-head adjacent to the inner or rear end thereof, of a link having its rear end square with respect to its sides and having its forward end beveled, substantially as and for the purposes specified.

2. In a car-coupling, substantially as described, the combination, with a draw-head comprising a bottom wall, side walls, and a top wall at the inner ends of the side walls, a rearwardly-pitched hook rising from the bottom wall adjacent to its forward end and having its forward edge beveled, a pin taking through the draw-head, and a link engaged by said pin, of the vertically-disposed pitmen taking through apertures formed in the bottom of the draw-head and adapted to engage the link, a cross-bar connecting said pitmen, and a suitable means for raising said pitmen, substantially as specified.

3. In a car-coupling, substantially as described, the combination, with a draw-head, a hook rising from the bottom wall of the draw-head, a pin taking through the draw-head, a link straddling the hook and engaging the pin, the vertically-disposed pitmen taking through apertures in the bottom of the draw-head and adapted to engage the link, and a cross-bar connecting said pitmen, of the levers fulcrumed upon the sides of the draw-head and having the laterally and rearwardly extending hooks at intermediate points in their length, links connecting the levers and the cross-bar of the pitmen, the rock-shaft, the arms carried by said rock-shaft and engaging the hooks of the levers, and a suitable means for rocking the rock-shaft, substantially as specified.

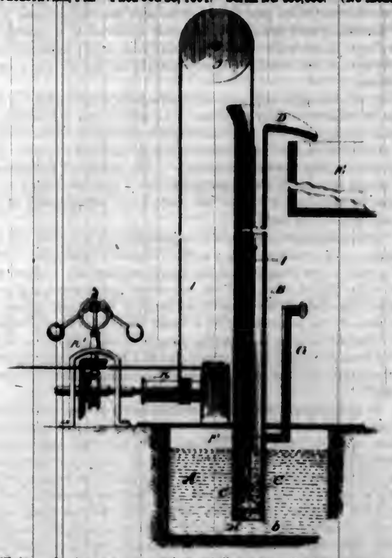


4. In a car-coupler, a link in combination with a draw-head, a rearwardly pitched hook rising from the draw-head at the forward end thereof and having its forward edge beveled, and a curvilinear plate connected to the forward edge of the hook and extending rearwardly of the same, substantially as specified.

482,615. CAR-COUPLING. DAVID BREWER, Emporia, Kans. Filed Apr. 16, 1892. Serial No. 429,460. (No model.)

Claim.—In a car-coupler, substantially as described, the combination, with a draw-head and a pin taking through the draw-head and having a head adjacent to its upper end, of the upright rising from the draw-head and having a way or groove in its forward side reduced in width at an intermediate point in its length, a vertical sheave carried by said upright, a vertical sheave carried by a support rising from the draw-head, a horizontal sheave also carried by said support, and a cable connected at one end to the pin of the draw-head and taking over the vertical sheaves of the upright and support and around the horizontal sheave of said support, substantially as and for the purpose specified.

482,616. HOLLOW-MANDREL CHUCK. FREDRICK A. BUSH, Urbana, Ohio. Filed July 16, 1891. Serial No. 399,702. (No model.)



Claim.—1. As an improved article of manufacture, a hollow-mandrel chuck open at both ends to permit the work to pass entirely through it and provided with separate and independent frictionally-driven yielding dies or jaws separated longitudinally from end to end and adapted to remain stationary at times within the body of the chuck while the latter continues to rotate, substantially as set forth.

2. As an improved article of manufacture, a chuck provided with frictionally-driven dies or jaws separated longitudinally from end to end and about which the body of the chuck is free to be rotated by the mandrel at times and springs between the adjacent sides of the chucks, substantially as set forth.

3. As an improved article of manufacture, a chuck provided with frictionally-driven dies or jaws about which the body of the chuck is free to be rotated by the mandrel at times, opposed recesses in the sides of the dies or jaws, and spiral springs resting at their ends in said recesses, substantially as set forth.

4. As an improved article of manufacture, a chuck consisting in a mandrel having a flaring unbroken circular mouth *e*, a cone or body portion C, screwed upon the mandrel and having a circular mouth *f*, flared or tapered reversely to the mouth *e* and of unbroken or uninterrupted contour, the dies or jaws beveled or inclined oppositely on their outer edges at their ends to be held to the work by friction between the two unbroken mouths *e f* and at times remain stationary while the mandrel and cone or body rotate, and spiral springs between the sides of the dies or jaws, substantially as set forth.

482,617. TANK-FEEDER. MERRITT BURT and JOHN W. SKILTON, Jacksonville, Fla. Filed Oct. 23, 1891. Serial No. 409,636. (No model.)

Claim.—1. An apparatus substantially as described, comprising a pipe having a water-inlet and provided at about the water-level with an air-opening, through which air may enter to break the suction, and a piston and hoisting means therefor, the piston being movable from a point below the air-opening up to a point above the same, substantially as set forth.

2. In an apparatus substantially as described, the combination of the reservoir, the pipe extending at its lower end thereinto and provided near the water-level with an air-opening, the piston movable in the pipe past the said air-opening, and means whereby to hoist the said piston, substantially as set forth.

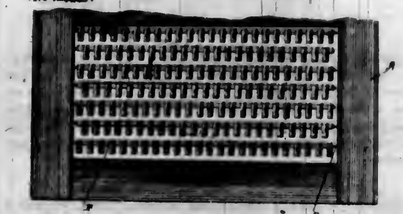
3. In an apparatus substantially as described, the combination of the reservoir, the pipe opening at its lower end into the reservoir and having an air-opening F at about the water-level, and a pipe G, communicating at one end with the said opening and extended at its upper open end above the ground-level, the piston in the pipe, and the means whereby to raise said piston, substantially as set forth.

4. The improved apparatus herein described, comprising the reservoir the pipe having an air-inlet, the piston movable in the pipe past the said opening, and the rope connected with the said piston, whereby to raise the same, substantially as set forth.

5. The improved apparatus substantially as herein described, consisting of the reservoir, the pipe opening at its lower end in the reservoir and having an air-opening F, and a pipe G, communicating with said opening, the piston movable in the pipe past the opening G, the rope connected with said piston, and the guide-pulley J, all substantially as set forth.

6. The combination, substantially as described, of the tank E, reservoir A, pipe B, having its inlet in the reservoir and its discharge arranged to deliver into the tank, the piston in the pipe, the latter having an air-opening at about the water-line in the reservoir, the rope connected with the piston, and mechanism for pulling said rope to lift the piston, substantially as set forth.

482,618. RUBBER-DAM CLAMP. AMBER I. F. BUKBAUM, Walnut Hills, Ohio. Filed June 13, 1892. Serial No. 436,609. (No model.)



Claim.—1. A dental cervix-clamp having arms D D, with teeth or spurs adapted to embrace between them a portion of the neck of the tooth, the said arms being pivotally connected to the clamp and made adjustable, as described.

2. In a dental cervix-clamp, the arms D D, with teeth or spurs adapted to embrace between them a portion of the neck of the tooth, in combination with a slide moving vertically in the clamp-frame and having a screw-stem passing through the arms and forming a connection for the same and a screw nut or knob fitting said screw-stem and adapted when turned up to rigidly fix the arms to the clamp, substantially as shown and described.

3. A dental cervix-clamp consisting of the flanged and slotted main frame A and the bent arm B, having clutch-points at their lower ends, the clamp-screw for fastening the two together, and the pivotally connected and adjustable arms D D, with means for rigidly connecting the same to the main frame, substantially as shown and described.

482,619. RUBBING-SURFACE FOR PULP-REDUCING MACHINES. JOHN B. CARTER, Kokomo, Ind. Filed June 20, 1891. Serial No. 396,921. (No model.)

Claim.—1. A rubbing-surface for pulp-reducing machines, consisting of bars having transverse rubbing surfaces or teeth, substantially as described.

2. A rubbing-surface for pulp-reducing machines, consisting of bars having transverse rubbing-surfaces, which are slightly rounded on their upper edges, substantially as specified.

3. A rubbing-surface for pulp-reducing machines, consisting of bars having transverse rubbing-surfaces and recesses between the rubbing-surfaces, substantially as specified.

4. A rubbing-surface for pulp-reducing machines, consisting of a series of parallel bars separated a suitable distance and each having transverse rubbing projections, substantially as described.

5. A rubbing-surface for pulp-reducing machines, consisting of a series of parallel bars separated a suitable distance and each having transverse rubbing-surfaces, the rubbing-surfaces of the bars alternating, as described, substantially as described.

482,620. EXTENSION-TABLE. HENRY CORBAN, Jr., Warren, Pa. Filed Mar. 25, 1892. Serial No. 426,362. (No model.)

Claim.—1. In an extension-table, the combination, with the sliding rails, of a top formed of a central fixed section and end sections hinged to the central section and formed of a series of slats hinged together, and depending brackets carrying the end legs and receiving the slats of the end sections between the members thereof, substantially as described.

2. In an extension-table, the combination, with the sliding rails, of brackets carried by the rails, having parallel and spaced members and provided with sockets, end legs secured in the said sockets, and a top consisting of a fixed central section and end sections hinged to the central section and formed of hinged slats adapted to enter the space between the members of the brackets when the table is contracted, substantially as described.

3. In an extensible table, the combination, with a fixed top section and roll-sections connected with the fixed section at its ends, the said roll-sections consisting of a series of hinged slats, of side rails adapted to slide beneath the roll-sections, brackets supported by the side rails and adapted as supports for the legs of the table, and an expanding and contracting medium operated from the fixed portion of the table-top and connected with the sliding side rails, as and for the purpose set forth.

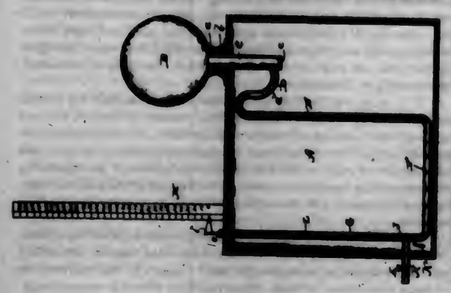
4. In an extensible table, the combination, with a fixed top section, roll-sections connected with the ends of the fixed section, and sliding side rails adapted as an upper and lower support for the roll-sections, of beam connections between opposite sliding side rails, return-brack-

ets attached to the said beams and adapted as supports for the lower folds of the roll-sections, said brackets being provided with sockets to receive legs, friction-rollers carried by the brackets, endless cables passed over the friction-rollers of each bracket and connected with the roll-sections and top, and an expanding and contracting mechanism, substantially as shown, connected with the sliding side rails, as specified.

482,621. BUTTON-FASTENER. ANNA W. CURRIER and GEORGE CLARK, Malden, Mass. Filed July 1, 1891. Serial No. 398,136. (No model.)

Claim.—A button-fastener consisting of a length of wire having a single bend intermediate of its ends to form a pin part and a body part and having an eye-retaining loop formed in the body part and a tab or loop at the end of the latter, the said body part, pin part, and tab or loop being in one flat plane and the eye-retaining loop projecting out of said plane substantially at a right angle thereto, substantially as described.

482,622. DRAFT DEVICE FOR WHIFFLETREES. GRIFFIN V. P. DAY, Dimbo, Cal. Filed Oct. 9, 1891. Serial No. 408,251. (No model.)

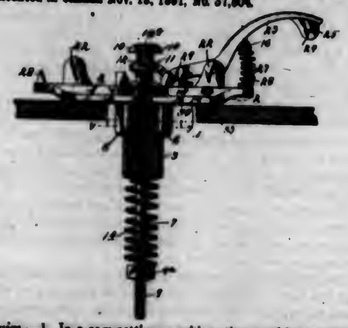


Claim.—1. The improved draft device, substantially as herein described, consisting of the casing, the springs located therein, and the draft-bar arranged between said springs and having lateral arms or portions engaging the same, such draft-bar being provided with a stud projected above such casing and with a bracing rib or portion b^3, all substantially as and for the purposes set forth.

2. As an improved article of manufacture, a draft device consisting of the casing composed of upper and lower sections provided in their inner faces with coincident recesses D, having wings d, and provided centrally with grooves C, opening out of the front end of the casing, and the top section being provided with a slot d', and the draft-bar movable longitudinally in the grooves C, extended at its front end beyond the casing, provided at its rear end with lateral arms extended into the wings d and engaging in rear of the springs, and provided at its upper side with a stud or pin projecting up through the slot d' and above the casing, the said stud being adapted to receive a buggy-whiffletree and the front end of the draft-bar for engagement by the hook of a plow singletree, all substantially as described, and for the purposes set forth.

3. The improved draft device, substantially as described, comprising the casing provided with recesses D, having lateral wings d at their rear ends, springs E, fitted in the recesses D, and the draft-bar arranged and movable longitudinally in the casing between the recesses D and provided with arms b, extended in opposite directions and across the recesses D and bearing in rear of the springs E, all substantially as and for the purposes set forth.

482,623. STRENGTH-TESTING DEVICE. PATRICK J. DOOLING, Folsom, Cal. Filed Apr. 26, 1892. Serial No. 431,018. (No model.)



Claim.—1. In a strength-testing device substantially as described, the combination, with a resilient bulb and a suitable means for feeding air thereto, of the pipe G, connected with the resilient bulb, a piston movable in said pipe G, the piston-rod connected to the piston and carrying an index-finger, and a graduated scale or bar placed adjacent to the path of the index-finger, substantially as and for the purpose set forth.

2. In a strength-testing device substantially as described, the combination, with a resilient bulb and a suitable means for feeding air thereto, of the pipe G, a pipe intermediate the pipe G and a clack or check valve arranged in the intermediate pipe and opening away from the bulb, a piston movable in the pipe G, the piston-rod connected to the piston and carrying an index-finger, and a graduated scale or bar placed adjacent to the path of the index-finger, substantially as and for the purpose set forth.

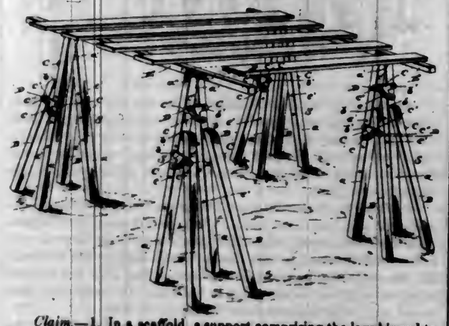
3. In a strength-testing device substantially as described, the combination, with a resilient bulb, a suitable means for feeding air thereto, the pipe G, a pipe intermediate the pipe G and the bulb, a piston movable in the pipe G, the piston-rod connected to the piston and carrying an index-finger, and a graduated scale or bar placed adjacent to the path of the index-finger, of a check or clack valve arranged in the intermediate pipe and opening away from the bulb and a cock or valve arranged in the intermediate pipe at a point between the check or clack valve and the pipe G, substantially as and for the purpose set forth.

4. In a strength-testing device substantially as described, the combination, with the bulb, the pipe C, connected therewith and having a check or clack valve opening toward the bulb, the pipe G, a pipe intermediate the pipes C and G, a check or clack valve arranged in the intermediate pipe and opening away from the bulb, a cock or valve arranged in the intermediate pipe between the clack or check valve and the pipe G, the branch leading from the pipe G, and a cock or valve mounted in said branch, of a piston mounted in the pipe G and a piston-rod connected to the piston and carrying an index-finger at its free end, all substantially as and for the purpose described.

482,624. SAW-SETTING MACHINE. FRANCIS J. DRAKE, Belleville, Canada. Filed Jan. 30, 1892. Serial No. 419,811. (No model.) Patented in Canada Nov. 16, 1891, No. 37,904.

Claim.—1. In a saw-setting machine, the combination, with the plate and the boss formed integral or in one piece, said plate being provided with apertures and upwardly-projecting lugs at each side, of the removable and reversible lever provided with a pivoted pawl and the vertically-reciprocating plunger having lateral projections with which said pawl is adapted to engage to elevate the plunger, substantially as described.

2. In a saw-setting machine, the combination, with the plate and the boss formed integral therewith, having an angular recess at its upper end and a cylindrical aperture at its lower end, of the plunger having a square upper part with lateral projections at its side and a projection at its front, an adjustable hammer having a series of radial heads adapted to abut against the projection on the front of the plunger, a cylindrical screw-threaded lower end, a coiled spring and a regulating-nut, and the lever and pivoted dog for elevating the plunger, substantially as described.



3. In a saw-setting machine, the combination of the plate, the boss formed integral therewith, the spring-actuated reciprocating plunger within said boss, having a projection upon its upper front end, the adjustable hammer having a series of beveled striking-heads, and means, substantially as described, for reciprocating said plunger.

4. In a saw-setting machine, the combination, with the plate and the boss, the spring-actuated plunger having front and lateral projections at its upper end, the adjustable hammer having a series of beveled striking-heads adapted to abut against said front projection, the adjustable anvil having a series of arms with beveled faces, and the set-screw for adjusting the inclination of the saw, of the pivoted lever having a pivoted dog adapted to engage with the lateral projections to elevate the plunger, substantially as described.

5. In a saw-setting machine, the combination, with the plate and boss and the spring-actuated plunger, of the cones at each end of said plate, the lugs intermediate thereof and the plunger, the reversible lever adapted to be pivoted in said lugs, the cone formed thereon, the adjustable guide provided with forwardly-projecting arms, and the coiled spring engaging with said cones, substantially as described.

6. In a saw-setting machine, the combination, with the plate having a boss, upwardly-extending lugs, cones at each end, and slots with beveled sides intermediate of the lugs and boss, of the spring-actuated plunger, the lever having the pivoted dog, the cone, the leg at the outer end with a transverse slot, and the coiled spring engaging with the cones, substantially as described.

482,625. SCAFFOLD. JOHN DUNBAR, Brooklyn, N. Y. Filed Mar. 23, 1892. Serial No. 426,909. (No model.)

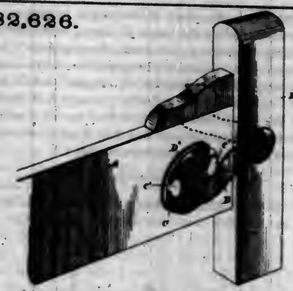
Claim.—1. In a scaffold, a support comprising the legs hinged together, the struts or braces hinged to the legs, and the locking-plates adapted to lock the parts together when folded, substantially as described.

2. A support for scaffolds, consisting of the legs hinged together near the upper ends, the struts or braces hinged to the legs, and the locking-plate pivoted on one leg and having a segmental slot therein, and the pin or screw on the other leg projecting through said slot, substantially as and for the purpose described.

3. A support for scaffolds, consisting of the legs hinged together near their upper ends, the struts or braces hinged to said legs, the locking-plate pivoted on one leg and having a segmental slot therein with a lateral offset, and the pin in the other leg projecting through said slot and offset, substantially as and for the purpose set forth.

4. A support for scaffolds, consisting of the legs hinged together, the plate pivoted on one leg and having a segmental slot with a lateral offset at one end, the pin on the other leg projecting through said slot, the struts or braces hinged to the legs to unfold at an angle thereto, and the plates adapted to lock the struts or braces to said legs, substantially as described.

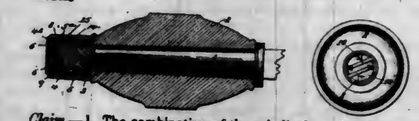
5. A support for scaffolds, comprising the legs hinged together and the struts or braces therefor and the locking-plates pivoted on said legs and adapted to lock the legs and braces compactly together, substantially as described.



6. In a support for scaffolds, the legs hinged together, the locking-plate pivoted on one leg and having a segmental slot and lateral offset therein, a pin or screw in the other leg and projecting through the slot in the plate, said plate being adapted to lock the legs tightly and compactly together when the end with the offset is turned upward, the struts or braces hinged to said legs, and the locking-plates pivoted on the legs and adapted to lock the struts or braces, substantially as described.

482,626. BED-LOCK. IRVIN H. ELLIOTT, Allapaha, Ga. Filed Mar. 11, 1892. Serial No. 424,582. (No model.)

Claim.—1. In a bed-lock, the combination of a plate having horns thereon and an irregularly-curved headed arm having flanges to take under the horns of said plate, the said plate being secured to a bed-rail and the arm pivotally secured to the bed-post, substantially as described.



2. In a bed-lock, the combination of a plate having horns thereon, with flanges overhanging toward the center thereof and lugs on the back of said plate, an irregularly-curved arm having a head and flanges to take under the said horns of the plate, the said arm being formed with a lug to assist in holding the same in position, the said plate being

482,626.

arranged in connection with a bed-rail, and the arm pivotally secured to the bed-post, substantially as described.

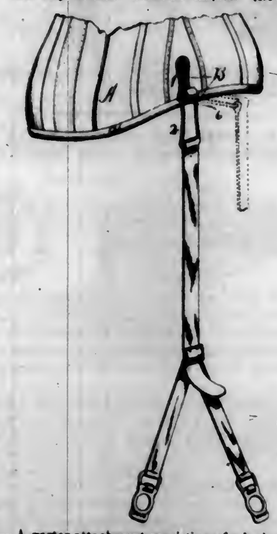
482,627. VEHICLE-HUB-ATTACHING COLLAR. LAFAYETTE FARR, Priestown, Ohio. Filed Apr. 5, 1892. Serial No. 427,871. (No model.)

Claim.—1. The combination of the spindle formed with angular grooves in its end, a hub on said spindle, a locking ring provided with internal lugs adapted to be turned into engagement with said angular grooves, and means for preventing the reverse movement of said locking-ring, whereby the hub will be securely held in place, substantially as set forth.

2. The combination of the spindle formed with angular grooves in its end, a hub on said spindle, a locking-ring provided with internal lugs adapted to enter said angular grooves and be turned into engagement therewith, and suitable pins, screws, or dogs adapted to lock said ring against movement on said spindle, substantially as set forth.

3. The combination of the spindle formed with right-angled grooves near or at its end, the hub on said spindle, the locking ring or nut provided with inwardly-projecting lugs and correspondingly arranged to said grooves, said ring being adapted to be moved longitudinally and circumferentially on the spindle for causing the lugs to engage in said right-angled grooves, and spring-dogs carried by said locking-ring and adapted to engage in said grooves for holding the ring from revolving, substantially as and for the purpose set forth.

4. The combination of the spindle formed with the grooves or notches at its end, which extend longitudinally and circumferentially, the hub on said spindle, the locking ring or nut formed with inwardly-projecting lugs which are adapted to engage in said grooves, and spring-arms mounted on said locking-ring and carrying dogs at their free ends which are adapted to engage in the longitudinal terminals of said grooves, said locking ring or nut being adapted to move longitudinally on the spindle to lock the parts in position, substantially as set forth.



5. The combination of the spindle formed with grooves in its outer end, a hub on said spindle formed with a screw-threaded outer end, a locking-ring provided with inwardly-projecting lugs adapted to engage the groove of said spindle, means for retaining the lugs into engagement, a friction-ring mounted on said locking-ring and held against movement thereon, and a cap engaging the screw-threaded end of the hub and bearing against said friction-ring, substantially as set forth.

482,628. LIFTING-JACK. WILLIAM Y. FISHER and CHARLES PERRY, Big Timber, Mont. Filed Apr. 29, 1892. Serial No. 431,184. (No model.)

Claim.—A lifting-jack consisting of the base A, having mounted thereon the standard B, having the recess *b'* formed in the front portion thereof, the strap *b*, spanning said recess, the cap-piece C, inclosing the top and upper side portions of the standard and having an extension *a'*, with opening *b'*, the lifting-bar D, adapted to slide in said opening, strap, and recess and provided with the dogs E M, the latter having branch *m*, the ball G, and lever F, pivoted to bolt *f*, said lever having a link *d* connected to a branch *e* of dog E, all combined and arranged to operate as and for the purposes specified.

482,629. GARTER ATTACHMENT. PETER H. FLYNN, Syracuse, N. Y. Filed May 12, 1892. Serial No. 432,703. (No model.)

Claim.—A garter attachment consisting of a body having an outward and upward extending hook, means for securing the body to the garment, and a loop having a bar at its upper end, the width of said bar being greater than the distance between the point of the hook and body, as set forth.

482,630. FRYING-PAN OR SKILLET. BENJAMIN F. FOWLER, Minneapolis, Minn., assignor of one-half to Clarence R. Waterman, same place. Filed Apr. 20, 1892. Serial No. 429,931. (No model.)

Claim.—1. A pan or skillet comprising a body provided with notches at its upper edge, a removable handle provided at its inner end with a groove forming a flue and extending from the top of the pan to the bottom thereof, and a cover provided with curved flanges and having slots therein adapted to register with the notches and to close the same, substantially as described.

2. A pan or skillet comprising a body provided with notches at its upper edge and having beveled flanges arranged on its outer face and forming a dovetailed way, a detachable handle having its inner end beveled and adapted to fit in the dovetailed way and provided with a vertical groove extending from the top to the bottom of the pan, and a cover having curved flanges provided with slots to register with said notches and having a flange arranged to close the top of said groove, substantially as described.

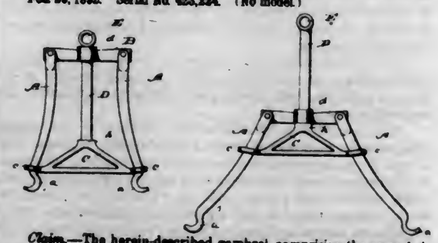
482,631. TOOTH-BRUSH CASE AND PENCIL-HOLDER COMBINED. SAMUEL S. FOX, Marion, Ohio. Filed Feb. 6, 1892. Serial No. 420,606. (No model.)

Claim.—The herein-described tooth-brush case and pencil-holder

482,631.

combined, consisting of the case composed of two sections connected by a spring hinge, the pencil-holder attached to the brush-case and provided with a spring extension, and the spring-clamp, all constructed and arranged substantially as and for the purpose herein set forth.

482,632. PLANTER ATTACHMENT FOR DISK HARROWS. JASPER E. GALLUP, Mellette, S. D., assignor of one-half to Burnham W. Cole, same place. Filed Mar. 18, 1892. Serial No. 425,490. (No model.)



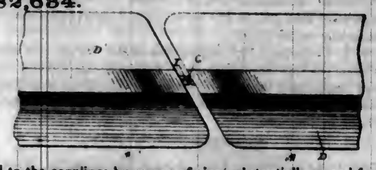
Claim.—1. In a planter attachment for disk harrows, the seed-box, the depending arms adjustably secured to said seed box, the plates removably secured to said depending arms, and the feed tubes or chutes leading from said seed-box and supported by said depending arms, and means for feeding the grain to said tubes or chutes, substantially as set forth.

2. The herein described planter attachment for disk harrows, comprising the seed-box, the adjustable plate secured thereto, the depending arms secured to said adjustable plate, the guide-plates removably secured to said arms, the feed tubes or chutes leading from said seed-box, the rings or collars secured to said depending arms and designed to support said feed tubes or chutes, and means for feeding the grain to said feed tubes or chutes, substantially as set forth.

3. The herein-described improved planter attachment for disk harrows, consisting of the metal plate for guiding the grain, the ring or collar having a lower flange to which said plate is secured, a supporting-arm inserted in said ring or collar, and the set-screw for securing the same thereto, substantially as set forth.

4. The herein-described improved planter attachment for disk harrows, comprising the combination of the seed-box, the adjustable plate secured thereto, the depending arms secured to said adjustable plate, the rings or collars secured to said depending arms and having lower flanges, the guide-plates secured to said flanges, the feed tubes or chutes leading from the seed-box, the rings or collars secured to said depending arms and designed to support said feed tubes or chutes, and means for feeding the grain to the feed tubes or chutes, substantially as set forth.

482,633. GAMBREL. HARRISON GARWICK, Morrison, Ill. Filed Feb. 29, 1892. Serial No. 423,294. (No model.)



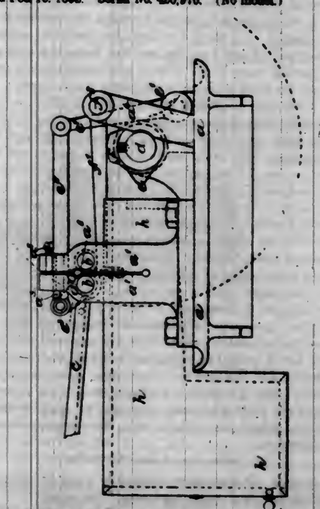
Claim.—The herein-described gambrel, comprising the arms A A, having hooks at their lower extremities, the cross-head to which said arms are pivoted at their upper portions, the transverse yoke-piece C, having eyes at its extremities through which said arms loosely pass, and the arm or stem D, connected to the central portion of said yoke-piece and passing loosely through an aperture in the central portion of the cross-head, substantially as specified.

482,634. RAILWAY-COACH. MAX GOETZE, Fort Meade, S. D. Filed Mar. 26, 1892. Serial No. 426,543. (No model.)

Claim.—The combination, with the cars of the character described, of the couplings having their front portions beveled in opposite directions, the side walls having slots formed therein and on opposite sides thereof, and a link with a hook and eye, adapted to be connected to the couplings by means of pins, substantially as and for the purposes specified.

482,634.

482,635. DIP-NET. FRANK HANEM, Terre Haute, Ind. Filed Apr. 31, 1892. Serial No. 430,067. (No model.)



Claim.—1. A minnow-seine consisting of the seine proper, the umbrella-frame supporting the same and having a short stick, and the bait-bag suspended from the end of the stick so as to rest within the seine and provided with a weight, substantially as described.

2. A minnow-seine consisting of the stick, the ribs secured to the upper ends thereof, the seine attached to the lower ends of the ribs, the runner having the stretchers to close and open the ribs, and a bait-bag suspended from the stick within the seine, and a weight or sinker, substantially as described.

3. A minnow-seine comprising a stick, a weighted bait-bag removably suspended in the lower end thereof, an umbrella-frame carried by the stick, a seine attached to the lower ends of the ribs of the umbrella-frame, the upper end of said stick being formed for attachment to a fishing rod or pole, substantially as described.

4. The seine consisting of the stick adapted to have a bait-bag suspended from its lower end, the ribs, stretchers, and runners carried by said stick, and the seine attached to the lower ends of the ribs, so as to be beneath the bait-bag.

482,636. MEANS OR APPARATUS FOR GAGING AND SORTING SPHERICAL ROLLERS OR BALLS. WILLIAM HILLMAN, Coventry, England, assignor to the Auto Machinery Company, Limited, same place. Filed Feb. 10, 1892. Serial No. 420,970. (No model.)

Claim.—1. In means or apparatus for gaging and sorting spherical rollers or balls, the combination of adjustable parallel gaging-bars, a slightly-inclined feeding-tray in front of the gaging-bars, a feeder between the lower edge of the said tray and the front gaging-bar and moving in an arc around the latter, an inclined grooved ejector working up and down between the gaging-bars, cams and levers for operating the feeder and ejector, and boxes for receiving the balls assorted, substantially as herein shown and described.

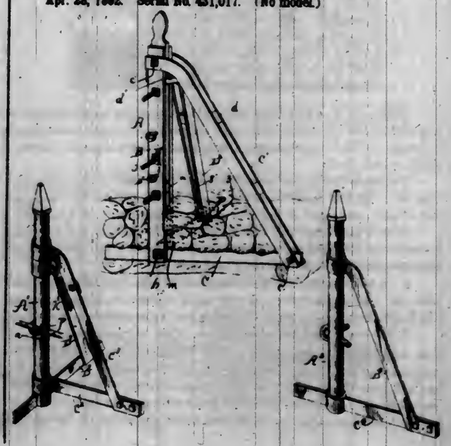
2. In a gaging and sorting apparatus, the combination of the tray, the pair of adjustable gage-bars, the feeder working at the end of the tray and delivering the balls directly on the gage-bars, and the intermittently-reciprocating ejector working between the gage-bars, said parts having suitable driving mechanism, substantially as described.

3. In a gaging and sorting apparatus, the combination of the inclined tray, the pair of parallel gage-bars located parallel with the mouth of the tray, and the oscillating feeder journaled on one of the gage-bars and working between the tray and gage-bars, whereby a row of balls are simultaneously delivered from the tray to the gage-bars, for the purpose explained.

4. In means or apparatus for gaging and sorting spherical rollers or balls, a pair of adjustable gaging-bars between which balls below a given size will fall into a receptacle below, means for feeding balls to such gaging-bars, and an inclined grooved ejector working up and down between the gaging-bars and ejecting into a side receptacle those balls which were too large to pass through the space between the gaging-bars, substantially as herein shown and described.

5. In a gaging and sorting apparatus, the combination of the tray, the parallel gage-bars located parallel with the tray, and the segmental feeder between the tray and gage-bars journaled on and oscillating about the adjacent gage-bar, in the manner substantially as described, and for the purpose set forth.

6. In a gaging and sorting apparatus, the gage-bars, the pair of vertical arms in which the ends of said gage-bars are mounted, and the micro-adjustment for the bars, consisting of the set-screws threaded in one arm and bearing on the other of each pair of arms for regulating the distance between them, substantially as explained.

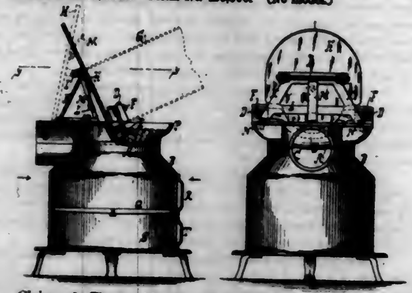


7. In a gaging and sorting apparatus, the combination of the gage-bars and a pair of vertical brackets for supporting said gage-bars, each of said brackets being split to form arms and provided with the push-screws, and binding-screws for accurately spacing the distance between the arms, all substantially as and for the purpose set forth.

8. In a gaging and sorting apparatus, the combination of the pair of parallel gage-bars and the vertically-reciprocating ejector having a grooved upper side working between said bars, substantially as and for the purpose set forth.

9. In a gaging and sorting apparatus, the combination, with the parallel gage-bars, of the vertically-reciprocating ejector working between said gage-bars and having grooved and inclined upper side, substantially as and for the purpose set forth.

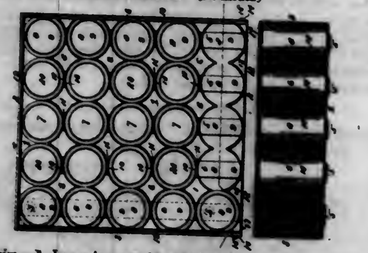
10. In a machine for gaging and sorting, the combination of a suitable base, a pair of vertical brackets supporting gage-bars, an inclined tray terminating on a line adjacent to the gage-bars, the feeding-segment journaled on one of the gage-bars and having a controlling-lever, an ejector having an inclined grooved upper side reciprocating between the gage-bars, a suitably-fulcrumed lever upon which the ejector is supported, a suitably-fulcrumed controlling-lever connected by a link to the feed-lever, a power-shaft having cams for engaging the ejector-lever and the feed-controlling lever, and suitable receptacles beneath the gage-bars and the end of the ejector, all substantially as and for the purposes set forth.



482,637. FENCE-POST. DANIEL HINDLEY, Beard, Ind. Filed Apr. 28, 1892. Serial No. 431,017. (No model.)

Claim.—1. In a fence-post, the combination, with the spaced vertical bars B and the anchor-bars C and D, interposed and secured between the spaces of the lower ends of the bars B, of the spaced bars C' D', arranged on opposite sides of the outer ends of the anchor-bars and secured thereto, the upper ends of said bars C' D' secured on opposite sides of the bars B and arranged at right angles thereto, substantially as and for the purposes specified.

2. In a fence-post of the character described, the combination, with the spaced vertical bars B, provided with a series of openings formed therein, of the threaded tightening-hooks E, passing through said openings, with nuts F thereon, substantially as and for the purposes specified.



482,638. FLOATING POT. JOHN B. HOLSTEN, New York, N. Y. Filed Mar. 30, 1892. Serial No. 426,560. (No model.)

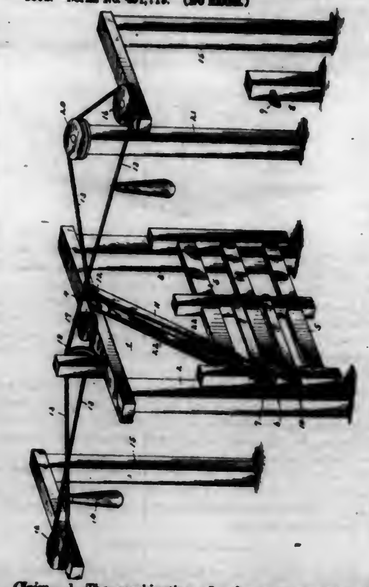
Claim.—1. The combination of a floating pot having upwardly-projecting standards or supports D, a guide-bar E, having its ends secured to the standards or supports, a bracket K, adjustable on the pot toward and from the guide-bar, and an inclined gage H, pivoted to the bracket and provided with a catch M for engaging a part of the bracket to hold the gage in a fixed position, substantially as described.

2. The combination of a floating pot having upwardly-projecting standards or supports D, a guide-bar E, having its ends secured to the standards or supports, a bracket K, adjustable on the pot toward and from the guide-bar and provided with a cross-piece L, and an inclined gage H, pivoted to the bracket and provided with a catch M for engaging the cross-piece of the bracket, substantially as described.

482,639. COIN-TRAY. ANTHONY ISCH, East St. Louis, Ill. Filed Apr. 27, 1892. Serial No. 430,832. (No model.)

Claim.—1. In a coin-tray, the combination of the bottom and sides and ends of the tray having separable concave-convex partitions gaged in height to hold a certain given amount of coin in deposit, substantially as described.

2. In a coin-tray, the combination of the bottom, the sides, and rear end, and the concave-convex separable partitions that separate the columns and rows of columns of coin, substantially as described.



3. In a coin-tray, the combination of the bottom, the channel-grooves 5 in said bottom, the sides 3, and rear end 4, and the concave-convex partitions 6, substantially as described.

4. In a coin-tray, the combination of the bottom, the sides 3, and rear end 4, said sides provided with the look-slots 16 and the end gate 12, that locks into said slots of the side pieces, substantially as described.

5. In a coin-tray, the combination of the bottom, the sides, and rear end, the said sides being provided with the look-slots 16, the concave-convex partitions 6, forming the coin-depository chambers 20, the end-gate 12, the concave-convex plate secured to the inside of said end-gate, the concavities of which plate embrace the rear column of coins, the said end-gate provided with the trigger-slots 18, the spring-snap catches 14, secured to said end-gate, and the triggers 17, that pass through said slots 18 and by which said spring-snaps are tripped, substantially as described.

6. In a coin-tray, the combination of the bottom and sides and rear end of the tray, the spring-snapped end-gate 12, and the concave-convex partitions 6, inlapping surmounting flanges 19 of said side and rear end, that overlap and hold said partitions and coin in place, substantially as described.

482,640. GATE. PETER JOHNSON, Cambridge, Ill. Filed May 3, 1892. Serial No. 431,719. (No model.)

Claim.—1. The combination of a frame, a gate hinged to the frame and provided with latches, an inclined bar extending upward and rearward from the front of the gate and provided at its upper end with a pulley, the uprights 15, arranged on opposite sides of the gate, the upright 21, arranged to have the gate open adjacent to it, pulleys mounted on the uprights and the frame, an endless operating-rope passing around the pulleys and provided with depending handles, and the latch-ropes extending along the inclined bar and having their lower ends connected with the latches and their upper ends secured to the endless rope and disposed on opposite sides of the pulley at the upper end of the inclined bar, substantially as described.

2. The combination of a frame, a gate hinged to the frame, the uprights 15, arranged at opposite sides of the gate and having horizontal arms extending inward and carrying pulleys, the upright 21, arranged in the direction in which the gate swings and provided at its top with a pulley, the horizontal and vertical pulleys mounted on the frame, and the endless operating-rope passing around the pulleys and connected with the gate, substantially as described.

3. The combination of a frame, a gate hinged to the frame and provided with upper and lower latches, a keeper mounted on the frame and adapted to be engaged by one of the latches, a supplemental latch-post having a keeper adapted to be engaged by the other latch, an inclined bar extending upward from the gate and provided at its upper end with a pulley, the uprights 15 and 21, the pulleys mounted on the frame and the uprights, an endless operating-rope passing around the pulleys, and latch-ropes having their lower ends connected to the latch and their upper ends arranged on opposite sides of the pulley of the inclined bar and secured to the operating-rope, substantially as described.

482,641. BAG-HOLDER. EVERETT H. KETCHUM, Jamestown, N. Y. Filed Dec. 26, 1891. Serial No. 416,256. (No model.)

Claim.—1. A bag-holder, substantially as described, comprising the pivoted jaws or members having the curved or bulged portions between their meeting ends and the pivot, as set forth.

2. A bag-holder, substantially as described, comprising the spring-pressed jaws or members having the curved or bulged portions and the roughened opposing faces, as set forth.

3. A bag-holder, substantially as described, comprising the spring-pressed jaws pivoted together and having the bulged or curved portions and the longitudinal reinforcing-ribs, as set forth.

4. A bag-holder comprising the pivoted jaws or members having the bulged or curved portions adapted to receive and hold the folded edge of paper, one of the jaws having on its outer face a label-receiving pocket located at or near one end of said jaw, substantially as described.

5. A bag-holder comprising the jaws or members, one of which has a slotted label holder on its outer face, as set forth.

6. A bag-holder comprising the jaws or members provided with the curved or bulged portions, one of said jaws having one end doubled or folded upon itself and forming an open pocket adapted to receive a label, substantially as described.

7. In a bag holder or rack, the standard and cross-arm having the hooks which have the upright prongs on opposite sides of the standard and arm, as described.

8. In a bag holder or rack, the upright post and cross-arm, the double hooks thereon, and the backing-plates rigid with the cross-arm below the hooks thereof and between the vertical prongs of the same, substantially as described.

9. A bag-holder having a pocket on its outer side and a folded label having numerals or characters on its folds and adapted to fit within said pocket to expose the numeral or character on its outer face, as and for the purpose described.

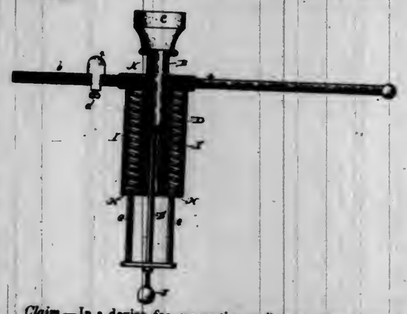
10. A bag-holder having the slotted pocket on its outer side and the foldable label consisting of a series of members connected together and designed to fold upon transverse creases or lines, so as to lie flat upon each other, each fold having on its faces numerals or characters indicating the sizes of bags, substantially as described.

482,642. COMBINED FUSE AND FILE HOLDER. JOHN LORAUER, Crenshaw, Pa. Filed May 2, 1892. Serial No. 431,534. (No model.)

Claim.—A file and fuse holder consisting of the parallel compartments 1 2, the former having the retaining-spring and the latter provided with an upwardly-movable bottom and a suitable means for raising the same, as set forth.

482,643. DEVICE FOR SUPPORTING AND CARRYING VESSELS. JOSEPH MAILLIARD, San Geronimo, and JAMES H. JOHNS, San Francisco, Cal. Filed Dec. 9, 1891. Serial No. 414,667. (No model.)

Claim.—The herein-described device for supporting and carrying vessels, consisting of a rectangular band or hoop B, a second band or hoop C, the ends of whose side pieces are pivoted to the band B at the middle points of two opposite sides thereof, so that the hoops B and C may be relatively movable upon their pivotal points to permit them to occupy either a position in the same plane with each other or in a position at right angles to each other, substantially as shown, and a handle or bail D, whose ends are pivoted upon the same pivots which connect the hoops B and C, said bail being so arranged that it will span the frame and top of the can which is to be supported, substantially as described.



482,644. FOLDING COOP. JOSEPH H. MARQUIS, Utley, Ohio. Filed Apr. 30, 1892. Serial No. 431,377. (No model.)

Claim.—1. The herein-described folding poultry coop of rectangular form, said coop comprising the bottom A, having the longitudinal strips *a a* at its lateral edges, the top and sides formed of the angular wires D D, having the upper horizontal portions *d* and the vertical arms E E, loosely engaging the strips *a a* at their lower ends, the top strips *c c*, running parallel and longitudinally of the coop and spaced from each other on the portions *d* of the angular wires, the ends F F', consisting each of a series of wires bent into elongated U shape and pivotally connected to the bottom and to end wires C of the top, and means for locking the parts in both upright and folded position, substantially as specified.

2. The herein-described folding poultry-coop, comprising the rectangular bottom of thin material reinforced by the longitudinal edge strips *a a* and the under battens *b*, the top B, consisting of the parallel longitudinal strips *c c*, spaced from each other on horizontal portions *d*, a series of angular wires D, the vertical arms E E of said angular wires loosely engaging the strips *a a* of the bottom and forming the sides of the coop, the elongated U-shaped wires forming the ends of the coop and loosely connected to the bottom of the coop and to transverse end wires C C of the top, the braces H for securing the coop in upright position, said braces consisting of stiff wire loosely connected at its ends to staples in the bottom of the coop and having upwardly-converging oblique arms *k*, united by a hook-eye designed to engage slots in the side strips *c*, and the small hooks for securing the parts in their folded positions, all substantially as specified.

482,645. DEVICE FOR SUPPORTING WALL-PAPER. ELBERT D. MILES, Machias, N. Y. Filed Apr. 29, 1892. Serial No. 431,190. (No model.)

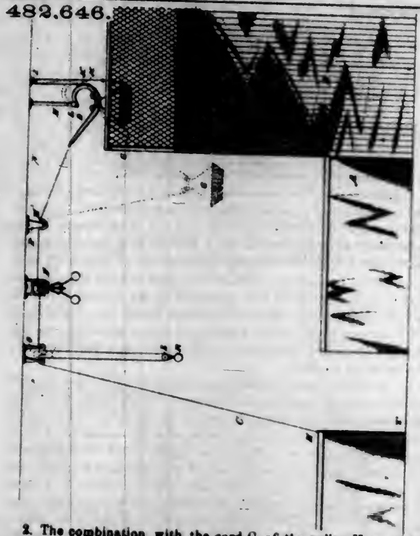
Claim.—In a device for supporting wall-paper, the combination of the body having an air-chamber formed therein, a sucker-cup at one end, a piston engaging the air-chamber, a piston-rod connected thereto and provided with a cross-head, guide-rods connected to said cross-head and having disks at their upper ends, springs mounted in the body and bearing upon the disks, a lever fulcrumed on said body, and a counterbalance-weight mounted on said lever, substantially as described.

482,646. STORE-SERVICE APPARATUS. CHARLES W. MCCORMICK, Emporia, Kans. Filed Sept. 22, 1891. Serial No. 406,507. (No model.)

Claim.—1. In a store-service apparatus for raising and lowering goods, the combination of the cord C, the pendent fish-hook-shaped hook D, connected to one end thereof and pivoted at L, the pull-cord H, and the counterbalance-weight R, substantially as set forth.

482,646.

482,648.

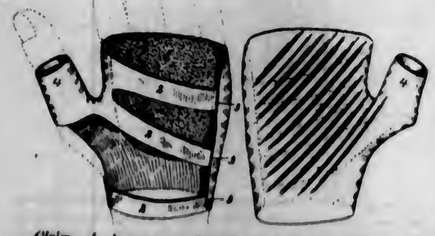


coiled spring mounted on the rod between the axle and the nut or collar of the tube, and a spring mounted on the rod within the tube and having one of its ends connected to the rod and the other end bearing against the frame, all substantially as specified.

482,650. HORSESHOE. CHARLES A. READE, Chicago, Ill. Filed Feb. 13, 1892. Serial No. 421,425. (No model.)

platform in line with the discharge end of the throat or chute for receiving and temporarily holding the material in charges, said platform being pivotally secured and provided at its rear end with a gate adapted to close the throat or chute to cut off the further supply of material when the desired charge has been deposited upon the platform, substantially as herein described.

2. In a feeder having a supply hopper or bin with discharge-throat or chute, the combination of a gate controlling said throat or chute and a tilting platform for receiving the material in charges, said platform being located beyond said gate and connected therewith, and



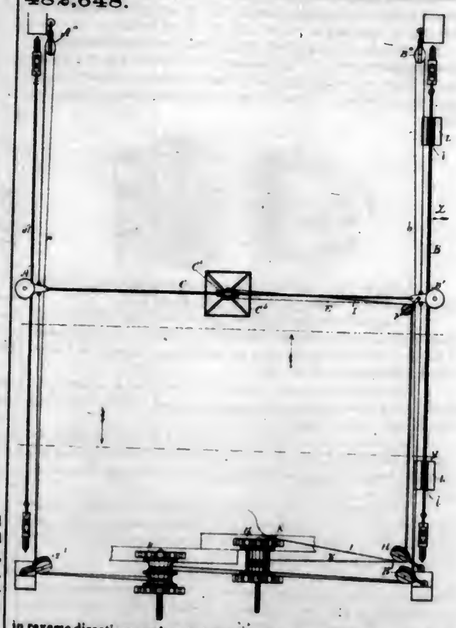
482,646.

2. The combination, with the cord C, of the pulley U, provided with a metal boxing V, having a flange W and inclined grooves X and push-lugs Z, with the annular grooved disk *a*, the governor-spindle, and the fixed collar *g*, secured to the spindle, substantially as set forth.

3. The combination, with the governor mechanism, of the adjustable cross-head *e*, the adjustable stop *i*, and the spring *o*, substantially as set forth.

482,647. TENNIS-GLOVE. CLARENCE C. OSBAR, St. Louis, Mo. Filed Aug. 31, 1891. Serial No. 404,322. (No specimens.)

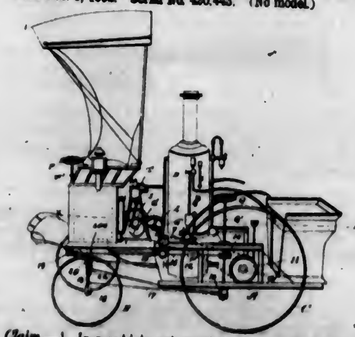
Claim.—1. As a new article of manufacture, a rubber tennis-glove having its palm lined with an absorptive material, substantially as and for the purpose set forth.



2. As a new article of manufacture, a rubber tennis-glove formed with a corrugated palm and a lining of some suitable absorptive material, substantially as and for the purpose set forth.

3. As a new article of manufacture, a rubber tennis-glove having the palm lined with a suitable felt, whereby the moisture from the hand will be absorbed and the glove prevented from slipping on the hand, substantially as set forth.

482,648. HOISTING DEVICE. ANDREW OLSON, Quincy, Mass. Filed Apr. 11, 1892. Serial No. 428,577. (No model.)



Claim.—A hoisting apparatus consisting of a pair of longitudinal cables A and B, one of which is arranged at a higher elevation than the other, the traveling rollers A' and B', mounted, respectively, on the longitudinal cables, a transverse cable C, connected with said traveling rollers, a trolley C', mounted on the transverse cable and provided with a suspended block and tackle composed of a sheave C^2, pulleys C^3 C^4, and a hoisting-rope E, a rope I, connected with said trolley, a pair of endless ropes *a* and *b*, connected with the traveling rollers on the longitudinal cables, a windlass D, on which said endless ropes are wound

482,648.

in reverse directions, and an independent hoisting-windlass G, on which the hoisting-rope is wound, substantially as described.

482,649. STEAM-CARRIAGE. ACHILLE PHILION, New York, N. Y. Filed Feb. 5, 1892. Serial No. 420,443. (No model.)

Claim.—1. In a vehicle substantially as described, the combination, with the main frame and the axle pivotally connected thereto, of the shaft Q', carrying a hand-wheel, the drum 16, fixed on said shaft, a cable taking around the drum and having its ends connected to the axle adjacent to the ends thereof, the sprocket-wheel 14, fixed on the shaft Q', the shaft P', carrying a hand-wheel, the sprocket-wheel 13, fixed on said shaft P', and a sprocket-chain taking around the sprocket-wheels 13 and 14, substantially as and for the purpose set forth.

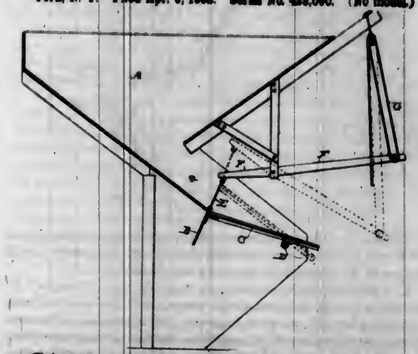
2. In a vehicle substantially as specified, the combination, with the main frame or body and a tube connected to and depending from the frame or body and having a nut or collar at its lower end, of the axle, a rod connected to the axle and extending up into the tube of the frame or body, a coiled spring mounted upon the rod between the axle and the nut or collar of the tube, and a coiled spring mounted upon the rod within the tube and having one of its ends connected to the rod and the other end bearing against the frame or body, substantially as specified.

3. In a vehicle substantially as described, the combination, with the main frame or body and a tube connected to and depending from the frame or body and having a nut or collar at its lower end, of the axle, the shield connected to the axle, the rod pivotally connected to the shield and axle and extending up into the tube of the frame, a

coiled spring mounted on the rod between the axle and the nut or collar of the tube, and a spring mounted on the rod within the tube and having one of its ends connected to the rod and the other end bearing against the frame, all substantially as specified.

482,650. HORSESHOE. CHARLES A. READE, Chicago, Ill. Filed Feb. 13, 1892. Serial No. 421,425. (No model.)

Claim.—1. A horseshoe consisting of its body having on its under side a toe-calk, the full-height calks connected therewith and having their inner edges resting flush with the inner edge of the body, the angular branches connected to and extending from the outer edges of the side calks to the outer edge of the body, and the linear heel-calks located midway of the heel of said body and below and out of line with said side calks, substantially as and for the purposes specified.

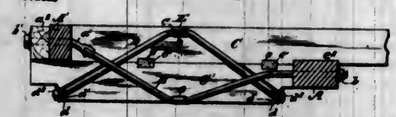


2. The combination, with the body of a horseshoe, having a toe and side calks, with angular branches extending from the side calks to the outer edge of the body, and the heel-calks located midway of the heel of said body and below and out of line with said side calks, of a web spanning the shoe on its upper side and having quarter-pads adapted to be seated between the contiguous ends of the side and heel calks and the frog pad connected to the web between said quarter-pads, substantially as and for the purpose specified.

482,651. BUTTON. JAMES B. RICHTER, Reedsburg, Wis. Filed May 27, 1892. Serial No. 434,632. (No model.)

Claim.—In a separable button, the combination, with the head having a collar extending from the upper wall to the bottom thereof, a tube with slotted wall arranged midway of the collar and having a recess at the upper portion thereof at an angle to said slotted part of the same, and a coiled spring located above said tube and in the collar, of a shank having on its upper end a lug, said shank with the lug adapted to be inserted in the slotted tube and rotated so that the lug will be seated in the recess of the tube, substantially as and for the purposes specified.

482,652. FEEDER FOR COAL, ORE, &c. LOUIS ROSENFELD, New York, N. Y. Filed Apr. 6, 1892. Serial No. 428,090. (No model.)



Claim.—1. A feeder for coal, ore, &c., having a supply hopper or bin provided with a discharge throat or chute, in combination with a platform in line with the discharge end of the throat or chute for receiving and temporarily holding the material in charges, said platform being pivotally secured and provided at its rear end with a gate adapted to close the throat or chute to cut off the further supply of material when the desired charge has been deposited upon the platform, substantially as herein described.

2. In a feeder having a supply hopper or bin with discharge-throat or chute, the combination of a gate controlling said throat or chute and a tilting platform for receiving the material in charges, said platform being located beyond said gate and connected therewith, whereby as the gate moves to control the passage of the material the platform varies its inclination to receive, regulate, temporarily hold, and deliver the charge, substantially as herein described.

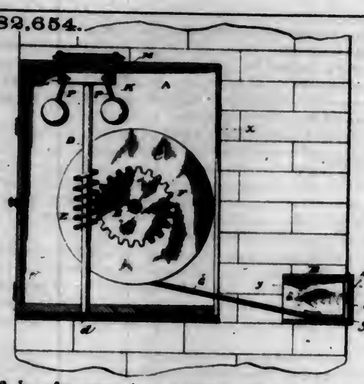
3. In a feeder having a supply hopper or bin with discharge throat or chute, the combination of a gate controlling said throat or chute, a tilting screen beyond said gate and adapted to vary its inclination simultaneously with the movement of said gate, an operating-lever, and a connection therefrom with the gate, substantially as herein described.

4. A feeder consisting of the hopper or bin with discharge throat or chute, the movable gate traversing said throat or chute from below, the tilting charge-platform connected with said gate, the bail of the gate, and the operating-lever connected with the bail, substantially as herein described.

482,653. DRAW-TIMBER FOR CARS. JOHN ROVER and WILLIAM A. ROVER, Lima, Ohio. Filed May 24, 1892. Serial No. 434,134. (No model.)

Claim.—1. In a car, the combination, with the upper and lower sills C C', the end draft-bars A A', and the upper and lower cross-bars E E', engaging, respectively, the upper and lower sills, of the bent brace and truss rod B, engaging the lower cross-bar and having its ends detachably secured to the upper and lower draft-bars, the cross-plates *d*, bearing against the lower sill, and the bent brace and truss rod D, engaging the upper cross-bar and having its ends detachably secured to the cross-plates, substantially as described.

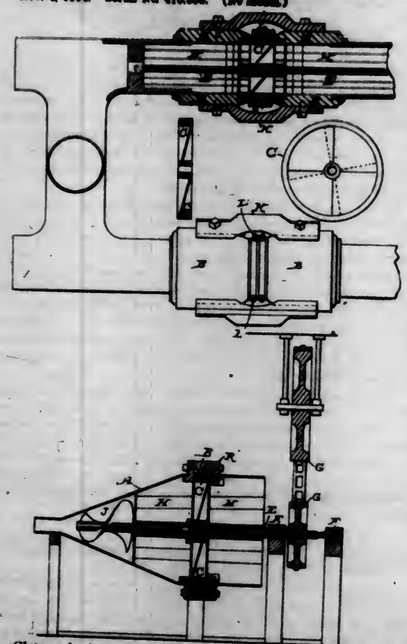
2. In a car, the combination of the upper and lower sills C C', the front draft-bar A, abutting the front end of the lower sill, the rear draft-bar A', abutting the rear end of the upper sill, the upper and lower cross-bars E E', mortised into the upper and lower sills and having curved end portions *c*, the bent brace and truss rod B, engaging the curved end portions of the lower cross-bar and having its ends extending through the upper and lower draft-bars and detachably secured in place, the cross-plates *d*, bearing against the lower sill, and the bent brace and truss rod D, engaging the curved end portions of the upper cross-bar and having its ends detachably secured to the cross-plates, substantially as described.



3. In a car, the combination, with the end draft-bars and upper and lower sills or beams and lower sills or beams, of the angular brace and truss rods and the cross-bars supported upon said sills or beams and having curved projecting ends to receive said brace and truss rods at their angles, said brace-rods connecting said draft-bars together and said truss-bars having their ends secured to cross-bars resting upon abutments or offsets of said lower sills or beams, substantially as set forth.

482,654. FIRE-ESCAPE. CHARLES R. SAMSOUSY, Duluth, Minn. Filed Nov. 30, 1891. Serial No. 413,564. (No model.)

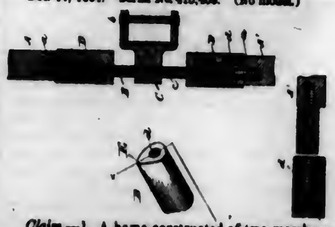
Claim.—1. The fire-escape comprising the case or closure adapted to be inclosed in the inner face of a wall or building near an exit thereof, the spools or drums journaled therein, the chains or cables carried thereby, the straps, the vertical shaft carrying a worm in engagement with the gear of said drums, the friction-brake for said shaft, and the second and smaller case in the outer wall of the building and provided with a spring-actuated hinged face or cover, substantially as specified.



482,654.

2. In a fire-escape, the combination, with the drums or spools and the ropes or cables carried thereby, the gear, and the vertical shaft having the worm thereon in engagement with said gear, of the block on said shaft, the governor-arms connected to said block, the loose block adapted to be operated by said arms, and friction-disks in contact with said loose block, substantially as specified.

482,655. APPARATUS FOR THE PROPULSION AND TRANSMISSION OF WATER. MARK P. SEXTON, San Francisco, Cal. Filed Nov. 4, 1891. Serial No. 410,898. (No model.)



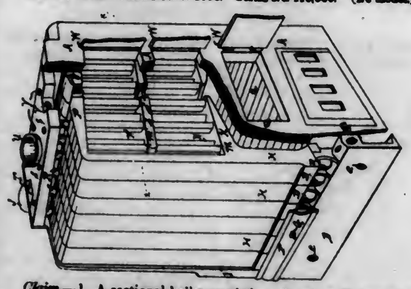
Claim.—1. An apparatus for the propulsion and transmission of water, consisting of the combination of a conical-shaped casing having a ring at the larger end of the casing and having a counterbore groove or channel in its inner face, a circular disk having angularly-disposed overlapping plates or blades fixed within it, and means for rotating the disk, substantially as herein described.

2. An apparatus for the propulsion and transmission of water, consisting of a disk having angularly-disposed overlapping plates or blades fixed within it, a means by which said disk may be rotated, a ring or casing having a counterbore in which the periphery of the disk is fitted to rotate, antifrictional wheels in the ring to sustain the disk, an extension-chamber connected with the ring, through which the water is delivered from the propeller-disk, and a web formed of angularly-united plates fitted into said chamber A or on both sides of the disk C.

forming passages through which the water is discharged, substantially as herein described.

3. An apparatus for the propulsion and transmission of water, consisting of the rim or disk with the radial angularly-disposed overlapping plates or blades, a means by which rotary motion is imparted to the propeller disk, a ring or casing with a counterbore in which the periphery of the disk rotates, antifriction wheels against which the disk is supported, an extension-chamber from said ring having an interior web with openings formed of plates whereby the rotation of the water in the chamber A, as well as on the other side of the disk C, is prevented as it is received or delivered by the propeller-disk C, an extension of the propeller-shaft passing through said web into the chamber, and a worm-screw or propeller-blade secured to said extension, substantially as herein described.

482,656. HAME. WILLIAM H. SIMMONS, Buffalo, N. Y. Filed Dec. 17, 1891. Serial No. 415,408. (No model.)

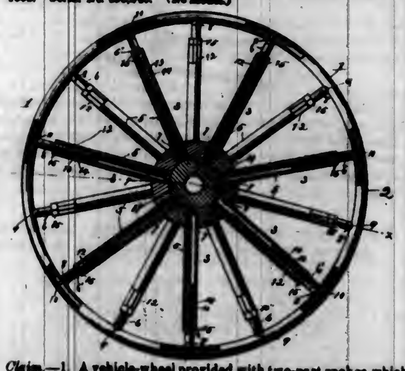


Claim.—1. A hame constructed of two members or sections having the threaded sockets in their contiguous ends, the connecting-rod having its threaded ends screwed into said sockets and adapted to be adjusted vertically therein, and the screw-threaded draft-iron carried by the threaded bar and adjustable thereon independently of the adjustment of the members to each other, substantially as described.

2. A hame constructed in two parts having the sockets in their contiguous ends, the collars fitted on said ends and each having an opening therein, part of which opening in the collar aligns with the sockets in the hame, and the connecting-rod adjustably fitted in the openings in the collars and hame, substantially as described.

3. A hame constructed in two parts, each having the sockets in one end, the collars fitted on the contiguous ends, and each collar having an opening therein, the opening in the collar at the outer end thereof being in alignment with the socket in the hame, the beveled extension on one side of each collar arranged to pass between the rim and body of the collar, the threaded connecting-rod, and the draft-iron, substantially as described.

4. A hame constructed of two parts having the sockets in their contiguous ends, the connecting-rod adjustably fitted in said socket, the draft-iron carried by said rod between the sections of the hame, and the collars fitted on said contiguous ends of the hame and each having a beveled extension on one side thereof, adapted to be fitted between the rim and body of the horse-collar, substantially as described.



482,657. CAST-IRON SECTIONAL BOILER. HENRY A. SMITH, Detroit, Mich. Filed Nov. 3, 1891. Serial No. 410,800. (No model.)

Claim.—1. A sectional boiler consisting of sections H, having the parts K and P connected together by the pipes M N, the box L, and the pipes M' N', substantially as shown and described.

2. A sectional boiler consisting of opposing rows of sections H, each section having an intermediate water-box L, a damper between the opposing boxes L, end sections covering the vertical space between the two rows of sections H, a manifold at the base of each row of sections, and a drum connected with the top of all the sections, substantially as shown and described.

482,658. VEHICLE-WHEEL. WILLIAM W. TAYLOR, Wood, Ky., assignor of one-half to Charles L. Searcy, same place. Filed Apr. 23, 1892. Serial No. 430,940. (No model.)

Claim.—1. A vehicle-wheel provided with two-part spokes which are made of tubular metal and telescoped intermediate of their ends and with a continuous or endless metallic rim having no tire, substantially as described.

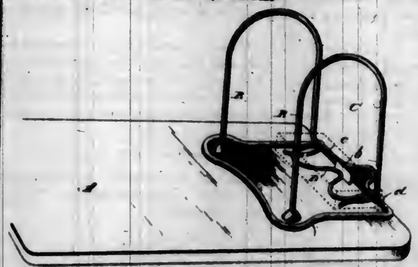
2. A vehicle-wheel provided with two-part spokes which are made of tubular metal and telescoped intermediate of their ends, with means for adjusting the length of said spokes, and with a continuous or endless and cylindrical metallic rim having no tire.

3. A vehicle-wheel constructed entirely of metal and provided with a rim which is wholly composed of a continuous pipe or tube, with two-part tubular spokes which are telescoped intermediate of their ends, and with means for adjusting the length of said spokes, substantially as described.

4. A vehicle-wheel constructed entirely of metal and provided with a rim which is wholly composed of a continuous pipe or tube, with two-part tubular spokes which are telescoped intermediate of their ends, and with means for adjusting the length of said spokes, said means including the exteriorly-screw-threaded portions of the outer parts of said spokes and the long interiorly-screw-threaded nuts mounted thereon, substantially as described.

5. A vehicle-wheel constructed entirely of metal and provided with a rim which is wholly composed of a continuous pipe or tube, with two-part tubular spokes which are telescoped intermediate of their ends, and with means for adjusting the length of said spokes and holding them as adjusted, said means consisting of the exteriorly-screw-threaded portions of the outer parts of said spokes and the long interiorly-screw-threaded nuts and jam or lock nuts mounted thereon, substantially as described.

6. A vehicle-wheel constructed entirely of metal and provided with a rim which is wholly composed of a continuous pipe or tube having openings in its inner surface, with a hub having screw-threaded spoke-openings, with two-part tubular and telescoped spokes having screw-threaded inner ends and forked or concaved shoulders with tenons at their outer ends, and with means for adjusting the length of said spokes, substantially as described.



7. A vehicle-wheel constructed entirely of metal and provided with a rim which is wholly composed of a continuous pipe or tube having openings in its inner surface, with a hub having screw-threaded spoke-openings, with two-part tubular and telescoped spokes having screw-threaded inner ends and forked or concaved shoulders with tenons at their outer ends, and with means for adjusting the length of said spokes, said means including the exteriorly-screw-threaded portions of the outer parts of said spokes and the long interiorly-screw-threaded nuts mounted thereon, substantially as described.

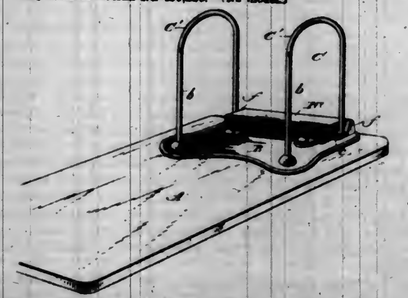
8. A vehicle-wheel constructed entirely of metal and provided with a rim which is wholly composed of a continuous pipe or tube having openings in its inner surface, with a hub having screw-threaded spoke-openings, with two-part tubular and telescoped spokes having screw-threaded inner ends and forked or concaved shoulders with tenons at their outer ends, and with means for adjusting the length of said spokes and holding them as adjusted, said means consisting of the exteriorly-screw-threaded portions of the outer parts of said spokes and the long interiorly-screw-threaded nuts and jam or lock nuts mounted thereon, substantially as described.

9. A vehicle-wheel constructed entirely of metal and provided with a rim which is wholly composed of a continuous pipe or tube, with two-part and tubular spokes, and with a hub having an interiorly-screw-threaded bore or opening and a two-part vertically-divided exteriorly-screw-threaded and removable journal-box, substantially as described.

10. A vehicle-wheel constructed entirely of metal and provided with a rim which is wholly composed of a continuous pipe or tube, with two-part tubular and adjustable spokes, and with a hub having a two-part and vertically-divided journal-box in its bore, a space or oil chamber between said parts, one or more feed-ducts leading thereto, and one or more screw-plugs for normally closing said ducts, substantially as described.

482,659. BILL-FILE. JAMES TRALL, Rochester, N. Y. Filed July 7, 1892. Serial No. 439,214. (No model.)

Claim.—1. In a paper-file, a swinging frame having the lower or connecting portion within a cover or casing, said connecting portion having a plate secured thereto which extends beyond each side of the same, and a spring located within the casing and adapted to exert a spring pressure upon the plate, substantially as shown, and for the purpose set forth.



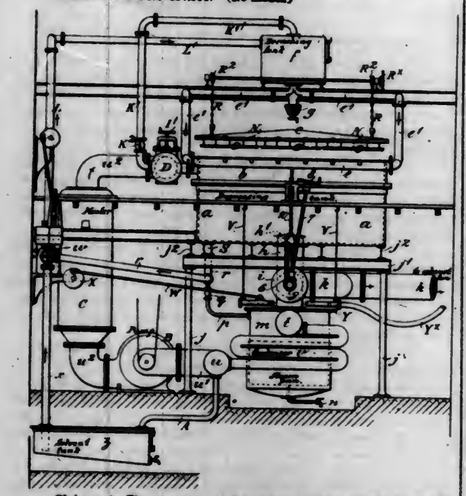
2. A bill or paper file having a swinging frame made up of a single piece, a plate *b*, secured to the central portion of said swinging frame, and a spring having its terminal members bent to embrace the connecting portion of the swinging frame and bear upon the plate carried thereby, substantially as shown.

3. In a bill-file constructed substantially as shown, a swinging frame C, provided with a concave plate *b*, and a spring having a central portion which bears upon said plate, the terminal members being curved and looped around the transverse portion of the swinging frame and adapted to contact with a casing or cover, substantially as shown, and for the purpose set forth.

4. In a bill-file, the combination of a base having upwardly-projecting pins B B, a swinging frame made of a single piece, the connecting portion thereof carrying centrally a plate, and a spring adapted to engage with said plate on opposite sides of the connecting portion, so as to hold the swinging frame either in contact with the pins or away from the same by exerting a spring-pressure on opposite sides of the cross-bar, substantially as shown, and for the purpose set forth.

5. In a bill-file, the combination of a base carrying upwardly-projecting pins, a casing retaining therein a swinging frame, said casing having lugs adjacent to the openings through which the connecting-bar of the swinging frame passes, the connecting-bar having a plate secured thereto, a wire or bar spring having a central portion which bears upon the plate, and curved portions connecting the central portion with the terminal members, said terminal members being looped over the connecting-bar of the swinging frame and the ends extended to bear against the casing, substantially as shown.

482,660. BILL-FILE. CHRISTIAN D. THEN, Rochester, N. Y. Filed July 7, 1892. Serial No. 439,220. (No model.)



Claim.—1. A paper file having a base with upwardly-projecting pins and concave legs carried thereby and a movable frame made of a single piece, the connecting portion of said frame being curved up-

wardly to provide a spring portion which abuts against the inner side of a covering-plate, so as to hold the movable frame in contact with the pins or rearwardly inclined, substantially as shown, and for the purpose set forth.

2. In a bill-file, the combination of the base B, having upwardly-projecting pins secured thereto, a covering plate or frame adapted to be secured to the base and provided with end recesses through which the lower portion of the swinging frame passes, and inclined stops formed on the covering-plate, the swinging frame having a transverse portion which is bent out of line with its bearings and flattened, said central connecting portion being adapted to abut against the inner side of the covering-plate, substantially as shown, and for the purpose set forth.

3. In a bill-file, the combination of a swinging frame secured to a base B, having upwardly projecting pins, and a covering-plate therefor having a flat inner side with which the connecting portion of the swinging frame engages, said connecting portion being bent out of line with the side bearings and provided with flattened portions, substantially as shown, and for the purpose set forth.

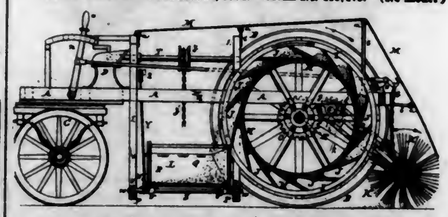
482,661. PROCESS OF AND APPARATUS FOR DEGREASING LEATHER. FREDERICK N. TURNEY, Nottingham, England. Filed Jan. 9, 1892. Serial No. 417,555. (No model.)

Claim.—1. The process of degreasing leather herein described, which consists in suspending the leather within a closed tank, drenching it with a solvent, passing a current comprising heated air and a vapor of the solvent over the leather, condensing the vapor of the solvent out of the current of heated air and vapor, and passing air substantially free of the vapor over the leather, substantially as described.

2. The process of degreasing leather herein described, which consists in suspending the leather within a closed tank, drenching it with a solvent, passing a current comprising heated air and a vapor of the solvent over the leather, and recovering the solvent for reuse by condensing the vapor of the solvent out of the current of heated air and vapor, substantially as described.

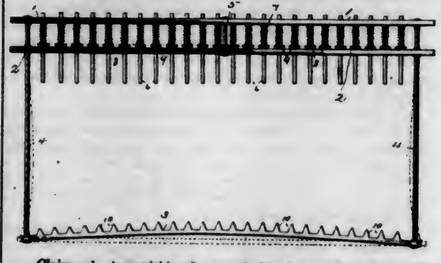
3. In an apparatus for degreasing leather, the combination, with a storing-tank for the solvent and a degreasing-tank, of means for suspending the leather in said tank, a drenching-tank having communication with the degreasing-tank, a steam-jacketed pan for vaporizing the solvent, communicating with the degreasing-tank, a longitudinal pipe located beneath and communicating with the degreasing-tank, condensing-coils connected with said longitudinal pipe and with the solvent-storing tank, a pump for conveying the solvent from the storing-tank to the drenching-tank, and a pan connected with the vaporizing-chamber and with the degreasing-tank, substantially as described.

4. In an apparatus for degreasing leather, a degreasing-tank formed with flanged pipes *c* and provided with orifices *d*, communicating with said flanged pipes, and provided, also, with an oblong passage J and having angle and T bars 17 located therein, substantially as described.



5. In an apparatus for degreasing leather, the combination, with a degreasing-tank, and angle and T bars located within said tank, of perforated trays for showering a solvent upon the leather and leather-supporting frames provided with rollers running on said angle and T bars, substantially as described.

482,662. MOTTO-PLATE. CHARLES M. UNDERWOOD, Hamilton, Canada. Filed Mar. 14, 1892. Serial No. 424,876. (No model.) Patented in Canada Apr. 23, 1892, No. 36,787.



Claim.—An inscription or motto plate consisting of a main frame having a depressed panel between two perpendicular slits, a letter-plate holder fitted in said panel having bent prongs at each end for securing to said frame, and letter plates and blank plates bent down at top and bottom about said letter-plate holder, substantially as described.

482,663. STREET-SWEEPING MACHINE. ANDREAS VOELKLE, New York, N. Y. Filed Dec. 18, 1891. Serial No. 415,475. (No model.)

Claim.—The combination, in a street sweeping machine, of the rotating drum having peripheral pockets, the collecting-trough located in front of said drum, the flat spring upon which the rear of the trough rests, the crank-arbor carrying the rear portion of the trough and journaled in bearings in the frame, the roller upon which the front portion of the trough rests and is adapted to move, the hinged door, latch-hook, and engaging-stud, and the elevating-rope and hand-crank, whereby the door is opened and the trough raised and moved forward, substantially as and for the purposes specified.

482,664. VARNISHING FRAME OR HOLDER. ALBERT G. WEISENBORN, Jersey City, N. J., assignor to the American Lead Pencil Company, New York, N. Y. Filed Mar. 23, 1892. Serial No. 426,157. (No model.)

Claim.—1. A varnishing frame or holder for pencils and other like articles, provided with means for engaging by end pressure the terminals only of the pencil or other article, substantially as described.

2. A varnishing frame or holder for pencils and other like articles, containing a number of individual clamps for engaging by end pressure the terminals of the pencils to the exclusion of any portion of the sides, substantially as described.

3. A varnishing frame or holder provided with a series of clamps, each composed of a spring-actuated pin-follower and a blunt lug opposite to and matching said follower, substantially as described.

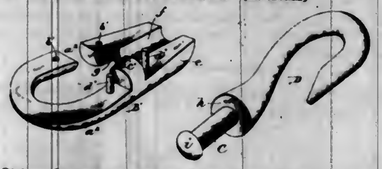
4. A varnishing frame or holder composed of two parallel bars, spring-actuated followers mounted therein, another bar provided with lugs equal in number to and matching the followers, and side rods connecting the last named bar with the two parallel bars, substantially as described.

5. A holder for articles to be varnished, composed of a rigid guide with a series of elastically-supported pin-followers mounted therein and a frame connected with the rigid guide and provided with a bar having lugs in alignment with the pins, substantially as described.

6. A holder for articles to be varnished, composed of a rigid guide with a series of elastically-supported pins mounted therein and an elastic frame connected with the rigid guide and provided with an elastic bar having lugs in alignment with the pins, substantially as described

7. A varnishing frame or holder for pencils and other like articles, provided with means for engaging by end pressure a portion only of the terminals and no portion of the sides of the pencil or other article, substantially as described.

8. A varnishing frame or holder for pencils and other like articles, containing a number of individual clamps for engaging by end pressure a portion only of the terminals of the pencils to the exclusion of any portion of the sides, substantially as described.



9. A varnishing frame or holder provided with a series of spring-actuated followers and a series of lugs or supports for the articles to be varnished equal in number to and matching the followers, the clamping-faces of the followers and lugs being smaller than the terminal faces of the articles, substantially as described.

10. A varnishing frame or holder provided with a series of clamps, each composed of a spring-actuated follower and a blunt lug opposite to and matching said follower, the clamping-faces of the followers and lugs being smaller than the terminal faces of the articles, substantially as described.

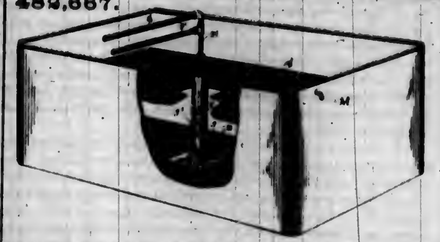
11. A varnishing frame or holder composed of two parallel bars, spring-actuated followers mounted therein, another bar provided with lugs equal in number to and matching the followers, the clamping-faces of the followers and lugs being smaller than the terminal faces of the articles to be held thereby, and side rods connecting the last-named bar with the two parallel bars, substantially as described.

12. A holder for articles to be varnished, composed of a rigid guide with a series of elastically-supported pin-followers mounted therein and a frame connected with the rigid guide and provided with a bar having lugs in alignment with the pins, the clamping-faces of the followers and lugs being smaller than the terminal faces of the articles to be held thereby, substantially as described.

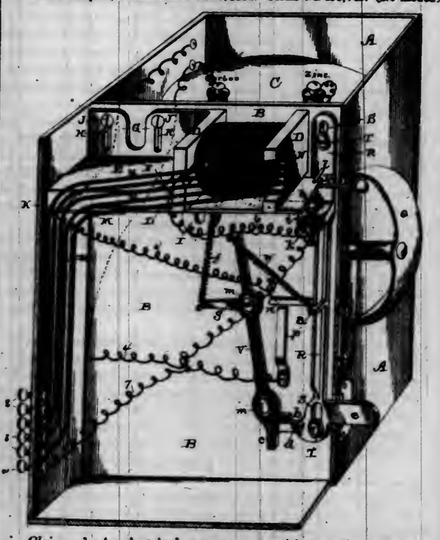
482,665. CHAIN-LINK. DAVID M. WILLIAMS, Edwardsdale, Pa. Filed May 11, 1892. Serial No. 432,642. (No model.)

Claim.—In a chain substantially as described, the combination, with a link consisting of two sections respectively comprising the body of a general loop form having an opening, the transverse apertures formed in the body adjacent to the opening therein, the shoulder extending from the inner side of the body, the studs extending from the inner side of the body on opposite sides of the shoulder and adapted to take through the transverse apertures of the other section and be riveted, and the extended portion *e*, having a groove *f*, of semicircular form in cross-section, in its inner side, and the seat *g* at the inner end of said groove, of the hook having its shank journaled in the bearing formed by the grooves *f* of the extended portion *e* and reduced to form the shoulder A and the head *i*, substantially as specified.

482,666. BRUSH AND METHOD OF MAKING THE SAME. ARTHUR H. WOLCOTT, Winthrop, assignor to John L. Whiting & Son, Boston, Mass. Filed Nov. 18, 1891. Serial No. 411,783. (No model.)



Claim.—The method herein described of securing brush-bristles, which consists in compressing the butt-ends of the bristles inwardly toward the center of the mass by simultaneously compressing all parts of an annular ductile metal band directly against the butt-ends of the bristles, substantially as described.



482,667. APPARATUS FOR THE PASTEURIZATION OF BEER. SAMUEL S. WOODBURY, Bradford, Pa. Filed Nov. 3, 1891. Serial No. 410,661. (No model.)

Claim.—The combination, with a tank, of a circulation-pipe supported therein, a hot and cold supply-pipe connected to the upper end of the circulation-pipe, and a deflector composed of diverging sides arranged beneath the last-named pipe, substantially as shown and described.

482,667.

482,668. ELECTRICAL APPARATUS. LEONIDAS G. WOOLLEY, Grand Rapids, Mich. Filed June 6, 1892. Serial No. 435,745. (No model.)

Claim.—1. An electrical apparatus comprising a coil or helix, two circuits, a vibrating rheotome within both circuits, a shifting bar carrying a contact-point within both circuits and engaging the said rheotome, a second contact-point carried by the said shifting bar for closing and opening one of said circuits, and electrodes connected with the said helix or coil, substantially as specified.

2. An electrical apparatus comprising a coil or helix, two circuits, a vibrating rheotome within both circuits, a shifting bar carrying a contact-point which is within both circuits, the said contact-point engaging the said rheotome, the shifting bar limiting the upward movement of the rheotome and itself moving substantially at right angles to the said rheotome, and electrodes connected to the said coil or helix, substantially as described.

3. An electrical apparatus comprising an electro-magnet, the coil thereof being formed into a loop or loops, a vibrating rheotome therefor carrying a clapper, a shifting bar moving at substantially right angles to the said rheotome and engaging with both the circuit-breaker and armature thereof, an outer and inner circuit, the said shifting bar being within both circuits and carrying a contact for breaking and closing the said inner circuit, and electrodes connected to the said coil, substantially as specified.

4. An electrical apparatus comprising an electrical source, an electro-magnet, the coil thereof being formed into one or more loops, a vibrating rheotome, a sliding shifting bar engaging both the armature and circuit closer and breaker of the rheotome, the said bar being supported and sliding substantially at right angles to the rheotome, a stop with which the said shifting bar engages for holding it in its shifted position, an inner and outer circuit connected with the said shifting bar, the said bar having a contact for closing and opening the inner circuit, and electrodes connected with the said magnet-coils, substantially as specified.

5. An electrical apparatus comprising an electro-magnet, a vibrating rheotome, a shifting bar engaging the said rheotome, the bar being at right angles to the rheotome, having longitudinal slots, and an operating arm or handle, supporting-screws passing through the said slots, a stop engaging the said shifting bar for holding it in its shifted position, and the circuits formed substantially as described, whereby the shifting of the bar opens or closes one circuit and shifts the rheotome, substantially as described.

6. An electrical apparatus comprising an electro-magnet, a vibrating rheotome, a shifting bar engaging said rheotome, the bar being substantially at right angles to the rheotome and having a longitudinal and lateral movement at its lower end, the bar being provided with a projection, stops with which the projection engages, one stop being nearer the rheotome than the other, an operating-handle, a spring for holding the bar projection in engagement with the stop, and the circuits formed substantially as described, whereby the shifting of the bar opens or closes one circuit and shifts the rheotome, substantially as set forth.

7. An electrical apparatus comprising an electro-magnet, a vibrating rheotome, a sliding shifting bar engaging the said rheotome, the bar having a longitudinal and lateral movement at its lower end, an operating-handle, stops for the said projection, one nearer the rheotome than the other, and a spring for normally holding the bar toward the rheotome and also toward the said stops, and the circuits formed substantially as described, whereby the shifting of the bar shifts the rheotome and breaks or closes one of the circuits, substantially as specified.

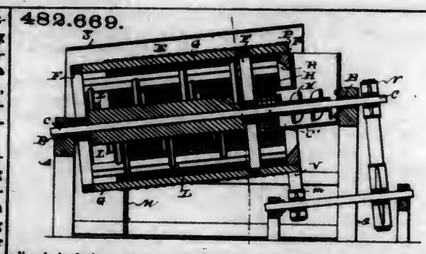
8. An electrical apparatus comprising an electro-magnet, a vibrating rheotome therefor, a shifting bar substantially at right angles to the rheotome and which engages the rheotome for shifting it, the said magnet having an adjustment longitudinal of the said bar for the purpose specified, and the circuits formed substantially as described, whereby the shifting of the bar shifts the rheotome and closes or opens one of the circuits, substantially as specified.

9. An electrical apparatus comprising an electro-magnet, a vibrating rheotome therefor, a longitudinally-sliding shifting bar substantially at right angles to the said rheotome and engaging therewith, stops for the bar, the said magnet and stops each having an adjustment longitudinal of the said bar, as specified, and the circuits formed substantially as described.

10. An electrical apparatus comprising an electro-magnet, a vibrating rheotome therefor, a longitudinally-sliding shifting bar substantially at right angles thereto, engaging the said rheotome, a stop-bar having stops at its lower ends for the said shifting bar and extending upward, a spring secured to the said stop-bar and the rheotome, a spring also secured to the said stop-bar and the shifting bar, all operating as described, and the circuits formed substantially as set forth.

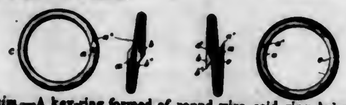
11. An electrical apparatus comprising an electro-magnet having transverse slotted supporting-ears, a rheotome, a longitudinally-sliding shifting bar engaging the said rheotome, and the circuits formed substantially as specified, whereby the magnet is adjustable in relation to the shifting bar, substantially as described.

12. An electrical apparatus comprising an electro-magnet having a securing projection at one pole-piece, a vibrating rheotome having one end secured to the said projection and its free end overlapping the other pole, whereby the magnetism of the magnet is concentrated at the pole adjacent to the free end of the rheotome, a circuit, and contact-points, substantially as set forth.



13. An electrical apparatus comprising a battery, a magnet having only a primary coil which is itself formed into loops for the purpose specified, a vibrating rheotome, two circuits formed through the said coil, a shifting bar engaging the free end of the rheotome and within both the circuits a contact upon the sliding bar for closing and breaking one circuit, and electrodes connected with the said magnet-coil and the said loops, substantially as specified.

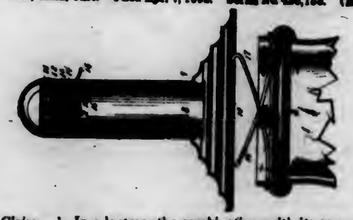
14. An electrical apparatus comprising a coil or helix, two circuits, a vibrating rheotome within both circuits, a shifting bar carrying a contact-point within both circuits and engaging the said rheotome, and a second contact-point carried by the said shifting bar for closing and opening one of the said circuits, substantially as specified.



482,669. COTTON-CLEANING MACHINE. CORNELIUS YOUNG, Selma, Ala. Filed Nov. 19, 1891. Serial No. 412,400. (No model.)

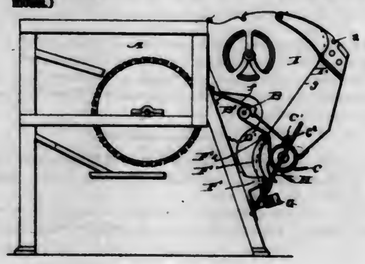
Claim.—1. In a cotton-cleaning machine, the combination, with the framework having the transverse under partition and the inclined shaft journaled in said framework, said shaft having a series of spirally-arranged beaters terminating short of one end thereof, of the inclined large-mesh-wire cylinder around said shaft, said cylinder having at its upper end, around that portion of the shaft free from beaters, a circular receiving-chamber located between the upper end frame of the cylinder and an interior circular frame, and mechanism for rotating said shaft and cylinder, substantially as specified.

2. In a cotton-cleaning machine, the combination, with the inclined shaft, its series of spirally-arranged beaters in close proximity to each other and terminating short of one end of the shaft, of the inclined large-mesh wire-cloth cylinder around said shaft, the circular frame therein near one end portion, and a circular receiving-chamber around that portion of the shaft free from the beaters, said chamber being located between said circular frame and the upper end frame of the cylinder, and mechanism designed to rotate said shaft and cylinders at different rates of speed, substantially as specified.



482,670. RING. RUDOLF B. ACKERMAN, Minneapolis, Minn., assignor to John Chester Lyman, Chicago, Ill. Filed Dec. 16, 1891. Serial No. 415,311. (No model.)

Claim.—A key-ring formed of round wire, said ring being normally helical in form and with free ends beveled in reverse direction, the cylindrical portion of the ends overlapping and adapted by torsion to have the beveled ends reversed for the insertion of a key, substantially as described.



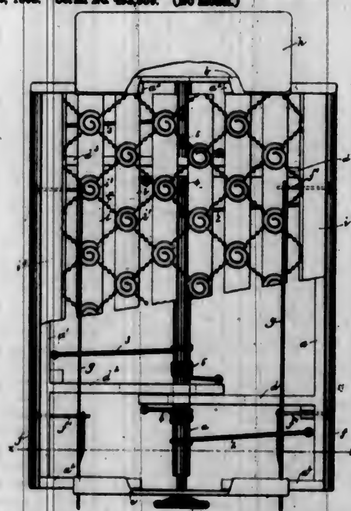
482,671. LANTERN. ALFRED L. RABOS and BENJAMIN F. COCKAYNE, Tiffin, Ohio. Filed Apr. 7, 1892. Serial No. 428,138. (No model.)

Claim.—1. In a lantern, the combination, with its cap and suitable supporting parts, of a globe-holder consisting of two separate equal spring-loops fastened to the lower end of the cap and extending obliquely in opposite directions, so as to act with equal resiliency against the top of the globe and hold it in place, substantially as and for the purpose specified.

2. In a lantern, the combination, with a tube and supporting parts, of an open-sided sleeve thereon adapted to carry a cap-piece, and a spring secured to the sleeve and passing around a guard formed between the openings 12 and 14 to form a catch, and a notch in the tube, substantially as and for the purpose specified.

482,672. HULLER COTTON-GIN. WILLIAM G. BOOKWITH, Prattville, Ala., assignor to the Daniel Pratt Gin Company and Washington L. Hill, Sr., same place. Filed Mar. 31, 1892. Serial No. 427,251. (No model.)

Claim.—1. In a huller-gin, the combination, with the saws, the spiked roller, and the driving belt, of the belt-regulator and its lever and the pivoted cotton-box head normally in contact with an arm of said lever, substantially as specified.



2. In a huller-gin, the combination, with the cotton-box head having a tail-piece, the spiked roller, the saw-shaft and saws, and the belt driving said roller from the saw-shaft, of the belt-regulator normally held against said belt, the lever carrying said regulator, the lower end of said lever being extended into position to be engaged by the tail-piece of the cotton-box head, substantially as specified.

3. In a huller-gin, the combination, with the hinged or pivoted head, the spiked roller, its adjustable bearing, the saws, and the driving-belt, of the tightener-lever acting on said belt, and means on said cotton-box head for engagement with an arm of said lever when said head is in its normal position, substantially as specified.

4. In a huller cotton-gin, the combination, with the hinged or pivoted head, the spiked roller, and its driving-belt, of the tightener-lever acting on said belt, the spring-box on the tail-piece of the head, and the lever for operating the cotton-box, substantially as specified.

5. In a huller cotton-gin, the combination, with the spiked roller, the saws, the driving-belt, and the lever carrying the regulator for said belt, of the hinged or pivoted cotton-box head formed in two sections having a loose connection, one of said sections having a tail-piece adapted to engage an arm of said lever, substantially as specified.

482,673. LOUNGE. WILLIAM S. BOWIE, Boston, Mass. Filed May 9, 1892. Serial No. 432,290. (No model.)

Claim.—1. In a lounge or couch bed, two transversely-movable slat-supporting sections and slats carrying springs thereon, the side slats being rigidly secured to their supports and the intermediate slats being free to move on their supports and connected with the side slats, combined with a single longitudinal operating-shaft *e* and intermediate connections between said shaft and said transversely-movable sections, whereby the latter are extended and retracted by the operation of the former, substantially as described.

2. In a lounge or couch bed, two longitudinal side rails and two transverse slat-supporting frames connected to each side rail and movable transversely therewith, and several longitudinal slats carrying springs, mounted on said transverse supporting-frames, the side slats being rigidly secured to their supports and the intermediate slats being free to move on their supports and connected with the side slats, combined with the longitudinal operating-shaft *e* and intermediate connections between said transversely-movable parts and said shaft, whereby the bed may be extended and retracted by turning said shaft, substantially as described.

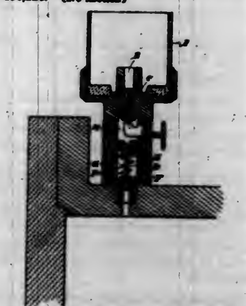
3. In a lounge or couch bed, two longitudinal side rails and two transverse slat-supporting frames connected to each side rail and movable transversely therewith, end pieces a^6, also connected to said side rails, and several longitudinal slats carrying springs, mounted on said transverse supporting-frames, separable transversely, combined with the longitudinal operating-shaft *e* and intermediate connections between said transversely-movable parts and said shaft, whereby the width of the bed may be varied by turning said shaft and a single-width head-board and foot-board formed to present guides for said end pieces a^6, substantially as described.

4. In a lounge or couch bed, two longitudinal side rails and two transverse slat-supporting frames connected to each side rail and movable therewith, and several slats carrying springs, supported on said frames, combined with the longitudinal operating-shaft *e* and cords or chains connecting said shaft with the transversely-movable parts, whereby the latter are extended or retracted by said shaft, substantially as described.

5. In a lounge or couch bed, two longitudinal side rails and two transverse slat-supporting frames connected to each side rail, having slots or openings a^5, slats carrying springs, placed on said slotted frames, combined with a single longitudinal operating-shaft *e*, placed in said slots or openings a^5, and intermediate connections between said shaft and the transversely-movable parts, whereby the bed is extended or retracted by the operation of said shaft, substantially as described.

6. In a lounge or couch bed, two transversely-movable sections, slats carrying springs placed thereon, the side slats being rigidly secured to these supports and the intermediate slats being free to move on their supports, and the slats i^3, placed on top of the springs on said rigidly-secured side slats, combined with a full-width mattress placed on said springs and pockets to receive the side edges of said mattress when the bed is closed up and used as a lounge, substantially as described.

7. In a lounge bed, two transversely-movable slat-carrying frames, slats independently movable thereon, and springs borne by said slats, combined with the side pieces *f f* to hold the side edges of the bedclothing, substantially as described.



8. In a lounge-bed, two transversely-movable slat-carrying frames, slats independently movable thereon, and springs borne by said slats, combined with side pieces *f f* and a locking or retaining device therefor, substantially as described.

9. In a lounge or couch bed, two transversely-movable sections, slats carrying springs thereon, the side slats being rigidly secured to their supports and the intermediate slats being free to move on their supports and connected with the rigidly-secured side slats, combined with a full-width mattress placed on said springs and pockets at the sides of the transversely-movable sections to receive the side edges of said mattress when the bed is retracted and used as a lounge, substantially as described.

10. In a lounge or couch bed, two transversely-movable slat-supporting sections and slats carrying springs thereon, the side slats being rigidly secured to their supports and the intermediate slats being free to move on their supports and connected with the rigidly-secured side slats, and means for extending and retracting said sections transversely to widen or narrow the bed, combined with a full-width mattress placed on said springs and pockets to receive the side edges of said mattress when the bed is retracted and used as a lounge, substantially as described.

11. In a lounge or couch bed, two transversely-movable slat-supporting sections and means for extending and retracting them, combined with a series of slats carrying springs, supported on said sections, the outside slats being rigidly secured to the sections and the intermediate slats being free to move independently on their supports and connected with each other and with the rigidly secured side slats, whereby they will be separated as the slat-supporting sections are extended, substantially as described.

482,674. LUBRICATING-CUP. IRA J. REIGER, San Francisco, Cal., assignor of one-half to A. W. Sanborn, same place. Filed Dec. 26, 1891. Serial No. 416,223. (No model.)

Claim.—1. A lubricator-cup having the opening and extension below, and an upwardly-closing valve which opens by gravitation when relieved of pressure and closes when pressure is applied from below, whereby oil is admitted into the valve-chamber from the cup when

the valve is opened, said extension having a second chamber containing a double-ended valve situated below the first one, one of the valves closing upwardly when exposed to pressure from below and the other closing downwardly when exposed to pressure from above, substantially as herein described.

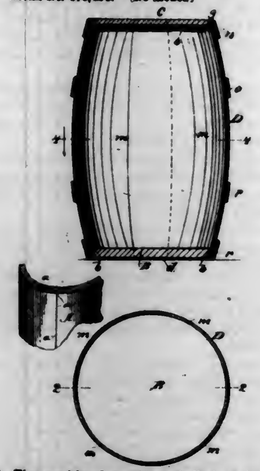
2. A lubricating-cup having the passage and chamber below the bottom of the cup, a valve situated within said chamber, closing upwardly when exposed to pressure from below and opening by gravitation to allow oil to flow into its chamber, an extension from said cup having a second chamber situated below and communicating with the first-named chamber, a valve-stem within said chamber, having an upwardly-closing valve at the lower end, and a spring surrounding the valve-stem, acting to close the lower valve, whereby the upper valve is opened, said extension having a second chamber containing a double-ended valve situated below the first one, one of the valves closing upwardly when exposed to pressure from below and the other closing downwardly when exposed to pressure from above, substantially as herein described.

to said fixed standards with freedom for both a sliding and pivotal motion thereon, substantially as and for the purpose set forth.

4. The combination, with a supporting-truck, of pivoted standards rising from one end of said truck, a band-cutter and feeder frame having the delivery end of the same pivoted to said pivoted standards and its receiving end free for sliding and pivotal movement, a fixed gear carried by said frame, and a worm and worm-gear carried by the pivoted standards, having one member of the train engaging said fixed gear, whereby the said frame may be adjusted both vertically and longitudinally by said worm-gear, substantially as described.

livering thereto from its top, and means for moving said grain-board toward and from the celled feed-cylinder, whereby any shattered grain accumulating at the throat between the grain-board and feed-cylinder will be forced into the cells of the said cylinders and be carried over to the thrashing-cylinder, substantially as described.

5. The combination, with the feed-board G, of the grain-board B^2 B^3, pivoted to the frame near its inner end and pivotally connected to the feed-board G at its outer end, means, such as the eccentric B^5 and the rod B^6, for imparting a rocking motion to said grain-board, the cylinder E, overhanging the said feed-board and provided with band-cutting knives and stripping-combs, and the celled feed-cylinder B B', overhanging the grain-board B^2 and delivering from its top, substantially as described.



arm for adjustably securing the same in any desired position, and an eccentric strap or ring on said eccentric engaging crank-arms on said shaft for feathering the said shafts under the motion of the cylinder, substantially as described.

12. In a band-cutter and feeder, the combination, with the rotary cylinder having feathering shafts for carrying the band-cutting knives, stripping-combs, and clearing teeth, as described, of the stripping-comb and clearing-teeth castings formed with half-hubs and means for detachably clamping the same together and to the said shafts, and the comb member of which casting is provided with a shank for securing the knives thereto, substantially as described.

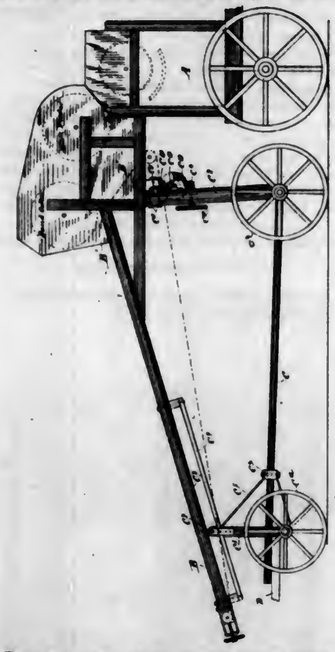
the valve is opened, said extension having a second chamber containing a double-seated valve situated below the first one, one of the valves closing upwardly when exposed to pressure from below and the other closing downwardly when exposed to pressure from above, substantially as herein described.

2. A lubricating-cup having the passage and chamber below the bottom of the cup, a valve situated within said chamber, closing upwardly when exposed to pressure from below and opening by gravitation to allow oil to flow into its chamber, an extension from said cup having a second chamber situated below and communicating with the first-named chamber, a valve-stem within said chamber, having an upwardly-closing valve at the lower end, and a spring surrounding the valve-stem, acting to close the lower valve, whereby the upper valve is closed when exposed to pressure from below and the lower valve is closed and the upper valve opened by the action of the spring when relieved from pressure from below, substantially as herein described.

482,675. BARREL. EMERSON COLE, Brooklyn, N. Y. Filed Jan. 18, 1892. Serial No. 418,458. (No model.)

Claim.—1. The combination, with a shell or body which is provided with a longitudinal slit near the end and having the edges of said slit chamfered and overlapping and an inwardly-extending head thereon near the end edge of the body, of a head that is disk-like and coniform on the edge seated on the interior bead and a hoop adapted to compress the end wall of the body against the edge of the head and seal the overlapping joints of the body, substantially as described.

2. The combination, with a body or shell which has a longitudinal slit near each end extending through the ends, the edges of which slits are chamfered and overlapping, and an inwardly-projecting bead at each end of the body, of a coniform top head seated on an adjacent bead, a peripherally-grooved lower head interlocking with an adjacent bead, and a hoop at each end adapted to compress the body against the edges of the heads and close the overlapping edges of the body-slits, substantially as described.



482,676. SUPPORT FOR BAND-CUTTERS AND FEEDERS. ROBERT E. DORTON, Minneapolis, Minn. Filed Mar. 15, 1892. Serial No. 424,946. (No model.)

Claim.—1. The combination, with a supporting-truck, of a band-cutter and feeder frame mounted on said truck and means for independently raising and lowering either end of said frame on the said truck, substantially as and for the purpose set forth.

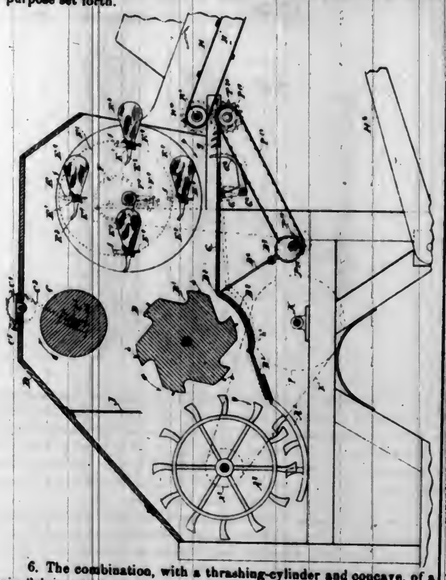
2. The combination, with a truck, of fixed standards rising from one end of the truck and pivoted standards from the other and a band-cutter and feeder frame having one end pivoted to said pivoted standards and the other secured to the other standard with freedom for both a sliding and pivotal movement, whereby the band cutter and feeder frame may be adjusted by moving the pivoted standards, substantially as described.

3. The combination, with a wagon-like truck having its front and rear sets of wheels adjustably coupled together, of pivoted standards rising from one end of said truck and fixed standards rising from the other and a band-cutter and feeder frame having its delivery end pivoted to said pivoted standards and having its receiving end connected to said fixed standards with freedom for both a sliding and pivotal motion thereon, substantially as and for the purpose set forth.

4. The combination, with a supporting-truck, of pivoted standards rising from one end of said truck, a band-cutter and feeder frame having the delivery end of the same pivoted to said pivoted standards and its receiving end free for sliding and pivotal movement, a fixed gear carried by said frame, and a worm and worm-gear carried by the pivoted standards, having one member of the train engaging said fixed gear, whereby the said frame may be adjusted both vertically and longitudinally by said worm-gear, substantially as described.

5. The combination, with the wagon-like truck having its sets of wheels adjustably coupled together, of standards rising from the front axle, fixed against pivotal motion when the wheels are coupled together, standards rising from the rear axle free for pivotal motion thereon, a band-cutter and feeder frame having its delivery end pivoted to said pivoted standards and its receiving end mounted for both sliding and pivotal motion on said fixed standard, a fixed gear carried by said frame, and a worm and train of worm-gear carried by said pivoted standards, one member of which meshes with said fixed gear, substantially as and for the purposes set forth.

482,677. BAND-CUTTER AND FEEDER. ROBERT E. DORTON, Minneapolis, Minn. Filed Mar. 15, 1892. Serial No. 424,947. (No model.)



Claim.—1. In a band-cutter and feeder, a rotary cylinder carrying the band-cutting knives and provided with a series of stripping-combs, whereby the bands are cut and a series of endwise divisions of the bundles are effected, substantially as described.

2. The combination, with the longitudinally-reciprocating toothed feed-board, of the rotary cylinder overhanging said board transversely to the line of feed and provided with band-cutting knives and stripping-combs and a bundle-supplying conveyer having its delivery end overlapping the receiving end of the feed-board and offset from the same in the vertical plane, whereby an endwise division of the cut bundle is effected and the shattered grain from the conveyer is caught by the feed-board, substantially as described.

3. The combination, with the rotary cylinder provided with band-cutting knives and stripping-combs, of the reciprocating toothed feed-board and the retarding-teeth working through slots of the feed-board into and out of engagement with the lower layers of the stock, substantially as described.

4. In a thrashing-machine, the combination, with the feed-board, of a pivoted grain-board spanning the space between the feed-board and the thrashing-cylinder and concave, a band-cutter located over said feed-board, a coiled feed-cylinder overhanging the said grain-board and having a movement opposite to that of the thrashing-cylinder, delivering thereto from its top, and means for moving said grain-board toward and from the coiled feed-cylinder, whereby any shattered grain accumulating at the throat between the grain-board and feed-cylinder will be forced into the coils of the said cylinders and be carried over to the thrashing-cylinder, substantially as described.

5. The combination, with the feed-board G, of the grain-board B^2 B^3, pivoted to the frame near its inner end and pivotally connected to the feed-board G at its outer end, means, such as the eccentric B^5 and the rod B^6, for imparting a rocking motion to said grain-board, the cylinder E, overhanging the said feed-board and provided with band-cutting knives and stripping-combs, and the coiled feed-cylinder B B', overhanging the grain-board B^3 and delivering from its top to the thrashing-cylinder, the said parts operating substantially as and for the purpose set forth.

6. The combination, with a thrashing-cylinder and concave, of a parallel oppositely-moving feed-cylinder delivering thereto from its top and a combined resistance and stripping cylinder overhanging the feed-cylinder and spaced apart therefrom to form a feed-throat, the said feed-cylinder being driven at a slow speed and the said resistance and stripping cylinder at a relatively-high speed, substantially as and for the purpose set forth.

7. The combination, with a thrashing-cylinder and concave, of the parallel oppositely-moving slow-speeded feed-cylinder delivering thereto from its top, the overhanging relatively-high-speeded combined resistance and stripping cylinder turning in the same direction as the thrashing-cylinder, and a clearing-cylinder located in the front angle between said feed and resistance cylinders, turning in the same direction as the feed-cylinder at a relatively-high speed, and provided with projecting teeth working against the back-pressure from said feed and resistance cylinder to throw back any accumulating excess of stock, substantially as described.

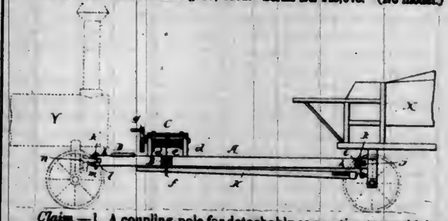
8. The combination, with the slow-moving feed-cylinder B, of the fast-moving resistance and stripping cylinder C, the fast moving cylinder E, provided with the feathering shafts E', having secured thereto the backwardly-extended band-cutting knives E^2 and the forwardly-extended clearing-teeth E^3, the reciprocating toothed feed-board G, and the retarding-teeth G^3, substantially as described.

9. In a band-cutter and feeder, the combination, with the feed-board, of sliding boxes mounted on the side of the frame and provided with draw-bolts for adjusting the same, the rotary cylinder mounted in said sliding boxes and provided with feathering shafts having secured thereto the band-cutting knives, stripping-combs, and clearing-teeth, substantially as described.

10. In a band-cutter and feeder, the combination, with a rotary cylinder having feathering shafts for carrying parts operating on the stock, of an adjustable feathering mechanism for setting said shafts and parts carried thereby in any desired angular relation to said cylinder, substantially as described.

11. In a band-cutter and feeder, the combination, with a rotary cylinder provided with a series of shafts journaled in its head for carrying parts operating on the stock, of an eccentric loosely mounted on the cylinder-shaft, having an extended hub provided with a locking-arm for adjustably securing the same in any desired position, and an eccentric strap or ring on said eccentric engaging crank-arms on said shaft for feathering the said shafts under the motion of the cylinder, substantially as described.

12. In a band-cutter and feeder, the combination, with the rotary cylinder having feathering shafts for carrying the band-cutting knives, stripping-combs, and clearing teeth, as described, of the stripping-comb and clearing-teeth castings formed with half-hubs and means for detachably clamping the same together and to the said shafts, and the comb member of which casting is provided with a shank for securing the knives thereto, substantially as described.



13. The combination, with the bundle-table detachable from the separator at its delivery end, of the riser-arms pivotally connected at their lower ends to the separator-frame and having a pivotal and sliding connection with the bundle-table at their outer end for lifting the bundle-table to the top deck of the separator, substantially as described.

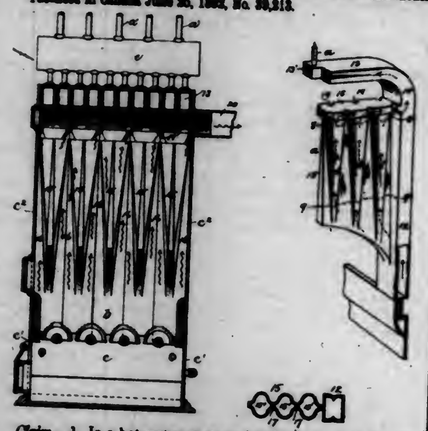
14. In a band-cutter and feeder, the combination, with fixed ways secured to the frame, of sliding boxes mounted in said ways, hangers suspending said boxes from the top of the frame with freedom for upward and downward movement in the said ways, and the combined resistance and stripping cylinder journaled in said boxes overhanging the feed-cylinder and riding on the stock as a float, substantially as described.

15. In a band-cutter and feeder, the combination, with the feed-cylinder B, of the curved ways C^3, fixed to the frame, the sliding boxes C', mounted in said ways, the combined resistance and stripping cylinder C, journaled in said boxes, the link C^5, connected to said boxes at their lower end and pivotally connected at their upper end to the hand-wheel C^4, and means for securing the said hand-wheels in any desired position, substantially as and for the purpose set forth.

16. A band-cutting and feeding mechanism organized for cutting the bands, spreading the cut bundles, and effecting a series of endwise divisions of the stock and the delivery of the same to the thrashing-cylinder with a sliding and butt-spreading feed in imitation of hand-feeding, the said mechanism consisting of the following combination of elements, to wit: suitable bundle-supplying conveyers, as H, the fast-moving cylinder E, in constant motion, having the feathering shaft E', carrying the knives E^2, the clearing-teeth E^3, and the stripping-combs E^4, the slow-moving feed-cylinder B, delivering from its top to the thrashing-cylinder, the fast-moving resistance and stripping-cylinder C, overhanging the feed-cylinder, the overdecking hood D, and a suitable resistance surface, such as the feed-board G, and the grain-board B^3, underlying the said cylinders E and B, substantially as and for the purpose set forth.

482,678. COUPLING-POLE. ALFRED DREW, De Lisle, Ohio. Filed Oct. 2, 1891. Renewed Aug. 15, 1892. Serial No. 443,075. (No model.)

Claim.—1. A coupling-pole for detachably connecting two vehicles arranged one behind the other, consisting of a body portion, arms extending laterally therefrom, a winding-drum, and a chain or rope guided by said arms and wound in opposite directions upon the drum, said chain or rope adapted to engage the tongue of one of the vehicles, substantially as described.



2. A coupling-pole for detachably connecting two vehicles arranged one behind the other, consisting of a body portion, laterally-extending arms near one end thereof, guides at the ends of the arms, a winding-drum, and a chain or rope passing over said guides and wound in opposite directions upon the drum, said chain or rope adapted to engage the tongue of one of the vehicles, substantially as described.

3. A coupling-pole for detachably connecting two vehicles arranged one behind the other, consisting of a body portion, lateral arms having guide-pulleys at their ends, a winding-drum mounted in standards above the arms, a hand-wheel, a chain or rope passing over said pulleys and wound in opposite directions upon the drum, and a ring on the chain or rope adapted to receive the tongue of one of the vehicles, substantially as described.

4. A coupling-pole for detachably connecting two vehicles arranged one behind the other, consisting of a body, arms extending laterally from the body near one end, guide-pulleys on the arms, standards, a drum and hand-wheel carried by the standards, a chain or rope passing over the pulleys and wound in opposite directions upon the

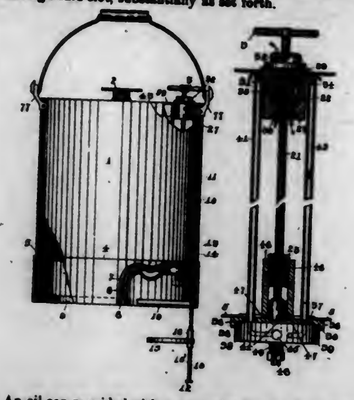
dram, a ring on the chain or rope to receive the tongue of one of said vehicles, and a platform on the pole-body adjacent to the hand-wheel, substantially as described.

482,679. HEATING APPARATUS. JOHN H. GATES, Holyoke, and EUGENE H. GATES, Fitchburg, assignors to the H. H. Gates Heating Company, Boston, Mass. Filed May 6, 1892. Serial No. 432,012. (No model.) Patented in Canada June 25, 1892, No. 39,213.

Claim.—1. In a hot-water or steam heating apparatus, the combination, with a fire-box, of a series of heating-sections overhanging the fire box and comprising heads, each as 18, collectively forming a substantially horizontal partition or septum above the fire-box, tapering receptacles depending from said heads and having inclined heat-absorbing surfaces separated by tapering flues which gradually decrease in width from their lower to their upper ends, said heads having recesses, each as 19, which when the sections are assembled form contracted outlets from the tapering flues through the said partition or septum, as set forth.

2. In a hot-water or steam heating apparatus, the combination, with a fire-box, of a series of heating-sections, each comprising a side portion, each as 12, a top portion, each as 13, and a wing including a head 18, extending inwardly from said side portion, and tapering receptacles depending from the head, the said side and top portions forming the sides and top of the heater, while the heads form a substantially horizontal partition below the top, said heads being provided with outlet-openings connecting said space with the tapering flues between the tapering receptacles, as set forth.

3. A hot-water or steam-heater comprising two rows of sections, each row constituting one-half of the fire-box-inclosing structure, each section comprising a side portion, such as 12, a top portion, such as 13, and a wing portion having a head projecting inwardly from the side portion and tapering receptacles depending from said head, the side and top portions of each row forming one side and a part of the top of the structure, while the wings of each row meet the wings of the other row over the center of the fire-box, the heads of the two rows forming a horizontal partition below the top of the structure, said partition having outlet-openings for the flues between the tapering receptacles, as set forth.



4. A hot-water or steam heater comprising two rows of sections, each row constituting one-half of the fire-box-inclosing structure, each section comprising a side portion, such as 12, a top portion, such as 13, recessed at its end, and a wing portion projecting inwardly from the side portion, the recess in the end of each top portion receiving the corresponding end of the opposite top portion, combined with a header or receptacle located over the meeting ends of the top portions and connected with said portions by tubes, said header being connected with the distributing-pipes, as set forth.

5. In a hot-water or steam heating apparatus, the base or ash-pit section having hollow walls, the outer sides of which are recessed to offset the upper edges of said walls, combined with heating-sections supported by said walls and connected with the latter by short pipes located in the recesses of the walls, as set forth.

482,680. LAMP-FILLING OIL-CAN. JAMES GRARY, Bradford, Pa., assignor of three-fourths to L. Emery, Jr., same place. Filed Apr. 26, 1892. Serial No. 430,891. (No model.)

Claim.—1. An oil-can provided with a supporting-band at its bottom, having a slot 8 therein, and with an oil-discharging spout jointed to the can and adapted to be swung through said slot and a drip-pan secured to the band on each side of the slot, said spout in its closed position being entirely within the band and having both ends over the pan, all substantially as set forth, whereby the band is strengthened and drip either from the spout or from its joint with the can is received.

2. An oil-can provided with a supporting-band at its bottom, having a slot 8 therein, and with an oil-discharging spout and an air-inlet pipe in proximity thereto, the spout and pipe being connected to a disk 29, supplied with suitable ports and eccentrically pivoted to a disk 36, fixed to the can-bottom and having corresponding ports, said spout and pipe being adapted to be swung together and entirely within the band through said slot, substantially as set forth.

3. An oil-can provided with a supporting-band at its bottom, having a slot 8 therein, and with an oil-discharging spout communicating with an opening in the bottom of the can, and an air-inlet pipe in proximity thereto, both being adapted to be swung together through said slot, said air-inlet pipe communicating with a pipe extending within the can to its upper part, and a valve adapted to close both the oil and air passages, substantially as set forth.

4. An oil-can provided with a supporting-band at its bottom, having a slot 8 therein, and with an oil-discharging spout, in combination with the vertically-adjustable lamp-holding device attached to the can, substantially as set forth.

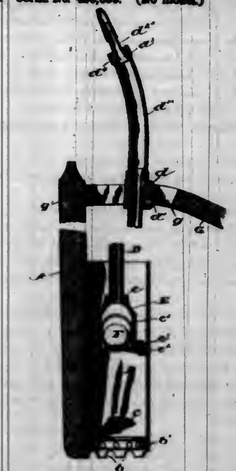
5. An oil-can provided with a supporting-band at its bottom, having a slot 19 therein, in combination with a horizontally-movable pivoted lamp-support adapted to be moved through said slot and under the can, substantially as set forth.

6. An oil-can provided with a supporting-band at its bottom, having a slot 19 therein, in combination with a horizontally-movable pivoted lamp-support adapted to be moved through said slot and under the can, said support being also vertically adjustable, substantially as set forth.

7. An oil-can provided with a supporting-band at its bottom having a slot 8 therein, in combination with a horizontally-movable lamp-support adapted to be moved through said slot and under the can, said support being attached to a rod vertically adjustable on the can, whereby its foot can be raised to a level with the bottom of the can-supporting band, substantially as set forth.

8. In an oil-can, the plug 39, rotatably supported near its bottom and provided with air-passages 58 and 54 and oil-passage 45, in combination with air-inlet pipes 43 and 41 and with an oil-outlet in the can-bottom and a valve therefor, said oil-passage and air-passage being eccentrically situated with respect to the plug, substantially as set forth, whereby the rotation of the plug opens or closes the passages.

9. In an oil-can, the combination of the correspondingly-apertured plugs 39 and 36, with the air-pipes and the oil-spout and air-inlet pipe, said oil-spout and air-inlet pipe being secured to the rotatable apertured plug 39, substantially as set forth.



10. In an oil can, an oil-spout and an air-inlet pipe having the open ends in proximity and each provided with tapered points to prevent the retention of drops, the end of the air-pipe being above that of the spout, whereby the retention of a drop between them is avoided, substantially as set forth.

11. In an oil-can, its cover, the plug 27, the flanged nut 32, having air-inlet holes, and the valve-stem having a screw-threaded and perforated enlargement 22, all in combination, whereby air may be admitted to or excluded from the can, substantially as set forth.

12. In an oil-can, its cover, the plug 27, the flanged nut 32, having air-inlet holes, and the valve-stem having a screw-threaded and perforated enlargement 22, the bottom having an oil-discharge passage, and a pipe whereby the upper part of the can and such oil-discharge passage communicate, whereby external air may be admitted to said discharge-passage, substantially as set forth.

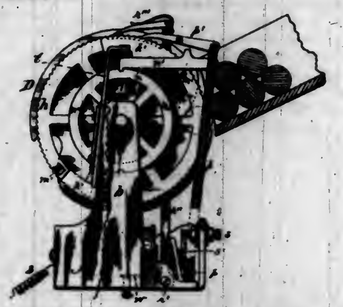
13. In an oil-can, the combination of an oil-discharge passage at the bottom of the can, a valve therefor, and a pipe extending from the inner end of said passage to the upper part of the can, and a discharge-spout communicating with the lower or outer end of said passage, whereby air may be admitted to the inner end of the spout to facilitate the discharge of drip, substantially as set forth.

482,681. PORTABLE GARDEN OR SPRAYING PUMP. GIDEON D. HAMBLIN, Deering, assignor to Dennis A. Meaher, Portland, Me. Filed Apr. 6, 1892. Serial No. 428,089. (No model.)

Claim.—1. In a pump, the combination, with a cylinder, of a flanged hollow plunger therein, an annulus c^3, secured to the plunger and having a valve-seat, a check-bar c^2, having its ends bent outwardly and secured between said annulus and the flange of the plunger, a ball-valve inclosed between said check-bar and the annulus, and means for operating the plunger, substantially as set forth.

2. In a pump, the combination, with the stock or standard, of a cylinder mounted thereon having a valve at its base, a forked lever secured to the other end of the standard and projecting from the same side as the cylinder, a hollow plunger within the cylinder, provided with a valve, a collar pivotally secured in the fork of the lever, a hollow piston-rod communicating with the plunger and the collar, and a flexible tip secured to the collar above the handle, substantially as set forth.

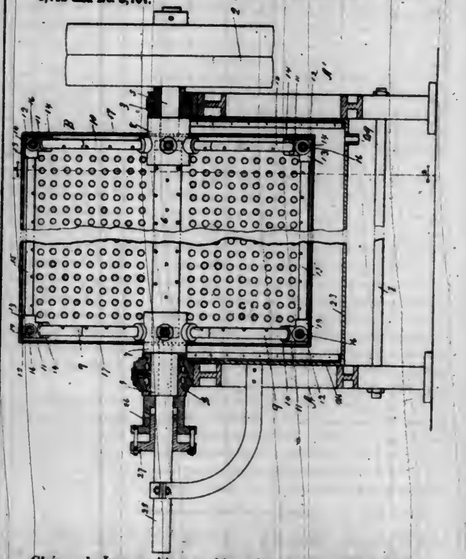
482,682. BOTTLE AND STOPPER. HENRY HEARTFIELD, Croydon, assignor of two-thirds to Thomas Webb, Stockport, England, and Charles Henry Heartfield, New York, N. Y. Filed Jan. 27, 1891. Serial No. 379,319. (No model.) Patented in England May 28, 1889, No. 8,871.



Claim.—A bottle for aerated waters and other liquors, having a screw-thread of buttress shape formed in the neck thereof, provided at its lower end with an abutment or abrupt termination, in combination with a plain cork, substantially as described.

482,683. VENDING-MACHINE. ARCHIE J. HENRY, Watertown, N. Y., assignor of one-half to Ernest A. E. Meyer and Charles H. Sprague, same place. Filed Nov. 26, 1891. Serial No. 413,276. (No model.)

Claim.—1. The combination, with the delivery-cylinder secured upon a shaft, of a ratchet-wheel secured thereon and a ratchet-bar loose thereon, pawls in engagement therewith, and means to reciprocate the push-pawl.

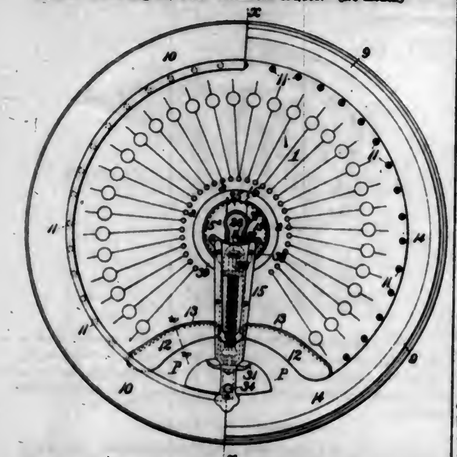


2. The combination, with the delivery-cylinder secured upon a shaft, of a ratchet-wheel secured thereon and a ratchet-bar loose thereon, a spring connecting said bar to said wheel, and means to rotate said ratchets.

3. The combination, with the delivery-cylinder secured upon a shaft and the escapement-wheel secured thereon, of a ratchet-wheel upon said shaft, a ratchet-bar loose upon said shaft, wedging-lugs upon said bar, an escapement-look raised by said lugs to release the escapement, a spring connecting said bar to said wheel, and means to operate said ratchet-bar to produce a tension upon said spring before the escapement is released.

4. The combination, with the delivery-cylinder secured upon a shaft, the ratchet-wheel and ratchet-bar thereon, and the reciprocating push-pawl in engagement therewith, of an electro-magnet, its armature, and means to vibrate said armature and said pawl to which it is connected.

482,684. MACHINE FOR WASHING SHAVINGS. RUDOLPH H. HERLAN, Chicago, Ill. Filed June 22, 1891. Serial No. 397,113. (No model.) Patented in Germany Jan. 26, 1891, No. 58,961; in France Feb. 6, 1891, No. 211,223, and in Austria-Hungary Dec. 6, 1891, No. 3,712 and No. 3,767.



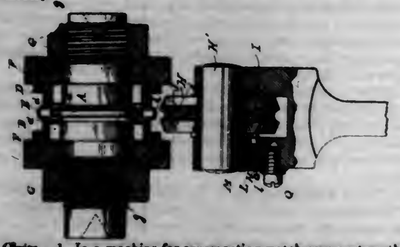
Claim.—1. In a washing-machine of the kind specified, the combination, substantially as hereinbefore set forth, of a revolable perforated cylinder provided with a hollow perforated shaft and with perforated pipes located along its ends and sides, said shaft and pipes communicating with a source for supplying water thereto, substantially as shown and described.

2. In a washing-machine of the kind specified, the combination, as hereinbefore set forth, of a revolable perforated flat-sided cylinder provided with a hollow perforated shaft and with perforated pipes located along its ends and sides, said shaft and pipes communicating with a source for supplying water thereto, substantially as shown and described.

3. In a washing-machine of the kind specified, the combination, as hereinbefore set forth, of a main frame, a revoluble perforated cylinder having the means set forth and shown for spraying water within the same, a trough or receptacle inclosing the lower portion of said cylinder, and a deflecting-plate removably secured to said main frame along one side of said cylinder, substantially as shown and described.

482,685. GAME APPARATUS. MORRIS V. MILLER, Bellaire, Ohio, assignor of one-half to Natalie Immerwahr and Edward Jones, same place. Filed Aug. 29, 1891. Serial No. 404,108. (No model.)

Claim.—1. In a game apparatus, the combination of a table, an upwardly-projecting band or rim arranged at or near the perimeter of the table, a series of cushioned posts or pillars arranged a short distance apart inside of the band or rim, said posts and rim forming pockets for the reception of balls, and a ball propelling or shooting device pivoted at the center of the table and adapted to drive the balls across the table, substantially as set forth.



2. In a game apparatus, the combination of a revoluble table provided at or near its perimeter with a series of pockets or pigeon-holes for the reception of balls and a ball propelling or shooting device pivoted at the center of the table, adapted to drive the balls horizontally across the table, substantially as set forth.

3. In a game apparatus, the combination of a table, a series of pockets or pigeon-holes arranged around the table for the reception of balls, a pool, and a gutter passing around behind the pockets and constructed to conduct the balls to the pool, and a ball propelling or shooting device pivoted at the center of the table and adapted to drive the balls horizontally across the table, substantially as set forth.

4. In a game apparatus, the combination of a table, an upwardly-projecting band or rim arranged at or near the periphery of the table, a series of cushioned posts or pillars arranged a short distance apart inside of the band or rim, said posts and band forming pockets for the reception of the balls, the space between the posts and band having a bottom inclined toward one point of the table, and a ball propelling or shooting device pivoted at the center of the table and adapted to drive the balls across the table, substantially as set forth.

5. In a game apparatus, the combination of a table provided at or near its perimeter with a series of pockets or pigeon-holes, a ball propelling or shooting device pivoted at the center of the table, a gutter arranged on top of the shooting device for conducting the balls toward the inner end thereof, and a loop at the end of the shooting device for guiding the ball into position, substantially as set forth.

482,686. KNURLING OR ORNAMENTING WATCH-CASES. FRITZ MINK, Philadelphia, Pa. Filed Oct. 11, 1890. Serial No. 367,846. (No model.)

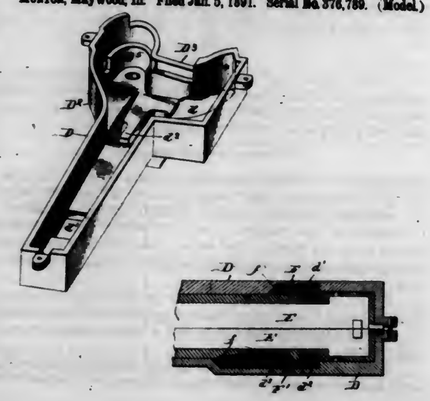
Claim.—1. In a machine for ornamenting watch-case centers, the combination of a mandrel, two clamping-rings having a larger internal diameter than the mandrel, so as to be free to move upon the mandrel-shaft transversely to its axis, for clamping the article to be ornamented between them, and a rotary die-wheel adapted to be brought in contact with the surface of the metal exposed between said clamping-rings.

2. In a machine for ornamenting watch-case centers, the combination of a mandrel, two clamping-rings having a larger internal diameter than the mandrel, so as to be free to move upon the mandrel-shaft transversely to its axis, and formed with annular clamping-ledges corresponding with the ledges upon the rims of the center for clamping the article to be ornamented between them, with an annular surface exposed between said rings, and a rotary die-wheel adapted to be brought in contact with the surface of the metal exposed between said clamping-rings.

3. In a machine for ornamenting watch-case centers, the combination of a mandrel, two clamping-rings having a larger diameter than the mandrel and movable transversely to the axis thereof for clamping the article to be ornamented between them, and a rotary die wheel adapted to be brought in contact with the surface of the metal to be ornamented, exposed between said clamping-rings, said die-wheel being formed with one or more projecting lips on the edge of its annular die-surface for forming the hinge-flats of the center.

4. The combination, with a rotating supporting-mandrel for a watch-case center, of a wheel H, having an annular die-surface *h*, and lips J, projecting from the edge of said die surface and formed with the pins or points *j* in said projecting lip, substantially as and for the purpose specified.

5. The combination, with a supporting-mandrel for a watch case center, of a wheel having an annular die-surface adapted to be pressed in contact with the annular edge of the center, a supporting-handle in which said wheel is journaled, and a stop between said handle and wheel for arresting the movement of the latter after a complete rotation.



6. The combination, with a supporting-mandrel for a watch-case center, of a knurling-wheel having an annular die-surface adapted to be brought in contact with the surface of the center and having a recess upon one of its sides, a supporting-handle in which said wheel is journaled, and an adjustable stop carried by said handle and adapted to engage with the recess of the knurling-wheel to arrest it after one complete revolution.

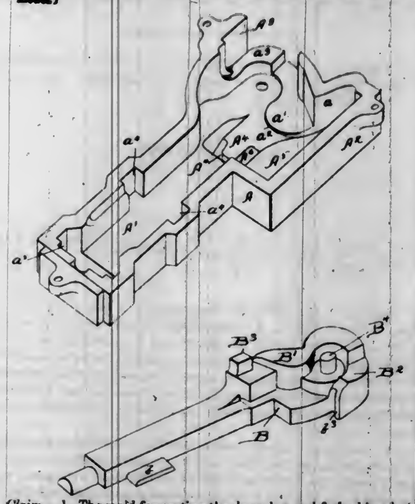
7. The combination, with a supporting-mandrel for a watch-case center, of a knurling-wheel having an annular die-surface adapted to be brought in contact with the annular surface of the center and having a recess upon one of its sides, a handle in which said wheel is journaled, provided with a slot M, a plate L, pivoted to said handle, having a slot R, a spring-pressed pin N, carried by the plate L, and an adjusting-screw Q, working in the slot R of the plate L, substantially as and for the purpose specified.

8. In a machine for ornamenting watch-case centers, &c., the combination of a rotating mandrel having a central portion formed to correspond with the interior of the center but of smaller diameter, clamps to clamp the center in line with said central portion of the mandrel, with freedom of movement transversely to the axis of the mandrel, and a knurling-wheel having an annular die-surface adapted to be brought in contact with the annular face of the center.

9. A knurling-wheel for ornamenting watch-case centers, having an annular die-surface and provided with one or more lips projecting upon said annular die-surface for forming the hinge-flats upon the center simultaneously with imparting the ornamentation thereto.

482,687. MOLD FOR CASTING STEEL CAR-COUPLINGS. JAMES MUNTON, Maywood, Ill. Filed Jan. 5, 1891. Serial No. 376,789. (Model.)

Claim.—1. The mold for casting the draw-bar and forked head of steel car-couplers, comprising two metal half-molds D D′, having a stem portion and two forks D^4 D^5, a core E, and a yielding core-block fitting in a recess or pocket in the metallic stem portion of said mold to form the external projection on the draw-bar and to permit the draw-bar portion of the casting in contracting to move toward the head thereof, substantially as specified.



2. The iron or metallic mold D D′ for casting the fork or divided portion of a car-coupler, said mold having two forks D^4 D^5, furnished with a rounded and tapering intermediate portion D^6, lying between said forks D^4 D^5, said mold being provided with means for slipping or crowding the forks of the coupler-casting off of said intermediate portion of the mold as the metal contracts to give room for the forks to move toward each other in the contracting action of the casting, said means consisting of a shoulder or projection d^3 at the body or shank portion of the mold, and said mold also having a pocket for a core-block in the stem portion thereof, and a core-block fitting in said pocket of smaller diameter than the pocket, and a filling of yielding material at the end of said core-block to permit the stem portion of the coupler-casting to move toward the body or shank portion thereof in contracting, whereby said coupler-castings may be made of steel, substantially as specified.

3. The metal mold for casting steel car-couplings, consisting of two metallic half-molds D and D′ having rounded and tapering intermediate portion D^6, core E, and core-blocks E′, said half-molds having recesses *d* to receive said core-blocks E′, substantially as specified.

4. The metal mold for casting steel car-couplings, consisting of two metallic half-molds D and D′, having rounded and tapering intermediate portion D^6, core E, core-blocks E′, and sliding core-blocks F F′, said half-molds having recesses or pockets *d*, *d*′, and d^3 to receive said core-blocks E′, F, and F′, respectively, substantially as specified.

5. The iron or metallic mold for casting the forked divided portion of a steel car-coupler, said mold having two forks with a rounded intermediate portion between said forks to permit the casting in its contracting action to withdraw its forks from the forks of the mold sufficiently to permit the forks to approach each other as the intermediate body portion of the casting contracts, said mold being provided with a shoulder or projection near the back part of the body or shank portion thereof to cause the casting to hug the back portion of the mold opposite to said forks, and thereby cause the forks of the coupler to withdraw out of the forks of the mold, substantially as specified.

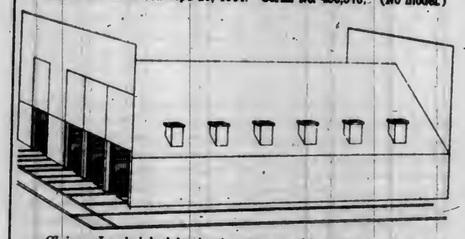
482,688. METALLIC MOLD FOR CASTING DRAW-BARS. JAMES MUNTON, Maywood, Ill. Filed Apr. 7, 1892. Serial No. 428,106. (No model.)

Claim.—1. The mold for casting the draw-bar and forked head of steel car-couplers, comprising a metallic shell A, having stem portion A′, two limbs or forks A^2 A^3, one of said forks having a metallic inner wall, and a core B, having an extension forming the inner wall of the other of said forks, substantially as specified.

2. The mold for casting the draw-bar and forked head of steel car-couplers, comprising a metallic shell A, having a shank and body portion and two forks, one of said forks having an inner metallic wall *a* and the other a raised ledge *a*′, and a core B, a part of which fits upon said raised ledge *a*′ and constitutes, with said raised ledge, the inner wall of one of said forks, substantially as specified.

3. The mold for casting the draw-bar and forked head of steel car-couplers, comprising a metallic shell A, having a shank and body portion and two forks, one of said forks having an inner metallic wall *a* and the other a raised ledge *a*′, and a core B, a part of which fits upon said raised ledge *a*′ and constitutes, with said raised ledge, the inner wall of one of said forks, said metallic shell A having also a raised ledge or wall a^3, and the core and extension B^3, fitting on said raised ledge a^3, substantially as specified.

4. The mold for casting the draw-bar and forked head of steel car-couplers, comprising a metallic shell A, having a shank and body portion and two forks, one of said forks having an inner metallic wall *a* and the other a raised ledge *a*′, and a core B, a part of which fits upon said raised ledge *a*′ and constitutes, with said raised ledge, the inner wall of one of said forks, said metallic shell A having, also, a raised ledge or wall a^3, and the core an extension B^3, fitting on said raised ledge a^3, the body portion of said metallic shell A having recess A^5 and the core having corresponding projection B^5, substantially as shown and described.



5. The mold for casting the draw-bar and forked head of steel car-couplers, consisting of a metallic shell having two forks, one of said forks having an inner metallic wall and the other an inner wall of sand or core material, substantially as specified.

482,689. CASTING STOVE-LININGS. JAMES MCDERMOTT, Louisville, Ky., assignor of one-fourth to David A. Keller, same place. Filed Apr. 24, 1891. Serial No. 390,236. (No model.)

Claim.—The improved mold for casting stove-linings, consisting of the cope B, the drag A of metal, a fixed journal *a* on each end thereof, a flattened portion *a*′ on one end of one of said journals *a*, adapted to receive a crank for revolving said drag, a stop *b*, projecting laterally from one side of said drag, and a matrix in one face of said drag adapted to receive a pattern corresponding thereto while filling the cope with sand, in combination with the pattern C, all constructed and combined to operate substantially as described, and for the purpose shown.

482,690. BRICK-DRIER. FRANCIS R. MCELFRESH, New Cumberland, W. Va. Filed Sept. 23, 1891. Serial No. 406,573. (No model.)

Claim.—In a brick-drier having upper and lower sections of pipes arranged against its side walls and extending throughout their length, the leaves 22, hinged to the said side walls midway between the two sections of pipes and adapted to throw the rising heat against the goods, substantially as set forth.

482,691. PNEUMATIC REGISTERING BALLOT-BOX. JOHN MCTAMMANY, Worcester, Mass., assignor to Alexander McTammany, Akron, Ohio. Filed Dec. 19, 1891. Serial No. 415,659. (No model.)

Claim.—1. A ballot-box comprising a chamber for containing ballots and a ballot bed or guideway into or upon which the ballot is deposited and having combined therewith means for testing the ballots for ascertaining if more than one candidate is indicated thereon for the same office, and a count-registering mechanism automatically controlled by the ballot, a dropway into the containing-chamber, and a feeding-carrier whereby the ballot is advanced along said way and into the drop, substantially as set forth.

2. In a ballot-box, a ballot-registering mechanism provided with an operating-pneumatic actuated by air passed through a perforation in the ballot, substantially as set forth.

3. A pneumatic ballot-registering mechanism, in combination with a perforated ballot, a ballot-bed having air-channels, and a wind-inducing apparatus whereby an air-current is caused to pass through said ballot for actuating the pneumatic and registering devices corresponding to the perforations of the ballot, substantially as set forth.

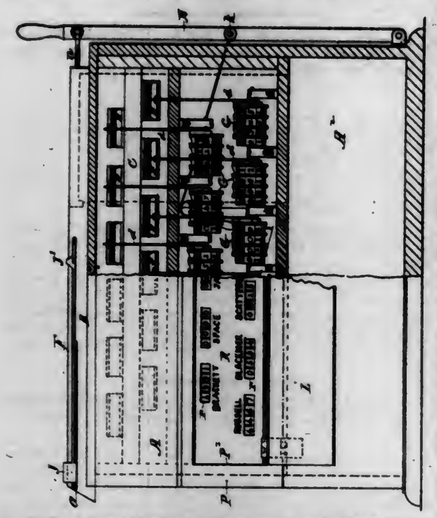
4. In a ballot-box, a counting-register and a mechanical ballot, in combination with an automatically-operating register-actuating mechanism controlled by said ballot, said register-actuating mechanism being arranged wholly below the ballot-bed and at intervening position between the ballot and counting-register, for the purpose set forth.

5. A ballot box comprising a receiving-way having a system of air-ducts, a series of pneumatics communicating with said ducts, a series of counting-registers respectively connected for operation with said pneumatics, a ballot-receiving chamber, and means, substantially as described, for advancing the ballot by stages along said guideway or bed, and bellows apparatus for inducement of air-currents in the wind-ways, substantially as set forth.

12. In a ballot-box, the combination, with the ballot-receiving bed and its overlying guards having windways I, of the reed-cells M, containing reeds, and having air-channels, substantially as described, for the purpose set forth.

13. In a ballot-box, the combination, with the ballot-receiving bed and its overlying guard-pieces that conceal the perforated parts of the ballot, having a primary and a secondary series of air-ducts that each correspond to the positions of ballot-perforations, a series of reeds or pneumatic sound-producing devices arranged in said primary series of air-ducts, a series of pneumatic motors arranged in connection with said second series of air-ducts, registering devices connected with said pneumatics, a ballot-receiving chamber, and means, substantially as described, for advancing the ballot by stages along said guideway or bed, and bellows apparatus for inducement of air-currents in the wind-ways, substantially as set forth.

482,692.



482,694. ICE-MACHINE. MAGNUS J. PALSON, Gloucester, Mass., assignor of two-thirds to William H. Perkins and Loring B. Haskell, same place. Filed Mar. 28, 1891. Serial No. 386,690. (No model.)

3. A pneumatic ballot-registering mechanism, in combination with a perforated ballot, a ballot-bed having air-channels, and a wind-inducing apparatus whereby an air-current is caused to pass through said ballot for actuating the pneumatic and registering devices corresponding to the perforations of the ballot, substantially as set forth.

4. In a ballot-box, a counting-register and a mechanical ballot, in combination with an automatically-operating register-actuating mechanism controlled by said ballot, said register-actuating mechanism being arranged wholly below the ballot-bed and at intervening position between the ballot and counting-register, for the purpose set forth.

5. A ballot box comprising a receiving-way having a system of air-ducts, a series of pneumatics communicating with said ducts, a series of counting-registers respectively connected for operation with said pneumatics, and a perforated ballot controlling said air-ducts, substantially as set forth.

6. A ballot-box having a bed or way fitted with a series of air-inlet ducts whereon the ballot is caused to rest before its final transfer into the containing-chamber of the box, a series of pneumatic motors respectively connected with said air-ducts, counting-registers actuated by said pneumatic motors, and an opposite series of air-ducts corresponding to the air ducts of the bed and leading to an exhaust-bellows or wind-inducing apparatus, in combination with a perforated ballot corresponding to the arrangement of said bed and adapted to serve as a valve between said opposing air-ducts, substantially as set forth.

7. A mechanical ballot for automatic registering ballot-boxes, having its face apportioned into a series of spaces for containing the names of candidates, a corresponding series of spaces near the border for indicating-marks, and a second corresponding series of spaces for receiving perforations denoting the candidates for which the ballot will register, said latter spaces containing dots or imprints to denote the proper position for punching the ballot, substantially as set forth.

8. In a ballot-box or vote-registering apparatus, a ballot-receiving bed or guideway having edge pieces or guards that extend along the sides of said bed, with inwardly-overlying parts that form guiding-grooves for the edge of the ballot and that conceal the marked or perforated parts of the ballot when entered therein, substantially as set forth.

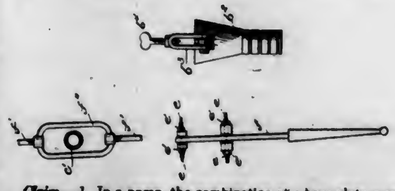
9. In a ballot-box, a ballot-receiving bed, table, or guideway adapted for supporting a perforated paper ballot and provided with windways overlying guard-pieces that conceal the perforated parts of the ballot, having passages therethrough that correspond with the windways of the receiving-table, and sound-producing devices disposed in the windways for operation by air-currents passed through the same and controlled by the ballot, for the purpose set forth.

10. The method of testing ballots in which the indicating-marks are formed by perforation of the ballot fabric, which consists in subjecting the ballot upon a suitable bed having windways that communicate with sound-producing devices to the induced current of air passed through perforations of the ballot, whereby said sound-producing devices are made responsive to any excess of inlet air over the normal quantity due to the correct perforation, substantially as set forth.

11. A ballot-box comprising, in combination, a guideway, table, or bed provided with air-ducts for the reception of the perforated ballot and overlying guard-pieces that conceal the perforated parts of the ballot, having a primary and a secondary series of air-ducts that each correspond to the positions of ballot-perforations, a series of reeds or pneumatic sound-producing devices arranged in said primary series of air-ducts, a series of pneumatic motors arranged in connection with said second series of air-ducts, registering devices connected with said pneumatics, a ballot-receiving chamber, and means, substantially as described, for advancing the ballot by stages along said guideway or bed, and bellows apparatus for inducement of air-currents in the windways, substantially as set forth.

12. In a ballot-box, the combination, with the ballot-receiving bed and its overlying guards having windways I, of the reed-coils M, containing reeds *m*, and having free air-passages *l'* and reed-ducts *m'*, leading into the wind-chest or exhaust-chamber, and a group of air-ducts *i*, leading from the bed into the reed-coil corresponding to the office groups of candidates, substantially as set forth.

13. The combination, with an automatically-registering ballot-box having a series of counters or indicating-registers, of a removable card or tablet having apertures that correspond with the several indicating-registers, through which the figures thereon can be observed, and containing the names of candidates or designating signs corresponding to the ballots for denoting the particular indicating-registers appropriated to the respective candidates, substantially as set forth.



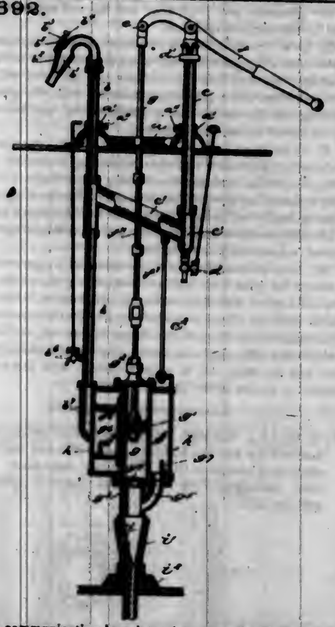
14. The combination, with the ballot-receiving bed or guideway and its overlying guard-pieces, of reciprocating carriers or feeders consisting of rods that run in guideways and having hooks that engage the ballot and means for imparting motion thereto for advancing the ballots by intermittent action along said guideway and into the interior of the ballot-box, substantially as set forth.

15. A ballot-box comprising, in combination, a ballot-testing bed or way provided with a series of wind ways or ducts that communicate with sound-producing devices and an adjustable stop-valve or slide arranged for individually closing or stopping said windways for ascertaining in which of the series any sound is produced.

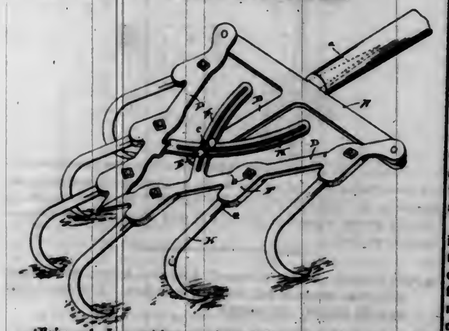
16. The combination, with the ballot-testing bed and its overlying guards having windways that lead therethrough and communicate with reeds or sound-producing devices, of a slide or adjustable stop-valve for individually closing the entering windways, means for shifting said stop-valve, and an indicating-scale to denote the official title of the candidate or candidates on that portion of the ballot corresponding with the windways over which said stop-valve is adjusted, substantially as and for the purpose set forth.

17. In a ballot-box comprising a series of indicating-registers and automatic operating mechanisms, the combination, with said registers, of a securable door or glazed shutter, a designating tablet or card supported in front of said indicating-registers, and a second door or shutter affording access to said glazed shutter, substantially as and for the purpose set forth.

482,692. DOUBLE-ACTING PUMP. GEORGE J. HETH, Dayton, Ohio, assignor of one-half to Joseph Gress, same place. Filed Oct. 7, 1891. Serial No. 408,029. (No model.)



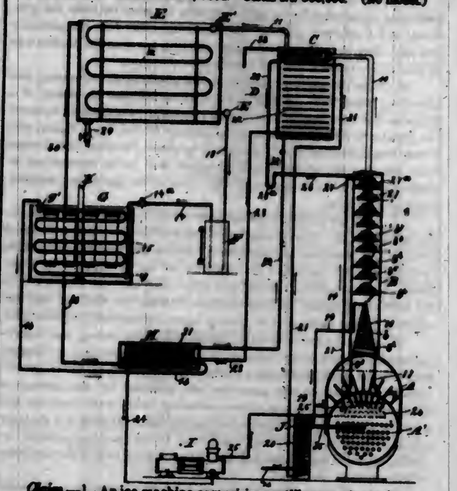
Claim.—1. In a pump, the combination of a base-plate, a supply-pipe supported thereon, a pump-cylinder and valve-chambers connected to the lower end of the supply-pipe, a piston and rod, an air-chamber supported by the base-plate, and a lateral tubular connection *c'*, connecting the supply-pipe at a point between the base-plate and pump-cylinder with the lower end of the air-chamber, said connection inclining downwardly toward the air-chamber, substantially as described.



2. In a pump, the combination, with a well-platform and a removable pump adjustably depending therefrom, said pump having its inlet-pipe formed into a hollow cone *i* at its lower end, of a stationary support within the well and a stationary suction-pipe supported thereon and carrying a conical cup, this cup being adapted to receive and closely fit the cone *i* when the pump is let down into the well, as and for the purpose described.

3. In a double-acting pump, the combination of a cylinder *g*, having its ends closed by removable heads g^2 and g^3, the latter being provided with a valved opening g^4, and a suction-pipe depending therefrom, longitudinal chambers g^5, formed integrally on the exterior of the cylinder, one of these chambers being provided with a valve-opening at its lower end, communicating by a lateral passage g^6 with the suction-pipe, and the other one being provided with two separated horizontal partitions having each an inwardly-opening valve, side plates *h h*, removably bolted over the open sides of said chambers, one of these plates having formed integrally with its exterior a vertical passage h^7, communicating at its lower end with the chamber between the valved partitions, a supply-pipe, and a piston and piston-rod, substantially as described.

482,692.



482,693. HAND-CULTIVATOR. ROBERT O. ORMSBY, Paris, Mo. Filed Dec. 21, 1891. Serial No. 415,740. (No model.)

Claim.—1. In a cultivator substantially as described, the combination, with the head-bar, the tongue extending forwardly from said head-bar, and the threaded post rising from said tongue, of the adjustable frame-bars pivotally connected to the head-bar and carrying teeth, the lateral branches extending inwardly from the adjustable frame-bars and having longitudinal slots to receive the threaded post of the tongue, and a nut for fixing said branches and the adjustable bars with respect to the head-bar and the threaded post, substantially as and for the purpose set forth.

2. In a cultivator substantially as specified, the combination, with the frame-bars, the laterally-oblique projections formed on said bars, the slots G, formed in the under side of said projections, and the vertical apertures formed in the bars at the inner end of said slots, of the teeth having their inner portions seated in the slots G and having angular branches at their inner ends taking up through the apertures in the bars, and a suitable means for securing the ends of the teeth in the apertures of the bars, substantially as specified.

482,694. ICE-MACHINE. MAGNUS J. PALMER, Gloucester, Mass., assignor of two-thirds to William H. Perkins and Loring B. Haskell, same place. Filed Mar. 28, 1891. Serial No. 386,660. (No model.)

Claim.—1. An ice-machine comprising a still, an analyzer in communication therewith, a separator in communication with the analyzer and serving to finally separate the aqueous vapor from the gas, a condenser in communication with the separator, a refrigerator in communication with the condenser, an absorber communicating with the refrigerator, a feed-water heater having a coil which is connected with the still for the passage of the weak liquor, a reducer connected with said coil for further reducing the temperature of such liquor, and connections between the reducer and the absorber, connections between the absorber and the analyzer, and means for forcing the liquor from the absorber to the analyzer, substantially as described.

2. In an ice-machine having generating, condensing, and absorbing apparatus, an analyzer consisting of a chamber into which the gas generated is directed, coils in said analyzer for receiving the strong liquor from the absorber, and a separate coil also in said analyzer and adapted to receive the weak liquor passing from the vaporizing apparatus to the absorber, substantially as described.

3. In an ice-machine, the combination, with a generator, of a chamber above the generator and communicating therewith, a series of baffle-partitions in the chamber, and a strong liquor-supply pipe entering the top of the chamber and provided with a series of coils, one above each of the baffle-partitions and discharging into the said chamber, substantially as described.

4. In an ice-machine, the combination, with a generator, of a chamber communicating with the generator, baffle-partitions in the chamber, the lower ones of which are provided with spiral depressions, and a supply-pipe entering the chamber at the top and provided with a series of coils above the upper baffle-partitions, substantially as and for the purpose specified.

5. In an ice-machine, the combination, with generating, condensing, and absorbing apparatus, of a chamber in communication with the generating apparatus, coils in said chamber at the top, to which coils the strong liquor from the absorbing apparatus is delivered, baffle-plates below said coils and formed with spiral depressions or corrugations, and a separate coil below said baffle-partitions, the latter coil being connected with the still for receiving the weak liquor passing to the absorber, substantially as described.

6. In an ice-machine, the combination, with generating, condensing, and absorbing apparatus, of a chamber, a shell or casing within said chamber and formed with outlet-openings near the bottom, and a pipe entering said shell from the generator and extending above the outlets thereof, substantially as described.

7. In an ice-machine, the combination, with generating, condensing, and absorbing apparatus, of a chamber between the generator and condenser, coils at the upper end of said chamber for receiving the strong liquor from the absorber, baffle-plates below the outlet of said coils, a conical shell at the bottom of the chamber having outlet-openings near its lower end, a pipe entering said conical shell from the generator and extending above the outlets thereof, and a helical coil around said shell, the coil forming the receiver of the weak liquor passing from the generator to the absorber, substantially as described.

8. In an ice-making machine having generating, condensing, and absorbing apparatus, the combination of a boiler and connections be-

tween the absorber and the still, said connections including a coil in the smoke-box of the boiler, substantially as described.

9. In an ice-making machine having generating, condensing, and absorbing apparatus, the combination of a chamber between the generator and condenser, a boiler, and connections between the absorber and said chamber, said connections including a coil in the smoke-box of the boiler, substantially as described.

10. In an ice-making machine having generating, condensing, and absorbing apparatus, the combination of an analyzer consisting of a chamber between the generator and condenser, connections between the generator and absorber for the passage of the weak liquor, said with the generator and projecting into the said casing, substantially as and for the purpose specified.

22. In an ice-machine, the combination, with a generator and a chamber above the generator and communicating therewith, of a conical casing projecting into the chamber and provided with apertures above its bottom and a pipe communicating with the generator and projecting into the conical casing nearly to the top thereof, substantially as herein shown and described.

23. In an ice-machine, the combination, with a generator, a chamber above the generator and communicating therewith, and an absorber, of a conical and apertured casing projecting into the chamber,

Claim.—1. In a bell adapted to be secured to the under side of a platform of a car, the combination, with a gong and a revolving frame adapted to sound the same, of actuating mechanism for operating the frame, restoring mechanism for operating the same in one direction, and a foot-piece or push-rod adapted to be operatively connected with the actuating mechanism below the platform and to extend upward through the platform for imparting motion to the actuating mechanism in opposition to the force of the restoring mechanism, substantially as set forth.

2. In bell mechanism adapted to be secured to the under side of a platform of a car, the combination, with a gong suitably supported

---

482,698. WHIPPLETREE. WILLIAM J. ROSE, Horseheads, assignor of one-half to Norris M. Compton, Sullivanville, N. Y. Filed Feb 24, 1891. Serial No. 382,622. (Model.)

tween the absorber and the still, said connections including a coil in the smoke-box of the boiler, substantially as described.

9. In an ice-making machine having generating, condensing, and absorbing apparatus, the combination of a chamber between the generator and condenser, a boiler, and connections between the absorber and said chamber, said connections including a coil in the smoke-box of the boiler, substantially as described.

10. In an ice-making machine having generating, condensing, and absorbing apparatus, the combination of an analyzer consisting of a chamber between the generator and condenser, connections between the generator and absorber for the passage of the weak liquor, said connections including a coil in the said analyzer-chamber, and connections between the absorber and chamber, said latter connections including a coil in the smoke-box of the boiler of the generator, substantially as described.

11. In an ice-machine having generating, condensing, and absorbing apparatus, the combination of an analyzer consisting of a chamber between the generator and condenser, a feed-water heater, connections between the generator and the absorber for the passage of the weak liquor, said connections including a coil in the analyzer and a coil in the feed-water heater, and connections between the absorber and the analyzer for the passage of the strong liquor, substantially as described.

12. In an ice-machine having generating, condensing, and absorbing apparatus, the combination of an analyzer consisting of a chamber between the generator and condenser, a boiler, a feed-water heater, connections between the generator and absorber for the passage of the weak liquor, said connections including a coil in the analyzer and a coil in the feed-water heater, and connections between the analyzer and absorber for conducting the strong liquor, said connections including a coil in the smoke-box of the boiler and a coil in the analyzer substantially as described.

13. In an ice-machine having generating, condensing, and absorbing apparatus, the combination of a feed-water heater for the boiler of the generator and connections between the generator and the absorber for the passage of the weak liquid, said connections including a coil in the said feed-water heater, substantially as described.

14. In an ice-machine having generating, condensing, and absorbing apparatus, the combination of a feed-water heater, a reducer receiving water from the condenser, and connections between the generator and the absorber for conveying the weak liquor, said connections including a coil in the feed-water heater and a coil in the reducer, substantially as described.

15. In an ice-machine having generating, condensing, and absorbing apparatus, the combination of a separator between the generator and the condenser for separating the aqueous vapor from the gas and a reducer for reducing the temperature of the weak liquor, the separator being arranged in the reducer and the latter forming the receiver of the cooling-water from the condenser, and connections between the generator and the absorber, said connections including a coil in the reducer, substantially as described.

16. In an ice-machine, the combination, with a generator, condenser, absorber, and separator between the generator and condenser, of a reducer in which the separator is arranged, a feed-water heater for the boiler of the generator, a coil in the feed-water heater, and connections between the coil of the feed-water heater and the generator and reducer, substantially as described.

17. In an ice-machine, the combination, with a generator, a chamber above the generator, a condenser, a separator between the generator and condenser, an absorber, and a reducer in which the separator is arranged, having a coil and connected with the absorber, of a coil in chamber above the generator and communicating with the generator, a feed-water heater for the generator, and a coil in the feed-water heater and connected with the coil in the chamber and with the coil of the reducer, substantially as herein shown and described.

18. In an ice-machine, a separator for condensing the aqueous vapor of the gas, said separator having chambers arranged in zigzag form and each provided with transverse baffle-bars comprising a single large bar alternating with two smaller bars, substantially as described.

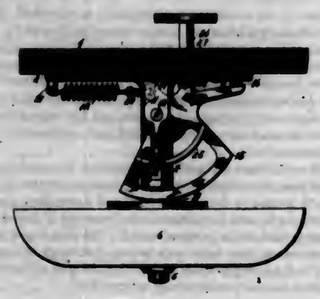
19. In an ice-machine having generating, condensing, and absorbing apparatus and a cooler or reducer for the weak liquor, a separator arranged to receive the gas, said separator being arranged in said reducer and consisting of chambers arranged in zigzag form and having transverse baffle-bars, substantially as described.

20. In an ice-machine having generating, condensing, and absorbing apparatus, the combination of a feed-water heater for the boiler of the generator, a reducer or cooler, a water-pipe coil in the absorber, connections between said coil and the body of the condenser and between the coil and the reducer, and connections between the generator and the absorber, the said connections including a coil in the feed-water heater and a coil in the reducer, substantially as described.

21. In an ice-machine, the combination, with a generator and a chamber above the generator and communicating therewith, of an apertured casing projecting into the chamber and a pipe communicating with the generator and projecting into the said casing, substantially as and for the purpose specified.

22. In an ice-machine, the combination, with a generator and a chamber above the generator and communicating therewith, of a conical casing projecting into the chamber and provided with apertures above its bottom and a pipe communicating with the generator and projecting into the conical casing nearly to the top thereof, substantially as herein shown and described.

23. In an ice-machine, the combination, with a generator, a chamber above the generator and communicating therewith, and an absorber, of a conical and apertured casing projecting into the chamber, a pipe communicating with the generator and projecting into the conical casing, and a coil around the conical casing, having one end leading into the generator and its other end in communication with the absorber, substantially as described.

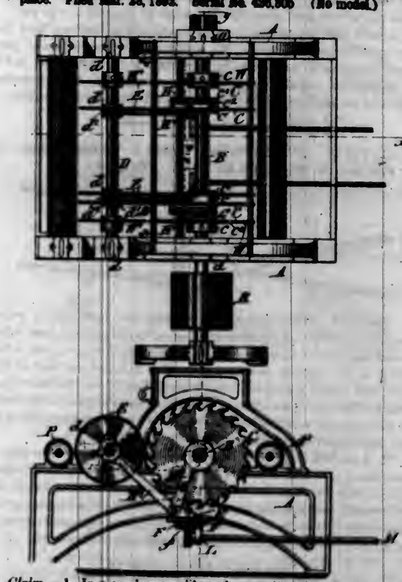


24. In an ice-machine, the combination, with a generator, a chamber above the generator and communicating therewith, and an absorber, of a series of baffle-partitions in the chamber, a pipe in communication with the absorber, projecting into the chamber and provided with a series of coils above the baffle-partitions, and a coil in the chamber below the baffle-partitions and having one end leading into the generator and its other end in communication with the absorber, substantially as herein shown and described.

482,695. SUPPORT FOR WHIRLS OF SPINDLE-BOBBINS. JOE ROBINSON and RICHARD ROBINSON, Dudley Hill, near Bradford, England, assignors of one-half to Oliver Brook Lister, same place. Filed Jan. 8, 1892. Serial No. 417,598. (No model.) Patented in England Mar. 26, 1891, No. 5,375.

Claim.—In a spinning and twisting machine, the combination of the non-rotating integral spindle A, the grooved cap D, encircling the spindle A, the balls E E, the rotating washer F, the cap for retaining the said washer in position, the tube H, and driving-whirl J, substantially as set forth.

482,696. BELL. HOWARD D. ROCKWELL, Bristol, Conn., assignor to the New Departure Bell Company, same place. Filed Apr. 7, 1892. Serial No. 428,105. (No model.)



Claim.—1. In a bell adapted to be secured to the under side of a platform of a car, the combination, with a gong and a revolving frame adapted to sound the same, of actuating mechanism for operating the frame, restoring mechanism for operating the same in one direction, and a foot-piece or push-rod adapted to be operatively connected with the actuating mechanism below the platform and to extend upward through the platform for imparting motion to the actuating mechanism in opposition to the force of the restoring mechanism, substantially as set forth.

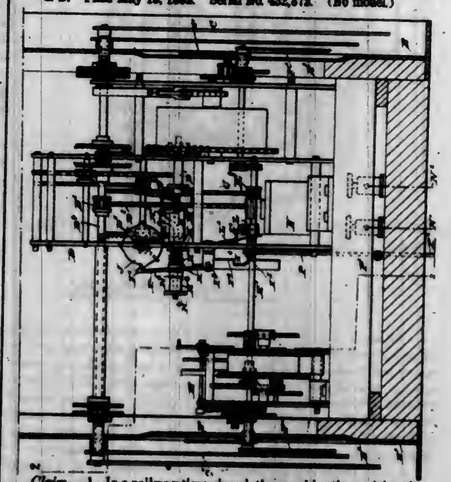
2. In bell mechanism adapted to be secured to the under side of a platform of a car, the combination, with a gong suitably supported and a revolving frame adapted to sound the same, of mechanism for actuating the frame and a foot-piece or push-rod designed to extend upward through the floor of the platform for communicating motion to the actuating mechanism, substantially as set forth.

3. In bell mechanism adapted to be secured to the under side of a platform of a car, the combination of a stud, a gong carried on the lower end thereof, a revolubile frame carried concentrically within the gong, a pinion adapted to rotate the frame, a gear meshing with the pinion, and a foot-piece or push-rod vertically movable in fixed bearings in the platform, adapted to rotate the gear, substantially as set forth.

482,697. SAWING-MACHINE. ALEXANDER ROGERS, Sr., Muskegon, Mich., assignor to the Rodgers Iron Manufacturing Company, same place. Filed Mar. 26, 1892. Serial No. 426,905. (No model.)

Claim.—1. In a sawing-machine, the combination of the arbor, the saws adjustably mounted thereon, the shaft journaled back of and parallel with the said arbor, the disks adjustably mounted thereon, and the shifters connecting each disk with a particular saw to hold the same in alignment, so that when the latter is adjusted a like adjustment will be given to the former, substantially as described.

2. In a sawing-machine, the combination of the arbor, the saw adjustably mounted thereon, the shaft journaled back of and parallel with the said arbor, the disks adjustably mounted thereon, the movable racks, and the fixed and the hinged shifters connecting, respectively, the disks and saws with the racks, each disk being so held as to be immediately back of a particular saw, so that when the latter is adjusted a like adjustment will be given to the former, substantially as described.



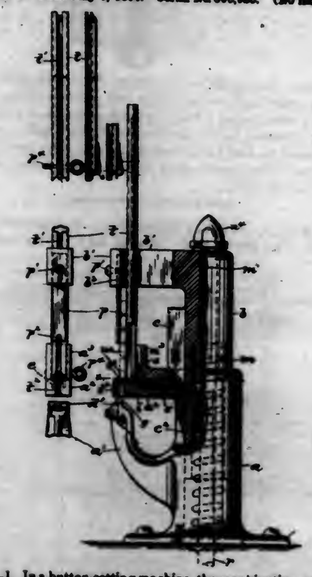
3. In a sawing-machine, the combination of the main frame, the parallel arbor and shaft journaled in the said frame, the saws and disks adjustably mounted on the said arbor and shaft, respectively, the guides secured to main frame parallel with the arbor and shaft, the movable racks carried by the guides, the fixed and hinged shifters connecting, respectively, a saw and a disk with the same rack, so that the said saw and disk will be held in alignment and both be adjusted to the same extent by the movement of the rack, substantially as described.

482,698. WHIFFLETREE. WILLIAM J. ROSS, Horseheads, assignor of one-half to Harris M. Compton, Sullivanville, N. Y. Filed Feb 24, 1891. Serial No. 382,682. (Model.)

Claim.—In a whiffletree connection, the combination of a plate, a tongue projecting from said plate and having one face beveled or inclined, a plate having a sleeve projecting therefrom and adapted to enter a perforation in the first-mentioned plate, and a loop on said plate adapted to receive said tongue, said loop being provided with an inclined inner face against which said tongue is adapted to bear, substantially as set forth.

482,699. RAILWAY TIME-SIGNAL. WALTER SCOTT, Hot Springs, S. D. Filed May 13, 1892. Serial No. 432,572. (No model.)

Claim.—1. In a railway time-signal, the combination, with a time-clock indicating the time of the day, of an auxiliary clock mechanism, an electro-magnetic releasing mechanism for the said auxiliary clock mechanism, and a stop mechanism, substantially as described, controlled from said time-clock and arranged to stop the auxiliary clock mechanism, the said stop mechanism comprising a lever fulcrumed on a wheel of the auxiliary clock mechanism and adapted to abut on an arm on one of the said wheels of the time-clock, a rod connected with the said lever, and a stop-lever connected with the said rod and adapted to engage a stop-wheel on the wind-wheel shaft of the said auxiliary clock mechanism, substantially as shown and described.



2. In a railway time-signal, a stopping mechanism comprising an arm held on a revolubile gear-wheel, a wheel mounted to turn and carrying a lever adapted to abut on the said arm, a rod connected with the said lever and fitted to slide in the hub of the said second wheel, and a stop lever connected with the said rod, substantially as shown and described.

3. In a railway time-signal, a stopping mechanism comprising an arm held on a revolubile gear-wheel, a wheel mounted to turn and carrying a lever adapted to abut on the said arm, a rod connected with the said lever and fitted to slide in the hub of the said second wheel, a stop-lever connected with the said rod, and a spring pressing on the said stop-lever, substantially as shown and described.

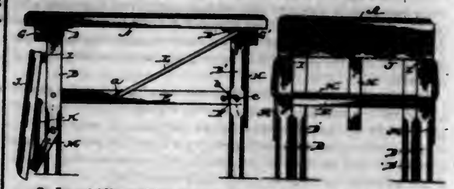
4. In a railway time-signal, a stopping mechanism comprising an arm held on a revolubile gear wheel, a wheel mounted to turn and carrying a lever adapted to abut on the said arm, a rod connected with the said lever and fitted to slide in the hub of the said second wheel, a stop-lever connected with the said rod, a spring pressing on the said stop-lever, and an armature-lever controlled by electro-magnets and having its free end extending into a notch in the said stop-lever, substantially as shown and described.

5. In a railway time-signal, the combination, with an electro-magnet, of a releasing device for the armature-lever of the said electro-magnet and comprising a plate adapted to be actuated by the wheels of the passing train, a lever engaging the said armature-lever, and intermediate mechanism for connecting the said second lever to impart a swinging motion to the latter when the said plate is pressed, substantially as shown and described.

482,700. BUTTON-SETTING MACHINE. ISAAC H. SIMON, Providence, R. I. Filed July 9, 1891. Serial No. 398,925. (No model.)

Claim.—1. In a button-setting machine, the combination, with the following stationary or fixed elements—viz., a die-carrying anvil, a button and fastener holding tube or magazine, and a holder interposed between the adjacent faces of said anvil and tube—of a suitably-mounted spring-resisted driving-head, a plunger or driver secured thereto, a yielding pusher mounted between the tube and holder, means for forcing the pusher in an endwise direction, and mechanism for intermittingly operating the driver-head, substantially as described.

2. In a button setting machine, the combination, with a spring-resisted head, a setting-plunger attached thereto, a stationary anvil, and a holder and runway, of a yielding pusher actuated and controlled by the movement of said head and having the outer or free end of the pusher arranged to engage a combined button and pronged fastener and force them laterally from the mouth of the runway into the said holder preparatory to being attached to the material *f* by the driver, substantially as described.



3. In a button-setting machine provided with a stationary anvil and holder and a chute or runway, the combination therewith of a suitably mounted and actuated head, a setting-plunger attached thereto, and a pusher actuated by said head arranged to convey a button and fastener from the runway to the holder, substantially as described.

4. In a button-setting machine, the combination, with a stationary die, holder, and tube or magazine, of a movable driver, as *p*, mounted in front of the tube to form a guide for the column of buttons mounted therein, a yielding pusher mounted to travel back and forth past the lower end of the tube or runway, and a vertically-moving head having the driver secured thereto and also arranged to actuate and control the pusher, substantially as described.

5. In a button setting machine, a suitable upsetting die or anvil, a substantially vertical button-chute for containing buttons and attached fasteners, and a reciprocating setting-plunger the rear face of which is immediately adjacent to the string of buttons in the chute, as and for the purpose set forth.

482,701. FOLDING TABLE. JAMES C. SHOW, Butler, Pa., assignor of one-half to William J. Barrickman, same place. Filed Mar. 5, 1892. Serial No. 423,908. (No model.)

Claim.—1. In a folding table, the combination, with a top and pairs of legs hinged to the under side of the top, of a shelf hinged at one end to one pair of legs and a latch consisting of a depending strip notched near the lower end, adapted to engage the fore end of the shelf and hold the same in a horizontal position, as set forth.

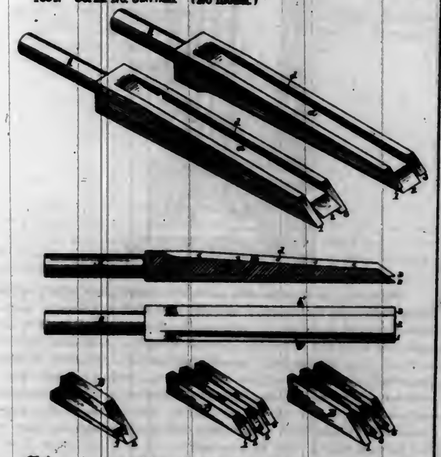
2. In a folding table substantially as described, the combination, with the top and the pair of legs B B' flexibly connected to the under side of the top and having the transverse connecting-strips at their upper ends, of the shelf pivotally connected at one end to one pair of legs and having angular recesses or notches in the corners of its opposite end to engage the other pair of legs, and the latch connected to the transverse strip of the legs B' and having a shoulder adjacent to its lower end and its inner side beveled from said end to the shoulder, substantially as and for the purpose set forth.

3. In a folding table substantially as described, the combination, with the top and the pairs of legs flexibly connected to the under side of the top, of the shelf pivotally connected at one end to one pair of legs, a latch adapted to engage the free end of the shelf and hold the same in its horizontal position, the auxiliary leaf hinged to one pair of legs, the angular bail pivotally connected at its ends to the under side of said leaf, and the straps pivotally connected to the transverse portion of the bail and to the pair of legs, substantially as specified.

482,702. CURLING-TONGS. GEORGE L. THOMPSON, Chicago, Ill. Filed Nov. 10, 1891. Serial No. 411,497. (No model.)

Claim.—1. A curling-tongs comprising two jaws, one of which forms the mandrel and the other the clasp of the tongs, said jaws being pivoted together at their inner ends, handles for the jaws, and a link pivoted at its opposite ends to the handles between the ends of the latter, one of said jaws being rigid with its handle and the other jaw being pivoted to its handle at a point between the pivot connecting the latter handle with said link and the pivot which connects the jaws with each other, substantially as described.

2. A curling-tongs comprising a cylindric jaw, a concave jaw of sheet metal, provided with ears by which it is pivoted on the cylindric jaw and with an extension or arm adjacent to its pivot, a handle for the cylindric jaw, forming an extension of the same, a handle for the concave jaw, pivotally connected with said arm or extension thereof, and a link connecting said handles, substantially as described.



482,708. REFRIGERATOR-CAR. OSCAR VERIN, New York, N. Y. Filed Sept. 21, 1891. Serial No. 406,306. (No model.)

Claim.—1. In a refrigerator-car in which a refrigerant-chamber at one end of the interior of the car is separated from the central storage-space of the car by an imperforate partition extending laterally of the car and terminating at its top and bottom edges somewhat below and above, respectively, the car-roof and car-floor, and thereby constituting continuously-open throats above and below said partition, the combination, with said partition, of an offset a^2, projecting horizontally from its lower edge on the side toward the refrigerant-chamber, and a valve C, extending laterally of the car and adapted to close said throat below said partition and eccentrically pivoted on a longitudinal axis under said offset, whereby when said valve is turned to an open position on its said axis its narrower portion will lie beneath said offset and its wider portion will project into said refrigerant-chamber, substantially as and for the purpose set forth.

2. In a refrigerator-car in which a refrigerant-chamber at one end of the interior of the car is separated from the central storage-space of the car by an imperforate partition extending laterally of the car and terminating at its top and bottom edges somewhat below and above, respectively, the car-roof and car-floor, and thereby constituting continuously-open throats above and below said partition, the combination, with said partition, of an offset a^2, projecting horizontally from its lower edge on the side toward the refrigerant-chamber and provided with a depending stop a^3 and a valve C, extending laterally of the car and adapted to close said throat below said partition and eccentrically pivoted on a longitudinal axis under said offset, together with the upwardly-projecting lip *a*, extending laterally on the car-floor below said partition, whereby when the valve is closed its receptive longitudinal edges will abut against the said stop and lip, substantially as and for the purpose set forth.

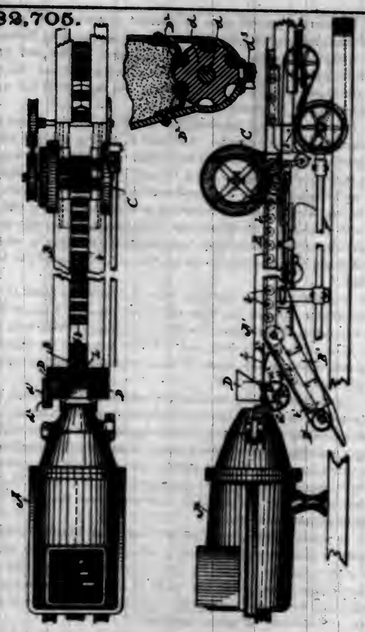
482,704. MORTISING-CHISEL. CHARLES L. WALL, Philadelphia, Pa., assignor of one-half to Jacob G. Wall, Camden, N. J. Filed July 6, 1891. Serial No. 398,523. (No model.)

Claim.—1. A mortising-chisel having a series of cutting-edges side by side, but in different longitudinal planes, and grooved longitudinally in its front face, substantially as specified.

2. A mortising-chisel having a series of cutting-edges side by side, but in different longitudinal planes, and grooved both as to its front and rear faces, substantially as specified.

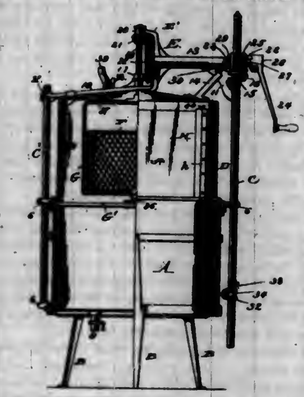
3. A mortising-chisel grooved longitudinally and having cutting-edges side by side, but in different longitudinal planes, one or more of the grooves of the chisel being contracted in width toward the cutting end of the chisel, substantially as specified.

4. A mortising-chisel having cutting-edges side by side, but in different longitudinal planes, and having grooves in its front and rear faces, both of said grooves being contracted in width toward the front or cutting end of the chisel, substantially as specified.



5. A mortising-chisel having a series of cutting-edges side by side and in different longitudinal planes, but in the same transverse plane, substantially as specified.

482,705. BRICK-SANDING MACHINE. WILLIAM W. WALLACE and RAYMOND C. PENFIELD, Willoughby, Ohio, assignors to J. W. Penfield & Son, same place. Filed Aug. 22, 1891. Serial No. 403,460. (No model.)



Claim.—1. In sanding apparatus for brick cut-off tables, the combination, with an endless apron having an inclined section, of one or more sand-containers adapted to discharge onto such inclined section of the apron, a fluted roller located in the eduction of a container, and a scraper or cut-off adapted to engage the periphery of such roller, substantially as set forth.

2. In sanding apparatus for brick cut-off tables, in combination, an endless apron having an inclined section next the brick-machine, a bridge located over such inclined section for supporting the bar of clay, sand-boxes located on either side of such bridge and adapted to discharge sand onto the inclined section of the apron, and a scraper or distributer adapted to spread the sand on the apron, substantially as set forth.

482,705.

482,706. DISH-WASHING MACHINE. STEPHEN A. WALTER, Moline, Ill. Filed Mar. 17, 1892. Serial No. 425,202. (No model.)

Claim.—1. A dish-washing machine comprising a water-tank having vertical guides on opposite sides, a vessel slidable on said guides and provided with a dish-holding basket, and means comprising an engaging rack and pinion carried by the vessel for lowering and raising said vessel into and out of the tank, substantially as herein described.

2. In a dish-washing machine, the combination of a water-tank having vertical uprights or rods, an open-bottom vessel adapted to enter said tank, a dish-holding basket supported within the vessel, suitable guides on said vessel engaging the uprights on the tank, whereby the vessel is vertically guided, a pinion, and a vertically-guided rack-bar engaged thereby for vertically moving the vessel, substantially as herein described.

3. In a dish-washing machine, the combination of a water-tank having the uprights or rods, the vessel D, having an open bottom and closed top, a support for said vessel slidable on said uprights, means for raising and lowering the vessel, a dish-holding basket supported within said vessel, a frame for supporting the basket provided with a shaft mounted in said support, and a shaft and gearing for rotating the frame and basket within said vessel, substantially as herein described.

4. In a dish-washing machine, the combination of a water-tank

having the vertical guides upon its exterior opposite sides, an open-bottom vessel adapted to enter said tank, a basket-holding frame supported within said vessel, a dish-holding basket within said frame, means for rotating the frame and its basket, and a rack and pinion by which the inner vessel is moved vertically into and out of the water-tank, substantially as herein described.

5. In a dish-washing machine, the combination of a water-tank, the vertical guides or uprights, the vessel D, having an open bottom and closed top, a casting secured to the top of the vessel for supporting the same and having the arms 10 and 11 guided upon said uprights, and a head-casting E', a basket holding frame within the vessel D, having a vertical shaft mounted in said head-casting and provided with a pinion, a shaft mounted horizontally within the arm 11 and provided with a gear-wheel, and means for rotating it, whereby the basket and its supporting-frame are rotated, substantially as herein described.

6. In a dish-washing machine, the water-tank, the vessel D, vertically adjustable thereon, the basket-holding frame, and means for rotating the same, in combination with a vertically-movable rack-bar, a pinion loose on the drive-shaft, and a clutch between the pinion and drive-shaft, whereby the vessel D may be raised and lowered, substantially as herein described.

7. In a dish-washing machine, the water-tank, the vessel D, the horizontal and vertical shafts with interposed gearing, a crank-handle on the horizontal shaft having a clutch-surface, a pinion on said shaft having a corresponding surface adapted to engage the clutch-surface of the crank-handle, a pivoted shipper for throwing the pinion into and out of engagement with the crank-handle, and a vertically-guided rack-bar engaged by the pinion to raise and lower the vessel D, substantially as herein described.

8. In a dish-washing machine, the water-tank having the uprights or guides, a vessel movable on said guides in vertical planes, and provided with means for supporting the dish-holding basket, and means for raising said vessel above the plane of the top of the water tank, whereby said vessel may swing laterally about one of the uprights as an axis, substantially as herein described.

9. In a dish-washing machine, the combination of the water-tank, the open-bottom vessel having means for supporting the basket, the casting for supporting the vessel having the arms 10 and 11 and head-casting E', the vertical and horizontal shafts, and interposed gearing for rotating the basket, the uprights on said tank extending through guides in the ends of the arms 10 and 11, and means for raising and lowering the vessel and enabling it to be swung laterally beyond the vertical plane of the tank and about one of the uprights as an axis, substantially as herein described.

10. In a dish-washing machine, the water-tank with its uprights 10 and 11, the vessel D mounted thereon and supporting the basket, means for rotating said vessel, a pivoted stop on one of the uprights, a rack-bar having a stop for engaging the pivoted stop, and a pinion and driving mechanism for operating the pinion to raise the vessel above the tank and enabling it to be swung laterally about one of the uprights as an axis, substantially as herein described.

11. In a dish-washing machine having a water-tank, a dish-holding vessel, and means for raising and lowering the same, comprising the uprights C and C', a vertically-movable rack bar provided with a stop, a pinion for moving the rack-bar, and a stop on one of the uprights engaged by the rack-bar and pivotally secured, so that it may be moved to increase the vertical movement of the vessel and to enable said vessel to be raised above the tank and to swing about one of the uprights as an axis, substantially as herein described.

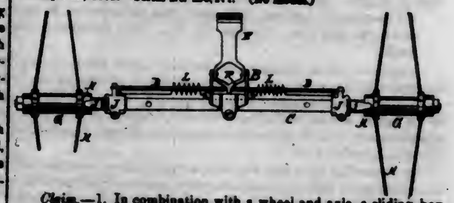
12. In a dish-washing machine, the vessel D, having a vertically-sliding door in its side, a frame within the vessel, and a basket supported therein, in combination with a water-tank and means for rotating the vessel and raising and lowering the same, substantially as herein described.

13. In a dish-washing machine, the tank, the vessel D, with its supporting-casting provided with arms 10 and 11, and the vertical and horizontal shafts and interposed gearing, in combination with a vertically-guided rack-bar, a pinion loose on said horizontal shaft, having the pins or lugs projecting from one of its faces, and a clutch-surface on its opposite face, a locking-lug on the supporting-casting, with which the pins or lugs on the pinion engage to hold the vessel elevated, a pivoted shipper for moving the pinion out of contact with said locking-lug, and a clutch-surface on the drive-shaft, into contact with which the pinion may be thrown, substantially as herein described.

14. In a dish-washing machine, the water-tank, the vessel D with its basket, and means for rotating and raising and lowering the vessel, in combination with a spray pipe or nozzle supported in the top of the vessel and connected with a hot-water supply and a valve for controlling said pipe or nozzle, substantially as herein described.

15. In a dish-washing machine, the tank, the vessel D, provided with a dish-holding basket and having pivotally-secured wings or blades on its inner surface with limiting stops therefor, whereby said wings or blades are thrown outward to direct the water inward toward the center of the vessel and upon the dishes upon one movement of the vessel and folded inward on the reverse movement, and means for rotating the basket, substantially as herein described.

482,707. CUT-OFF PISTON-VALVE. FRANK J. WATERS, Providence, R. I., assignor of one-half to George Howe, same place. Filed Apr. 25, 1892. Serial No. 430,505. (No model.)



Claim.—1. In a piston slide-valve, the combination, with a cylindrical slide-valve having solid ends and provided with central longitudinal inlet-slots and outlet-ports intermediate said slots and the end walls and a tubular valve-stem secured through a perforation in one end wall, of an independently-movable cut-off valve carried in the forward end of said valve-chamber and provided with a tubular valve-stem extending through the stem of the slide-valve, and an independently-movable cut-off valve carried in the rear portion of the slide-valve and provided with a valve-stem extending through the stem of the forward cut-off valve, as described.

2. The combination, with the slide-valve 10, longitudinally-movable in a suitable valve-casing and provided with inlet and outlet ports, and the extensions 15 and 17, provided with outlet-ports 16 and 18, of the bearing-rings 11 11, contained within circumferential depressions in the walls of the slide-valve, as described.

3. The combination, with the slide-valve 10, having solid ends and provided with the inlet-slots 12 and the outlet ports 13 and 14, the extensions 15 and 17, provided with the ports 16 and 18, and the tubular valve-stem 19, secured in a perforation in the forward end of the slide-valve, of an independently-movable cut-off valve 20, contained within the forward portion of the slide-valve and provided with a tubular valve-stem 21, extending through the stem of the slide-valve, and an independently-movable cut-off valve 22, contained within the rear portion of the slide-valve and provided with a valve-stem 23, extending through the stem of the forward cut-off valve, as described.

482,708. LOCK FOR BABY-CARRIAGES. GARDNER A. WATKINS, Gardner, Mass., assignor to Heywood Bros. & Co., same place. Filed Apr. 25, 1892. Serial No. 430,477. (No model.)

Claim.—1. In combination with a wheel and axle, a sliding box provided with one or more projecting arms or dogs constructed to engage said wheel, a pedal, a cam, and an operating-rod secured to the said sliding box and co-operating with the said cam, substantially as and for the purposes set forth.

2. In combination with the wheels and axle of a baby-carriage or other vehicle, a pair of sliding boxes carried upon the said axle and each provided with one or more projecting arms or dogs constructed to engage one of the said wheels, a pedal, a cam, and one or more operating-rods co-operating with the said cam and arranged to simultaneously throw the said dogs into or out of engagement with the said wheels, substantially as and for the purposes set forth.

3. A lock for the wheels of baby-carriages, consisting of a sliding clamp and a plate turning with one of the said wheels and provided with recesses or projections to engage the said clamp, substantially as set forth.

4. A lock for the wheels of baby-carriages, consisting of a sliding clamp and studs secured to one of the said wheels and constructed to engage the said clamp, substantially as and for the purposes set forth.

5. In combination with a wheel and axle, one or more dogs constructed to engage the said wheel, a pedal-movement secured at or near the center of the said axle, and one or more rods co-operating with the said pedal-movement to throw the said dogs into or out of engagement with the said wheel, substantially as and for the purposes set forth.

482,709. THRASHING-MACHINE. JAMES H. WILSON, Minneapolis, Minn., assignor of one-half to Thomas A. Whitworth, same place. Filed Jan. 23, 1892. Serial No. 418,897. (No model.)

Claim.—1. In a thrashing-machine, the combination, with a carrier-frame pivoted at its receiving end, of an endless separating-carrier over which the stock is passed mounted on said frame and a constantly-running shaft having an eccentric or crank connection with the delivery end of said carrier-frame for imparting to the same an oscillating motion in the vertical plane.

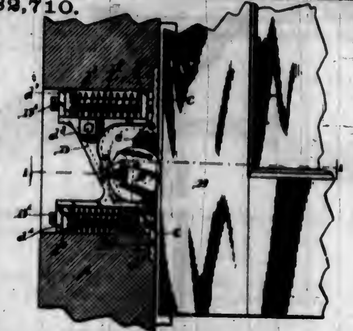
2. In a thrashing-machine, the combination, with the separating-carriers and their supporting-shafts, of shields inclosing the said shafts and supported in a fixed position with reference thereto, whereby the straw or fiber cannot wrap about the said shafts.

3. The combination, with the carrier-supporting shafts, of shields inclosing the said shafts fixed against rotary motion constructed in two sections telescoping with each other at their inner ends and working at their outer ends with a close joint against the faces of the carrier-wheels, substantially as described.

4. A carrier-shaft shield for inclosing the shaft, divided longitudinally for permitting the same to be placed over the shaft when in working position, substantially as described.

5. The combination, with the carrier-shaft, of a shield for inclosing the shaft, constructed in two telescoping sections divided longitudinally, whereby the same may be sprung over the shaft and fitted to any width of carrier without the removal of the wheels, substantially as described.

6. The combination, with the carrier-shaft, of a shield for inclosing the same, constructed in two telescoping sections divided longitudinally to permit the same to be sprung over the shaft and provided with interlocking flanges on the meeting edges of their divided parts, and means for securing the said sections against rotary motion on the shaft when in position, substantially as and for the purpose set forth.



482,710. SASH-HOLDER. WILLIAM H. DALBEY, Indianapolis, assignor of one-half to Edward D. Kingsbury, Irvington, Ind. Filed Apr. 29, 1892. Serial No. 431,142. (No model.)

Claim.—1. A sash-balance consisting of a supporting plate or frame, an adjustable frame connected therewith, and a friction-roller mounted on an inclined way in said adjustable frame, to which it is connected by means whereby its rotary motion is positively limited, substantially as set forth.

2. In a sash-balance, the combination of the main supporting plate or frame, a frame mounted to slide on guide-pins or parts connected therewith, springs interposed between a bearing-point connected with said main plate and a bearing-point on said adjustable frame, means for adjusting the tension of said springs, and a frictional bearing connected with said adjustable frame and extending through the opening in said main frame to bear against the sash, substantially as set forth.

3. In a sash-balance, the combination of the frame C, the frame D, connected therewith by means of the bolts D' and springs D^2, the roller E, mounted against the inclined wall of said frame D and connected

482,710.

therewith by means of the lugs *d*, which engage loosely with recesses in the ends of said roller, substantially as set forth.

4. In a sash-balance, the combination, with the supporting plate and frame, of a roller mounted in a recess therein, said roller being formed oblong or cam-shaped and connected loosely to the frame, whereby its motion is limited and it is held directly against the sash when in use, substantially as set forth.

482,711. EARTH-SCRAPER. JULIUS D. BRAINARD, St. Paul, Minn. Filed June 5, 1891. Serial No. 395,177. (No model.)

Claim.—1. In an earth-scraper, the scoop having the draft-bail B, pivoted thereto at its forward end, a handle-bail pivoted to the side of the scoop near its rear, cross stop-bar E', connecting the sides of said handle-bail and adapted to rest beneath the rear upper portion of the scoop to limit the upward motion of the handle-bail, and a catch pivoted to said cross stop-bar and adapted to lock said stop-bar and handle-bail to said scoop to prevent the downward movement of the handle-bail.

2. In an earth-scraper, the scoop having the draft-bail B, pivoted thereto at its forward end, a handle-bail pivoted to the scoop near its rear end, cross stop-bar E', connecting the sides of said handle-bail and adapted to rest beneath the rear portion of the scoop, rod E^3, journaled upon said stop-bar and with upturned end E^4, having catch *g*, adapted to engage with the scoop and hold the handle-bail connected thereto, downwardly-projecting portion E^4 on said rod and having adjustable eyebolt *h'*, hanger F', pivoted to said scoop, chain F^2, connecting said hanger with a clip upon the draw-bail, and chain F^3, connected by one end to said hanger by a sliding link and by the other end to said eyebolt, whereby when said scoop is overturned said handle-bail is released, substantially as and for the purpose set forth.

3. In an earth-scraper, the combination of the scoop and a handle-bail formed with flat sides and semi-tubular rear and a wood filling or core inserted into said semi-tubular portion, as and for the purpose set forth.

482,712. EXTENSION-CHANDELIER. JOSEPH R. BOSHER, Ansonia, Conn., assignor to Wallace & Sons, same place. Filed Apr. 2, 1892. Serial No. 427,563. (No model.)

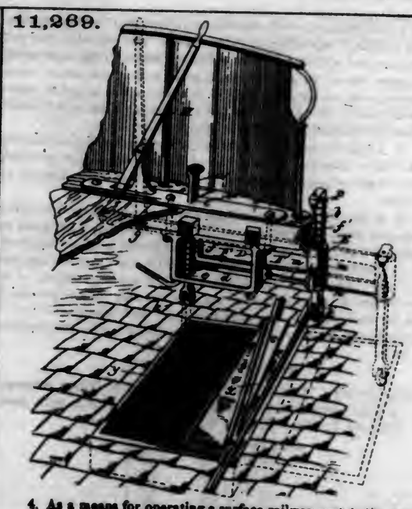
Claim.—1. In combination, in an extension-chandelier, an upper stationary tube and a lower tube movable thereon and adapted to carry the lamp-supports, an extensible suspension connection arranged within the tubes and adapted to permit their relative movement one on the other, which connection is constructed and attached to the lower tube, so as to only have movement therewith, a locking-rod projecting to within the upper tube and carried by and vertically movable on the

482,712.

lower tube, and a link located within the upper tube and arranged between the locking-rod and the suspension connections and adapted to force the rod and said connections to engaging contact with the upper tube, substantially as set forth.

2. In combination, the upper stationary tube A and the lower tube B, adjustable thereon, extensible suspension connections, as chain G and rod F, arranged within the tubes and attached to the lower tube to move only therewith, the locking-rod P, vertically movable on the lower tube and projecting to within the upper tube, the spring N, acting to press the rod upwardly, and a link or toggle Q, arranged between the rods F and P and adapted to separate said rods and permit them to come together by the vertical movement of rod P, whereby the rods are brought to engaging contact with the upper tube and released therefrom, substantially as set forth.

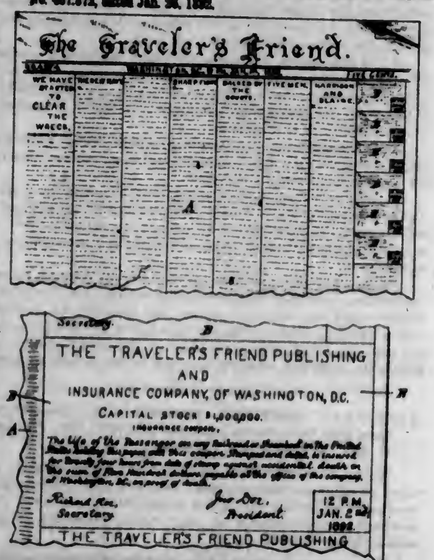
REISSUES.



11,269. SWITCH-OPERATING DEVICE FOR RAILWAY-CARS. JAMES KELLY, Pittsfield, Mass. Filed July 3, 1890. Serial No. 358,097. Original No. 427,577, dated May 13, 1890.

Claim.—1. The combination, with a suitable supporting part of a car-platform, of a supplemental support laterally movable on said primary support, a plunger vertically movable in relation to said supplemental support, and a spring for normally maintaining said plunger in its uppermost position, an appliance for causing the lateral movement of said supplemental support, a flexible connection by one end secured to a part of said plunger and thence guided to and attached to a stationary part of the car, all whereby when said supplemental support is outwardly moved said plunger will, through said flexible connection, be downwardly drawn, substantially as and for the purpose set forth.

2. The combination, with the platform of a car provided with a hanger-yoke having therein vertical perforations and the guideways *g g*, of the vertically-movable and spring-supported plunger-spindle *a* and the frame F, movable in said guideways and provided with a part B, constituting a vertical guiding-bearing, a plunger-spindle spring-supported in said latter bearing, a means for moving said frame and bearing-support laterally, and a means for securing a downward thrust of the plunger therein guided, substantially as and for the purpose set forth.



3. As a means for operating a surface-railway switch, the combination, with a car, of a laterally-movable guide-bearing and a vertically-movable plunger therein, mechanism for giving lateral movement to said guide-bearing, and connections of the plunger therewith for automatically actuating the plunger by said lateral movement of the guide, the same being adapted to actuate a platform-switch, substantially as described.

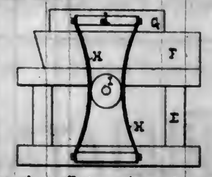
11,269.

4. As a means for operating a surface-railway switch, the combination, with two vertically-movable platforms connected with said switch and located one between the rails of the track and the other at one side of the track, of two vertically-movable plungers mounted on the car, one of said plungers being also laterally movable, and means for depressing either of said plungers, substantially as and for the purpose set forth.

11,270. MEANS FOR INSURING TRAVELERS AGAINST LOSS BY ACCIDENT. REBA H. HILL, Washington, D. C., assignor to John G. Slater, same place. Filed July 21, 1892. Serial No. 440,837. Original No. 407,872, dated Jan. 26, 1892.

Claim.—1. The herein-described means for insuring travelers and others against loss by accident, which consists of a newspaper or other periodical provided with a name or title, an address, and an issue-date and having one or more coupons containing the name of the insurer, and an accident-insurance policy specifying the time and amount beyond which the insurer is not responsible, substantially as described.

2. The herein-described means for insuring travelers and others against loss by accident, which consists of a newspaper or other periodical provided with a name or title, an address, and an issue-date and having one or more coupons containing a heading for the name and address of the insurer, and an accident-insurance policy specifying the



time and amount beyond which the insurer is not responsible, substantially as described.

3. The herein-described means for insuring travelers and others against loss by accident, which consists of a newspaper or other periodical provided with a name or title, an address, and an issue-date and having a series of coupons, each containing a heading for the name and address of the insurer, a date space, and an accident-insurance policy specifying the time and amount beyond which the insurer is not responsible, substantially as described.

4. The herein-described means for insuring travelers and others against loss by accident, which consists of a newspaper or other periodical containing columns for news, attractive reading matter, and advertisements, and a series of coupons, each of which is provided with a heading for the name and address of the insurer, and an accident-insurance policy specifying the time and amount beyond which the insurer is not responsible, substantially as described.

5. The herein-described means for insuring travelers and others against loss by accident, which consists of a newspaper or other periodical containing columns for news, attractive reading matter, and advertisements, and a series of coupons, each of which is provided with the name of the insurer, an accident-insurance policy specifying the time for and the amount of the insurance, and a space dated the same as or subsequent to that of said periodical and to that upon the coupon immediately above or preceding, substantially as described.

11,271. MECHANICAL MOVEMENT. HENRY D. MENTZEL, Baltimore, Md. Filed June 11, 1892. Serial No. 436,408. Original No. 447,964, dated Mar. 10, 1891.

Claim.—1. A toggle to effect a reciprocating motion, which consists of a spring-bar secured so as to be immovable at one end and at the other end attached to the device to be reciprocated, combined with a deflecting device which is applied to the said bar at a point between the ends thereof, substantially as and for the purpose specified.

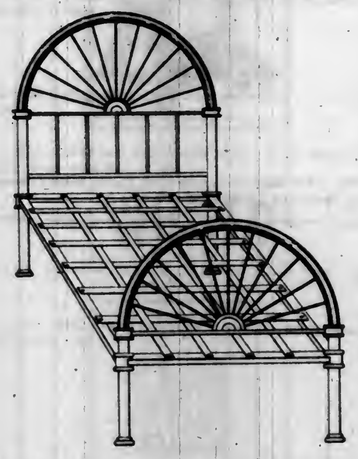
2. In combination with the frame or some other stationary part of a machine, spring-bars connected at their ends to the said frame and also to some device to be reciprocated, and means for deflecting intermediate portions of the said spring-bars in a direction practically at a right angle with the line of movement of the said driven device, substantially as and for the purpose specified.

3. In combination with the frame or some other stationary part of a machine, spring-bars connected at their ends to the said frame and also to some device to be reciprocated, and a revolable frame situated between the said bars and carrying eccentrics, whereby in the revolution of the said shaft the springs are deflected from their normal position or shape, substantially as and for the purpose specified.

4. In combination with a stationary frame and a movable frame situated above the stationary one, two separated bars or devices which connect the two frames and are held yieldingly in the position of their nearest approach to each other, and a rotating device situated between and in contact with the said connecting-bars or devices, adapted in its revolution to simultaneously and equally distend or further separate the said bars, (the said bars being adapted to return automatically to their normal position,) whereby a vertical reciprocating motion is imparted to the said movable frame, substantially as specified.

DESIGNS.

21,854. HANDLE FOR SPOONS, &c. JOHN LARSON and JAMES M. VAN SLYKE, Madison, Wis. Filed June 24, 1892. Serial No. 437,994. Term of patent 7 years.



Claim.—The design for the handles of spoons or similar articles herein shown and described.

21,855. HANDLE FOR SPOONS, &c. JOHN LARSON and JAMES M. VAN SLYKE, Madison, Wis. Filed June 27, 1892. Serial No. 438,393. Term of patent 7 years.

Claim.—The design for the handles of spoons or similar articles herein shown and described.

21,856. BEDSTEAD. FRED R. WILCOX, Syracuse, N. Y. Filed July 18, 1892. Serial No. 440,406. Term of patent 7 years.

Claim.—The design for a bedstead herein shown and described.

21,857. CARPET. HERBERT T. GEORGE, London, England, assignor to Arnold, Constable & Co., New York, N. Y. Filed Aug. 17, 1892. Serial No. 443,351. Term of patent 3½ years.

Claim.—The design for carpets, consisting of the ornamentations shown in the drawing accompanying this specification.

21,858. PATTERN FOR PRINTED FABRIC. SAMUEL M. SCHWAB, Jr., New York, N. Y. Filed June 27, 1892. Serial No. 438,317. Term of patent 7 years.

Claim.—The design for a pattern for printed fabric, substantially as herein shown and described.

21,859. BADGE. JOHN BART, Paterson, N. J. Filed July 22, 1892. Serial No. 440,960. Term of patent 3½ years.

Claim.—The design for a badge, substantially as described and shown.

TRADE-MARKS

REGISTERED SEPTEMBER 13, 1892.

21,731. A LINE OF MEDICINES. ARKWRIGHT MEDICINE CO., St. Louis, Mo. Filed June 27, 1892.

Essential feature.—An elliptical-shaped figure bearing the picture of an ark, upon which is the word "ARKWRIGHT." Used since May 19, 1892.

21,732. LARD. J. M. CERALLOS & Co., New York, N. Y. Filed Aug. 16, 1892.

CATALUÑA

Essential feature.—The word "CATALUÑA." Used since January 1, 1890.

21,733. DENTIFRICE. FLORENCE MANUFACTURING COMPANY, Northampton, Mass., New York, N. Y., and Chicago, Ill. Filed June 20, 1892.

TWIN LUXURIES.

Essential feature.—The words "TWIN LUXURIES." Used since June 1, 1892.

21,734. LIQUORS AND CORDIALS. GORDON & Co., London, England. Filed Aug. 15, 1892.

Essential feature.—The representation of a boar's head. Used since 1769.

21,735. SEEDS AND PLANTS. OASIS NURSERY COMPANY, Westbury, N. Y. Filed Aug. 12, 1892.

OASIS

Essential feature.—The word "OASIS." Used since July 15 1892.

21,736. ELECTRIC RINGS FOR THE CURE OF DISEASE. MALCOLM D. PENCHAM, New York, N. Y. Filed Aug. 16, 1892.

Essential feature.—The representation of a child holding a ring above its head. Used since June 1, 1891.

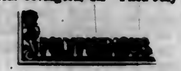
21,737. WHISKY. C. D. SMITH DRUG COMPANY, St. Joseph, Mo. Filed May 17, 1892.

THOROUGHBRED

Essential feature.—The word "THOROUGHBRED." Used since May, 1890.

21,738. LAUNDRY AND TOILET SOAP. BEACH SOAP CO., Lawrence, Mass. Filed May 31, 1892.

WORLD



Essential feature.—The word "WORLD." Used since April 1, 1881.

21,739. BEER. HAGEMANN BREWING COMPANY, San Francisco, Cal. Filed May 13, 1892.

AB

Essential feature.—The letters "A B." Used since March 1, 1862.

21,740. COTTON ROPE, CORDAGE, AND TWINE. PORTERDALE MILLS, Porterdale, near Covington, Ga. Filed July 20, 1892.

Essential feature.—The word "POLYPHEMOUS" and a representation of the one-eyed monster named "Polyphemous." Used since January 1, 1892.

21,741. NATURAL MINERAL WATER. JOHN SCHUSTTOSH, Rapid City, S. D. Filed June 13, 1892.

Essential feature.—The word "CATHOLICON" and the representation of two Indians at the rim of a basin or spring of water. Used since June 1, 1889.

21,742. VINEGAR, PICKLES, CATSUPS, CHOW-CHOW, MUSTARD, AND SAUCES. THE M. A. GEDNEY PICKLING COMPANY, Minneapolis, Minn. Filed Nov. 30, 1891.

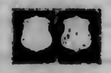
Essential feature.—The capital letter "O" inclosing the representation of a landscape and a cascade or waterfall. Used since October 1, 1891.

21,743. CANDIES. WILLIAM H. WEBER, Hazleton, Pa. Filed Aug. 19, 1892.

Essential feature.—The letters "W. H. W." in script. Used since January 1, 1887.

21,744. STRAW LUMBER. ANDREW S. CHURCH, New York, N. Y. Filed Aug. 5, 1892.

STRAWLUM



Essential feature.—The word "STRAWLUM." Used since June 1, 1892.

21,745. COTTON YARN. SANFORD SPINNING COMPANY, Fall River, Mass. Filed Aug. 20, 1892.

Essential feature.—The representation of a woman sitting at a spinning-wheel. Used since June 15, 1892.

21,746. FRANGIBLE BOXES CONTAINING POSTAGE-STAMPS FOR DELIVERY BY A COIN-CONTROLLED MACHINE. UNITED STATES POSTAGE STAMP DELIVERY COMPANY, Portland, Me., and Boston, Mass. Filed Aug. 22, 1892.

Essential feature.—The representation of the two duplicate shields arranged side by side. Used since July 1, 1892.

21,747. MACHINE FOR MAKING CALCULATIONS AND RECORDING THE RESULTS. CALCULAGRAPH COMPANY, East Orange, N. J., and New York, N. Y. Filed Aug. 22, 1892.

Calculagraph

Essential feature.—The word "CALCULAGRAPH." Used since April 15, 1891.

21,748. WHISKY. JOHN MILLER & Co., Boston, Mass. Filed Aug. 1, 1892.

MILLER'S GAME COCK

Essential feature.—The representation of the end of a whisky-barrel with a string of game birds hung in front of it and a faucet or cock in it, together with the words "MILLER'S GAME COCK, THE KING OF ALL WHISKIES." Used since June 14, 1892.

21,749. LAUNDRY SOAP. READS MANUFACTURING CO., Chicago, Ill. Filed Aug. 4, 1892.

EASY WORK

Essential feature.—The words "EASY WORK." Used since November 1, 1891.

21,750. WHEAT-FLOUR. SHELL & MAKEPEACE, Troupsburg, N. Y. Filed Aug. 30, 1892.

WHITE KID

Essential feature.—The words "WHITE KID." Used since October, 1883.

21,751. A PREPARATION OF CORN-STARCH OR CORN-FLOUR. THE NATIONAL STARCH MANUFACTURING COMPANY, Covington, Ky., and New York and Buffalo, N. Y. Filed Dec. 9, 1891.

Essential feature.—The representation of the Falls of Niagara. Used since August, 1884.

21,752. CANNED SOUP. VAN CAMP PACKING COMPANY, Indianapolis, Ind. Filed May 18, 1892.

ROYAL

Essential feature.—The word "ROYAL." Used since February 1, 1892.

21,753. CANNED TOMATOES. VAN CAMP PACKING COMPANY, Indianapolis, Ind. Filed May 18, 1892.

Essential feature.—The words "CHICAGO TRADE TOMATOES" upon the representation of a band and bar superimposed upon a vine with foliage and flowers. Used since August 1, 1889.

THE NORRIS PETERS CO., PHOTO-LITHO., WASHINGTON, D. C.

DECISIONS

OF THE

COMMISSIONER OF PATENTS

AND OF

UNITED STATES COURTS IN PATENT CASES.

COMMISSIONER'S DECISIONS.

EX PARTE HOUSTON.

Decided September 1, 1892.

PRACTICE—RULE 68.

After final rejection claims substantially different from those finally rejected cannot be admitted without the showing required by Rule 68.

ON petition.

ROLL-HOLDING PHOTOGRAPHIC APPARATUS.

Application of David H. Houston filed March 12, 1886, No. 195,019.

Messrs. Edson Bros. for the applicant.

FROTHINGHAM, *Acting Commissioner:*

This is a petition taken from the action of the Examiner refusing to incorporate into the case for the purposes of appeal certain claims as substitutes for the claims which are finally rejected.

The record shows that on March 3, 1892, claims 40, 41, 42, 43, and 45 were finally rejected; that on March 29, 1892, these claims were erased by applicant and two new ones (present claims 41 and 42) were offered; that on April 13, 1892, the Examiner stated that these claims (41 and 42) were the same as prior claims 42 and 45, respectively, and were "admitted for the purpose of appeal only." Thereafter applicant presented four claims in place of the two claims thus admitted, requesting consideration thereof. This request was refused by the Examiner. Thereupon applicant offered an amendment to the specification and six claims to be substituted in place of the two claims admitted on March 29, 1892, alleging that they were "in better form for appeal." The Examiner refused to enter this amendment including the six claims, and from this action the present petition is taken.

In the case of *ex parte Collis* (50 O. G., 992) it was held that—

1. Amendments canceling claims or presenting those rejected in better form for consideration on appeal may be admitted either before or after the appeal has been taken without a showing why they were not earlier presented.
2. An amended claim which does not differ materially from that finally rejected may be admitted for the purpose of appeal, but not otherwise, without further showing. The applicant's opinion may properly be consulted as to whether the proposed amended claim is couched in better form than the corresponding claim which has been rejected. [Syllabus.]

The words "which does not differ materially from" are to be particularly noted in said quotation. These words indicate that the amendment must be such as does not touch the merits of the case—that is, the amended claim must not differ in *substance* from the claim for which it is sought to be substituted to warrant its admission for the purpose of appeal. It is clear that if an applicant desires to substitute six claims for two claims for the purpose of appeal the four of the new claims must be different in scope from the two rejected claims.

It must be presumed, therefore, that some of the claims now sought to be introduced are materially different from those finally rejected. Such being the case, the claims cannot properly be entered except "upon a showing duly verified of good and sufficient reasons why they were not earlier presented." (Rule 68.)

It is contended on behalf of applicant that he is entitled to vary the substance of the claims standing finally rejected provided the new claims cover subject-matter the substance of which has at any time heretofore been finally rejected.

I am unable to take this view of the case, for it is held that where after final rejection it is sought to enter for the purposes of appeal claims which had been formerly erased such claims cannot properly be reinstated unless there is some showing of inadvertence, irreparable injury, or of special circumstances surrounding the case. (See *ex parte Jameson*, 43 MS. Dec., 436; *ex parte Smith*, 43 MS. Dec., 490; *ex parte Auchu*, 49 MS. Dec., 352.)

The object of Rule 68 is to put an end to proceedings in a case after final rejection except under certain specified conditions. As was said in the case of *ex parte Smith, supra*:

There must be an end somewhere to the prosecution of an application, and the Office, in consideration of the large amount of work imposed upon it and the constant struggle to keep from falling hopelessly behind, is fully justified in restricting the power to bring up for reconsideration matters which appear to have been finally disposed of. (See, also, *Bouvier, ex parte*, 42 MS. Dec., 1.)

Under all the circumstances of the case I am of the opinion that such showing has not been made as to warrant the admission of the proposed amendment.

The petition is denied.

DECISIONS OF THE U. S. COURTS.

U. S. Circuit Court—Southern District of New York.

AMERICAN SOLID LEATHER BUTTON COMPANY *v.* EMPIRE STATE NAIL COMPANY.

Decided April 22, 1892.

PATENT—INFRINGEMENT—PLEADING—DEMURRER.

A bill which sets forth a patent for a "process" of making furniture nails and then alleges that defendant, "in infringement of the aforesaid Letters Patent," did wrongfully "make, use, and vend to others to be used furniture-nails embracing the improvement set forth and claimed" in said patent, *Held* bad on demurrer as not alleging an infringement of the process.

SUIT for infringement of Letters Patent No. 270,239, issued January 9, 1883, to J. Wilson McCrillis, for an improvement in the process of manufacturing furniture-nails and analogous articles. Heard on demurrer to the bill.

STATEMENT OF THE CASE.

The bill, after alleging the issuance of the patent, averred—

that defendant, well knowing the premises and the rights secured to your orator as aforesaid, but contriving to injure your orator and to deprive it of the benefits and advantages which might and otherwise would accrue from said inventions, * * * did, * * * in violation of its rights and in infringement of the aforesaid Letters Patent No. 270,239, unlawfully and wrongfully and in defiance of the rights of your orator make, use, and vend to others to be used furniture-nails embracing * * * the improvement set forth and claimed in the aforesaid Letters Patent No. 270,239.

The bill prays that the defendant may be compelled to account for and pay to your orator the income thus unlawfully derived from the violation of the rights of your orator as above, as well as the damages therefor, and be restrained from any further violation of said rights.

Your orator prays that your honors may grant the writ of injunction restraining the defendant * * * from any construction, sale, or use in any manner of * * * furniture-nails, * * * in violation of the rights of your orator, as aforesaid, * * * and also that your honors * * * may assess, in addition to the gains and profit, * * * the damages your orator has sustained by reason of said infringement.

The bill contains a prayer for all other relief that it may be righteous in the premises to administer.

Messrs. Witter & Kenyon (*Alan D. Kenyon*, of counsel) in support of the demurrer.

The patent is for a process of manufacturing furniture-nails. Nowhere is it alleged in the bill that the defendant uses or has used this process. The bill simply alleges that defendant has made, used, and sold certain furniture-nails. The patent being for a process and not for a product, the use or sale of the product (furniture-nails) is of course not an infringement. (*Merrill* v. *Yeomans*, 94 U. S., 568-574; *Dittmar* v. *Rix*, 1 Fed. Rep., 342.) Nor is the making of furniture-nails, even of exactly the same kind as that made by the patented process, unless all the steps of the process are used. (*Hammerschlag* v. *Garrett*, 10 Fed. Rep., 479; *Dittmar* v. *Rix*, 1 Fed. Rep., 342; *Fermentation Co.* v. *Maus*, 20 Fed., Rep. 725.)

Mr. Rowland Cox opposed.

A general charge of infringement is sufficient. (*McCoy* v. *Nelson*, 121 U. S., 486; 7 Sup. Ct. Rep., 1000; *American Bell Tel. Co.* v. *Southern Tel. Co.*, 34 Fed. Rep, 804.) In the latter case there was a general charge of infringement of a patent "covering both a process and an apparatus." The court overruled the demurrer, citing numerous cases, (which see,) including *McCoy* v. *Nelson*, *supra*. In *Haven* v. *Brown* (6 Fish. Pat. Cas., 414) Mr. Justice Swayne states the rule, as follows:

The bill merely declares * * * that the patent is for an improvement in bedstead-fastenings, and in the same general terms it alleges infringement.

He then proceeds to say that—

upon the general principles of equity pleading the bill would be bad.

But he overruled the demurrer, adding:

The form of the bill in the present case rests upon a foundation too deep to be disturbed. We therefore feel bound to hold that the demurrer must on authority, though not on principle, be overruled.

In numerous other cases the same doctrine is referred to as one that cannot be disturbed. (3 Rob. Pat., 430.)

If there were here any doubt, it would be cured by the profert of the patent plus the allegation that it has been infringed.

WALLACE, *J.*:

The demurrer is sustained because the bill does not contain any sufficient averment of infringement by the defendant of the process of complainant's patent.

Bill may be amended upon payment of costs.

U. S. Circuit Court—District of New Jersey.

UNITED STATES ELECTRIC LIGHTING COMPANY *v.* EDISON LAMP COMPANY.

Decided June 20, 1892.

1. PATENTS FOR INVENTIONS—ANTICIPATION.
   Letters Patent No. 306,980, October 21, 1884, to Edward Weston, for an improvement in the process of manufacturing carbon conductors for incandescent electric lamps, *Held* anticipated by Letters Patent No. 211,262, issued January 7, 1879, to William E. Sawyer and Albon Man, for the same invention.
2. SAME—PRIOR PUBLIC USE.
   Independently of the question as to priority of invention, the Weston patent is invalid because of two years' public use, prior to his application, by Sawyer and Man in their workshop in New York city.

SUIT by the United States Electric Lighting Company against the Edison Lamp Company for infringement of a patent.

Messrs. Kerr & Curtis and *Mr. George H. Christie* for the complainant.

Messrs. Eaton & Lewis and *Mr. Frederic H. Betts* for the defendant.

ACHESON, *J.*:

This suit is brought for the infringement of Letters Patent of the United States No. 306,980, dated October 21, 1884, granted to Edward Weston upon an application filed May 27, 1881, for an improvement in the process of manufacturing carbon conductors for incandescent electric lamps. The nature of the invention is sufficiently indicated by the claim, which is as follows:

The improvement in the art of making carbon conductors for incandescent lamps, which consists in first forming a carbon core or base, and then building up said core with carbon obtained and deposited upon the same by and during the operation of electrically heating said core, while surrounded by or saturated with a carbonaceous substance, substantially as hereinbefore set forth.

A number of defenses to the suit have been interposed; but it seems to me to be necessary to consider only two of them, namely: first, the prior Letters Patent of the United States No. 211,262, for the same invention, dated January 7, 1879, granted to William E. Sawyer and Albon Man, upon an application filed October 15, 1878, and, second, the alleged public use of the invention by Sawyer and Man and those acting under them for more than two years before Weston's application for a patent. That the invention set forth in Weston's specification and claim was fully disclosed by Sawyer and Man in their above-recited earlier patent is clear. It is shown, also, beyond contestation that Sawyer and Man made and perfected the invention and actually reduced it to practical use in the month of March, 1878. Nevertheless, the plaintiff, the assignee of Weston, asserts priority of invention and right for Weston over Sawyer and Man, and it appears that in an interference proceeding in the

Patent Office between these inventors the decision of the Office was in favor of Weston upon the question of priority. The proofs in that proceeding, which were taken in the year 1882, have been brought into this case by stipulation, and some other additional evidence upon that question has been introduced.

Weston testifies that he commenced his experiments in treating carbons by electrically heating them in a carbon liquid at Newark, N. J., "some little time prior to the Centennial in 1876"—he "cannot, however, fix the precise date"—at his laboratory No. 194 Eighth avenue, and continued these experiments there, and afterward, with some described modifications, at 228 Plane street, whither he removed "in the early part of 1877—about the month of April, 1877;" that "soon after" his removal to Plane street, "about the month of June or July, 1877—it may have been a little later, or possibly a little earlier, but was not very far from the date named"—he transferred part of his apparatus, in order to have the advantage of steam-power, to the basement of the shop of the Weston Dynamo Electric Machine Company, at 284 Washington street. This building had originally been a Jewish synagogue, and hence is designated by the witnesses as the "church." Mr. Weston states that with his facilities in the "basement of the church" he there succeeded in obtaining carbons very much superior to anything he had before obtained. Upon that subject he says:

They were extremely hard; in fact, so hard that they suggested to my mind the possibility of preparing in this way black diamonds. They were so hard and dense that I took particular pains to show them to Mr. Edward E. Quimby, and I handed him a file to test them with, and he also endeavored to scratch the glass in one of the windows in the rear end basement of the factory. Mr. Quimby was so much struck by the metallic appearance of the carbon, its density and hardness, that he asked me to give him some samples, which I did at that time—namely, about the middle of the year 1877. From that time I saw that I had overcome all trouble relating to the preparation of carbons for incandescent lamps.

Mr. Weston then describes the process which he used most and preferred at that time. Being asked, upon his examination in chief, to state generally to what extent and under what circumstances he used this process of preparing carbons subsequently to the year 1877, he answered:

I have used the process more or less from that time up to the present time [*i. e.*, March, 1892] whenever I did any work on incandescent electric lighting, and I have done a great deal in this direction. After perfecting the carbons I still found there were numerous conditions to be met in order to secure a commercially successful incandescent electric lamp, and with this idea in view I worked from time to time, as time and circumstances would permit, trying to overcome the other difficulties. During this time I used almost exclusively the carbons prepared by treating at a high temperature in the presence of hydrocarbon gas or oil.

Being asked upon his cross-examination how many carbons he treated after he commenced work in the basement of the church, Mr. Weston answered:

Quite a number. I kept no record of the quantity treated. There were several dozens.

In response to the inquiry how long he continued to treat carbons in the basement of the church, he stated:

Until the removal of my laboratory to a separate building next door to the factory. I cannot fix the date without reference to the books of the company, as I took no pains to refresh my memory in regard to this matter. My impression is, however, that it was in the early part of the following year.

He added that he could and would ascertain the exact date of the removal of his laboratory from the basement of the church to the building next door, for the company had provided him the room in the building next door "and engaged to pay the rent." Afterward, when his examination was resumed, Mr. Weston stated:

I cannot fix the precise date when I moved into the laboratory next door to the church; but the first entry I can find on the books in regard to rent paid is on the 1st day of October, 1878.

Edward E. Quimby, (a solicitor of patents,) after fixing his first acquaintance with Mr. Weston as having occurred in May, 1877, testifies thus:

Mr. Weston did describe to me his discovery that a deposit of carbon was formed upon a carbon pencil maintained in a condition of incandescence by the passage of an electric current through it while it was surrounded by a hydrocarbon atmosphere. He brought to my office and gave me samples of such deposits, which were in small particles, but of extraordinary hardness. This communication was made to me by Mr. Weston, according to the best of my recollection, within six months of the date of my first acquaintance with him, while I was engaged in perfecting some of his older patents by reissuing them.

Mr. Quimby then states that a day or two later he visited Mr. Weston's laboratory on Washington street, in the basement of the old church, "and witnessed the operation of his method of obtaining such deposits;" and he describes the apparatus used and the operation. Upon his cross-examination, Mr. Quimby states that he has no memoranda in writing by which he can fix the date of this visit to Mr. Weston's laboratory, but says it—

was during the early part of my acquaintance with him; it was within six months of the time of my first seeing him, and was before cold weather set in.

He says:

Mr. Weston moved his laboratory into the adjoining building some time after the experiments to which I have referred, and after that removal my visits to his laboratory were more frequent than before.

He states he has no recollection when that removal took place. Being asked if, after the removal, he saw any incandescent electric lamps in operation in Mr. Weston's laboratory, he answered:

I cannot say. My memory is wholly at fault in the matter.

And being further asked when, after the experiments he testified about, he first saw any incandescent electric lamp made by or for Mr. Weston having an illuminating-conductor of this treated carbon, Mr. Quimby answered:

It is impossible for me to say. I cannot recollect.

Levi Broadbent, who was a foreman in the employ of the Weston Dynamo Electric Machine Company from July, 1877, to September, 1879, testifies that upon one occasion when passing through Mr. Weston's laboratory he—

saw him treating or having carbons in a globe filled with oil and running a current of electricity through them.

This, he says, occurred—

between the month of July, 1877, and the 1st of January, 1878. I can't positively fix the date; it was between these points of time.

He states that Weston subsequently spoke to him about the matter—

and said that the carbon that had been in the oil and the electricity run through it was very hard, and so that a file would not touch it.

Upon his cross-examination Mr. Broadbent testifies thus:

Question. How do you know that it was previous to January, 1878? By what circumstance do you fix on that date as being the date previous to which you saw Mr. Weston treating the carbon?
Answer. I know it by the circumstance that Mr. Weston's new laboratory was finished in December, 1877; it was in the laboratory I saw this.
Ques. Was it in the laboratory in the basement of the church?
Ans. Yes, sir; we used to call it the "church;" it was a church once.
Ques. And you saw Mr. Weston treat these carbons in that laboratory for the first time, as I understand you?
Ans. Yes, sir.
Ques. When did he move into that laboratory?

Ans. I couldn't place the date exactly; but it was just after it was finished. It was in December, 1877.

The substance of the testimony by which it is sought to anticipate Sawyer and Man has been above set forth. Is the evidence under all the circumstances sufficient to establish a completed invention by Weston prior to March, 1878? Leaving out of view the negative testimony of the defendant's witnesses, who naturally would know something of Weston's doings, the plaintiff's own evidence impresses me as singularly vague. Did Weston's operations as described by himself and his witnesses amount to anything more than experiments? Could the invention here in question be derived from anything Quimby or Broadbent saw Weston do or learned from him any more than it could have been deduced from the Despretz publication of 1849? Do the proofs convincingly show a perfected invention made by Weston in the summer of 1877, as alleged by him. Then, again, is there any reliable testimony as to the all-important matter of time? Here the plaintiff's case rests altogether upon mere recollection, which is always unreliable as respects dates. The only date certainly fixed is October 1, 1878, when rent was paid for the premises adjoining the basement of the "church," so called; but the book-entry of that payment strongly suggests that the removal of Weston's laboratory from that basement to the building next door took place, not in the early part of the year 1878, according Weston's "impression," but late in that year, and that conclusion would shake the whole fabric of the plaintiff's case. In this connection the testimony of Broadbent, quoted above, deserves the most serious consideration, for that witness seems to testify that Weston did not go into his laboratory in the basement of the church until December, 1877.

How can Weston's assertion that from "about the middle of the year 1877" he saw that he had "overcome all trouble relating to the preparation of carbons for incandescent lamps" be satisfactorily reconciled with his subsequent conduct, his silence as to an invention then deemed so important, and his supineness? His great delay in applying for a patent for this process is the more extraordinary when we discover from the proofs that in the years 1878 and 1879 he took out or applied for no less than ten patents for various other inventions. Furthermore, it is a significant fact that when Weston eventually moved, on May 27, 1881, his application for a patent was made in the interest of the plaintiff company (which had become the owner of his inventions) after the plaintiff had failed in its negotiations to purchase the Sawyer and Man patent or acquire a license under the same. To overthrow the prior patent of Sawyer and Man, which had issued so early as January 7, 1879, and was immediately followed by uncommon publicity, the proof of anticipation by Weston should be at least positive, unequivocal, and convincing. (*Cantrell* v. *Wallick*, 117 U. S., 689, 695; 6 Sup. Ct. Rep., 970; *Clark Thread Co.* v. *Willimantic Linen Co.*, 140 U. S., 481, 492; 11 Sup. Ct. Rep., 846.) Taking the proofs as a whole, they fail to satisfy me that Weston's alleged invention preceded that of Sawyer and Man.

But whatever conclusion upon the question of priority may be adopted, at any rate, under the proofs, the defense of two years' prior public use of the invention before the application for the patent in suit rests upon impregnable ground. A public use does not depend upon the number of persons to whom the use is known, and it is enough if a single device embodying the invention is publicly used by even one person, (*Egbert* v. *Lippmann*, 104 U. S., 333;) and a public use of the invention more than two years before the application for a patent, although without the consent of the inventor, invalidates the patent. (*Andrews* v. *Hovey*, 123 U. S., 267, 274; 8 Sup. Ct. Rep., 101, and 124 U. S., 694; 8 Sup. Ct. Rep., 676.) In March, 1878, when Sawyer and Man made the invention here in controversy, they were engaged in completing an incandescent electric lamp of their devising, which they perfected to their satisfaction and patented in June, 1878. Between March, 1878, and May, 1879, they and their assigns made a large number of these lamps, and continuously used therein for incandescent electric lighting, at their workshop in the city of New York, carbons prepared by the method described in and covered by their patent of January 7, 1879, and during that period they there exhibited both the actual treatment of the carbons by the patented method and the use thereof in their lamps to large numbers of persons besides the workmen in their employ. Clearly this use of the invention, as shown by the proofs, was a public and practical use. It is here worthy of remark that the *Scientific American*, in its issue of March 8, 1879, published a clear description of the process of treating carbons as practiced by Sawyer and Man and as set out in their patent. Whatever experiments Sawyer and Man may have made after March, 1878, concerned their lamp with a view of increasing its efficiency and commercial value and did not relate to the carbon treatment itself, which was perfected in March, 1878, and required no subsequent test. Now, it may be that the Sawyer and Man lamp did not prove the success the inventors supposed it to be and that no perfect incandescent electric lamp was produced until the fall of 1880; but still the Sawyer and Man lamp was actually operative and had some practical utility. That it was not a commercial success is not here a controlling consideration. The material fact is that the method invented and patented by Sawyer and Man for the treatment of carbons was put to successful practical use by them in their lamp. No doubt the commercial value of the invention depended much upon the production of a perfect incandescent electric lamp; but, nevertheless, the treatment of carbons by electrically heating them while surrounded by or saturated with a carbon liquid was a distinct invention. It was an independent and valuable contribution to the general art of electric lighting. This, indeed, is the position of the plaintiff company, for it alleges that Weston made and perfected the invention as early as the summer of 1877, before a perfectly-successful incandescent electric lamp had been devised by any one.

I have only to add that it is quite evident from the proofs that the issue of a patent to Weston was inadvertently made, in disregard of the expressed views

of the Examiner of Interferences and the Examiners-in-Chief that Weston was precluded from the grant of a patent by reason of the statutory bar of two years' public use, disclosed by the evidence in the interference proceedings in the Patent Office.

For the reasons above given and without reference to other alleged defenses the bill of complaint must be dismissed.

Let a decree be drawn dismissing the bill, with costs.

U. S. Circuit Court—District of Maryland.

YOUNG *et al.* *v.* BALTIMORE COUNTY HEDGE AND WIRE FENCE COMPANY.

Decided June 21, 1892.

PATENTS FOR INVENTIONS—LIMITATION OF CLAIM—HEDGE FENCES.

Letters Patent No. 254,085, to Wesley Young, February 21, 1882, for an improvement in plashed hedges, *Held* to be for a wire extending along the base of a hedge to prevent the passage of small animals, and further *Held* that the patent is void for want of patentability, it being old to use such a wire to keep the plants in position and to give the hedge increased lateral strength, and it being old to use a wire along the base of an ordinary fence to prevent the passage of small animals.

IN equity. Bill by Wesley Young and the Maryland Hedge and Wire Fence Company against the Baltimore County Hedge and Wire Fence Company for infringement of patent. Bill dismissed.

Messrs. Wood & Boyd, for the complainants.

Mr. G. L. Van Bibber, *Mr. M. Bailey*, and *Mr. W. F. Mitchell* for the defendant.

MORRIS, *J.*:

The bill of complaint in this case alleged the infringement of four patents; but the bill has been dismissed as to all except the patent to Wesley Young, No. 254,085, dated February 21, 1882. That patent is for an improvement in "plashed hedges." The claim is a narrow one, for a single and simple improvement. The patentee, Young, describes the method of plashing hedge fences as practiced at the date of his application, which he says is by bending over the plant in the line of the fence, the bending taking place in the root, and securing the first plant in its bent position by fastening it to a stake. Then a piece of wire is passed under the first plant quite near the ground and crossed and twisted around the next plant, and in like manner around as many succeeding plants as the wire is capable of holding in their proper relative positions, it being intended that the wire shall cross the plants approximately at right angles to their inclined positions and so that every plant is held down in its inclined position and in the plane of the fence. In describing this method, which he states was then in use, he says:

Or one or more of the lines of wire may be stretched first, and the plants bent down and secured in position by attaching them to the wire.

He further says:

The present invention looks to the still further development of this branch of industry, and has for its object to provide a hedge fence, which, from the time it is first plashed, will present a strong and impassable barrier to all ordinary stock which is permitted to run at large, and the proper growth of which hedge will not be interfered with by the causes ordinarily existing. * * *

In order to give the fence the requisite degree of lateral strength at the start, I apply a continuous horizontal line or lines of wire or other material along it from end to end, securing the said line or lines to the plants by staples, nails or loops or other suitable fastenings, as shown in the drawing, or by interweaving it with the plants, as shown. I preferably apply two lines of wire, one near the upper ends of the plants after they are plashed and cut off to the proper height, and one near their base, as represented in the drawing, though other intermediate lines of wire may also be employed, if thought necessary. I also prefer to employ barbed wire, as that affords additional effectiveness as a barrier to stock; but plain wire will answer reasonably well. * * *

The lower wire is indispensable, for by its aid the openings between the plants are closed at the bottom from the start, and small pigs are prevented from passing through, thereby enabling the side shoots of the plants to extend out and close the openings effectively, making a firm, close fence as soon as the plashing is done. This lower wire should be placed quite near the surface of the ground to be most effective.

It will be seen that additional lateral strength of the fence is secured by the employment of the two lines of wire, one at the top and another at the bottom, with or without intermediate lines, and, secondly, that the effectual closing of the lower intervals of the fence to enable the shoots to properly develop is accomplished by the lower wire alone.

I am aware that it is not new to place a line of barbed wire along the bottom of a post-and-board fence for the purpose of preventing small animals from passing under the fence; also, that it is not new to interweave in the upper portion of a live hedge fence withes or branches not a part of the growing fence, and such construction I do not claim as my invention. Neither do I claim a hedge fence on which the plants are plashed together by means of a continuous line of wire wound around them from one to another near the upper ends, as shown in patent to D. M. Kirkbridge, May 30, 1876.

The claims are:

1. A hedge fence composed of live plants bent down in the plane of the fence and held in place by suitable fastenings, and having a line of wire extending along the base of the plants near the ground, said wire being secured to the plants and operating to prevent the passage through the spaces between the plants of small stock before said spaces have become closed or protected by the growth of the shoots, substantially as described.

2. A hedge fence composed of live plants bent down in the plane of the fence and held in place by suitable fastenings, and having a horizontal line of wire extending along the upper portion of the plants, and secured thereto to give increased lateral strength, and having also a horizontal line of wire extending along and secured to the bases of the plants, for preventing the passage through the spaces between the plants of small stock before said spaces have become closed or protected by the growth of the side shoots, substantially as described.

The claims of the original application in the Patent Office were broader; but upon objection and a citation from the *Gardener's Chronicle* for 1873, page 1115, and for 1875, page 458, the applicant modified his claim so as only to cover a line of wire extending along the base of the plants near the ground, and secured to the plants, and operating to prevent the passage of small animals through the spaces between the plants before the spaces have become closed by the growth of shoots. The *Gardener's Chronicle* for 1875 describes an improvement in hedge culture by driving small stakes along the center of the hedge six to eight feet apart, to which a line of wire is stapled and drawn tight by being attached at the ends to gateways when they occur in the line of the fence. It is said:

The principal uses and advantages of the wire thus inserted are to constitute a permanent backbone, as it were, to the hedge, thereby preventing animals, as cattle and horses, from pushing themselves through, which they are very liable to do at all thin and weak parts of a hedge. When once the hedge grows over and fairly covers the wire, the posts are of little further use, and do not require renewal, as the fence itself sufficiently supports the wire and keeps it ever afterward in its place.

The only differences between what is described in the publication from which the above is taken and what is claimed in Young's patent is that by Young's method it is stated that the wire is to be used earlier in the life of the hedge—that is to say, when it is first plashed—and that the lower wire is to be placed quite near the ground, so as to intercept small animals before the lowest shoots are sufficiently grown to make a barrier. It is not said in Young's method whether the wires are to be stretched taut between convenient posts or not; but it is obvious that in practice this would be done if practicable. In Young's method the wires are to be stapled or otherwise suitably fastened to the plants, and in the published method the wires were at first to be stapled to the small posts; but in the end the plants supported the wire.

At the threshold of the consideration of the patentability of these matters connected with growing-hedge fences it suggests itself that the plashing of the hedges—that is, the bending over of the plants at the roots in the line of the fence, all at the same angle, and securing them in that position—and the discovery of the fact that growing in that position the shoots tend to spread out lower down, and the shoots of the lower inclined plants tend to interlace with those of the upper plants, so as to form an effective vigorously-growing-hedge fence, all this to the first discoverer, and also the best means of accomplishing it, might fairly be matters requiring invention and proper to be protected by a patent; but it also suggests itself that after this method of growing a hedge was known the use in connection with it of anything in such common use and so obvious as a line of wire along the hedge or interweaved in the hedge for the purposes of a fence merely and to prevent animals from passing through where the hedge was too weak itself to prevent them could not be a discovery or require invention.

It is said that no one before Young systematically used the lower wire for this purpose or taught the public how essentially important it was to the proper growth of the lower shoots of the plants that they should be thus protected, and no one before Young, it is said, for this reason was uniformly successful in growing at a moderate cost an effective hedge fence; but this is not showing Young to have been an inventor, but merely that he does systematically and thoroughly and with a sense of its importance what others had the means of doing and knew how to do, but did not appreciate the importance of, just as a man may know that a certain treatment is good for his fruit-trees, but does not obtain the best results because he does not use it intelligently at the right times and in the best manner.

The use of a wire along the base of an ordinary fence is admitted in the specification to be a common means of preventing the passage of small animals. Such a wire would be fastened in any suitable way, either to the fence itself or to stakes put down for that purpose, and it would either be stretched taut or interweaved, as might be convenient. It would with many ornamental fences or palings answer the double purpose of preventing the animals passing in and out and also of preventing the injury to the fence itself from the abrasion and forcing asunder which results when animals are frequently pushing through and enlarging an opening. In the growing-hedge fence the lower wire performs exactly these same uses. It is more important and the consequences of neglecting its timely use are more serious just to the extent that a growing hedge is more easily spoiled and more difficult to repair than an ordinary dead fence. In Young's patent the only use claimed for the lower wire is as a defense against animals, and he cannot be allowed to claim it generally, as he abandoned and erased from his application those claims in which he had attempted to cover the use of the wire to keep the plants in position and to give the hedge increased lateral strength. He was obliged to make this abandonment because he recited in his specification that one of the known ways of securing the plashed plants in position was by attaching them to a stretched line of wire, and the *Gardener's Chronicle* disclosed that it was old to use a stretched wire to give increased lateral strength while the hedge-plants were young and weak.

The decree of 19th June, 1891, in the Circuit Court of the United States for the Western Division of the Western District of Tennessee, called in this case the "Memphis decree," adjudges this patent to be valid, but confines it to a horizontal wire—

secured to the plants without any extraneous support.

If the claim of the patent is to be read with this restriction, then the respondents in this case do not infringe, as it is proved that the horizontal wires used by them remain stretched taut between posts or trees or gateways or whatever stationary objects in the line of the fence they can be conveniently attached to, and after they are thus stretched the plants are inclined and secured in their inclined position by being fastened to the stretched wires, using the diagonal wires only when necessary to keep a plant in position which was more than ordinarily stiff and refractory; but I think in the present case it has been shown by the complainants' witnesses, and notably by their expert witness, See, that the end attachments of the horizontal wires have no bearing upon the construction of the claims of the patent; and I conclude, as does complainants' witness, that at least a preliminary use of a post or some fixed object to which the ends of the wire might be fastened is clearly implied by the specification of the patent itself.

Upon the whole case my conclusion is that, in view of what had been before done, the claim for a line of wire secured to the plants near the ground to prevent the passage of animals is void for want of patentability, and that, however beneficial its timely use as pointed out by Young may be, it is an improvement in the art of hedge-making, resulting, not from invention or discovery, but from the more systematic and thorough attention to the fact that the young shoots at the base of the plants ought to be protected against small animals until they are sufficiently grown to be a barrier themselves.

Bill dismissed.

World's Columbian Exposition.

DEPARTMENT OF THE INTERIOR,
UNITED STATES PATENT OFFICE,
Washington, D. C., March 8, 1892.

To the Inventors and Manufacturers of the United States:

It is the intention of the Patent Office to make at the World's Columbian Exposition at Chicago in 1893 an exhibit which will show that great advance in the several arts which is due, in large measure, to the encouragement and support afforded by our patent system. This exhibit is to consist of models of patented inventions, which will be carefully selected, to show as far as is possible the inception of each art, the stages through which the art has advanced, and the final development reached at the present time. This display of typical inventions, embodied in concrete form and properly arranged, will, it is believed, constitute a grand historical exhibit of the progress of the useful arts and one which will be of great interest not only to inventors and manufacturers, but to the public generally.

The Office collection of models has been seriously impaired by fire, and is further incomplete by reason of the fact that models have not generally been required or received during the last ten years. The Office is not, therefore, in possession of the models of many valuable inventions which might properly be included in such an exhibit, and without which indeed, the exhibit would be incomplete. The limited appropriation for this exhibit will not permit the Office to make such models. An urgent appeal is therefore made to all inventors and manufacturers to come to the assistance of the Office in this matter, either by loans of models already built or by the construction of such models not in the possession of the Office as should properly be placed in such a collection. Of course, where models are loaned to the Office all proper credit will be given both in labels and catalogues to the parties by whom the loans are made, and such disposition will be made of the models after the close of the exhibit as the owners shall direct. Many inventors and manufacturers have already indicated a willingness to co-operate with the Office in this matter, and it is confidently expected that such a response will be made to this general appeal as will assure the unparalleled success of this attempt to graphically and concretely show the development of American invention.

W. E. SIMONDS,
Commissioner.

Protection of Foreign Exhibitors.

DEPARTMENT OF STATE,
Washington, D. C., July 30, 1892.

To the Diplomatic and Consular Officers of the United States:

GENTLEMEN: I subjoin a transcript of the act of Congress approved April 6, 1892, Public No. 29, entitled "An act to protect foreign exhibitors from prosecution for exhibiting wares protected by American patents and trade-marks," which reads as follows:

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, That no citizen of any other country shall be held liable for the infringement of any patent granted by the United States, or of any trade-mark or label registered in the United States, where the act complained of is or shall be performed in connection with the exhibition of any article or thing at the World's Columbian Exposition at Chicago.

You will transmit copies of this circular to the government of the country to which you are accredited, and ask that it be given the widest possible circulation for the information of those directly concerned.

I am, gentlemen, your obedient servant,

JOHN W. FOSTER,
Secretary of State.

DEPARTMENT OF THE INTERIOR,
OFFICE OF THE SECRETARY,
Washington, D. C., August 4, 1892.

Official copy to the Commissioner of Patents for his information and guidance.

E. M. DAWSON,
Chief Clerk.

Indexes to Foreign Patents.

The following indexes to foreign patents have been translated, compiled, and published under the authority of the Commissioner of Patents, and may be obtained as a Patent Office publication at the prices given below:

INDEX TO FRENCH PATENTS, 1791 to 1879, inclusive, (subject-matter,) one volume, 935 pages, bound in cloth $10 00

INDEX TO ITALIAN PATENTS, 1848 to May 1, 1892, (subject-matter,) one volume, 120 pages—

Bound half-turkey	2 50
Bound in cloth	1 25
Paper covers	1 00

Withdrawal of Cases from Issue.

Hereafter all amendments proposed to allowed applications which involve a withdrawal from issue, and all petitions and requests relating thereto, shall be filed with the docket clerk, Mr. J. M. Emory, and transmitted by him to the Primary Examiner for report. If the Examiner shall report favorably to the admission of such amendment, the matter will be laid before the Commissioner for immediate determination. If the Examiner shall report unfavorably, the case will be docketed and will be heard and decided by the Commissioner in regular course, unless good reasons shall appear for immediate action.

The Official Gazette.

THE OFFICIAL GAZETTE is published every Tuesday, simultaneously with the weekly issue of patents. From January 1, 1872, (the commencement of its publication,) to June 30, 1883, it was published and bound in semi-annual volumes; since July 1, 1883, in quarterly volumes. All subscriptions must commence with the beginning of a volume; none taken for less than three months. Terms: To all subscribers within the United States and Canada, $5 per annum; to foreign subscribers, $7; single copies, 10 cents; bound semi-annual volumes, (prior to June 30, 1883,) full sheep, $4 per volume; bound quarterly volumes, (subsequent to July 1, 1883,) full sheep, $2.75 per volume. No club rates. *Payment in advance.* All orders should be addressed to "The Commissioner of Patents, Washington, D. C."

Issue of September 20, 1892.

PATENTS

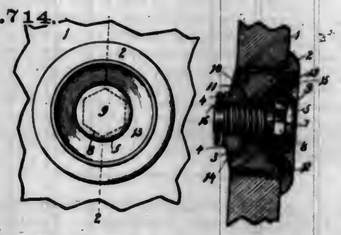
GRANTED SEPTEMBER 20, 1892.

482,713. BUNG. JOHN RANDELL, Milwaukee, Wis., assignor of one-fourth to Michael Postel, same place. Filed Jan. 27, 1892. Serial No. 419,463. (No model.)

Claim.—1. The combination, with a disk having a tapering peripheral edge provided with a rigid stem and a ring having tapering interior surfaces, of a collar loose on the stem, having a tapering periphery, the outer edge of which is adapted to bear on the bushing, and a countersunk tapering recess, a nut turning on the stem against the collar, and laterally-projecting substantially annular ears on the nut having recesses for a tool, the nut and the ears thereon being of less diameter that the countersunk recesses in the collar opposite thereto, so as to permit a hook-providing tool to be passed below and around into engagement with the ears for withdrawing the bung from the bushing, substantially as set forth.

2. In a bung, the combination, with a disk provided with a rigid stem and an elastic ring, of a collar loose on the stem, which collar is provided with a countersunk recess, a nut turning on the stem entirely within the countersunk recess of the collar, and an overturned head on the stem to prevent the removal of the nut therefrom, substantially as set forth.

3. In a bung, the combination of a disk having a central stem projecting from its interior face, said interior face provided with a series of ribs, an elastic ring seated upon said disk and provided with a series of complementary grooves to receive the ribs, a collar bearing against the outer side of the elastic ring, and a nut turning upon the stem, substantially as set forth.



4. In a bung, the combination of a disk having its outer face of substantially truncated conical shape and provided with a stem extending centrally and outwardly therefrom, a frusto-conical collar surrounding loosely the stem and provided upon its interior surface with a series of ribs, an interposed elastic ring having tapering interior surfaces provided with grooves to receive the ribs of the collar, and a nut engaging the stem, substantially as set forth.

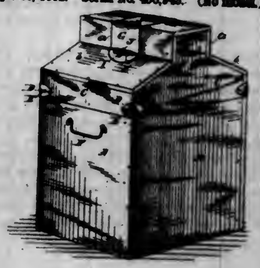
5. In a bung, the combination of a disk having a stem extending therefrom, said stem having its outer extremity enlarged and screw-threaded forming an annular shoulder, a collar loose on the stem below the annular shoulder, an elastic or yielding ring about the stem and interposed between the disk and collar, and a nut turning on the threaded extremity of the stem, substantially as set forth.

482,714. BUNG. JOHN RANDELL, Milwaukee, Wis., assignor of one-fourth to Michael Postel, same place. Filed Apr. 30, 1892. Serial No. 431,236. (No model.)

Claim.—1. The combination, with a bung, of a screw-bolt working therethrough, said bolt provided upon its inner end with a contacting-surface constructed to act against the inner face of the bung upon the unscrewing of the bolt and to rotate said bung therewith, substantially as set forth.

482,714.

2. In a bung, the combination of an elastic ring, disks acting against opposite faces of said ring and a screw-bolt passing through said disks and drawing the same together to expand the ring, said bolt provided upon its inner end with a contacting-surface constructed to act against the inner face of the inner disk upon the unscrewing thereof and to rotate the bung therewith, substantially as set forth.



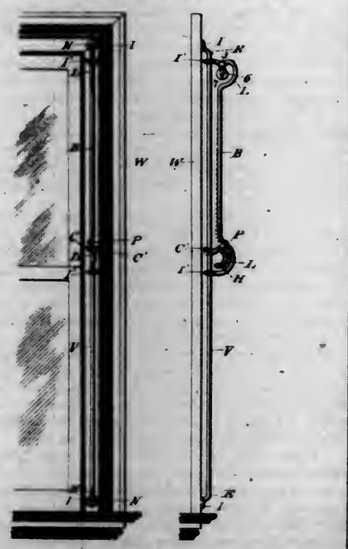
3. In a bung, the combination of an elastic ring, disks acting against the opposite faces of said ring, the inner disk provided upon its inner face with a series of radial ribs, and a screw-bolt passing through the disks and drawing the same together to expand the ring, said bolt provided upon its inner end with a transverse pin, substantially as set forth.

4. In a bung, the combination of an elastic ring substantially cylindrical upon its outer surface and its inner surface beveled from the ends inwardly, forming tapering faces, a disk fitting against the inner tapering face of the ring, a frusto-conical collar fitting against the outer tapering face, and a screw-threaded bolt passing through an aperture in the collar and through a threaded opening in the disk, said bolt provided upon its inner end with a contacting-surface constructed to act against the inner face of the disk upon the unscrewing thereof and to rotate the bung therewith, substantially as set forth.

5. In a bung, the combination of an elastic ring, disks acting against opposite faces of said ring, and a screw-bolt passing through the disks, said bolt provided upon its outer end with an integral headed portion and upon its inner end with means for preventing its entire withdrawal from the bung, substantially as set forth.

6. In a bung, the combination of an elastic ring, disks acting against opposite faces of said ring, and a screw-bolt provided upon its inner end with means for preventing its entire withdrawal from the bung, near its outer end with an enlargement, and at its extremity with a headed portion having its edge extending laterally beyond the enlargement, said enlargement adapted to be engaged by a tool or spanner passing beneath the headed portion, substantially as set forth.

482,715. PACKING-CASE. GEORGE W. BARKER, Brooklyn, N. Y. Filed Apr. 28, 1892. Serial No. 430,943. (No model.)



Claim.—1. In a packing-case, the combination of vertical posts in the corners of the case, which project above the sides of the case, metallic clips at the corners of the cover, and devices for attaching the cover to the posts, which pass through the metallic corner-clips, substantially as set forth.

2. In a packing-case, the combination of vertical posts in the corners of the case, which project above the sides of the case, metallic clips at the corners of the cover, and a hole in each clip for the passage of a screw and screws, which pass through the clips, the sides of the cover, and enter the posts, substantially as set forth.

3. A cover for a demijohn or jar case, having inclined laterally-arranged upper parts, a rectangular nozzle-protecting part between the inclined parts and a rabbeted piece of wood at the junction of the inclined parts, and the nozzle-protecting part provided laterally with two surfaces against which, respectively, the inclined parts and the vertical portions of the nozzle-protecting parts rest, whereby they may be nailed direct to the said rabbeted piece, substantially as set forth.

4. A cover for a demijohn or jar case, having inclined laterally-arranged upper parts and a rectangular nozzle-protecting part between the inclined parts, a rabbeted piece of wood at the junction of the inclined parts, and the nozzle-protecting part provided laterally with two surfaces against which, respectively, the inclined part and the vertical portions of the nozzle-protecting part rest, whereby they may be nailed direct to the said rabbeted part, and blocks placed interiorly at the ends of the nozzle-protecting part, the grain whereof runs substantially at right angles to the grain of the end pieces of the cover, substantially as set forth.

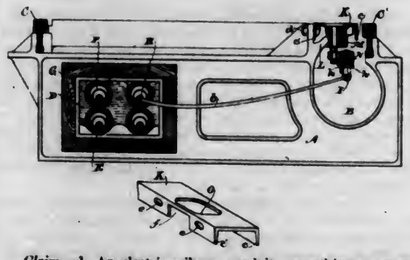
482,716. CURTAIN-FIXTURE. FRED H. BASSETT, Saranac Lake, N. Y. Filed Sept. 25, 1891. Serial No. 406,611. (No model.)

Claim.—1. In a curtain-fixture, the combination of a vertical rod to be secured to a window, a resilient bracket having eyes sliding on the rod, and a friction-clutch pivoted to the bracket and provided with an eye receiving the rod and adapted to bind against the same, said clutch being provided with a depending handle arranged to be drawn outward to draw the eye of the clutch out of frictional engagement with the rod, substantially as described.

2. The combination, with vertical rods at the sides of a window, of a bracket comprising a spring-rod having loops near its ends with eyes at their extremities sliding on each rod, a friction-clutch pivoted to the bracket, having a curve passing behind the rod and having a handle standing in the lower loop, and a curtain-fixture carried by the upper loop, as and for the purpose set forth.

3. The combination, with a bracket, of a curtain-fixture comprising a vertically slotted disk having an integral tongue bent into an eye embracing the bracket, a rivet connecting the tongue to the body, and a segment pivoted on said rivet and swinging to close the upper portion of said slot, as and for the purpose set forth.

482,717. WHIP-SOCKET. FRANCIS E. BENTON, Stoughton, Mass. Filed Apr. 12, 1892. Serial No. 428,828. (No model.)



Claim.—A whip-socket clasp made of a single block of rubber molded to fit snugly at top and bottom, there provided with oppositely-extending outer flanges and metallic bands, the clasp-body being of less diameter than the ends, with longitudinal corrugations convex on the inside and concave at the rear, substantially as shown and described.

482,718. COMPOSITION COATING FOR PAPER TUBES. SIGMUND BERGMANN, New York, N. Y., assignor, by mesne assignments, to the Interior Conduit and Insulation Company, same place. Filed Mar. 4, 1891. Serial No. 383,704. (No specimens.)

Claim.—A coating for a tube or conduit, consisting of a mixture of plumbago and plaster-of-paris, substantially as specified.

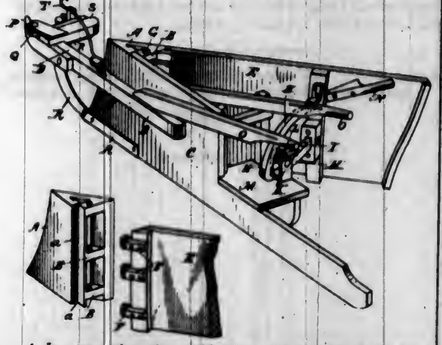
482,719. CONDUIT FOR ELECTRIC RAILWAYS. FRANCIS O. BLACKWELL, Boston, Mass., assignor to the Thomson-Houston Electric Company, of Connecticut. Filed Dec. 4, 1890. Serial No. 373,543. (No model.)

Claim.—1. An electric-railway conduit comprising transverse yokes and slot-rails, one, at least, of which consists of an inverted channel-iron set substantially flush with the street-surface and bolted to the yokes, as set forth.

2. An electric-railway conduit comprising transverse yokes and slot-rails, one, at least, of which consists of an inverted channel-iron, one flange forming a drip edge and the other bolted to the yokes, as described.

3. In an electric-railway conduit, the combination of transverse yokes and an inverted channel-slot iron forming a shield over the supply-conductor with an upright slot-rail forming the other edge of the slot, as set forth.

4. The combination, in an electric-railway conduit, of the transverse yokes having inwardly-extending bracket-seats, with the inverted channel-iron substantially flush with the street surface and provided with perforations which receive the insulator-hangers, as set forth.

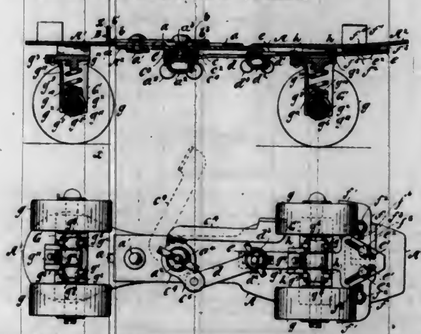


482,720. SNOW-PLOW. ALBERT B. BLACK, Concord, Mass. Filed Apr. 13, 1892. Serial No. 428,939. (No model.)

Claim.—1. In a snow-plow, a point having the landside and diverging share with cross-bars uniting their rearward portions all cast integral and formed with a vertical recess to receive, flush with the landside, the forward end of the side wall of the plow, in combination with the adjustable wing having projecting lugs at its forward end and with a vertical rod through said lugs and the cross-bars of the point constituting hinges on which the wing swings horizontally, substantially as set forth.

2. In a snow-plow, a rigid point and landside and an adjustable wing hinged vertically to swing horizontally from said point, in combination with a double brace hinged at the ends to the adjustable wing

and with an intermediate ratchet on said brace and a pivoted cam-lever engaging therewith, substantially as set forth.



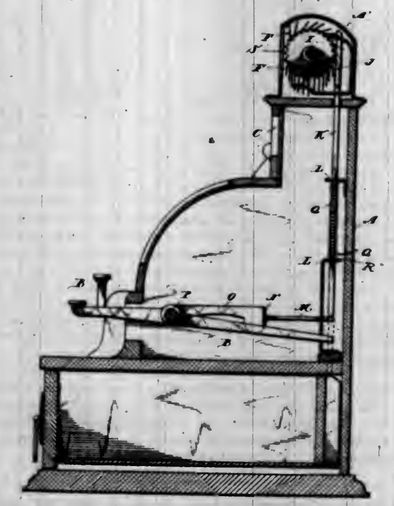
3. In a snow-plow, the point and landside and the adjustable wing hinged vertically in rear of the point, in combination with the adjusting-brace hinged to the wing at two points, one above the other, a single ratchet-fastening applied to said brace at a point intermediate between its hinges, and with a handle whereby said wing may be manipulated independently, substantially as set forth.

4. In a snow-plow, the combination, with the body of the plow, of the offset fender P, applied to the front of the beam, and the roller-fender Q, adapted to protect the landside of the plow, substantially as set forth.

5. In a snow-plow, the combination, with the rigid point and adjustable wing, of the curved upturned guard secured to the lower edges of the point and at its upper end bolted to the beam, whereby it serves as a cutter and as a guard in surmounting obstacles, substantially as set forth.

482,721. ROLLER-SKATE. JAMES CARRIE, Brooklyn, N. Y. Filed May 18, 1892. Serial No. 433,436. (No model.)

Claim.—1. A support for a roller-skate axle, comprising a bracket G, secured to the shoe-plate and having two side portions $g' g^3$, provided with perpendicular slots open at the bottom, a journal-box extending the entire width of the axle between the hubs of the rollers g and having flat-sided and parallel grooves $g^1 g^2$, in which are loosely fitted the slotted portions of the sides $g' g^3$, a spring g^3, and a stop-plate g^{11}, substantially as described.



2. The combination, in a roller-skate of a shoe plate, toe-grips having slotted extensions connected thereto and arranged to slide transversely thereof, a reciprocating bar provided with slots converging toward each other and engaging with pins secured to the extensions of the toe-grips, a link pivotally and adjustably connected to the reciprocating bar, means for guiding the latter to move longitudinally of the skate, a lever having an arm pivotally connected to the said link, a heel-grip adjustably connected to the shoe-plate, a locking device, as C, for locking or unlocking the skate to or from a shoe, and a bolt, secured from turning, extending through the heel-grip, shoe-plates, locking device, and lever and provided with a thumb-nut to clamp the said parts together, substantially as described.

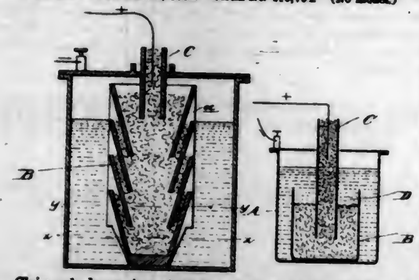
3. In a roller-skate, the combination of a shoe-plate, toe-grips, each having a slotted extension, one of which is fitted to slide within a bifurcated end portion of the other, rivets secured to the shoe-plate and extending through the slots of the extensions to support and guide the same, a bar fitted to move longitudinally of the shoe-plate and having slots converging toward each other and in which are fitted to slide pins secured to the extensions of the toe-grips, and means for reciprocating the said bar and locking the same in position, substantially as described.

4. In a roller-skate, the combination of a shoe-plate composed of two overlapping sections, a heel-grip adjustably connected thereto, a locking device comprising a disk secured to the front section and having an annular inclined rim forming a cam-surface against which bears a corresponding cam-surface of a disk secured to the hub of a lever, and a bolt, prevented from turning, extending through the heel-grip, front and rear sections of the shoe-plate, and locking device for clamping the said parts together, substantially as described.

5. In a roller-skate, the combination of the shoe-plate A, composed of two longitudinally-adjustable sections $A' A^3$, overlapping each other, the heel-grip B, and toe-grips $f f'$, adjustably connected thereto, the reciprocating bar e, having slots converging toward each other and adapted to impart a lateral to-and-fro motion to the toe-grips, the link d, pivotally and adjustably connected to the bar e and to an arm of a lever c^3, and the locking device C, comprising the cam disks $c c^1$, the bolt c^2, thumb nut c^4, and lever c^5, the latter being arranged to operate the toe-grips and lock the same, together with the heel-grip and the two sections of the shoe-plate, together simultaneously, substantially as described.

482,722. ADVERTISING APPARATUS FOR CASH-REGISTERS. HUGO COOK, Dayton, Ohio. Filed July 27, 1891. Serial No. 400,870. (No model.)

Claim.—1. In a cash register and indicator, the combination of the casing having in its upper portion the usual window or sight-opening C, through which the indicators which exhibit the amount of the sale are exposed, and provided, also, with a second window S, located above the window C, the revoluble disks E E, supported within the space behind the window S, the advertising-plates F, pivotally supported by and between the disks E E, the toothed wheel I, revoluble with the disks E E, the actuating-pawl J, co-operating with the wheel I, and connections between said pawl and a movable part of the machine, whereby the pawl is caused to turn the wheel I and disks E E at each operation of the machine, substantially as and for the purpose described.

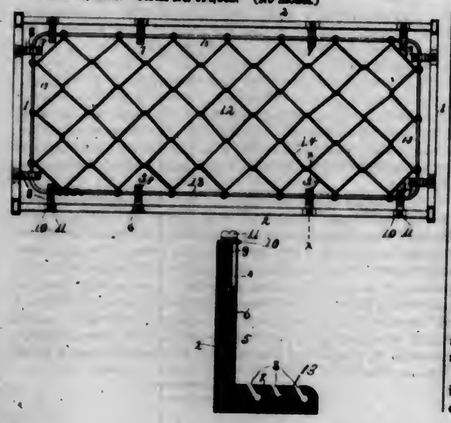


2. In a cash register and indicator, the combination of the casing having in its upper portion the usual window or sight-opening D, through which the indicators which exhibit the amount of the sale are exposed, and provided, also, with the second window S, located above the window C, the revolvable shaft D, journaled in the space behind the window S, the disks E E and toothed wheel I, fast upon said shaft, the advertising plates F, pivotally supported by and between the disks E E, the pawl J, co operating with the wheel I, the vertically-movable rod K for actuating the pawl, the operating-keys B, and the vibrating cross-bar N, co-operating with the keys B and with the rod K, in the manner described.

482,723. DRIVE-CHAIN. THOMAS CORSCADEN, New Britain, Conn., assignor to the Stanley Works, same place. Filed Jan. 30, 1892. Serial No. 419,836. (No model.)

Claim.—In a drive-chain, a link having a pintle of a flattened form in cross-section and flat side bars extending in their flat form to the outer edge of said pintle, while a portion of said pintle between said side bars is bent or twisted, substantially as described, and for the purpose specified.

482,724. ELECTROLYTIC APPARATUS. THOMAS CRANEY, Bay City, Mich. Filed Jan. 2, 1892. Serial No. 416,764. (No model.)



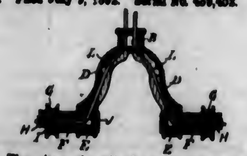
Claim.—1. In an electrolytic apparatus, an anode consisting of a body of carbon arranged to expose a number of separate horizontal surfaces and a coil of non-conducting material inclosing said anode and having openings leading to said surfaces, substantially as described.

2. In an electrolytic apparatus, a carbon anode incased within an outer supporting-coil of non-conducting material, said anode consisting of a central body of pulverized carbon packed within the wall of the coil and having segregated portions contained within pockets or interstices formed in the walls of the coil and forming exposed horizontal surfaces, substantially as described.

3. In an anode for electrolytic apparatus, the combination of a coil of non-conducting material formed with open interstices in the wall thereof and a carbon body incased within said coil and provided with segregated portions contained in the interstices of the coil and forming exposed horizontal surfaces, substantially as described.

4. In an anode for electrolytic apparatus, the combination of a coil consisting of a series of superimposed sections projecting within each other and forming open interstices between each sections and a body of carbon incased within said coil and having segregated portions extending into the interstices between the sections and forming the exposed sections of the anode, substantially as described.

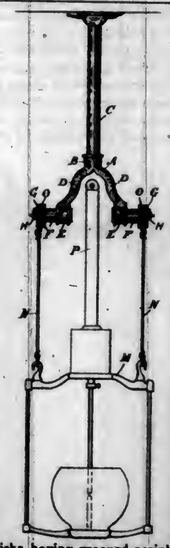
482,725. BEDSTEAD. GEORGE H. CURREY, Evant, Tex. Filed Dec. 12, 1891. Serial No. 414,602. (No model.)



Claim.—In a bedstead, the combination, with the side and end rails having vertical mortises or grooves, the cap-plates covering the upper ends of the grooves or mortises and having threaded apertures, and a mattress-support, of the hangers respectively comprising the vertical shank or body seated in the grooves or mortises of the rails, and the horizontal branch extending inwardly from said shank or body and having a slot to seat the side and end bars of the mattress-support, and the adjusting-screws taking through the threaded apertures of the cap-plates and having their lower ends connected to the hangers, substantially as and for the purpose set forth.

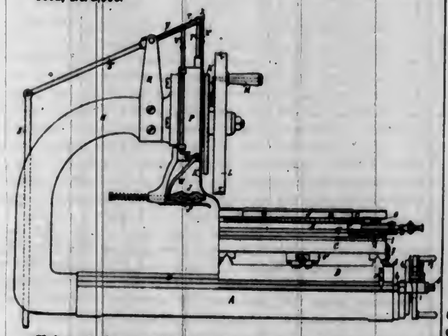
482,726. GUARD FOR VEHICLE-SHAFTS. FRED DE LA MATER, Fremont, Nebr. Filed Nov. 27, 1891. Serial No. 413,241. (No model.)

Claim.—As an article of manufacture, a shaft-guard, comprising tips or thimbles, adapted to be secured to the ends of the shafts, said tips or thimbles provided each with a pair of parallel slots *b b'* on their sides, whereby a loop *c* is formed, a strap buckled in each loop, and a snap-hook connected with one strap and a ring with the other, said straps made just long enough to reach from one shaft to the other when coupled together, whereby they are held taut, substantially as set forth.



482,727. SUSPENSION-BRACKET FOR ELECTRIC LAMPS. THOMAS DILLON, Indianapolis, Ind., assignor of one-half to John Caven, same place. Filed July 9, 1892. Serial No. 439,452. (No model.)

Claim.—1. The above-described suspension-bracket for electric lamps, consisting of a socket adapted to receive a standard or hanger, a pair of hollow diverging arms extending from said socket and each terminating in a socket whose axis is at right angles to the axis of the standard-socket, a pair of arms, formed of wood or other like non-conducting material, mounted in said sockets and projecting in opposite directions therefrom, and a pair of metallic disks each provided with a peripheral groove and a binding-post and mounted upon the ends of said arms, all substantially as set forth.

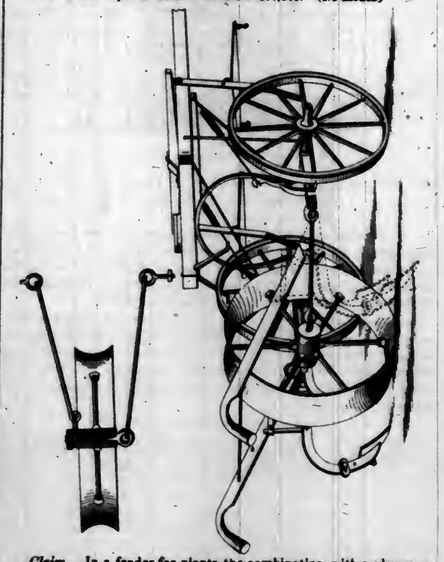


2. The combination of the bracket having a pair of hollow diverging arms terminating in open sockets adapted to receive a pair of non-conducting arms, the pair of non-conducting arms mounted in said

482,727.

sockets, the metallic disks having grooved peripheries and mounted upon the ends of said non-conducting arms, the electric conductors extending through said arms and electrically connected, respectively, with said disks, the pair of rods embracing the peripheries of said disks, and the lamp suspended from said rods, all arranged to co-operate substantially as set forth, whereby the lamp is supported and is connected with an electric conductor which is concealed within the bracket, substantially as set forth.

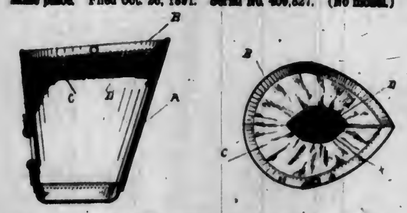
482,728. MACHINE FOR PRINTING MUSIC. LOUIS DURDILLY, Paris, France. Filed Apr. 23, 1892. Serial No. 430,205. (No model.) Patented in France Sept. 26, 1891, No. 216,373, and in England Mar. 26, 1892, No. 5,896.



Claim.—1. In a machine for printing music, the combination of a frame A, with two sliding carriages B and C placed thereon, a hand screw-spindle D for effecting the forward and rearward displacement thereof, an index X, a transverse screw-spindle *e*, effecting the displacement from right to left, an index Z for the same, gears from the shaft *d* to actuate spindle *e*, and a crank 1, which can be displaced between stops 5 and 6, inserted in a plate 4, so as to limit this motion, substantially as set forth.

2. In a machine for printing music, a revolving plate G, rubber sheet placed thereon, pins and hinges *g* for fixing the paper, carriage D, upon which said plate is mounted, graded rollers E E' for displacing said carriage, runners F F' adjustable thereon, slide-blocks *d'* for causing said adjustment, and the spring-actuated finger of said block, substantially as set forth.

3. In a machine for printing music, a wheel L, a slide-block Q, upon which said wheel is mounted, a fixed crown N, and musical signs or type engraved on the circumference of said wheel L and repeated on the side of the rim to guide the operator, substantially as set forth.



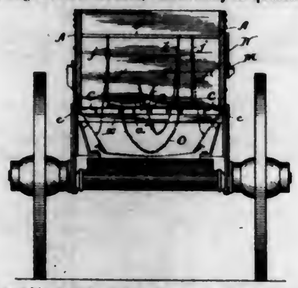
4. In a machine for printing music, a system of levers S, branches V, T, X, and U, a rod T', moved thereby, a slide-block Q, actuated by said rod in order to bring the sign on the wheel down to the paper, a rod X', an index K, guided thereby, rods V', U', and W, and inking-rollers J, substantially as set forth.

482,729. CULTIVATOR ATTACHMENT. ALONZO DYER, Odessa, Mo. Filed Sept. 23, 1891. Serial No. 407,079. (No model.)

Claim.—In a fender for plants, the combination, with a plow or a straddle-row cultivator, of a wheel having suitable connection therewith and a concave or hollow rim adapted to run over and protect a row of growing plants, substantially as shown and described.

482,730. NOSE-BAG. WILLIAM BERNHARDT, New York, N. Y., assignor, by mesne assignments, to the Economic Feed Bag Company, same place. Filed Oct. 26, 1891. Serial No. 409,827. (No model.)

Claim.—In a nose-bag for animals, the combination, with the bag, of a flexible diaphragm C, composed of open-work and secured to the upper margin of the bag, an annular water-tight spring-case D, secured around the inner margin of the diaphragm, and a spring X within said case, substantially as set forth.

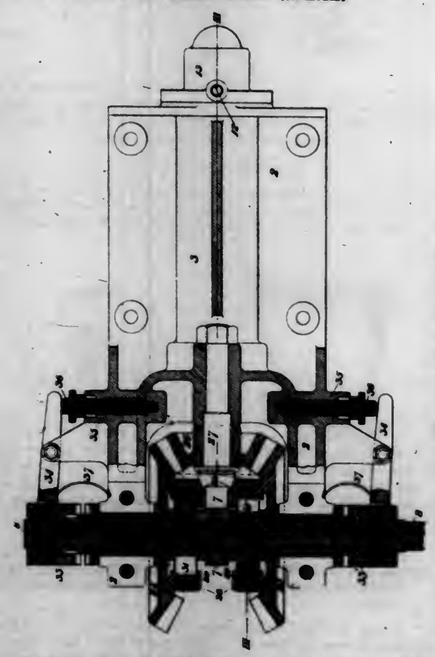


482,731. DUMPING-WAGON. JOHN S. FIELD and WILLIAM J. BERDO, Chicago, Ill. Filed June 3, 1892. Serial No. 435,360. (No model.)

Claim.—1. The dumping-wagon having its bottom divided into three longitudinal sections, the outside ones of which are hinged at their outer edges and swing down at their inner edges and the central one is pivoted at its ends, so as to tip sidewise, substantially as specified.

2. The dumping-wagon having its bottom divided into three longitudinal sections, the outside ones of which are hinged at their inner edges and the central one of which is pivoted at its ends, so as to tip sidewise, and also having movable supporting devices for locking the sections in the raised position, substantially as specified.

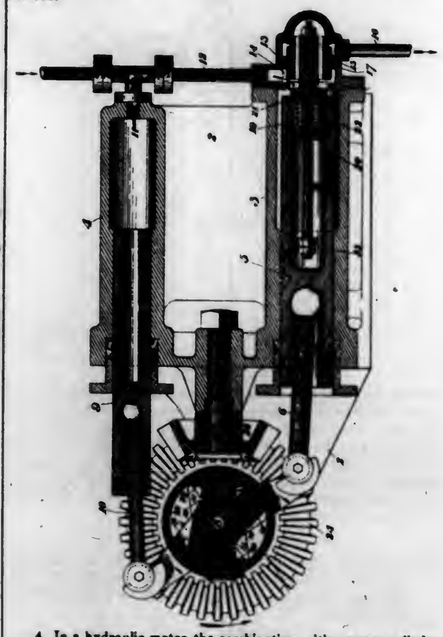
3. The combination, in a dumping-wagon, of three longitudinal floor sections, the outer ones of such sections being hinged so as to swing downwardly at their inner edges and the central section being



pivoted at its ends and adapted to tip sidewise, movable supporting-bars for supporting said floor-sections in their raised position, devices for moving said bars into and out of their acting positions, and devices for raising the floor-sections, substantially as specified.

4. The combination, in a dumping-wagon, of three longitudinal floor-sections each adapted to tip sidewise, essentially as described, the central section overlapping the edges of the side sections, means for raising said sections after dumping, and means for supporting the sections in the raised position, substantially as specified.

5. In a dump-wagon having a floor consisting of three longitudinal sections, whereof the side sections are hinged at one edge and swing downward and the center section is pivoted at its ends and tips sidewise, the combination, with the side sections, of the chain O, secured to said sections and limiting their downward movement, substantially as specified.

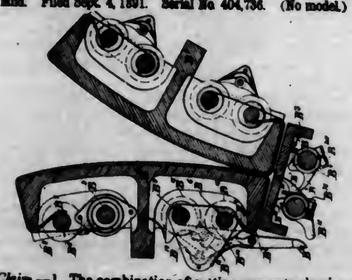


482,782. HYDRAULIC MOTOR. SAMUEL FORTER, Allegheny, Pa. Filed Sept. 19, 1891. Serial No. 406,169. (No model.)

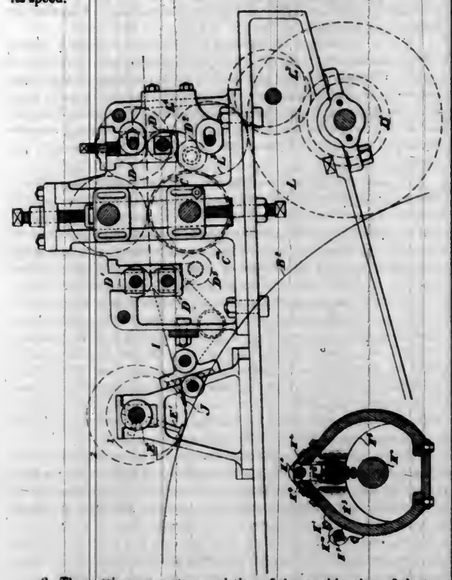
Claim.—1. In a hydraulic motor having two coacting cylinders and plungers, the combination of two piston-valves, one situated in each cylinder and controlling its inlet and exhaust ports, plungers in said cylinders adapted to engage and move said valves in one direction, and connecting mechanism by which the motion of one valve by the plunger will move the other valve in reverse direction, substantially as and for the purposes described.

2. In a hydraulic motor, the combination, with a motor-cylinder, reciprocatory plunger, and main shaft, of gear-wheels connected by clutch mechanism with the motor and adapted to be rotated thereby in opposite directions and a third gear-wheel connecting said first-named gear-wheels, substantially as and for the purposes described.

3. In a hydraulic motor, the combination, with a motor-cylinder, reciprocatory plunger, and main shaft, of gear-wheels connected by clutch mechanism with the motor and adapted to be rotated thereby in opposite directions, a third gear-wheel connecting said first-named gear-wheels, and clutches adapted to connect either of the latter gear-wheels with the main shaft, substantially as and for the purposes described.



4. In a hydraulic motor, the combination, with a motor-cylinder, reciprocatory plunger, and main shaft, of gear-wheels connected by clutch mechanism with the motor and adapted to be rotated thereby in opposite directions, a third gear-wheel connecting said first-named gear-wheels, clutches adapted to connect either of the latter gear-wheels with the main shaft, and auxiliary motor-cylinders adapted to operate the clutches, substantially as and for the purposes described.



5. The combination, with the reciprocatory plunger and main shaft, of a hub connected with the plunger and oscillatory thereby, flanged wheels 24 25, set in proximity to the hub, shoes bearing against the flanges of the wheels, and toggle-links interposed between the hub and shoes, substantially as and for the purposes described.

6. The combination, with the reciprocatory plunger and main shaft, of a hub connected with the plunger and oscillatory thereby, flanged wheels 24 25, set in proximity to the hub, shoes bearing against the flanges of the wheels, and toggle-links interposed between the hub and shoes, and a gear-wheel 26, connecting the wheels 24 and 25, substantially as and for the purposes described.

482,783. PRINTING-MACHINE. THOMAS GIBSON, London, England. Filed Sept. 4, 1891. Serial No. 404,736. (No model.)

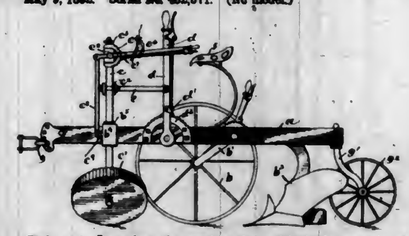
Claim.—1. The combination of cutting apparatus having cutting-blades radially adjustable to cut sheets of different lengths, change-speed gear for the cutting apparatus to drive it at different speeds to make the proper number of cuts for each revolution of the impression-cylinder, the form and impression cylinders, the segments thereof readily removable, so that segments of one size can quickly be changed for segments of another size, a roller on which the sheets printed at each revolution are collected, and change-speed gear for regulating its speed.

2. The cutting apparatus consisting of the combination of the two shafts and the collars secured thereto, the segmental bars connected with the collars and radially adjustable relatively to the shafts, a plate carried by one of the segmental bars, and the pins O^3 on the bars, for the purpose specified.

3. The combination of an impression-cylinder having across it at equal distances apart around its circumference lines of grippers, two pairs of feed-rollers for feeding forward a continuous web of paper to this cylinder, pairs of cutting-segments adjustable radially on the axes which carry them, situated between the pairs of feed-rolls, gearing for driving them from the axis of the impression-cylinder at a slower surface speed than this cylinder, change-gear wheels for enabling the feed rollers and segments to be always driven at the same surface speed, and detacher-rods carried by a revolving axis near the feed-rolls and close to the impression-cylinder and which nip the forward edge of the paper between themselves and the impression-cylinder at a time when a partial line of severance formed across the paper by the cutting-segment has passed beyond the second pair of feed-rolls.

4. The impression-cylinder herein described carrying at equal distances apart around its circumference removable segments which pass across it from one side to the other, the outer surface of each segment being covered with a thick blanket, which at its ends is secured to two rollers at the back of the segment, and means for turning these rollers to wind up and stretch the blanket and for preventing the rollers from turning back and allowing the blanket to slacken and with canvas covering attached at its end to other rollers at the back of the segment, one impeded by friction from revolving too freely and the other caused to revolve slowly and wind canvas onto itself.

5. An impression-cylinder provided with a series of removable segments arranged at equal distances apart around its circumference and which pass across it from one side to the other, each of said segments having a thick blanket covering provided with means for stretching it, said blanket having a canvas covering provided with means for feeding it across the face of the blanket, substantially as described.



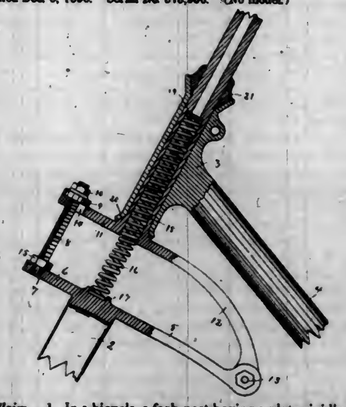
6. The form cylinder provided with a series of removable beds arranged at equal distances apart around its circumference, each bed having a series of undercut grooves formed longitudinally in its outer face and provided with a series of bars arranged at right angles to said grooves, each of said bars having projections which enter and fit into the undercut grooves and which are adjustable therein, the sides of said bars being undercut to overlap the sides of printing-plates placed on the bed, substantially as described.

7. In a form cylinder, the combination of a supporting-frame and a series of removable beds, each having a series of longitudinal undercut grooves, a series of bars arranged transversely to said grooves and having projections fitting the undercut grooves, so that the bars may move laterally across the face of the cylinder, said bars being undercut on their sides to overlap the sides of printing-plates placed on the cylinder, and means for clamping the bars to the plates, substantially as set forth.

8. A pasting-cylinder in which the reservoir is made cylindrical on the exterior, where the bearings which carry the pin-bar are to be secured to it, in combination with a pin-bar carried in bearings secured to the reservoir by radial screw-bolts, substantially as described.

9. A paste-reservoir made curved or cylindrical on the exterior where the bearings which carry the pin-bar are to be secured, in combination with said pin-bar and its bearings, and radial screw-bolts secured to the bearings and adjustable toward and from the mouth of the paste-reservoir, substantially as described.

482,784. SULKY-PLOW. MICHAEL GLYNN, Otterbein, Ind. Filed May 9, 1892. Serial No. 432,371. (No model.)

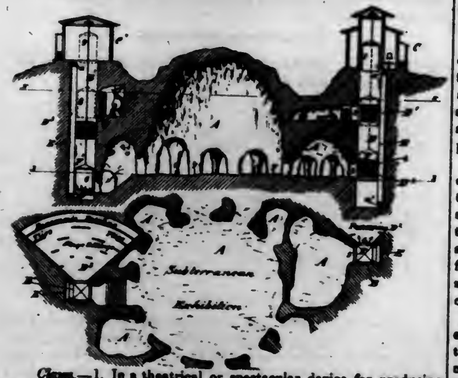


Claim.—1. In a plow, the combination, with the beam, side wheel *b*, and caster-wheel g^4, of a rod *c*, supported in the forward portion of the framework, a guide-wheel on said rod, a lever *d*, and a connecting mechanism between said lever *d* and rod *c*, by means of which rotary motion is imparted to said rod through the motion of said lever, substantially as and for the purpose specified.

2. In a plow, the combination, with the plow-beam, its share and supporting wheels, and a lever *d*, rising from the framework, of beam-arm b^4, rod *c*, journaled thereto and carrying wheel c', arm c^3, projecting from said rod *c*, and a connecting-piece *e* between said arm c^3 and lever *d*, substantially as and for the purpose specified.

3. In a plow, the combination, with the beam, share, and framework, supporting-wheels therefor, and a lever *d*, fulcrumed to said frame, of an arm b^4, projecting, as described, from the beam, wheel-carrying rod *c*, journaled in said arm, rack c^4 on the upper end of said rod *c*, lever-arm c^2, fulcrumed to said rack, arm c^3, connecting said lever-arm and arm b^4, and connecting-piece *e* between said arm c^3 and lever *d*, substantially as and for the purpose specified.

482,785. BICYCLE. OLAUS HARSON, Toledo, Ohio, assignor of part to Joseph L. Yost, same place, and Harry A. Lozier, Cleveland, Ohio. Filed Dec. 8, 1890. Serial No. 373,936. (No model.)



Claim.—1. In a bicycle, a fork-post having a plate rigidly secured thereon, a steering-head, a plate pivotally connected with the plate of the fork-post, having an integral tubular extension working in the-

steering-head, a spring mounted in the said extension and bearing at its lower end on the plate of the fork-post, and a threaded bolt engaging the free ends of the plates.

2. In a bicycle, a fork-post, a plate rigidly secured thereon having a hollow boss on its upper face, a steering-head, the upper and the lower ends of which are flared, a plate pivotally connected with the plate of the fork-post and having an integral tubular extension working in the steering-head, said extension having conical bearings engaging the flared ends of the steering-head, a spring mounted in the extension and bearing at its lower end in the said hollow boss, and a threaded bolt engaging the free ends of the plates.

482,786. SUBTERRANEAN EXHIBITION APPARATUS. HIPPOLYTE HARDY, Minneapolis, Minn. Filed Feb. 10, 1891. Serial No. 380,900. (No model.)

Claim.—1. In a theatrical or spectacular device for producing illusory effects, the combination, with an elevator-car, of a traveling curtain arranged to move adjacent thereto in vertical direction and painted in imitation of the walls of a shaft in which the car is supposed to ascend or descend, whereby by the movement of such curtain the illusion is created of a movement of the car.

2. In a theatrical or spectacular device for producing illusory effects, the combination, with an elevator-car, of a vertically-moving endless revolving curtain arranged exterior to an opening in the side of the car and painted in imitation of the walls of a shaft in which the car is supposed to move.

3. In a theatrical or spectacular device for producing illusory effects, the combination, with an elevator-car, of a traveling curtain arranged to move in vertical direction adjacent thereto and painted in imitation of the walls of a shaft and means for imparting a tremor to the car during the movement of said curtain, whereby the illusion is created of a movement of the car.

4. In a theatrical or spectacular device for producing illusory effects, the combination, with an elevator-car and its shaft, of curtains arranged in said shaft adjacent to the sides of the car and driving mechanism for moving them simultaneously in vertical direction.

5. In a theatrical or spectacular device for producing illusory effects, the combination, with an elevator-car and a traveling curtain arranged to move in vertical direction adjacent thereto, of means for imparting a tremor to the car, consisting of a lever from which the car is hung and mechanism for imparting short and rapid vibrations to said lever.

6. In a theatrical or spectacular device for producing illusory effects, the combination of a vertical shaft, an elevator-car mounted therein, a vertically-moving curtain arranged to create the illusion of a movement of the car within said shaft, and movable screens at the top of said shaft for gradually cutting off the light proportionally to the supposed descent of the car.

7. In a theatrical or spectacular device for producing illusory effects, the combination of a vertical shaft, an elevator-car mounted therein, a vertically-moving curtain arranged to create the illusion of a movement of the car within said shaft, and movable screens at the top of said shaft arranged to overlap, forming between them a rectangular opening corresponding in shape to the shaft and adapted by their movement to reduce or enlarge the opening proportionally to the supposed descent or ascent of the car in said shaft.

8. In a theatrical or spectacular device for producing illusory effects, the combination, with an elevator-car and its shaft, of a blower for forcing air through said shaft to contribute to the illusion of a movement of the car.

9. In a theatrical or spectacular device for producing illusory effects, the combination, with an elevator-car and its shaft, of a blower for forcing air through said shaft and a source of hot or cold air, adapted to be put into communication with said blower, whereby air of different temperatures may be forced into said shaft at different times.

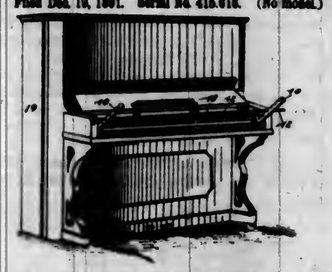
10. In a theatrical or spectacular device for producing illusory effects, the combination, with an elevator-car and its shaft, of a blower for forcing air through said shaft, a cold-air box, a hot-air box, and a swinging spout or section of pipe for establishing communication between the section of the blower and either of said boxes.

11. In a theatrical or spectacular device for producing illusory effects, the combination of a vertical shaft, an elevator-car therein, an opening through one side of the shaft for the passage of passengers into or from said car, and a traveling curtain arranged to move vertically along the side of the shaft through which said opening is formed and having an opening adapted to coincide with said opening, whereby passengers may enter or leave the car through the opening in said curtain.

12. In a theatrical or spectacular device for producing illusory effects, the combination of a vertical shaft, an elevator-car movable therein, openings into said shaft at different heights on one side thereof, and an endless traveling curtain arranged to move vertically along the side of the shaft containing said openings and formed with an opening adapted to coincide with either of said openings, whereby different positions of said curtain disclose different openings from said shaft.

13. In a theatrical or spectacular device for producing illusory effects, the combination of a vertical shaft, an elevator-car movable therein, openings into said shaft at different heights, one for the admission of passengers to the car, another for their exit therefrom, and a third for displaying to the passengers a scenic or spectacular representation, one or more revolving curtains lining the walls of said shaft for conveying the illusion of a continued movement of the car within said shaft, and mechanism for starting, driving, and stopping said curtains and for starting, driving, and stopping the car.

14. In a theatrical or spectacular device for producing illusory effects, the combination of a vertical shaft, an elevator-car movable therein, openings into said shaft at different heights, one for the admission of passengers to the car and another for their exit therefrom, a marine exhibition or aquarium-tank arranged behind a third opening, and one or more revolving curtains lining the walls of said shaft for conveying the illusion of a continued movement of the car within said shaft.



15. In a theatrical or spectacular device for producing illusory effects, the combination, with an elevator-car having an opening in its side, of an endless revolving curtain arranged outside said opening, rollers carrying said curtain mounted in bearings carried by the car, and means for revolving said rollers and curtain.

16. In a theatrical or spectacular device for producing illusory effects, the combination, with an elevator-car having openings in its sides, of a vertical shaft in which said car is movable, an endless curtain lining one end of said shaft and movable in vertical directions relatively to said car, an endless revolving curtain arranged outside one of the openings in said car on another side of said shaft, rollers carrying said curtain mounted in bearings carried by the car, and a driving-belt *u*, driven at a speed proportionate to that of the curtain lining said shaft and arranged to impart rotation to the rollers of the curtain carried by the car, whereby the latter or smaller curtain is driven at the same surface speed relatively to the car as the larger curtain.

17. In a theatrical or spectacular device for producing illusory effects, the combination of an elevator-car, a traveling curtain arranged to move in vertical direction adjacent thereto to create the illusion of a movement of the car, and a panoramic spectacle in a chamber at one side of the car, with communicating openings, whereby by suspending the movement of the curtain, displaying the panorama to the occupants of the car, and closing said openings and resuming the movement of the curtain the illusion is imparted of a scene exhibited at some point in the descent or ascent of the car.

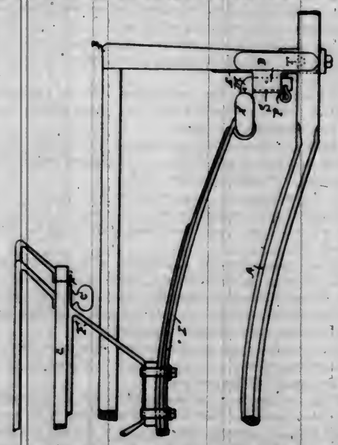
18. In a theatrical or spectacular device for producing illusory effects, the combination of an elevator-car and a traveling curtain arranged to move adjacent thereto in vertical direction to create the illusion of a movement of the car with two or more panoramas mounted on a movable platform arranged in a chamber adjacent to the car, so that either panorama may be exhibited to the occupants of the car through communicating openings, whereby by suspending the movement of the curtain, displaying a panorama, then closing the openings, resuming the movement of the curtain and moving the platform to bring another panorama into position to be viewed, again suspending the movement of the curtain, and displaying the panorama the illusion is created of a plurality of scenes viewed at different levels in the course of the descent or ascent of the car.

482,737. PIANO ATTACHMENT. HENRY A. HAUPT, Brooklyn, N. Y. Filed Dec. 19, 1891. Serial No. 415,616. (No model.)

Claim.—1. A piano attachment comprising the two bars having notches in their upper edges to receive the cross-rod and attaching devices at their lower ends to engage the keyboard, substantially as set forth.

2. A piano attachment comprising the two inclined bars provided at their lower ends with downward-projecting tongues and angle pieces or clips adapted to engage the keyboard, and a cross-rod adjustable on said bars, substantially as set forth.

3. The combination, with a piano, of notched supports extending diagonally forward and upward from in front of the keyboard and a cross-bar held in the notches of the supports, substantially as shown and described.



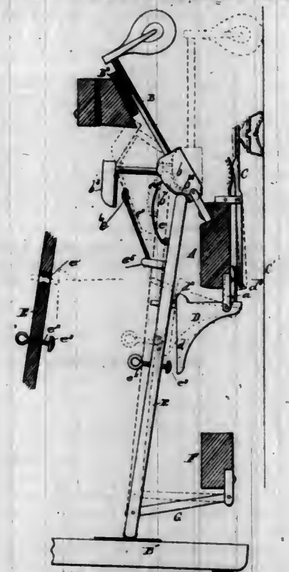
4. The combination, with a piano, of supports extending diagonally upward and forward from the front of its case, said supports having at their lower ends angle-pieces to fit the piano-case, and a cross-rod held in the notches of the supports, substantially as described.

5. The combination, with a piano having recesses in its case adjacent to the keyboard, of forwardly-extending supports having angle-pieces at their lower ends adapted to fit the edge of the piano case and having depending tongues to enter the recesses in the case, and a cross-bar connecting the supports, substantially as described.

482,738. EFFERVESCENT BEVERAGE. OLIVE M. HOSHTHAM, Washington, D. C. Filed Nov. 14, 1890. Renewed July 14, 1892. Serial No. 440,096. (No specimens.)

Claim.—The herein-described composition of matter to be used as a beverage, consisting of pure sugar, water, raspberry juice, tartaric acid, citric acid, soap-bark, caramel or coloring, and cooking-raisins, in the proportions desired, with a mixture to cause effervescence, composed of pure honey, boiling water, and the whites of nine eggs.

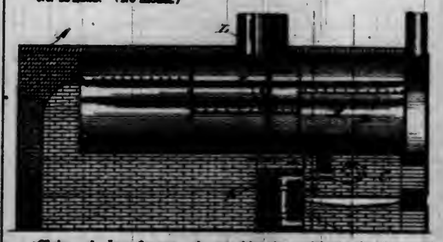
482,739. TWO-WHEELED VEHICLE. JACKSON W. HEWITT, Jackson, Mich. Filed Mar. 26, 1892. Serial No. 426,478. (No model.)



Claim.—1. A two-wheeled vehicle provided with sockets S secured to the running-gear thereof, and a spring I, provided at its ends with irons M, adapted to fit into said sockets, said spring being adapted to be detachably clamped to the seat of said vehicle, said vehicle being provided with a rod or rods R, adapted to fit into said sockets and to be clamped to said seat, substantially as shown, and for the purpose set forth.

2. In a two-wheeled vehicle provided with a screw-threaded aperture or aperture A upon the seat thereof and provided with sockets S upon the running-gear thereof, a spring I, provided with irons M at the ends thereof, said irons being adapted to fit into said sockets, said spring being provided with a lug or lugs F, said lugs having apertures through them, a rod or rods R, adapted to fit into said sockets and provided with lugs r, similar to lugs F, and thumb-screws C, substantially as and for the purpose set forth.

3. A two-wheeled vehicle provided with sockets S, secured to the running-gear thereof, and a spring I, provided at its ends with irons M, adapted to fit into said sockets, said spring being adapted to be detachably secured to the seat of said vehicle, substantially as and for the purpose described.



482,740. UPRIGHT-PIANO ACTION. ALFRED HIGEE, New York, N. Y. Filed Nov. 25, 1891. Serial No. 413,093. (No model.)

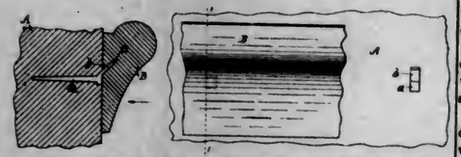
Claim.—1. In a piano-action, a sticker provided with a hole, as *c'*, in combination with a pivoted throw-off lever provided with a pin for engaging the hole in the sticker, substantially as set forth.

2. In a piano-action, the combination, with a sticker having a hole, as *c'*, of a pivoted throw-off lever provided with a pin for engaging the hole in the sticker and a heel, as *d*, for bearing against the sticker, substantially as set forth.

482,741. FURNACE. FRANK L. HIGGINS, Chicago, Ill., assignor of one-half to Percy H. Sloan, same place. Filed Mar. 3, 1892. Serial No. 424,222. (No model.)

Claim.—1. In a furnace, the combination, with the fire-box and the boiler, of air-flues having horizontal branches exposed to the heat of the fire-box and arranged to discharge thereinto against the natural draft of the furnace and pipes connected with the boiler and termi-

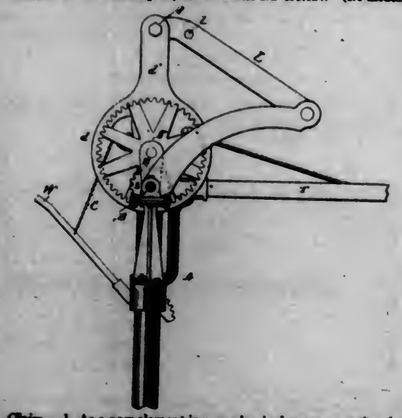
sating within said horizontal branches, whereby water may be allowed to drip into said horizontal branches while heated, substantially as set forth.



2. In a furnace, the combination, with a fire-box, the ash-pit, and the boiler, of upright metallic air-flues communicating with the ash-pit and having horizontal branches exposed to the heat of the fire-box and arranged to discharge therein against the natural draft of the furnace and pipes connected with the boiler and terminating within said horizontal branches, whereby water may be allowed to drip into said horizontal branches, substantially as set forth.

3. In a furnace, the combination, with the fire box and the bridge-wall, of upright air-flues having horizontal branches arranged to discharge into the fire-box away from the bridge-wall, the boiler, and the pipes extending into said horizontal branches of the air-flues and being connected with the boiler above and below its water-line, substantially as set forth.

4. In a furnace, the combination, with the fire-box and the bridge-wall, of a deflector arranged in said fire-box and projecting downwardly in front of the bridge-wall, upright air-flues arranged to discharge across the passage between the bridge-wall and said deflector against the natural draft of the furnace, the boiler, and pipes leading into said flues and being connected with said boiler above and below its water-line, substantially as set forth.

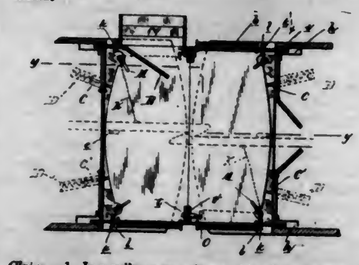


5. In a furnace, the combination, with the fire-box and the bridge-wall, of a deflector arranged within said fire-box and projecting downwardly in front of the bridge-wall, upright air flues arranged within the bridge-wall and having horizontal branches at their upper and lower ends leading into the fire-box and the ash-pit, respectively, the pipes J, projecting into the horizontal branches at the upper ends of said flues, and the manifold pipe K, connecting with said pipes J and being connected with a steam-supply, substantially as set forth.

482,742. MEANS FOR HANGING MOLDINGS. NICHOLAUS HOFFERD, Rochester, N. Y. Filed Dec. 28, 1891. Serial No. 416,363. (No model.)

Claim.—A molding having a continuous longitudinal kerf or channel formed in its rear surface, in combination with nails, each having its head formed with a surface at right angles with the shaft or body of the nails to receive the stroke of the hammer in driving and an inclined extended part at one side of the head, the latter, with its extended part, being received in said kerf or channel in the molding when the latter is put to place on the nails, substantially as shown, and for the purpose specified.

482,748. MECHANICAL MOVEMENT. CLIFFORD A. HOLCOMB, Beloit, Wis. Filed May 19, 1892. Serial No. 433,627. (No model.)



Claim.—1. As a new element in a mechanical movement, the plate D, constructed with the gear-rim d^2, the central means d^3 for connection by a link to the driving member, and the projecting arm d', having means d^3 for connection to the driven member, substantially as described.

2. The combination of the driving member with the driven member by means of the pinion *b*, the link E, and the plate D, constructed as herein described, as and for the purpose set forth.

3. The new mechanical movement herein described, consisting, essentially, in the pinion *b*, the link E, and the peculiarly-constructed plate D, adapted to operate together, substantially as set forth.

482,744. VESTIBULE-CAR. JOHN KERSHER, Cleveland, Ohio. Filed Apr. 15, 1891. Renewed Apr. 18, 1892. Serial No. 429,580. (No model.)

Claim.—1. In a railway-car, the combination, with the platform, of a horizontally-oscillating vestibule-section and a sliding connection between the car and vestibule, substantially as described.

2. In a railway-car, the combination, with the platform, of a horizontally-oscillating vestibule-section having its sides and roof overlapping the end of the car and having a sliding engagement therewith, substantially as described.

3. In a railway-car, the combination, with the platform, of a rigid vestibule-section pivoted thereon and a sliding connection between the car and vestibule, substantially as described.

4. In a railway-car, the combination, with the platform and an oscillating section thereon, of a guide-plate hinged to the sides of said vestibule and guide-bearings in the car with which said plates engage, substantially as described.

5. In a railway-car, the combination, with the platform, of the oscillating vestibule-section thereon, guide-plates at the sides of the vestibule, a hinge-joint in said plates, and a sliding connection between the vestibule-section and said plates, substantially as described.

6. In a railway-car, the combination, with the platform, of the oscillating vestibule-section thereon, the guide-plates engaging in bearings in the end of the car and hinged in said plates, and the sliding connection between the plates and the vestibule-section, substantially as described.

7. In a railway-car, the combination, with the platform, of the vestibule-section having a horizontal and vertical oscillation, the guide-plates engaging in guide-bearings in the car, a hinge in said plates, and a socket in the vestibule adapted to slidingly engage with said plates and arranged to permit the oscillation of said socket on the plates, substantially as described.

8. In a railway-car, the combination, with the vestibule, of the guide-plates *i*, the cross-heads *k*, the pins *n*, guide grooves *o*, sockets *l*, and pins *m*, substantially as described.

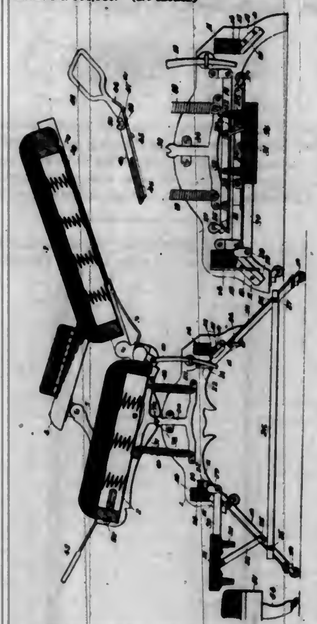
9. In a vestibule-car, the combination, with the vestibule-section extending from side to side of the car, of extensible steps secured to said vestibule, substantially as described.

10. In a railway-car, the combination, with the vestibule-section extending from side to side of the car, of steps secured to said vestibule-section and means for raising and lowering said steps, substantially as described.

11. In a railway-car, the combination, with the vestibule-section extending from side to side of the car, of steps secured to said vestibule-section by means of rods forming the steps supporting a railing, and means for raising and lowering said rod to fold the steps beside the vestibule-section, substantially as described.

12. In a railway car, the combination, with the vestibule-section, of steps secured thereto and adapted to be folded up across the door thereof, substantially as described.

13. In a railway-car, the combination, with a rigid vestibule-section supported upon the platform, of an extension of the roof of said vestibule slidingly engaging with the roof of the car, substantially as described.



14. In a vestibule-car, the combination, with the vestibule-section supported upon the platform, of an extension of the roof overlapping the roof of the car and a saddle upon which this extension is supported, substantially as described.

15. In a railway-car, the combination, with the platform, of a vestibule-section supported thereon, an extension of the roof overlapping the roof of the car, and an oscillating saddle upon which said extension slidingly engages, substantially as described.

16. In a railway-car, the combination, with a pivotal vestibule-section, of the springs D, applied to opposite sides thereof, substantially as and for the purposes described.

17. In a railway-car, the combination, with the vestibule-section, of the buffer-plates at the front side thereof, the hooks *t*, corresponding apertures in which said hooks engage, the bell-crank levers O, and means for rocking said bell-crank levers to disengage said hooks.

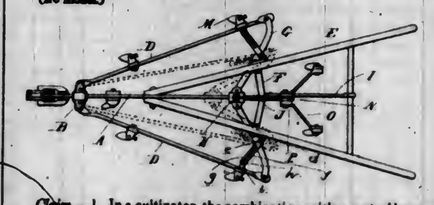
482,745. CHAIR. PEARL C. LEWIS, Catskill, N. Y. Filed Feb. 13, 1891. Serial No. 381,318. (No model.)

Claim.—1. The combination, with a reclining-chair, of supplemental leg-frames pivoted to each end of the base-frame of said chair and adapted to overlap each other and fold within the base, and each provided with the locking-lugs 25, adapted to engage a transverse notched leg-frame brace, and a pivoted supporting-hook catch loosely connected to one of the leg-frames and at its free end adapted to detachably engage one of the locking-lugs 25 of the opposite leg-frame, substantially as set forth.

2. The combination, with a reclining-chair, of the plates or castings secured to the inner sides of the side pieces of the base-frame of said chair and having laterally-flanged shoulders, and the oppositely-pivoted leg-frames adapted when extended from beneath said base-frame to rest within said lateral flanges, preventing lateral displacement, and against the main shoulder of said castings, substantially as and for the purpose set forth.

3. The combination, with a reclining-chair having the base-frame, the rocking seat, and the pivoted back-frame and the cross-pieces connecting the sides of the base-frame, of the plates or castings secured to the sides of the said base-frame and having heads abutting against and secured to the cross-pieces of the latter, and laterally-flanged shoulders, and the leg-frames connected pivotally to opposite ends of said base-frame by means of bolts or screws passing through clips or securing-plates and adapted when extended from beneath the frame to rest within said lateral flanges, forming supplemental stops, preventing lateral displacement, and against the main shoulder of said castings, substantially as set forth.

4. The combination of a reclining-chair, supplemental leg frames pivoted to each end of the base-frame of said chair and one of which frames is provided with a hook, said leg-frames being adapted to overlap each other and be folded under the base-frame, brackets pivoted to the front end of the latter, a foot-rest rigidly secured between the outer ends of said brackets and provided with lugs or studs, said foot-rest being adapted to be folded beneath the frame beneath the folded leg-frames and is supported thereunder by said hook of one of the leg-frames engaging a lug or stud thereof, substantially as set forth.



5. The combination, with a reclining-chair, of the supplemental leg-frames pivoted to and adapted to be folded under the base-frame of the same, arms or brackets pivoted to said base-frame, extending out horizontally from beneath and to the front of the same and carrying a foot-rest adapted to be folded under said base-frame and leg-frames, and means for supporting the foot-rest and leg-frames together independently of said base-frame when thus folded, substantially as set forth.

6. The combination, with a reclining-chair, of the supplemental folding leg-frames pivoted to the base-frame of said chair, the legs of the front frame being provided with mortised recesses, the arms or brackets pivoted independently to said base-frame and carrying the foot-rest, the legs or brackets hinged to the same and adapted to engage the recesses or mortises in the front legs, and a turn-buckle to secure said legs or brackets when folded under the same, said leg-frames and foot-rest being adapted to be folded and locked together beneath the base-frame and independently therefrom, substantially as and for the purpose set forth.

7. The combination, with a chair constructed substantially as described, the side rails of which are provided with notches or recesses, and the arm-connecting lugs, of the arms or brackets adapted to rest flat upon the forward ends of said side rails and having the stirrups at their front ends, longitudinal slots at their rear ends adapted to straddle said lugs, and downwardly-extending lugs or pins adapted to engage the notches or recesses in the side rails of the chair, substantially as specified.

8. The combination, with a chair constructed substantially as described, the side rails of which are provided with the arm-connecting lugs, and notches or recesses located at their forward ends, of the metallic plates provided with perforations registering with said notches or recesses, the stirrups having the arms or brackets composed of two parts pivotally connected and adapted to be held securely with relation to each other by means of a suitable set-screw, the rear end of said arm being provided with a longitudinal slot adapted to straddle said lugs within the side rails of the chair, and with a downwardly-extending lug adapted to engage one of the series of recesses in the side rail of the said frame of said chair, substantially as and for the purpose herein set forth.

482,746. CULTIVATOR. JAMES G. MALLERY and EDWIN J. YOUNG, Flint, assignors, by direct and mesne assignments, to the Gale Manufacturing Company, Albion, Mich. Filed Oct. 19, 1891. Serial No. 409,193. (No model.)

Claim.—1. In a cultivator, the combination, with a central bar and handles supported thereon, of hinged side bars having laterally-adjusting means, and adjustable braces connecting the side bars and handles, consisting of two fixed vertical members and a slotted horizontal member between and slidingly attached to the fixed members, substantially as described.

2. In a cultivator, the combination, with a central bar and handles supported thereon, of hinged side bars having laterally-adjusting means, and adjustable braces connecting the handles and side bars, consisting of projecting members on the handles and projecting members on the side bars, and a loosely-held sliding member uniting the projecting member, substantially as described.

3. In a cultivator, the combination, with a center bar and handles mounted thereon, of hinged side bars having adjusting means and braces connecting the handles and side bars, consisting of fixed depending standards on the handles having horizontal offsets, fixed standards on the side bars having horizontal offsets, and horizontal slotted links loosely secured to the offsets and uniting the same, substantially as described.

482,747. GAME FOR AMUSEMENT. JESSE S. MALIN, ISAIAH D. WIRT, and JONAS H. WIRT, Portland, Ind. Filed Feb. 1, 1892. Serial No. 420,019. (No model.)

Claim.—1. The game apparatus herein described, consisting of a board having thereon a revolving indicator surrounded by a circular arrangement of the names of all the States, with their respective number of electoral votes, a circle of perforated stars, in which to peg off, opposite the name of each State, the number of the electoral vote for each State as it is counted, so that it may not be again counted in adding up the total in one game, in connection with the two perforated spirals, in which is kept the count of the game, as specified.

provided with means for attachment to the apparel for retaining said form yieldingly in place upon the figure while being adjusted, substantially as specified.

3. A device for the purpose specified, consisting of a frame composed of vertical and transverse strands crossing at an angle and adjustably coupled, the plate *z*, having the inner curved edge, and the strands A and D, crossing at right angles, said strands being rigidly secured at their points of crossing and fixedly attached to said plate, whereby said strands are retained in the form of a square and the rocking of the frame is obviated.

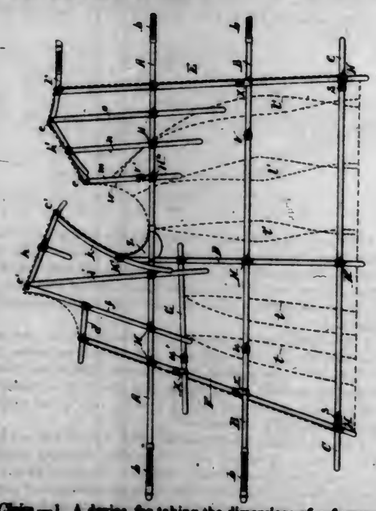
482,749. WRENCH. [illegible]

482,752. LAWN-MOWER. WILLIAM H. PRIEBLE and FREDERICK J. PRIEBLE, Aurora, Ill. Filed Jan. 26, 1892. Serial No. 419,579. (No model.)

levers, and the cultivating-plows attached to the draft-levers, substantially as set forth.

2. In a cultivator, the combination, with the axle having parallel axle-arms or ends, of horizontal equalizing draft-levers pivotally mounted within the opposite axle ends, the supporting-wheels adjustably connected to the rear ends of said draft-levers, the horizontal plow-levers pivotally mounted within said axle ends and carried by said horizontal draft-levers, and the cultivating-plows connected with the swinging ends of said plow-levers, substantially as set forth.

lugs extending beyond said recesses, and clamping-bolts passing through said legs, substantially as set forth.

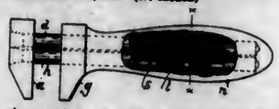


482,752. LAWN-MOWER. WILLIAM H. PRIEBLE and FREDERICK J. PRIEBLE, Aurora, Ill. Filed Jan. 26, 1892. Serial No. 419,579. (No model.)

peg off, opposite the name of each State, the number of the electoral vote for each State as it is counted, so that it may not be again counted in adding up the total in one game, in connection with the two perforated spirals, in which is kept the count of the game, as specified.

2. The game apparatus herein described, comprising the indicator *a*, the circle containing the names of all the States *b*, with their respective number of electoral votes, the circle of perforated stars *d*, and the two spirals *f f*, all substantially as set forth.

482,748. MEASURING AND DRAFTING DEVICE FOR GARMENTS. CASPAR MANNBACH, Detroit, Mich. Filed Mar. 31, 1892. Serial No. 426,742. (No model.)



Claim.—1. A device for taking the dimensions of a figure, consisting of a series of vertical and transverse strands adjustably coupled, the loops pivoted to the outer vertical strands, the intermediate vertical strand D, and the transverse strands B G, attached to said strand D and having their outer ends supported in said loops, substantially as set forth.

2. A device for obtaining the dimensions of a bust or figure, consisting of a form composed of a series of flexible crossed strands adjustably coupled at their points of crossing, said form adapted to inclose but one side of the figure from the center of the back to the center of the front, and the transverse strands having elastic extensions provided with means for attachment to the apparel for retaining said form yieldingly in place upon the figure while being adjusted, substantially as specified.

3. A device for the purpose specified, consisting of a frame composed of vertical and transverse strands crossing at an angle and adjustably coupled, the plate *s*, having the inner curved edge, and the strands A and D, crossing at right angles, said strands being rigidly secured at their points of crossing and fixedly attached to said plate, whereby said strands are retained in the form of a square and the rocking of the frame is obviated.

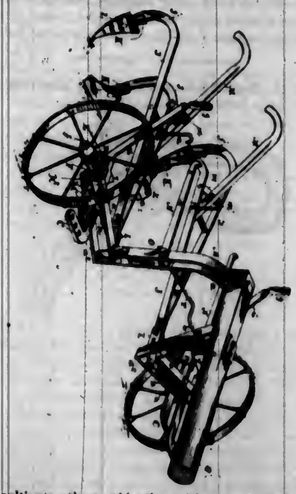
482,749. WRENCH. FRANK MOSHERG, Attleborough, Mass., assignor to the Mosberg Manufacturing Company, same place. Filed Feb. 3, 1892. Serial No. 420,154. (No model.)

Claim.—A wrench having a head with a shank consisting of two parallel bars adjustable in a handle having an inner jaw attached thereto, in combination with a nut having an internal screw-thread fitting into screw-threads on the outer sides of said bars and chambered in said handle to adjust the bars lengthwise thereon, as set forth.

482,750. MUCILAGE-HOLDER. FRANK H. PALMER, Brooklyn, N. Y. Filed Nov. 20, 1891. Serial No. 412,868. (No model.)

Claim.—1. A mucilage-holder comprising a wooden casing formed with a central bore and a stick of mucilage permanently fastened in the said bore and having one end projecting at the end of the casing, substantially as shown and described.

2. In a mucilage-holder, the combination, with a wooden casing having a central bore, of a stick of mucilage permanently fastened in the said central bore and having one end projecting beyond the cut-down end of the said casing, and a cap fitting over the cut-down end of the casing and protecting the projecting end of the mucilage-stick, substantially as shown and described.



3. In a mucilage-holder, the combination, with a casing having a central bore, of a stick of mucilage permanently secured in the said bore and projecting at one end thereof and a cap fitted over the said casing at the projecting end of the mucilage-stick, the said cap being provided with a reduced end into which extends the projecting end of the stick of mucilage, substantially as shown and described.

4. The combination, with a casing having two concentric bores, of a stick of mucilage permanently secured in one of the said bores and a stick of lead secured in the other bore, the said sticks extending in opposite directions to project at the ends of the casing, substantially as shown and described.

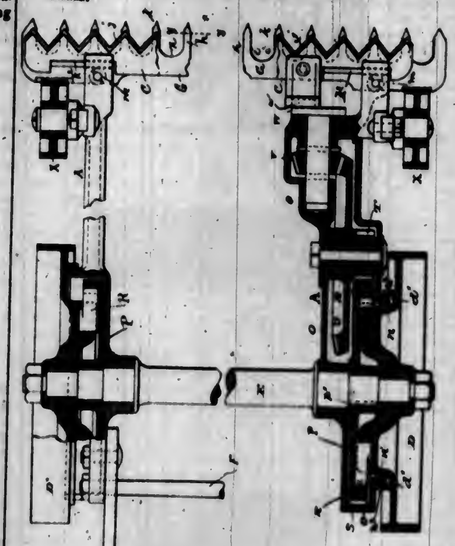
482,751. PLOW. CHARLES A. PYBURN, Wapello, Iowa. Filed Feb. 3, 1892. Serial No. 420,213. (No model.)

Claim.—1. In a cultivator, the combination of an arch axle having a central arch and opposite pairs of parallel axle arms or ends extending rearwardly at an angle from the central arch, horizontal equalizing draft-levers pivotally mounted within the opposite axle ends, the supporting-wheels vertically adjustable on the rear ends of said draft-levers, and the cultivating-plows attached to the draft-levers, substantially as set forth.

2. In a cultivator, the combination, with the axle having parallel axle arms or ends, of horizontal equalizing draft-levers pivotally mounted within the opposite axle ends, the supporting-wheels adjustably connected to the rear ends of said draft-levers, the horizontal plow-levers pivotally mounted within said axle ends and carried by said horizontal draft-levers, and the cultivating-plows connected with the swinging ends of said plow-levers, substantially as set forth.

3. In a cultivator, the combination, with the axle having the central arch and projecting axle ends, of the equalizing draft-levers connected with said axle ends and provided with notched blocks at their inner ends, adjustable spindle-arms having notched blocks at one end, adjustably clamped to the notched blocks of said draft-levers, and wheel-spindles at their other ends, and the cultivating-plows attached to the draft-levers, substantially as set forth.

4. In a cultivator, the combination, with the axle, of the horizontal draft-levers mounted in the axle ends and provided with notched blocks at their inner ends, vertically-adjustable spindle-arms having notched disks at one end, adjustably clamped to the notched blocks of said draft-levers, and wheel-spindles at their other ends, and the cultivating-plows attached to said horizontal draft-levers, substantially as set forth.



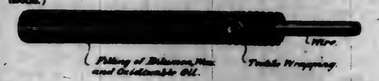
5. In a cultivator, the combination, with the axle having the opposite parallel axle arms or ends, of equalizing draft-levers pivotally mounted within the opposite axle ends and carrying the supporting-wheels, horizontal plow-levers pivotally mounted within said axle ends and loosely connected with said pivoted draft-levers, said plow-levers having limiting-slots working over the draft-levers' pivot-bolts, and the cultivating-plows adjustably connected with the swinging ends of said plow-levers, substantially as set forth.

6. In a cultivator, the combination, with the axle having the opposite parallel arms or ends, straight pivot-bolts passing through said axle ends, equalizing draft-levers pivotally mounted on said bolts within the axle ends and carrying the supporting-wheels, bowed or crank bolts located in the extreme ends of the axle-arms, horizontal plow-levers pivoted at their outer ends to said crank-bolts and having pivot-studs pivotally engaging the draft-levers, curved slots working over said straight pivot-bolts, and a series of coupling pins or studs at their inner swinging ends, and the cultivating-plows attached to said coupling-pins, substantially as set forth.

7. In a cultivator, the combination, with the axle, of the open wheel carrying draft-levers connected with the axle-arms and provided with shoulders at their inner ends and one side, sliding supporting-feet having flat-tread portions at one end and opposite slotted ends and bolts passing through said slotted ends and the shouldered ends of said draft-levers, said supporting-feet being adapted to have the heads thereof slide over said bolts to engage said shoulders and be slid within said open draft-levers, respectively, substantially as set forth.

8. In a cultivator, the combination, with the axle, the equalizing-levers working within each axle and having a series of coupling-studs and the cultivating-plows, of the coupling-plates or clevises pivotally connected with the front ends of the plows and comprising separate plates having oval slots, taking over the equalizing-levers, coupling-sockets receiving the studs above and below the levers, and perforated lugs extending beyond said recesses, and clamping-bolts passing through said lugs, substantially as set forth.

482,752. LAWN-MOWER. WILLIAM H. PRIBBLE and FREDERICK J. PRIBBLE, Aurora, Ill. Filed Jan. 26, 1892. Serial No. 419,078. (No model.)



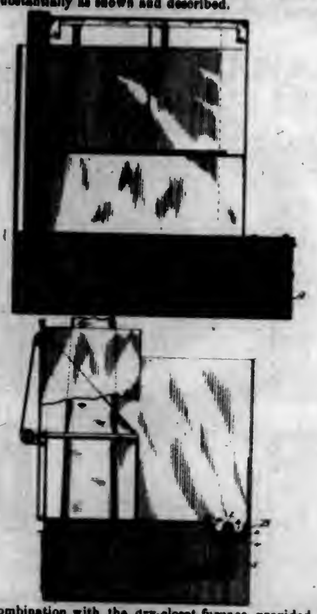
Claim.—1. In a lawn-mower, a fixed cutter-bar whose knives or blades have the following characteristics, namely: an upper surface in the same continuous plane to their extreme tip, triangular in cross-section as far back as the inner angles of the movable blades, long, narrow, and with their sides parallel with each other, and having their tips beveled to a point in the line of their top surface.

2. In a lawn-mower, the combination, with a fixed cutter-bar having narrow parallel-sided blades triangular in cross-section as far back as the inner angles of the movable blades and terminating in a sharp point in a line with their flat top surface, of a reciprocating cutter-bar having its cutters of ordinary saw-tooth or triangular form, substantially as set forth.

3. A reciprocating cutter-bar having near each of its ends an upwardly-projecting rib k^2, integral with and bent up at right angles to the body of the bar, in combination with stationary parts of the frame or machine, having in their under faces corresponding grooves in which said ribs lodge and move, substantially as and for the purpose set forth.

4. A traction-wheel for lawn-mowers, having an inwardly-projecting annular flange n^3 between its hub and perimeter and a deep annular groove between such flange and hub, in combination with the gear-inclosing case O, having the outwardly-projecting broad annular flange *n* between its perimeter and hub and entering such groove, all substantially as shown and described.

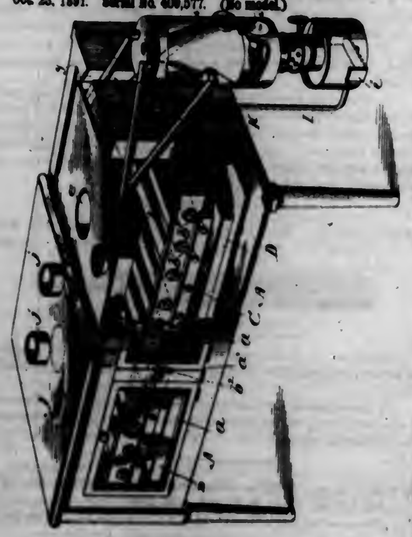
482,753. INSULATED ELECTRIC WIRE. THOMAS L. REED, Providence, R. I. Filed May 31, 1890. Serial No. 353,862. (No specimens.)



Claim.—1. A conducting-wire covered with a textile wrapping filled with a composition of bitumen, wax, and oxidized or oxidizable oil.

2. A conducting-wire covered with a textile wrapping filled with a composition of petricite, wax-tailings, and linseed-oil, in substantially the proportions specified.

482,754. URINAL. WILLIAM S. ROSS, Madisonville, Ky. Filed July 5, 1892. Serial No. 316,491. (No model.)



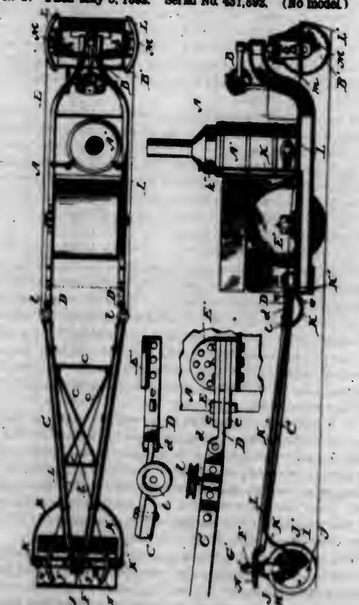
Claim.—1. A urinal consisting of a perforated top trough having

a bottom formed with two parallel gutters therein, an imperforate angular trough in cross-section, consisting of two sections secured under the perforated trough with their ends sealed thereto and arranged to incline downward from the ends of the trough to their point of union, and a conduit-pipe secured to the said sections at their lowest point, substantially as shown and described.

2. In combination with the dry-closet furnace provided with a perforated plate arranged above the floor of the combustion-chamber, a conduit-pipe opening into the combustion-chamber under the perforated plate and arranged at an upward incline, and the urinal-trough, consisting of the imperforate-bottom trough composed of sections secured to the upper end of the conduit-pipe and inclined upward from their connection therewith, and a perforated trough secured to the imperforate trough, said perforated trough being formed with parallel gutters, substantially as described, and for the purpose specified.

482,755. INCUBATOR. Joseph S. Rubel, Le Mars, Iowa. Filed Oct. 23, 1891. Serial No. 409,577. (No model.)

Claim.—1. The combination, in an incubator having an open front, of doors *a* and the intermediate piece *a'*, closing said open front, the evaporating-pans, and the roller-frame adapted to be inserted and removed through the said open front, one of the cranks b^3 of the rollers extending through the piece *a'* and adapted to have a suitable handle applied thereto, substantially as and for the purpose described.



2. The combination, in an incubator having its top closed by a cover and having slots in one end wall, which extend through the top edge of said wall, of a shallow boiler or radiator removably inserted through the said top and a heater and tank exterior to the said incubator, the tank being permanently connected to and movable with the said pan by the pipes G and G', substantially as set forth.

482,756. ROPE-HOLD. Ephraim T. Rugg, Alexandria, Ohio. Filed June 30, 1891. Serial No. 398,070. (No model.)

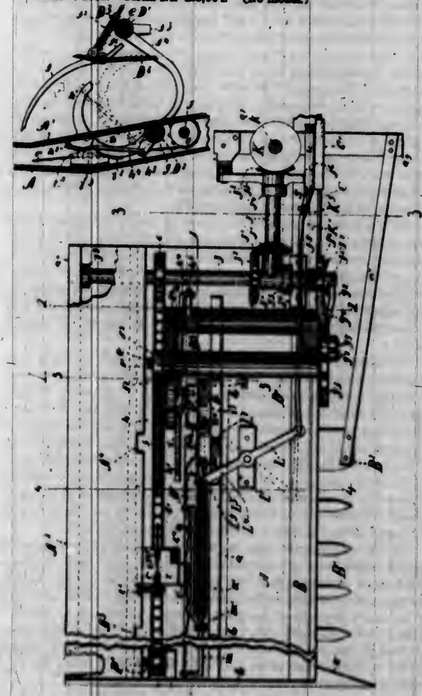
Claim.—A rope-holder for forming a loop by frictionally clamping an end of a rope to the body of the same, consisting of a plate with three eyes integrally connected, the central eye being slightly oblique to the left of a true vertical line, the right eye extending slightly above a horizontal plane at an angle from the lower portion of said central eye, and the left eye being obliquely arranged to the upper part of said central eye, all of said eyes being in different planes and the two end eyes arranged nearer to each other on one side of the central eye than on the other side of said latter eye, the two end eyes being adapted to receive the body of the rope and the central eye the end of said rope, which is interposed between the body of the rope passing through said end eyes and the plate, whereby a half-hitch of the rope is made, substantially as described.

482,757. COMBINATION ROAD-ROLLER. Robert C. Ruthven Buffalo, assignor to the Barber Asphalt Paving Company, New York, N. Y. Filed May 5, 1892. Serial No. 431,892. (No model.)

Claim.—1. The combination of a steam-roller, an advance roller, a connecting-reach, means for connecting and disconnecting the advance and the steam rollers, and suitable steering-gear for steering the advance roller adapted to be operated from the steam-roller, substantially as described.

2. The combination of a steam-roller, an advance roller, a reach connecting the two, means for connecting and disconnecting the advance and the steam rollers, and suitable steam connections between the steam-roller and the interior of the advance roller, substantially as described.

3. The combination of a steam-roller, an advance roller, a connecting-reach, suitable steam connections between the steam-roller and the interior of the advance roller, and steering-gear for steering the advance roller adapted to be operated from the steam-roller, substantially as described.



4. The combination of a steam-roller, an advance roller, a connecting-reach, suitable steam connections between the steam-roller and the interior of the advance roller, steering-gear for steering the advance roller adapted to be operated from the steam-roller, and means for connecting and disconnecting the rollers, substantially as described.

5. The combination of the steam-roller A, having the steering-roller B' and yoke *b*, the reach C, having the hinged links D D, detachably connected to the steam-roller A, the sleeve F, fastened to the reach, the yoke H, having the yoke-bolt G, an axle mounted in the yoke, rollers turning upon the axle, the cable connection L L between the yokes H and *b* of the respective rollers, and means for steering the roller B', substantially as described.

6. The combination of the steam-roller A, having the boiler A', the reach C, detachably connected to the steam-roller, the yoke H, pivoted to the forward end of the reach C, the fixed axle I, suspended in the yoke and having the tubular borings *i i*, the hollow rollers J' J', mounted upon and communicating with said tubular axle, the steam connection K between the boiler A' and the axle I, and means for connecting and disconnecting the same, substantially as described.

7. The combination of the steam-roller A, having the boiler A', the steering-roller B', the reach C, detachably connected to the steam-roller, the yoke H, pivoted to the forward end of the reach C, the fixed axle I, suspended in the yoke and having the tubular borings *i i*, the hollow rollers J' J', mounted upon and communicating with said tubular axle, the detachable steam connection K between the boiler A' and the axle I, and the detachable cable connection L L between the advance roller and the steering-roller B', substantially as described.

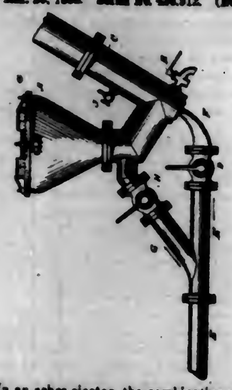
482,758. GRAIN-BINDER. George Schubert, Walnut, Tex. Filed Mar. 7, 1892. Serial No. 423,994. (No model.)

Claim.—1. In a grain-binder, a grain-receiving platform having a slot, a conveyer operated in said slot, a lever L, pivoted in the platform having a lug L^2, pivoted in its rear end, a rod *m*, extending through the lugs L^2 and *m'* and having its grainward end bent to extend into the passage-way of the conveyer, a rod *n*, secured to the rod *m* and extending stubbleward with its free end bent to extend into the passage-way of the conveyer, an inclined block n^2 in the passage-way of the rod *m*, having a projection n^4 to be engaged by a dog n^3, pivoted to the stubbleward end of the rod *m*, shoulders L^4 and L^5 in the platform in position to be engaged by the lever L, the shoulder L^5, slightly above the level of the shoulder L^4, and a spring *n'*, coiled on the rod *m*, in combination with gear-shifting mechanism connected with the forward end of the lever L, substantially as and for the purpose described.

2. In a grain-binder, a grain-receiving platform having a slot, a conveyer operated in said slot, a lever L, pivoted in the platform having a lug L^2 pivoted in its rear end, a rod *m*, extending through the lugs L^2 and *m'* and having its grain end bent to extend into the passage way of the conveyer-block, and a dog n^3, pivoted to the stubble end of said rod *m* in position to engage with the notch or shoulder n^4, formed on the block n^2, a shoulder L^5 in the platform, as shown, a rod *n* on the rod *m* and having a rearward-bent end projecting in the path of the conveyer, a coiled spring on the rod *m*, a rod K', pivoted with its grainward end to the forward end of the lever L, a movable bearing j^3 to engage with the inclined slot in the rod K', a shaft *j*, journaled in the movable bearing j^3 and in a pivoted bearing, a bevel-pinion j^3 on the shaft *j* to be engaged and disengaged with the bevel-pinion K^2 and K on the shaft *k*, a sprocket-wheel on the shaft J, a chain on said sprocket-wheel to operate the conveyer, and bevel-pinions J' and *j'* to operate the shaft J, as shown and described.

3. In a grain-binder, a needle formed in sections having the section A pivoted on the shaft *g*, projecting with its free end grainward, with the section A' pivoted to the free end of the section A and connected to the arm A^3 rigid on the shaft *g* by the connecting-rod A^4, a bracket i^3 in position to be engaged by the end A^5 of the connecting-rod A^4, a spring i^3, secured to the section A, projecting with its free end grainward in position to engage with the stud *i* on the connecting-rod A^4, a post i^2 to engage with the spring i^3, a grain-receiving platform having a slot, a conveyer operated in said slot to start the needle, operating mechanism, and clutch-tripping mechanism connected therewith and controlled by the shaft *g*, substantially as shown and described.

4. In a grain-binder, a needle formed in sections having the section A pivoted on the shaft *g*, projecting with its free end grainward, with the section A' pivoted to the free end of the section A and having a heel A^3, projecting stubbleward and connected to the arm A^3 rigid on the shaft *g* by a connecting-rod A^4, a bracket i^3 in position to be engaged by the end A^5 of the connecting-rod A^4, a spring i^3, secured to the section A, projecting with its free end grainward in position to engage with the stud *i* on the connecting-rod A^4, a post i^2 to engage with the spring i^3, a grain-receiving platform having a slot, a conveyer operated in said slot, operating mechanism, and clutch-tripping mechanism connected therewith and controlled by the shaft *g*, as shown and described.

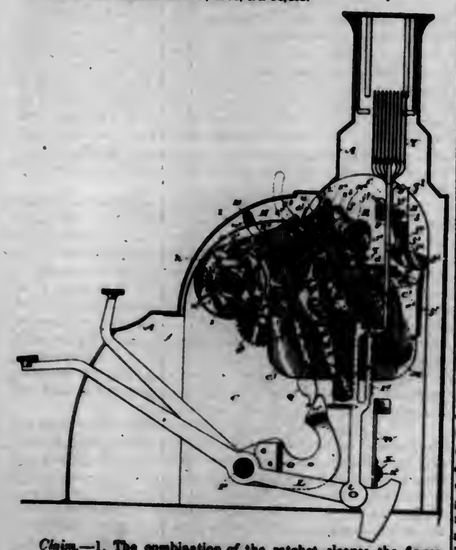


5. In a grain-binder, a needle formed in sections having the section A pivoted on the shaft *g* and projecting with its free end grainward, with the section A' pivoted to the free end of the section A, and having a heel A^3, projecting stubbleward and connected to the arm A^3 rigid on the shaft *g* by a connecting-rod A^4, a bracket i^3 in position to be engaged by the end A^5 of the connecting-rod A^4, a spring i^3, secured to the section A, projecting with its free end grainward in position to engage with the stud *i* on the connecting-rod A^4, said connecting-rod A^4 curved, as shown, to come in proper contact with the needle or section A', a post i^2 to engage with the spring i^3, a grain-receiving platform having a slot, a conveyer operated in said slot, operating mechanism, and clutch-tripping mechanism connected therewith and controlled by the shaft *g*, as shown and described.

6. In a grain-binder, a needle formed in sections having the section A pivoted on the shaft *g*, projecting with its free end grainward, with the section A' pivoted to the free end of the section A and having a heel A^3, projecting stubbleward and connected to the arm A^3 rigid on the shaft *g* by a connecting-rod A^4, a bracket i^3 in position to be engaged by the end A^5 of the connecting-rod A^4, a spring i^3, secured to the section A, projecting with its free end grainward in position to engage with the stud *i* on the connecting-rod A^4, a post i^2 in the platform, as shown, to engage with the spring i^3, and means to operate the shaft *g*, as and for the purpose described.

7. In a grain-binder, in combination with operating mechanism, a grain-receiving platform having a slot, a conveyer operated in said slot, a needle operated in said platform, a breast-plate, an arm *f*, pivoted on a stud D^6 on said breast-plate and having the extension f^4, an arm f^2 rigid on the shaft *e* to engage with said extension f^4, a rod *f'*, pivoted to the arm *f* and extending through a lug D^4, a nut or its equivalent on its free end to prevent the rod *f'* from disengaging from the

lug D^2, a spring f^3 coiled on the rod f', as shown, and for the purposes described, and means to operate the shaft e, substantially as shown and described.



482,759. ASH-EJECTOR FOR SHIPS. HORACE SEE, New York, N. Y. Filed Mar. 30, 1892. Serial No. 426,912. (No model.)

Claim.—1. In an ashes-ejector, the combination of an ash-receptacle, a jet-pipe provided with a valve or cock located in close proximity to the jet end of the pipe for opening and closing the jet-orifice, and a discharge-pipe connected to said ash-receptacle and jet-pipe to discharge said receptacle through its bottom, substantially as and for the purposes set forth.

2. In an ashes-ejector, the combination of an ash-receptacle provided with a removable cover or seal, a jet-pipe, a discharge-pipe, and a bilge-discharge pasover-pipe and valve connecting said pipes, for the purposes set forth.

482,760. CASH INDICATOR AND REGISTER. JOHN SHARPE, Toronto, Canada. Filed Jan. 21, 1892. Serial No. 418,754. (No model.) Patented in Canada Nov. 18, 1891, No. 33,405.

Claim.—1. The combination of the ratchet-sleeves, the finger-keys and ratchet-bars to partly rotate the sleeves on one stroke of the ratchet-bars, the vertical rods containing the tablets Y at their upper ends, supported in their normal position in guide-bars and designed to be moved upwardly by the upper throw of the ratchet-bars operated from the finger-keys, the pins J^3, secured in each ratchet-bar and extending rearwardly from the same, the detent J', secured to the rod R and designed to come in contact with the swinging dog z^3 and thereby throw the swinging frame Z clear in order to permit of the passage of each pin J^3 to be engaged by the said frame for holding the rod up, and the connections to the key-levers for rocking the rod R, as and for the purpose specified.

2. The combination of the ratchet-bars operated as described, the vertical rods containing the tablets on the same and having pins J^3, and the detent J' on the shaft R, designed to engage with the swinging spring-dog z^3, rigidly held against the shoulder z^4, so that the rearward movement of the detent J' will swing the frame Z, with its cross-bar z^2, rearwardly and allow the pin J^3 to rise above said cross-bar to be held thereby, as and for the purpose specified.

3. The combination of the registering-disks, the ratchet-sleeves geared thereto, the finger-keys and ratchet-bars to partly rotate the sleeves on one stroke of the ratchet-bars, the carrying-plate loosely supported on the shaft and held in position by the jaw-shaped end of the goose-neck arm of the lever c between each adjacent ratchet-sleeve and the upper notch of the spring-catch, which is pivoted on the intermediate standard-plate, and the spring-dog e, pivoted on the carrying-plate and designed to move the adjacent carrying-sleeve forward the space of one tooth, as and for the purpose specified.

4. The combination of the registering-disks, the ratchet-sleeve geared thereto, the finger-keys and ratchet-bars to partly rotate the sleeves on one stroke of the ratchet-bars, the carrying-plate loosely supported on the shaft and held in position by the jaw-shaped end of the goose-neck arm of the lever c between each adjacent ratchet-sleeve, the upper notch of the spring-catch, which is pivoted on the intermediate standard-plate, the spring-dog e, pivoted on the carrying-plate and designed to move the adjacent carrying-sleeve forward the space of one tooth, the pins b^3 on the gear-wheel adjacent to the carrying-plate designed to engage with the pin b^4 on the catch b, and in passing it to raise the said catch and the spiral spring d, attached to the lower end of the lever c and designed to bring the goose-neck arm of the lever rearwardly and throw the dog-shaped end a^2 into the lower notch of the catch b^2 and the dog e rearwardly, so as to engage with the next succeeding tooth, substantially as and for the purpose specified.

5. The combination of the registering-disks, the ratchet-sleeves geared thereto, the finger-keys and ratchet-bars to partly rotate the sleeves on one stroke of the ratchet-bars, the carrying-plate loosely supported on the shaft and held in position by the jaw-shaped end of the goose-neck arm of the lever c between each adjacent ratchet-sleeve, the upper notch of the spring-catch, which is pivoted on the intermediate standard-plate, the spring-dog e, pivoted on the carrying-plate and designed to move the adjacent carrying-sleeve forward the space of one tooth, the pins b^3 on the gear-wheel adjacent to the carrying-plate designed to engage with the pin b^4 on the catch b and in passing it to raise the said catch, and the spiral spring d, attached to the lower end of the lever c and designed to bring the goose-neck arm of the lever rearwardly and throw the dog-shaped end a^2 into the lower notch of the catch b^2 and the dog e rearwardly, so as to engage with the next succeeding tooth, the swinging dog pivoted on the lower end of one of the strips of the lever c and provided with a stop c^2, so as to enable its corresponding engaging arm, extending from the shaft R and receiving its upward movement from the tension of the spring r^3, attached to the arm r' on the outer end of the shaft R, to engage with the end of the swinging dog and in passing it to throw the lower end of the lever forwardly, so as to bring the carrying-plate and dog to their normal positions and the adjacent sleeve forward the space of one tooth, as and for the purpose specified.

6. The combination, with the carrying device consisting of the carrying plate and catch b and their operating mechanism, of the pin u^2, extending upwardly from the spindle u and designed to be held by the spring V, attached at one end to the curved arm u' of the arm u and at the other end to the standard-plates, so as to hold the pin u^2 against the upper spindle c^4 of the lever c when the lid is open, and thereby hold the lever c and the carrying-plate A stationary, as and for the purpose specified.

7. The combination, with the registering-disks and the finger-keys attached to and operating the ratchet-bars, which are connected with said disks, said keys being pivoted on the shaft P, supported in bearings in the outer standard-plates, of the bar O, attached at its outer end to the brackets o, secured to the shaft P and having the upper end o', against which the bottom ends of the levers Q abut, the upper ends of the levers Q having a quadrant q formed on them designed to engage with the quadrant r on the shaft R, which has arms r' extending rearwardly, the rear ends of the said arms being connected by the spiral springs r^3 to the bottom of the standard-plates, the said shaft R, with its spring, serving to return all the keys to normal position.

8. The combination, with the finger-keys attached to and operating the ratchet-bars and pivoted on the shaft P, supported in bearings in the outer standard-plates, the bar O, attached at its outer ends to the brackets o, secured to the shaft P, and the pin t at the outer end of one of the brackets, of the pivoted lever S, having a toe s, designed to be thrown above the pin t by the bell-crank T, which is tilted on its pivot by the engagement of the lower arm of the lever U, caused by the upward throw of its arm u' by the spring V when the lid is open, as and for the purpose specified.

9. The combination, with the finger-keys, the brackets o, and pivoted lever Q, provided at its upper end with the quadrant q to mesh with the quadrant r on the shaft R, of the arm N', extending beneath and abutting the pin L', secured in the rearwardly-projecting end of the stop-arm 11', rigidly secured to the shaft H', of the stop-arms 8', 9', 10', 11', 13', and 14', also secured to the shaft H', all of the stop-arms engaging with the projections 8, 9, 10, 11, 12, 13, and 14 on the disks 1 2 3 4 5 6 7, as and for the purpose specified.

10. The combination, with the finger-keys, the brackets o, the pivoted lever Q, provided at its upper end with the quadrant q, arranged to mesh with the quadrant r on the shaft R, and the arm N', extending beneath and abutting the pin L' and the pin L^2, both of which are secured in the rearwardly-projecting end of the stop-arm 11', rigidly secured to the shaft H, of the stop-arms 8', 9', 10', 11', 13', and 14', also secured to the shaft H', all of the stop-arms engaging with the projections 8, 9, 10, 11, 12, 13, and 14 on the disks 1 2 3 4 5 6 7, as and for the purpose specified.

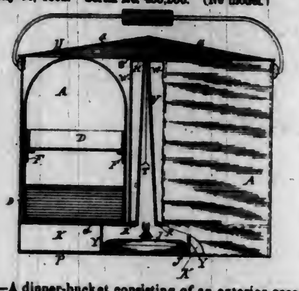
11. The combination, with the stop-arms 8', 9', 10', 11', 13', and 14', operated as described and having enlarged ends J', designed to fill up the space between two succeeding projections 8, 9, 10, 11, 13, and 14 on the disks 1, 2, 3, 4, 6, and 7, of the stop-arms 12', loosely journaled on the shaft H', and having an enlarged end j', designed to fill up the space between two succeeding projections 12 on the disk 5, and pin J^4, over which extends an arm a^3, projecting forwardly from the shaft H', as and for the purpose specified.

12. The combination, with the banks of keys, the registering-disks 1, 2, 3, and 4 of each bank connected to and operated from the finger-keys by means of the ratchet-bars, ratchet-sleeves and trains of gearing, as described, and the disks 5 6 7, connected to and operated from the disk 4, of the stop-arms for holding the said disks in alignment, and the spiral spring f', connected to the shaft H' at one end and at the other to the shaft J, whereby all of the said arms are subjected to tension, as and for the purpose specified.

13. In combination, the disks 1, 2, 3, and 4, with operating means therefor, said disks having projections 8, 9, 10, and 11, the stop-arms 8' 9' 10' 11', the disk 5, having an independently-movable stop-arm 12', the shaft H', on which the said arm is loosely secured, the projecting arm O^2, extending over the pin j', and the carrying mechanism between the disks 4 and 5, substantially as described.

14. In combination, the registering-disks M, secured to the hollow shaft in proximity to the faces of the disks 4, 5, and 6 and provided with notches, the pawls, the quadrant for engaging the said pawls, the means for manually operating the quadrant, consisting of the spindle m^4, extending through the hollow shaft, and the knob at its outer end, and the knob for turning the disks back to zero, substantially as described.

15. The disks M', secured to the hollow shaft D in proximity to the faces of the disks 4, 5, and 6 and provided with notches m, in combination with the quadrants m^2, secured in the spindle m^4, the turning-knob n^3, the slot n^2, made in the end of the spindle m^4, and the pin m^3 extending through the slot n^2 and turning-knob n^3, and the pin n^4, designed to extend into the pin n^5 in the end of the hollow shaft D, as and for the purpose specified.



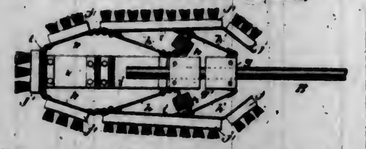
16. In combination, a series of disks having pins f and arranged side by side, a shaft D, carrying said disks, said shaft having a groove or grooves G, extending longitudinally of the same and in the same radial plane and corresponding to the zero position of the disks, the said shaft having a second short section of groove G', extending parallel with the main groove directly adjacent thereto, but in a different radial plane, said groove G' extending only under the last disk of the series and in radial position corresponding to the "9" digit and adapted to form a stop for the disk when its "9" digit is brought to view, substantially as described.

17. The shaft D, provided with a turning-knob E, a series of disks 1, 2, 3, 4, 5, 6, and 7, having spring-pins f, extending into a longitudinal groove G cut in the shaft D, in combination with the turning-knob E, secured in the end of the shaft D, and the bell-crank P^2, the forward end of which is depressed by the lever P', so as to raise the arm r', and thereby relieve the arm N' on the shaft R from its contact with the pin L' on the rearwardly-projecting end 11^2 of the arm 11', as and for the purpose specified.

18. In combination, in a cash-register, the casing, the disks arranged therein side by side, the carrying mechanism between the disks, the means for adjusting the same, including the shaft m^4, reaching outside the casing, and the turning-knob, the cover of the casing, and the arm z', projecting from the hub of the turning knob and adapted to engage with and resist the closing movement of the cover when the registering mechanism is not properly adjusted, substantially as described.

19. The disks Z and 4, provided with projections 9 and 11 and supported on the shaft B and operated as specified, in combination with the rocking detents Z^3 and Z^5, held in their normal position by the spring Z^4 and designed to be brought into the path of the projections 9 and 11, respectively, by the arms Z^2 and Z^6, extending from the rock-shaft R, the said rock-shaft being connected with the key-levers, substantially as described.

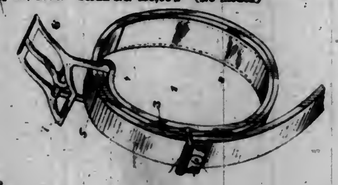
482,761. DINNER-BUCKET. HERBERT J. SIBLEY, Chicago, Ill. Filed May 16, 1892. Serial No. 433,238. (No model.)



Claim.—A dinner-bucket consisting of an exterior case provided internally at each end with a heating-chamber and between these chambers a central chamber with the conical heating-pipe extending vertically through it, a lamp-chamber extending from side to side of the bottom of the case, and dead-air chambers on both sides of the lamp-chamber, in combination with a metal basket in each end chamber, with pans therein, and a lamp provided with an inserting-plate, substantially as and for the purpose specified.

482,762. TRACE-FASTENER. DANIEL B. SMITH, Mobile, Ala. Filed May 16, 1892. Serial No. 433,190. (No model.)

Claim.—In a trace-fastener, the combination, with a singletree, of a loop or eye integrally formed with a shouldered head having a screw-shank, said loop or eye being in duplicate and vertically and immovably disposed across each of the ends of the singletree, and a flanged or headed stud or pin projecting from the rear of the said singletree and adapted to be engaged by the trace after having been passed through the said loop or eye, substantially as described.

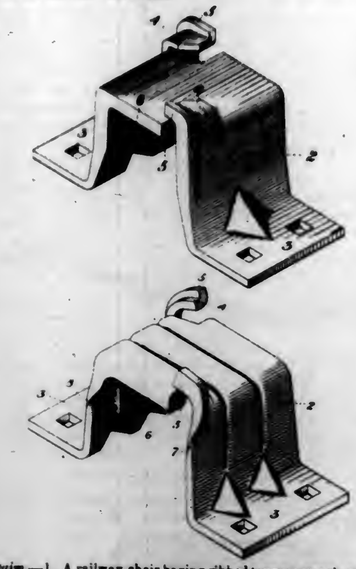


482,768. CAN-WASHER. CHARLES H. SOUTHARD, Preston, N. Y. Filed Aug. 17, 1891. Serial No. 402,800. (No model.)

Claim.—1. An expansion brush formed of the hubs g g', the swinging arms k k', the expansible frame formed of the bars i k and plate l and arranged for expansion by end pressure, the brushes carried by the expansible frame, and the springs n, arranged to contract the frame, substantially as specified.

2. In a can-washer, the combination of a trough adapted to receive cans and an expansible rotary brush arranged to revolve within the trough and constructed to be expanded by the pressure of the can and contracted by springs, substantially as specified.

482,764. THILL-TUG. SAMUEL STEWART, Ickesburg, Pa. Filed May 21, 1892. Serial No. 433,884. (No model.)



Claim.—1. In a tug, the combination of a rolled body having an end stitched within the same at the edges thereof to form a pocket, a flat spring mounted in said pocket and having its upper end secured and the lower end thereof free to move, a buckle having a loop secured in said body and a rear guard, a keeper attached to the body, and a stop located adjacent to and adapted to bear against the said keeper, substantially as described.

2. In a tug, the combination of the body constructed as set forth and having a billet extending therefrom, a buckle secured to said body, and a keeper independent of said buckle, comprising a rectangular frame and attached to said body and engaging said billet and having legs bent therefrom and extending in opposite directions at right angles to the plane of the frame, substantially as described.

3. In a tug, the combination of a body consisting of a rolled strap containing a spring, a buckle secured to said body, a keeper independent of said buckle, and an adjustable stop for said keeper, substantially as described.

482,765. RAILWAY-CHAIR. SIMON H. STUPAKOFF, Pittsburg, Pa., assignor to Charles H. Read, same place. Filed Jan. 15, 1892. Serial No. 418,184. (No model.)

Claim.—1. A railway-chair having ribbed tongues struck up from the body of the chair, substantially as described.

2. A railway-chair having diagonally-situate ribbed tongues struck up from the body of the chair, substantially as described.

3. A railway-chair having diagonally-situate tongues struck up from the body of the chair, the chair having ribs forced out from and of substantially the same thickness as the body, substantially as described.

4. A railway-chair having diagonally situate tongues struck up from the body of the chair, the chair having ribs forced out from and of substantially the same thickness as the top and sides of the chair, substantially as described.

5. A railway-chair having diagonally-situate ribbed tongues struck up from the body of the chair, the remainder of the chair having inwardly-projecting marginal flanges, substantially as and for the purposes described.

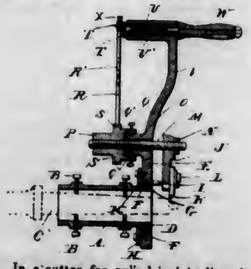
6. The method of making rail-chairs, consisting in cutting diagonally-opposite tongues in a rectangular blank and then bending the blank into chair form and forming ribs upon said tongues, substantially as and for the purposes described.

7. The method of making rail-chairs, consisting in cutting diagonally-opposite tongues in a rectangular blank, then bending the blank into chair form, and forming marginal flanges upon the edges of the tongues, substantially as and for the purposes described.

8. The method of making rail-chairs, consisting in cutting diagonally-opposite tongues in a rectangular blank, then bending the blank into chair form, and forming marginal flanges upon the edges of the tongues and chair-body, substantially as and for the purposes described.

482,766. GUARD-RAIL. SIMON H. STUPAKOFF, Pittsburg, Pa., assignor to Charles H. Read, same place. Filed Mar. 16, 1892. Serial No. 425,174. (No model.)

Claim.—1. A rail provided with a removable guard and a hook arranged to hold said guard in place, substantially as described.



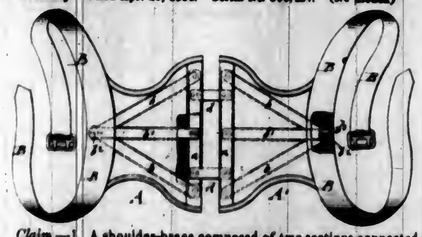
2. A rail provided with a guard fitting over its inner flange or tram and a hook secured to the rail and taking into a recess in the outer side of the guard, substantially as described.

3. A rail provided with a removable guard fitting upon its tram and a bolt passing through the web of the rail and provided with a hook engaging said guard, substantially as described.

4. A rail provided with a removable guard fitting upon its tram and a bolt having a nut bearing upon an inclined surface and having its end bent into a hook which engages the guard, substantially as described.

5. A rail provided with a block fitted between its flange and base, a removable guard fitting over the tram of the rail and resting upon a shoulder of the block, and a hooked bolt engaging the guard and passing through a slot in the block, substantially as described.

482,767. AXLE-CUTTER. JOHN SWEGLES, Wayne, Mich. Filed Feb. 23, 1892. Serial No. 422,378. (No model.)

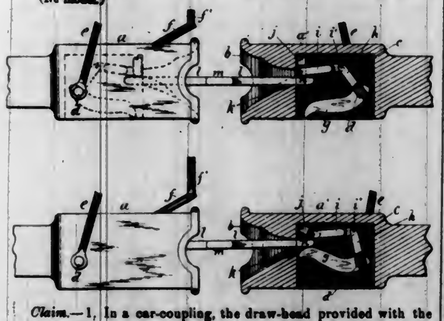


Claim.—1. In a cutter for cylindrical bodies, the combination, with an adjustable support, of a crank-arm movably secured on the support, a cutter-head carried by the crank-arm, a screw for adjusting the cutter-head, a ratchet engaging the screw, a pawl for rotating the ratchet, and a handle loosely mounted in the crank-arm supporting said pawl, substantially as described.

2. In a cutter for cylindrical bodies, the combination, with a support, cutter-head, and a crank-arm for operating the head, of a screw for longitudinally adjusting the cutter-head, a pawl-and-ratchet mechanism for moving the screw, and an independently-movable handle in the crank-arm engaging the pawl, substantially as described.

3. In an axle-cutter, the combination of a stationary sleeve, a disk journaled at one end, guide-pins extending from the face of said disk, a cutter-head carrying a cutter slidingly engaging said pins, a screw secured to said head and passing through the disk, an adjusting-nut on the screw having a ratchet thereon, a double spring-pawl engaging said ratchet, an arm extending from said disk forming an operating-crank, a spindle journaled in the end of said arm, and a pin on the end of said spindle engaging the pawl and adapted to actuate the adjusting-nut in the rotation of the head, substantially as described.

4. In an axle-cutter, the combination of the sleeve, the disk E, journaled at one end thereof, the cutter-head J, carrying the cutter and sliding on guides secured to the disk, the screw M, the nut P, rotating in stationary bearings on the disk, the spring-pawl R, the pin T, engaging in a slot in said pawl, the set-screw X for adjusting the movement of said pin, the spindle U, to which said pin is secured, the bearing U', in which said spindle is journaled, and the extension V, supporting said bearing, substantially as described.

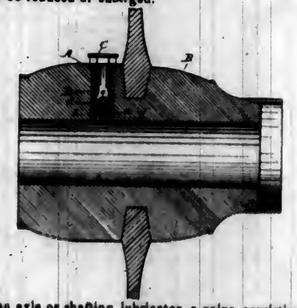


482,768. SHOULDER-BRACE. WILHELM J. TEUFEL, Stuttgart, Germany. Filed Apr. 25, 1891. Serial No. 390,427. (No model.)

Claim.—1. A shoulder-brace composed of two sections connected by short transverse pieces, each section being formed of a vertical strap, a fixed spring extending laterally from said strap, converging springs extending also from the vertical straps toward the fixed spring, the inner ends of the converging springs being pivoted to the vertical strap, while the outer ends are applied to the fixed spring, and shoulder straps at the outer ends of the fixed and converging springs, substantially as set forth.

2. A shoulder-brace formed of two sections, each section being composed of a vertical strap, a fixed laterally-extending spring attached to the vertical strap, converging springs, the inner ends of which are pivoted to said strap and connected by their outer slotted ends with a pin on the fixed spring, shoulder-straps attached to the outer ends of the fixed spring, and short transverse pieces connecting the vertical straps of both sections, substantially as set forth.

482,769. CAR-COUPLING. WILLIAM H. UNDERWOOD and WILLIAM R. CLUM, Woodland, Mich. Filed Apr. 13, 1892. Serial No. 429,012. (No model.)

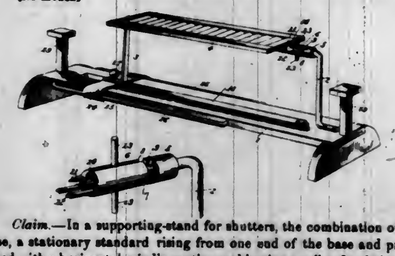


Claim.—1. In a car-coupling, the draw-head provided with the shoulders *k k'* and a chamber *c*, in open connection with the mouth *b*, a shaft *d*, extending through said chamber, with bearings in the sides thereof and levers attached to the terminals of said shaft outside the draw-head, and a tongue *g*, rigidly attached to said shaft within the chamber, in combination with an arm *h*, rigidly attached to the shaft, the pivoted link *i* and pivotal apron *j*, and the coupling-bar of the form described, substantially in the manner and for the purpose set forth.

2. In a car-coupling, the combination of the coupling-rod having the heads *n* at the terminals thereof, the tongue *g*, shaft *d*, and locking mechanism arranged within the chamber, as described, and the levers *e*, *f*, and *f'*, whereby the cars may be coupled or uncoupled from the top or on the side, substantially as specified.

482,770. AXLE-LUBRICATOR. GEORGE L. WEAVER, Dayton, Ohio. Filed June 3, 1892. Serial No. 435,382. (No model.)

Claim.—1. In an axle or shafting lubricator, an outer cylinder having a cap at one end and a shoulder at the other provided with a slot adapted to receive the head of a screw, a removable inner cylinder inclosed in said outer cylinder, in combination with a flap-valve within said inner cylinder having a screw adapted to increase or diminish the flow of the lubricant from the valve to the shaft or axle.



2. In an axle or shafting lubricator, an outer cylinder adapted to be inserted and secured in a wheel-hub, the said cylinder having an inner cylinder inserted therein, the said inner cylinder being provided with a hinged valve of convex form to enter a concave seat, the outlet from said seat having a transverse screw whereby the size of the outlet may be reduced or enlarged.

3. In an axle or shafting lubricator, a valve consisting of a flap pivoted to its seat, the said flap having an annular groove *g* and a convex surface *e'*, in combination with its seat having a concave surface *e*, an opening *i* in the bottom thereof, and a screw *i'*, adapted to reduce or enlarge the opening *i*, for the purposes herein set forth.

4. In an axle or shafting lubricator, the outer cylinder A, having cap C, and shoulder *a'*, in combination with the inner tube D, having a flap-valve *d* therein provided with an opening *i*, and screw *i'*, adapted to enter the groove *d'* in the shoulder *a* of the outer cylinder, for the purposes herein set forth.

482,771. STAND FOR WINDOW-SHUTTERS. AUGUSTUS D. WEBSTER, Springfield, Ill., assignor of two-thirds to Frank A. Webster and John S. Condell, Jr., same place. Filed Feb. 4, 1892. Serial No. 420,318. (No model.)

Claim.—In a supporting-stand for shutters, the combination of a base, a stationary standard rising from one end of the base and provided with a horizontal spindle portion and having a collar fixed thereon and provided with oppositely-disposed projections, a cylindrical chuck mounted on the spindle portion of the stationary standard and provided at one end with notches and having a limited longitudinal movement to engage and disengage the projections of the collar and provided at its other end with engaging-points and with supporting-flanges, and an adjustable standard rising from the opposite end of the base and adapted to engage and form a pivot for one end of the shutter, substantially as described.

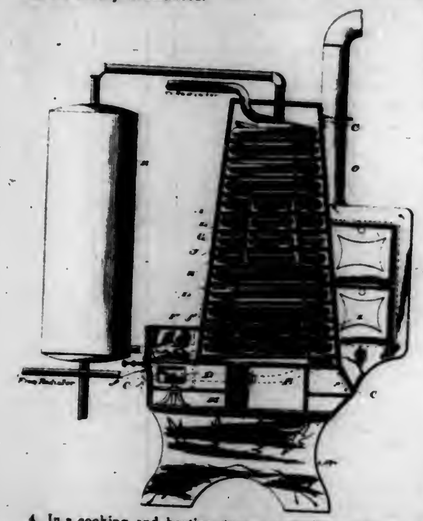
482,772. COMBINED COOKING AND HOT-WATER-HEATING STOVE. MARGARET A. WILCOX, Chicago, Ill., assignor to the Wilcox Water Heater Company, same place. Filed Oct. 29, 1891. Serial No. 410,239. (No model.)

Claim.—1. In a cooking and heating stove, two water-heating coils, one within the other, each arranged in a separate heating-flue, the inner coil constructed to be connected with a boiler and the city supply and the outer with a radiator, and means for cutting off the heat from the outer flue, substantially as described.

2. In a cooking and heating stove, a pair of coils of pipe arranged in separate chambers, one within the other, and a series of cooking-chambers arranged around the same, and means for heating said cooking-chambers or either of the coils at will, substantially as described.

3. In a cooking and heating stove, a water-heater set in a central chamber, passages around the base of the same, and a series of cooking-chambers around the central chamber, and means for directing the

products of combustion to the water-heater or cooking-chambers at will, substantially as described.



482,774.

outlet valve at one cylinder-head, a source of pressure connected therewith, an air inlet and outlet valve at the other cylinder-head, a receptacle for liquids, connected with the air-outlet valve, a faucet for drawing the liquid from the receptacle, a piston reciprocating in said cylinder and having a weighted piston-rod, and suitable connections between said piston-rod, automatic valve, and faucet, whereby when the liquid is drawn from the faucet compressed air is automatically forced into the liquid-receptacle.

3. In a coin-controlled apparatus for dispensing liquids, the combination of a cylinder, an automatically-controlled pressure inlet and outlet valve at one cylinder-head, a coin-operated latch for locking

482,776.

products of combustion to the water-heater or cooking-chambers at will, substantially as described.

4. In a cooking and heating stove, a central water-heating apparatus and a pair of circular passages arranged around said central water-heater, each of which is provided with a series of cooking-apertures and one side having closed cooking-chambers arranged over said cooking-apertures, substantially as described.

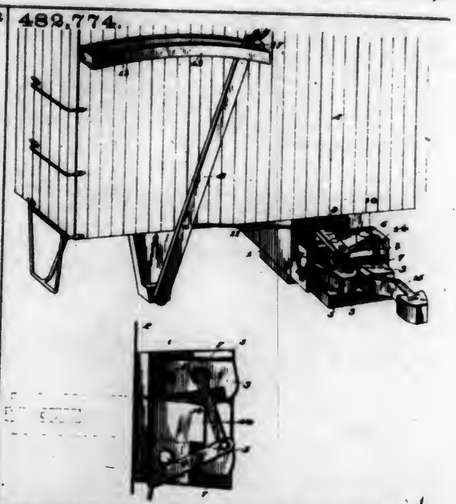
5. In a cooking and heating stove, a central water-heating apparatus, a combustion-chamber in front and oven in the rear, and curved passages surrounding said water-heating apparatus and leading from the combustion-chamber to the oven, and closed cooking-chambers over a portion of said passages, substantially as described.

482,773. BATHING-CAP. HARRY R WILLIAMS, Brooklyn, N. Y. Filed Dec. 3, 1891. Serial No. 413,947. (No model.)

Claim.—1. A bathing-cap comprising, essentially, two flat disks of waterproof material, the lower one being elastic and having a head-opening in it, and an elastic rubber band attached flatwise to the lower disk about the edge of the head-opening, substantially as set forth.

2. A bathing-cap comprising, essentially, two separate flat disks of waterproof material attached together at their outer edges, the lower one being elastic and having a head-opening in it, and an elastic rubber band attached around the edge of the head-opening and flatwise upon the said lower disk, substantially as set forth.

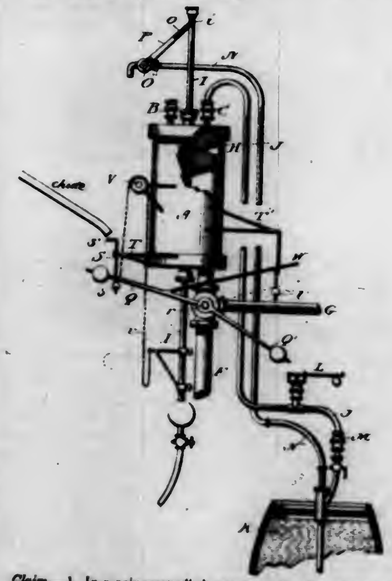
3. As a new article of manufacture, a lower section for caps, consisting of a flat disk of elastic rubber having a centrally-located head-opening and a reinforcing-band of elastic rubber attached flatwise upon said disk around the edge of the head-opening, substantially as set forth.



482,774. CAR-COUPLING. JAMES A. WENWALL, Embarrass, Wis. Filed May 3, 1892. Serial No. 431,747. (No model.)

Claim.—1. In a car-coupling, the combination of a draw-head having pivoted spring-actuated jaws, a toggle consisting of a lever fulcrumed intermediate its ends on one of the jaws, a bar connecting the outer end of the lever with the other jaw, and an operating-lever connected with the inner end of said lever, substantially as described.

2. In a car-coupling, the combination of a draw-head provided at its top with a projection, pivoted spring-actuated jaws mounted on the draw-head and provided with vertical stems arranged on opposite sides of the projection and adapted to abut against the same to hold the jaws partly open, a toggle comprising a lever fulcrumed on one of the stems, a bar pivoted to the outer end of the lever and to the stem of the other jaw, and an operating-lever connected with the inner end of said lever, substantially as described.



3. In a car-coupling, the combination of a draw-head having a horizontal extension projecting from its bottom and having its outer

482,774.

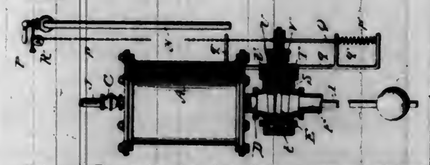
edge beveled, spring-actuated jaws having their inner ends pivoted in the draw-head and having their outer ends supported by the said extension and provided intermediate their ends with vertical standards, a toggle consisting of a lever fulcrumed intermediate its ends on one of the stems, a bar connecting the outer end of the lever with the other stem, and an operating-lever connected with the inner end of the other lever, substantially as described.

482,775. COIN-OPERATED AUTOMATIC HYDRAULIC AIR-COMPRESSOR. RUSSELL F. AVERY, Spokane Falls, Wash., assignor to Jacob Goetz, trustee, same place. Filed Apr. 13, 1891. Renewed July 19, 1892. Serial No. 440,518. (No model.)

Claim.—1. In a coin-controlled apparatus for dispensing liquids, the combination of a cylinder having an automatically-controlled pressure inlet and outlet valve, a coin-operated latch for locking and releasing said valve, a piston-head reciprocating in said cylinder and having a weighted piston-rod, and suitable connections between said valve and piston-rod, substantially as set forth.

2. In a coin-controlled apparatus for dispensing liquids, the combination of a cylinder, an automatically-controlled pressure inlet and outlet valve at one cylinder-head, a coin-operated latch for locking and releasing said valve, a source of pressure connected with said valve, an air inlet and outlet valve at the other cylinder-head, a receptacle for liquids, connected with the air-outlet valve, a faucet for drawing the liquid from the receptacle, a piston reciprocating in said cylinder and having a weighted piston-rod, and suitable connections between said piston-rod, automatic valve, and faucet, substantially as described.

3. In a coin-controlled apparatus for dispensing liquids, the combination of a cylinder, an automatically-controlled pressure inlet and outlet valve at one cylinder-head, a coin-operated latch for locking and releasing said valve, a source of pressure connected with said valve, an air inlet and outlet valve at the other cylinder-head, a receptacle for liquids, connected with the air-outlet valve, a faucet for drawing the liquid from the receptacle, a piston reciprocating in said cylinder and having a weighted piston-rod, and suitable connections between said piston-rod, automatic valve, and faucet, substantially as described.



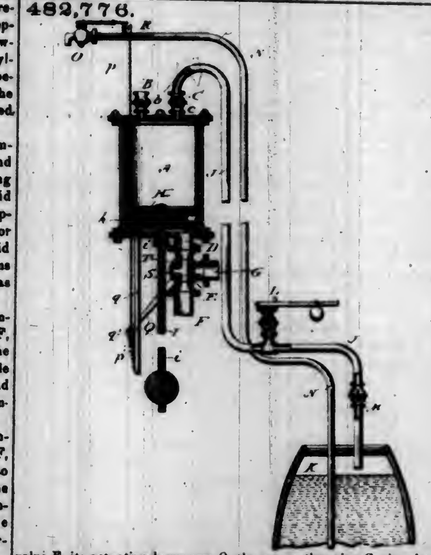
4. In a coin controlled apparatus for dispensing liquids, the combination of the cylinder A, the valve E, having inlet and outlet G F, its toothed spindle *r*, the weighted lever Q', permanently secured to the spindle, its latch U, the weighted lever Q, freely mounted on the spindle *r* and adapted to engage with the tooth *r'*, its arm W, the piston-head H, the weighted piston-rod I, the pulley V, and the chain *v*, all connected as described, and for the purpose set forth.

5. In a coin-controlled apparatus for dispensing liquids, the combination of the cylinder A, the valve E, having inlet and outlet G F, its toothed spindle *r*, the weighted lever Q', permanently secured to the spindle, its latch U, the weighted lever Q, freely mounted on the spindle and adapted to engage with the tooth *r'*, its arm W, its coin-operated latch S, the piston-head H, the weighted piston-rod I, the pulley V, and the chain *v*, all connected as described, and for the purpose set forth.

6. In a coin-controlled apparatus for dispensing liquids, the combination of the cylinder A, the valve E, having inlet and outlet G F, its toothed spindle *r*, the weighted lever Q', permanently secured to the spindle, its latch U, the weighted lever Q, freely mounted on the spindle and adapted to engage with the tooth *r'*, its arm W, its coin-operated latch S, the piston-head H, the weighted piston-rod I, the pulley V, the chain *v*, the faucet O, its slotted arm P, a receptacle for liquids, suitable connections between said receptacle, faucet, and air inlet and outlet in the other cylinder-head, and a source of pressure connected with the valve E, substantially as described.

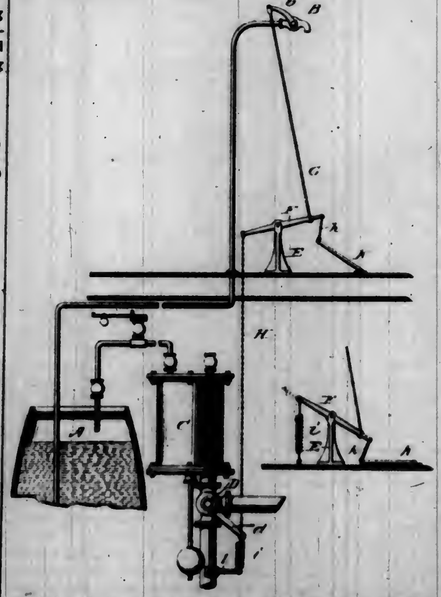
7. In a coin-controlled apparatus for dispensing liquids, the combination, with the liquid-containing vessel and a faucet for drawing the liquid therefrom, of an air-compressor, a tube connecting said air-compressor with said vessel, a suitable connecting device between said faucet and said air-compressor, and a coin-operated latch for locking and releasing said compressor, substantially as described.

482,776. AIR PUMP OR COMPRESSOR. RUSSELL F. AVERY, Spokane Falls, Wash., assignor to Jacob Goetz, trustee, same place. Filed Apr. 13, 1891. Renewed July 19, 1892. Serial No. 440,519. (No model.)



Claim.—1. The combination of a cylinder, a piston, a weighted piston-rod, an inlet and outlet at one cylinder-head, connected with a source of pressure, a valve controlling said pressure inlet and outlet, an air-inlet and an air-outlet at the other cylinder-head, a receptacle for liquids, a connecting-pipe between said air-outlet and receptacle, a check-valve in said air-inlet, a faucet for drawing the liquid from the receptacle, and suitable connections between the faucet and the valve controlling said pressure inlet and outlet, substantially as described.

2. The combination of a cylinder, a piston, a weighted piston-rod, an inlet and outlet at one cylinder-head, connected with a source of pressure, a valve controlling said pressure inlet and outlet, an air-inlet and an air-outlet in the other cylinder-head, a receptacle for liquids, a connecting-pipe between said air-outlet and receptacle, a check-valve and regulating-valve in said pipe, a check-valve in said air-inlet, a faucet for drawing the liquid from the receptacle, and suitable connections between the faucet and the valve controlling said pressure inlet and outlet, substantially as described.

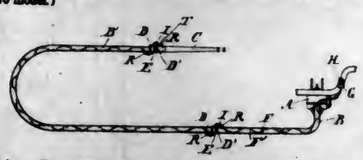


3. The combination of the cylinder A, having the outlet C and inlet B, the check-valves therein, the pressure-inlet having the three-way

482,776.

valve E, its actuating-lever arm Q, the connecting-pipe G, the piston-head H, having the weighted piston-rod I, the receptacle K, the connecting-tube having the valves L and M, the faucet O, its connecting-tube, its lever-arm P, chain *p*, and spring *p'*, connecting it with lever-arm Q of the valve E, substantially as described.

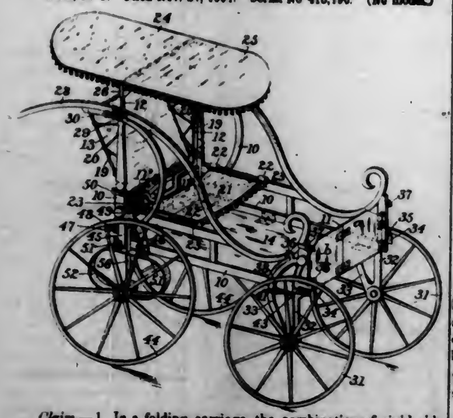
482,777. DEVICE FOR OPERATING PUMPS BY MEANS OF TREADLES. RUSSELL F. AVERY, Spokane Falls, Wash., assignor to Jacob Goetz, same place. Filed Aug. 5, 1891. Renewed July 19, 1892. Serial No. 440,520. (No model.)



Claim.—1. In an apparatus for dispensing liquids, the combination, with the faucet of the liquid-containing vessel and the pressure-valve of the air-pump connected therewith, of a centrally-pivoted lever, suitable connections between the arms of the lever, respectively, with the faucet and pressure-valve, a treadle attached to said lever,

and a device for automatically raising the lever after the treadle has been depressed, substantially as described.

2. In an apparatus for dispensing liquids, the combination, with the faucet B, communicating with the liquid-containing vessel A, of the arm *b* of the faucet, the pivoted lever F, the rod G, connecting one arm of the lever F with the arm *b* of the faucet B, the treadle K, pivoted to the lever F, and means for automatically raising the lever, substantially as described.



3. In an apparatus for dispensing liquids, the combination of the faucet B, communicating with the liquid-containing vessel A, the arm *b* of the faucet, the pressure-valve D of the pump C, the arm *d* of the pressure-valve, the lever F, the rod G, connecting one arm of the lever F with the arm *b* of the faucet, the chain H, connecting the other arm of the lever F with the arm *d* of the pressure-valve, the treadle K, pivoted to the lever F, and the spring *i*, attached at one end to the arm *d* of the pressure-valve and at the other to a fixed support, substantially as described.

482,778. ELECTRIC SIGNALING DEVICE FOR FIREMEN. GEO. L. BARNARD, Milwaukee, Wis. Filed July 24, 1891. Serial No. 400,525. (No model.)

Claim.—The combination of hose-sections, registering metallic couplings secured to the contiguous ends of said sections, flexible tubings projecting from the registering couplings, said tubings provided with enlarged insulating-heads, means for detachably connecting the ends of said tubings when the same are brought into juxtaposition, spirally-arranged wires embedded in each section of hose leading to the metallic couplings, spirally-wound embedded wires in each section passing through the metallic couplings into the flexible tubings, said wires being also spirally wound therein and provided with metallic disks adapted to be brought into contact when the ends of the tubings are secured together and to be surrounded by the insulating-heads of said tubings, and annular guards for the wires, extending out from the hose-couplings, said guards adapted to protect the wires at points close to the hose and provided with flaring mouths to permit free bending at points distant from the hose, substantially as set forth.

482,779. CHILD'S CARRIAGE. FREDERICK BORNEMANN, New York, N. Y. Filed Nov. 27, 1891. Serial No. 413,196. (No model.)

Claim.—1. In a folding carriage, the combination of rigid side frames, a front or foot board composed of two sections hinged to the side frames and to each other and adapted to be folded inwardly, a rigid bottom piece adapted to be turned upwardly against said side frame, and a rigid back frame hinged to one of said side frames and adapted to engage the other of said side frames, substantially as shown and described.

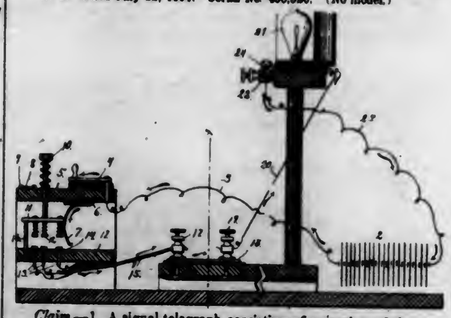
2. In a folding carriage, the combination of rigid side frames, inwardly-folding end pieces, a rigid bottom piece adapted to be turned up against one of said side frames, and an independent seat secured to one of said side frames, so that it may be turned up against the same and adapted to engage the other of said side frames, substantially as shown and described.

3. In a folding carriage, the combination of rigid side frames, inwardly-folding end pieces hinged to said side frames, a rigid bottom piece hinged to one of said side frames and adapted to be turned up against the same, and wheel-supporting arms pivoted upon said side frames to swing in a plane parallel therewith, substantially as shown and described.

4. In a folding carriage, the combination of a folding body having rigid side frames, handles hinged to said frames to fold laterally thereon, and means to maintain said handles in extended position, substantially as shown and described.

5. In a child's carriage, the combination of side frames, a back frame supported thereby, an adjustable back hinged at its lower edge to said back frame, eyes on the lateral edges of said back and frame, and cords passed alternately through the eyes on said frame and those on said back, substantially as shown and described.

6. In a folding carriage, the combination of rigid side frames, a back frame hinged to one of said side frames and adapted to engage the other, a canopy supported at the top of said frame to swing down against it, and means to maintain it in elevated position, substantially as shown and described.

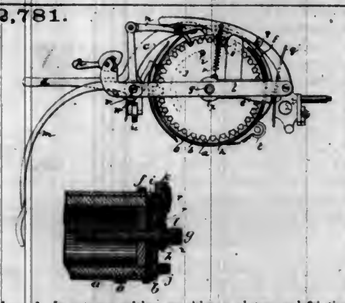


7. In a child's carriage, the combination of side frames, a back frame supported thereby, clips to engage the upper corners of said frame and removable therefrom, and a canopy carried by said clips, substantially as shown and described.

8. In a folding carriage, the combination of the side frames of the body, wheel-supporting arms pivoted thereto and having hooks formed thereon and spring-catches carried by said side frames above and below the pivots of said arms and adapted to engage said hooks to maintain the arms in the desired position, substantially as shown and described.

9. In a folding carriage, the combination, with the side frames of the body, of a wheel-supporting arm pivoted thereto, said arm consisting of two bars, as described, and a latch pivoted to said frame and having a nose to engage one of said bars to hold it against lateral movement and a tail to rest against the other of said bars, substantially as shown and described.

10. In a carriage, the combination of a stud-axle having a hub slotted vertically a flat spring secured to the body of the carriage and having both its ends secured to said hub by a bolt, and a rigid arm secured to said body and projecting downwardly through the slot in said hub, substantially as shown and described.



482,780. SIGNAL-TELEGRAPH. CLAUDIUS V. BOUGHTON, Buffalo, N. Y. Filed July 22, 1891. Serial No. 400,336. (No model.)

Claim.—1. A signal-telegraph consisting of a number of electric lights arranged in a continuous line, a number of spring-pressed keys arranged upon a board and representing the letters of the alphabet, each key opening or closing a circuit, which includes the necessary lights to form the dashes and dots of the Morse system called for by the letter upon the key in operation, all arranged and operating substantially as and for the purpose stated.

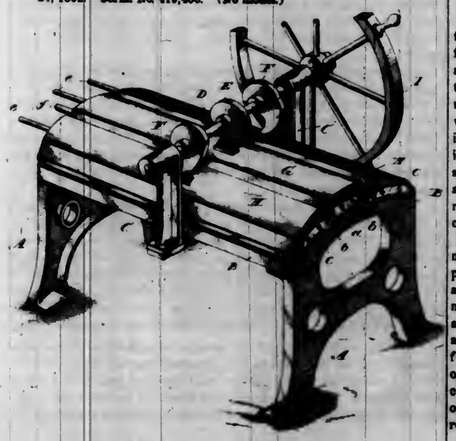
2. The herein-described signal-telegraph, consisting of the key-board 5, spring-pressed keys 10, movable index-plate 8, one or more spring-pressed pins 12, secured to each key for connecting the positive wire 3, leading from the battery 2, with one or more rigid pins to which return-wires are secured, and after passing through certain combinations of electric lamps are combined into a single return-current leading to the battery from which the positive wire is fed, all arranged and operating substantially as shown and described.

482,781. TYPE-WRITING MACHINE. BYRON A. BROOKS, Brooklyn, N. Y. Filed Oct. 2, 1886. Serial No. 215,134. (No model.)

Claim.—1. In a type-writing machine, a platen and friction feed-roll, combined with a pawl and ratchet for spacing between lines and a pawl and ratchet for revolving said platen on its axis to expose to view its printing-point and also for simultaneously revolving said roll about the axis of said platen.

2. In a type-writing machine, the combination of a platen and friction feed-roll adapted to revolve around its own axis while it remains stationary in space and means for revolving said platen on its axis to expose to view its printing-point and for simultaneously revolving said friction feed-roll about the axis of said platen without revolving it about its own axis.

3. In combination with the platen of a type-writing machine, a pawl and ratchet for spacing between lines and a pawl and ratchet for revolving the platen in one direction to expose to view the printing-point and a spring for returning the platen to its initial position.



4. In combination with the platen of a type-writing machine, a pawl and ratchet for revolving the platen in one direction to expose to view its printing-point, a spring for returning the platen to its initial position when released from the control of said pawl, and an arm having a notch for retaining it at its initial position.

5. In a type-writing machine, the combination, with a pawl and ratchet for revolving the platen about its own axis to expose the printing-point, of a pawl and ratchet for revolving said platen to space between lines of print, a detent meshing with the teeth of said ratchet-wheel, and a spring attached to said detent and to an arm moving with said platen when revolved to expose its printing-point.

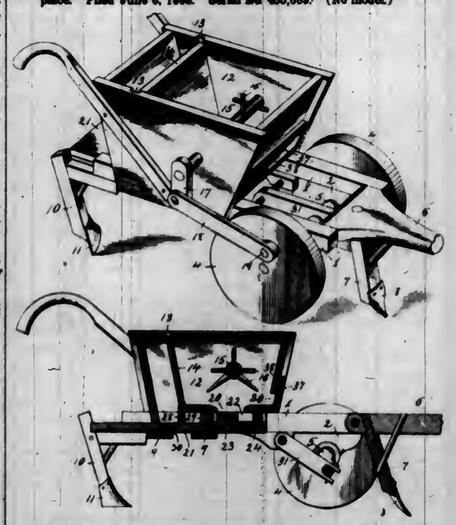
6. In a type-writing machine, a platen combined with fast and loose ratchet-wheels free to move independent of each other, one of said wheels being controlled by ratchet and spring to expose to view the printing-point on the platen and subsequently to return to its initial position and the other being controlled by pawl, by means of which spacing between lines is accomplished.

7. In a type-writing machine, a platen friction-roll and an apron-guide for keeping the paper smooth on the surface of said platen, combined with a pawl and ratchet for spacing between lines and a pawl and ratchet for revolving said platen, friction-roll, and apron-guide about the axis of said platen.

482,782. PROCESS OF AND MACHINE FOR BENDING AND DRYING WOOD. RICHARD P. BURKHARDT, Dayton, Ohio. Filed Jan. 27, 1892. Serial No. 419,406. (No model.)

Claim.—1. The process of bending wood, consisting in clamping it at its middle between rigid male and female dies and then bending its ends between said male die and additional female dies.

2. In a wood-bending machine, the combination, with a rigid male die, of a sectional female die, the parts of which are rigid, and means for clamping the wood first between the male die and middle section of the female die and then between the male die and outer sections of the female die, substantially as described.



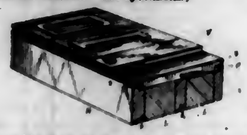
3. In a wood-bending machine, the combination, with a rigid male die, of a sectional female die, the parts of which are rigid and hinged together, and means for pressing the sections of the female die successively upon the male die, substantially as described.

4. In a wood-bending machine, the combination, with a male die and a sectional female die, of a shaft provided with cams for pressing the sections of the female die successively upon the male die, substantially as described.

5. In a wood-bending machine, the combination, with a male die and a sectional female die, of a shaft provided with cams for operating the sections of the female die successively in one direction and with chains or cables for operating it in the opposite direction.

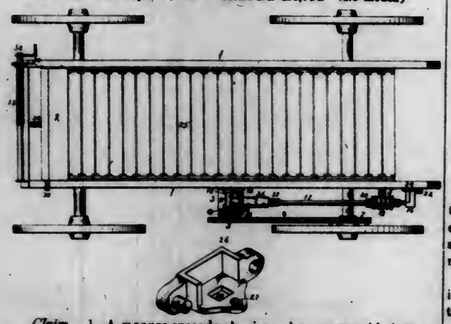
6. In a wood-bending machine, the combination of the steam-heated male die B, the hinged sectional steam-heated female die G H, the shaft D, provided with cams E F, and the cables *d*, uniting the sections H and the shaft, substantially as described.

482,783. PLANTER AND FERTILIZER-DISTRIBUTER. AYLMER BOSS, Summerfield, La., assignor of one-half to Sidney S. Tatum, same place. Filed June 6, 1892. Serial No. 435,689. (No model.)



Claim.—1. In a planter, the combination, with the framework, the cranked axle, and ground-wheels, of the hopper mounted on the framework and having its opposite side walls provided with grooves, a removable partition mounted in the grooves, an opening in front of the hopper, a closure for the same, a bottom for the front compartment of the hopper, provided with an opening and at its rear edge with a depending stop, constituting a cut-off, a seed-slide recessed at its front end and in rear of the same reduced, said slide being mounted in the framework under the hopper and by its reduction forming a stop or shoulder, a pair of adjustable blocks mounted in the recess and adapted to form an intervening opening and perforations in the rear reduced portion of the slide, and connections between the slide and crank of the axle, substantially as specified.

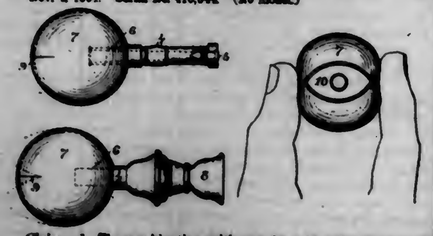
2. In a planter, the combination of the opposite side bars terminating at their rear ends in shovel-carrying standards and the front pivoted tongue carrying a furrow-opening shovel, the centrally-cranked axle having the opposite ground-wheels and the transverse bars connecting the side bars of the hopper, the opposite side walls of which are internally recessed, a partition removably mounted in the recess and forming a front and a rear compartment, a bottom located in the front compartment and provided with an opening and at its rear edge opposite the partition with a depending portion, forming a combined cut-off and stop, the seed slide recessed at its front end and having the opposite edges of its recess convexed, a pair of blocks mounted in the recess and having their opposite edges concaved to conform to the



edges of the recess, set-screws passed through the sides of the seed-slide and bearing on the blocks, said slide in rear of the recess being reduced upon its upper side to form a transverse shoulder adapted to abut against a stop and provided in rear of its shoulder with a seed-opening, and a forked bail loosely connected to the front end of the slide and at its front end to the central crank of the axle, substantially as specified.

482,784. TYPE. ALLISON COLEMAN, Henrietta, Tex. Filed June 11, 1891. Serial No. 396,009. (No specimens.)

Claim.—The combination of type-faces of various sizes having dovetailed projections across their backs adjacent to the front nicked edges, semi-dovetailed outwardly-inclined projections across the back of the face near the back edge and parallel with the adjacent angle or edge of the dovetail, and a guide-curve leading from the said adjacent dovetail angle downwardly to the rear face of the inclined projection, a base consisting of duplicate and independent sections, each having an acute angle-groove engaging the dovetail angle edges and said inclined projections, the front base-section having its engaging angle alone facing away from the nicked edge, while the angles of the other base-sections face toward said nicked edge and by the disposition of the type-face curve are adapted to be engaged simultaneously by the inner angle edges of the dovetail projections and the inclined projections, and leads between said sections, substantially as set forth.

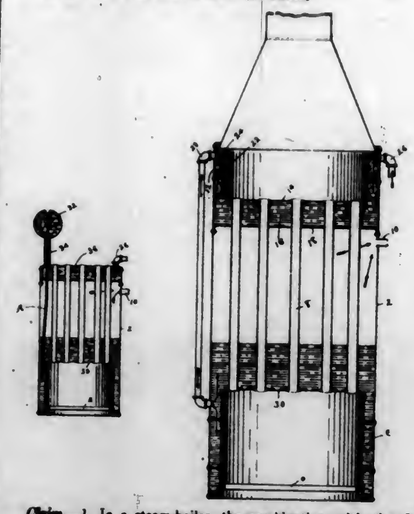


482,785. MANURE-SPREADER. WHITEFIELD COMPTON, Rockford, Ill. Filed Apr. 12, 1892. Serial No. 428,914. (No model.)

Claim.—1. A manure-spreader having a box, a movable bottom therefor, a shaft for driving the bottom, and a bottom composed of slats joined by brackets at each of their ends, each bracket having a pintle at one end and an eye at its other end.

2. A manure-spreader having a box, a movable bottom therefor, a shaft for supporting and driving the bottom, a polygonal wheel on the shaft, sprocket-teeth on the faces of the wheel, the bottom composed of slats joined by brackets at each of their ends, each bracket having a recess in its under face for the teeth of the sprocket-wheel, and a pintle at one end and an eye at the other.

482,786. RESONATOR. HENRY CROCKER, Fairfax, Vt. Filed Nov. 4, 1891. Serial No. 410,844. (No model.)



Claim.—1. The combination, with a reed or other device adapted to produce sound, of a hollow body made of flexible material having an opening the body and opening of which can be altered in shape at will, as described.

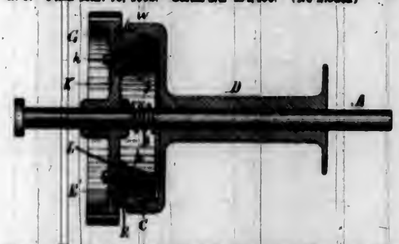
2. The combination, with a reed or other sound-producing device, of the resonator 7, consisting of a hollow body made of a flexible material, provided with a slit or opening which can be altered in shape at will by external pressure, adapted to modulate and control the sound, as described.

3. A hollow chamber made of a flexible material having an opening which can be so altered in shape as to resound at will the fundamental tone or mix together the fundamental tone and the overtones, an opening for the reception of the sound or the sound-producing device, and a tube or conduit connecting the flexible hollow chamber with a sound-producing device, as described.

482,787. STEAM-BOILER. OLIVER CROSBY, St. Paul, Minn. Filed Dec. 29, 1891. Serial No. 416,407. (No model.)

Claim.—1. In a steam-boiler, the combination, with the flues thereof and a water-chamber surrounding and inclosing the upper ends of the flues, of a reservoir located above and communicating with said chamber, having suitable outlet at or near its top and adapted to replenish said chamber automatically, substantially as described.

2. In a boiler, the combination, with a water-chamber surrounding the ends of the flues, of a reservoir connected with said chamber, the outer walls of which are formed by an extension of the boiler-shell, adapted to keep said chamber at all times filled, substantially as described.

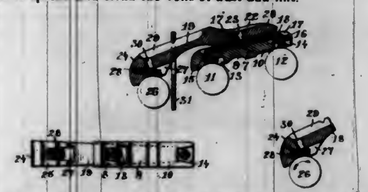


3. In an upright boiler, the combination, with the water-chamber surrounding and inclosing the upper ends of its flues, of an annular reservoir or extension to said chamber above the same, adapted to keep said chamber supplied with water, and an outlet-pipe communicating with said reservoir at or near its top, substantially as described.

4. The combination, with the shell of an upright boiler, of an upper extension thereof, the flue-sheet, the inner shell connected at its lower end to the flue-sheet and at its upper end with the top of said extension, the diaphragm arranged beneath said flue-sheet, constituting a water-chamber surrounding the upper ends of the flues, and a storage-reservoir therefor, and an outlet-pipe communicating with the space between the inner shell and the extension at or near their junction, substantially as described.

5. In an upright steam-boiler, the combination, with the flues, of a flue-sheet of less diameter than the boiler, a diaphragm beneath the flue-sheet, inclosing and surrounding the flues and forming a water-chamber, an upper extension of the boiler-shell, a concentric inner shell connected at its lower end to the edge of the flue-sheet and at its upper end to the shell extension, forming a reservoir for said chamber, an inlet-pipe for said chamber, and an outlet-pipe for said reservoir communicating with it near its top, substantially as described.

6. The combination, with the upright boiler-shell having an upper extension, of the flue-sheet of less diameter than the shell, the inner shell 22, connected to the edge of said flue-sheet and to the top of said extension, forming an annular chamber or reservoir 24, a diaphragm 18, arranged beneath said flue-sheet, the inlet water-pipe 26, and the outlet-pipe 28, communicating with the reservoir at or near its top and leading to the boiler beneath, substantially as described.

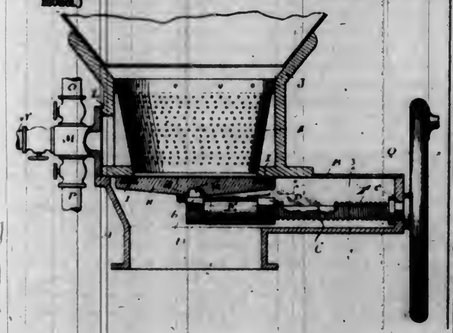


482,788. FRICTION-WHEEL. ALBERT J. DAVIS, Perth Amboy, N. J. Filed Mar. 10, 1892. Serial No. 424,600. (No model.)

Claim.—The combination, with the hoisting-drum D, provided with the hollow cone C, of the gear-wheel G, provided with disk K, having the recess L therein, and the ring E, having the plate E', divided into two parts and fitted to such recess and provided externally with the metallic dovetails G' and with the wooden blocks *w*, grooved each upon its two inner corners to fit such dovetails and tapered externally to fit the cone C, as and for the purpose set forth.

482,789. SADDLE FOR TOP ROLLS. EZRA DIXON, Bristol, R. I. Filed Jan. 21, 1892. Serial No. 418,782. (No model.)

Brief.—The wicks are fastened so as to project beneath the oil-opening, and not fastened in the oil-openings as heretofore, the object being to allow of a free flow of the oil. The wick cavities are made wider in the direction of the travel of the rolls, so as to allow the wick ends to spread and clean the rolls of dust and lint.

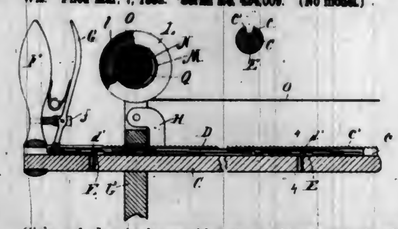


Claim.—1. A top-roll saddle the members of which are provided with transverse concaved bearing-surfaces and cavities forming wick-containing chambers adjoining such bearings, gradually widening in the direction of the travel of the rolls, as described.

2. In a top-roll saddle, the combination, with a member provided with a lubricant-containing chamber in the upper surface and a passage connecting said chamber with a bearing-surface, of a lubricating-wick secured in perforations in the end of said member and extending below said passage, as described.

3. In a two-part top-roll saddle, an upper member 19, having a tapering shank 20, a forward depending end 24, and a roll-depression 25, and provided with the reservoir 29, passage 30, and the wick 28, secured in perforations in said depending end and extending beneath said passage 30, as and for the purpose described.

482,790. GRAIN-TREATING APPARATUS. FRANKLIN B. GIBBS, Milwaukee, Wis. Filed July 11, 1891. Serial No. 399,157. (No model.)



Claim.—1. The receptacle having a discharge-opening and tracks beyond the latter, in combination with a cross-head consisting of parallel bars mounted on the tracks and joined by a screw-threaded sleeve, a knob on one of the cross-head bars, a valve for said opening having a recess engaged by the knob, and a screw-rod engaging the sleeve, substantially as set forth.

2. The receptacle having a recess-opening and tracks beyond the latter, provided at one end with risers, in combination with a cross-head consisting of parallel bars mounted on the tracks and joined by a screw-threaded sleeve, a knob on one of the cross-head bars, a valve for said opening having a recess engaged by a knob, and a screw-rod engaging the sleeve, substantially as set forth.

3. The combination of a grain-receptacle having an open-ended and inclosed foraminous portion as well as a valve-controlled discharge-opening below this foraminous portion, in combination with a water-pipe and air-pipe having a common inlet to the receptacle adjacent to said foraminous portion thereof, and a waste-pipe also in communication with the inlet for the water and air pipes, substantially as set forth.

482,791. BORING-MACHINE. CHARLES S. HARRIS, Milwaukee, Wis. Filed Mar. 7, 1892. Serial No. 424,009. (No model.)

Claim.—1. In a boring-machine, the combination of a longitudinally-moving pulling-rod, a bit-spindle moving therewith, an arm constructed to normally engage and bear upon the rod, and means for throwing the arm in and out of engagement with said rod, substantially as set forth.

2. In a boring-machine, the combination of a longitudinally-moving pulling-rod having a recess in the direction of its length, said recess having its bottom provided with inclined lugs, a sliding key fitting in the recess and provided upon its under side with inclined or beveled surfaces registering with the inclined lugs a spring-arm connected to one end of the key and constructed to simultaneously elevate said key and force the same lengthwise, an arm constructed to normally engage and bear upon the rod, and a bit-spindle constructed to move longitudinally with the pulling-rod, substantially as set forth.

3. In a boring-machine, the combination, with a pulling-rod, of a rotatable shaft, a tape or cord for operating the shaft, an adjustable arm upon the pulling-rod, to which the opposite end of the tape or cord is connected, and means upon the shaft for determining the distance the pulling-rod and bit have been moved in either direction, substantially as set forth.

4. In a boring-machine, the combination, with a pulling-rod, of stationary casings forming part of the frame, one of said casings provided with a slit or opening, a rotatable shaft passing through the casings, a tape secured to the shaft and wound upon the same within one of the casings, said tape passing out of the casing and connected with the pulling-rod, and a spring within the other casing, one end connected to the shaft and the other to the casing, substantially as set forth.

482,792. GATE. FLOYD HOPKINS, Belvidere, Ill. Filed Jan. 11, 1888. Serial No. 260,421. (No model.)

Claim.—1. A gate, a supporting-post therefor, a bar having a pivotal connection with the post, rollers on the bar, upon which the gate rests, a counterbalance-weight for the gate, and an adjustable diagonal brace for supporting the outer end of the bar.

2. A gate, a supporting-post therefor, a pintle offset from the post, an arm having an eye for said pintle, the arm bearing a flanged

roller and a bar, a like roller on the bar, one of the bars of the gate resting upon the rollers, and a counter-balance for the gate.

3. A gate, a supporting-post therefor, a bar pivoted to the post, two rollers secured to said bar, upon which rollers the gate rests, a counter-balance for the gate secured to the bar, and a diagonal brace pivoted to the supporting-post and adjustably connected to the bar.

4. A gate, a supporting-post therefor, a horizontal bar having an eyebolt extending therefrom, a flanged roller on the eyebolt, said eyebolt extending over a pintle on the supporting-post, a second roller on the horizontal bar upon which rollers a bar of the gate rests, a brace-bar having an eyebolt engaging a pintle on the post near its lower end, an adjustable connection between the horizontal bar and the brace-bar, and a movable counterbalancing-weight on the horizontal

---

482,795. ROCK-CRUSHER. HORACE L. KENT, Boston, Mass. Filed Sept. 7, 1891. Serial No. 404,975. (No model.)

of the links of the chain being adapted to be engaged by the pawl, substantially as described.

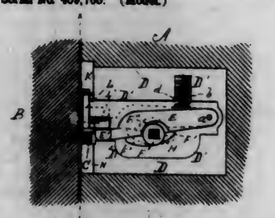
roller, a curtain or screen wound thereon, and means for securing the curtain in its adjustment, substantially as described.

4. In a curtain-fixture, the combination of a window, the track-plates secured to one of the sashes and provided with a series of perforations, the brackets arranged on the track-plates and engaging the same and provided with spring-actuated bolts arranged to engage the said perforations, the curtain-casing connecting the brackets, a spring-actuated curtain-roller, a curtain or screen wound on the roller, and means for securing the curtain in its adjustment, substantially as described.

roller and a bar, a like roller on the bar, one of the bars of the gate resting upon the rollers, and a counter-balance for the gate.

3. A gate, a supporting-post therefor, a bar pivoted to the post, two rollers secured to said bar, upon which rollers the gate rests, a counter-balance for the gate secured to the bar, and a diagonal brace pivoted to the supporting-post and adjustably connected to the bar.

4. A gate, a supporting-post therefor, a horizontal bar having an eyebolt extending therefrom, a flanged roller on the eyebolt, said eyebolt extending over a pintle on the supporting-post, a second roller on the horizontal bar upon which rollers a bar of the gate rests, a brace-bar having an eyebolt engaging a pintle on the post near its lower end, an adjustable connection between the horizontal bar and the brace-bar, and a movable counterbalancing-weight on the horizontal bar.

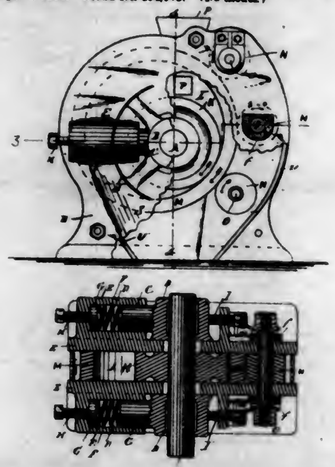


5. The combination of a gate, a hanger, and a hanger-post, the hanger being provided with antifriction-bearings for a part of the gate to slide upon and extended to the rearward of its hinges, said extension being provided with a counterbalance-weight, substantially as and for the purpose described.

482,793. GRAPHOSCOPE. FRANK R. HOUSE, Brattleborough, Vt. Filed Feb. 5, 1892. Serial No. 420,379. (No model.)

Claim.—The case A, open at top, having a central stem *a*, an opening *d* in the rim A', and the pins *e*, in combination with the open reel B, having the milled nut *b'*, fastening-screw *d*, the picture-strip C, and adjustable glass D.

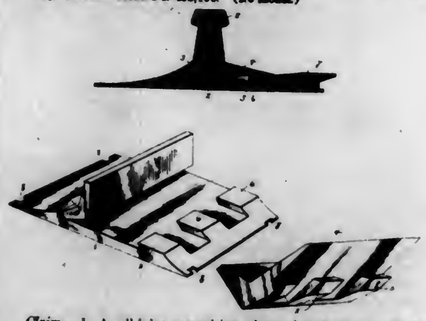
482,794. LATCH. MYRON R. HUBBELL, Wolcott, Vt. Filed Oct. 26, 1891. Serial No. 409,765. (Model.)



Claim.—1. In a latch, the combination of a rack or toothed bar secured to the jamb or door-frame, pawls pivotally suspended from the door and adapted to drop into and be engaged by said rack when the door is closed, and mechanism for raising the said pawls out of engagement with the rack when the door is to be opened, substantially as described.

2. In a latch, the combination of a rack or toothed bar secured to the jamb or door-frame, pawls pivotally suspended from the door and adapted to drop into and be engaged by said rack when the door is closed, a tumbler adapted to be lifted by means of the knob-spindle, and mechanism intermediate with said tumbler and pawls, whereby the latter may be lifted out of engagement with the rack, substantially as set forth.

3. In a latch, the combination of a tumbler adapted to be raised by the rotation of the knob-spindle, said tumbler being provided at its free end with a cross-bar or end piece, as E', a toothed bar secured horizontally to the door-jamb, and pawls pivotally secured to the stationary portion of the latch and hanging normally with the ends in engagement with said toothed bar and constructed to have their ends swung up directly by the said cross-bar E' when the spindle is rotated, substantially as described.

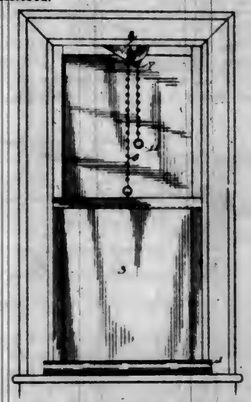


4. The herein-described improved latch, consisting, essentially, of the plate or case D D', provided with the cross-plate K, the winged sleeve F F, the tumbler E, provided at its free end with the cross-bar E', the pawls L, pivotally hung from said cross-plate K and provided with the shoulders L', and the toothed bar C, secured to the door-jamb, all substantially as described.

482,795. ROCK-CRUSHER. HORACE L. KENT, Boston, Mass. Filed Sept. 7, 1891. Serial No. 404,975. (No model.)

Claim.—In a rock-crusher, the combination of the roll K, supported in sliding bearings, the revolving ring M, and friction-rolls N with the frame E, provided with recesses S and the cover U, substantially as described, for the purposes specified.

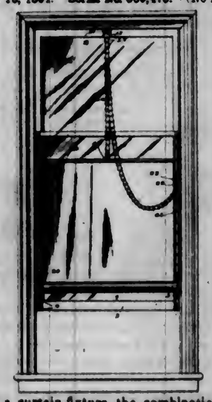
482,796. RAIL-JOINT. THOMAS J. KENNEDY, Renfrew, Pa. Filed May 7, 1892. Serial No. 432,190. (No model.)



Claim.—1. A rail-joint comprising a base-plate forming a seat for rails and provided at one end with an integral fish-plate and having at its other end lugs arranged at intervals and having their inner ends beveled, a removable fish-plate provided on its lower face with lugs having their outer ends beveled and arranged at intervals and adapted to interlock with the lugs of the base-plate, and means for holding the lugs in engagement, substantially as described.

2. A rail-joint comprising a base-plate forming a seat for rails and provided at one end with an integral fish-plate and having at its other end lugs arranged at intervals and having their inner ends beveled, a removable fish-plate provided on its lower face with lugs having their outer ends beveled and arranged at intervals and adapted to interlock with the lugs of the base-plate, and wedges arranged in the intervals or spaces between the lugs and holding the removable fish-plates against longitudinal movement and causing the same to clamp rails, substantially as described.

482,797. WINDOW-SHADE. MELROSE McK. KILLINGER, Battle Creek, Nebr., assignor to Fannie A. Grinnell, Wytheville, Va. Filed Feb. 13, 1891. Serial No. 381,234. (No model.)

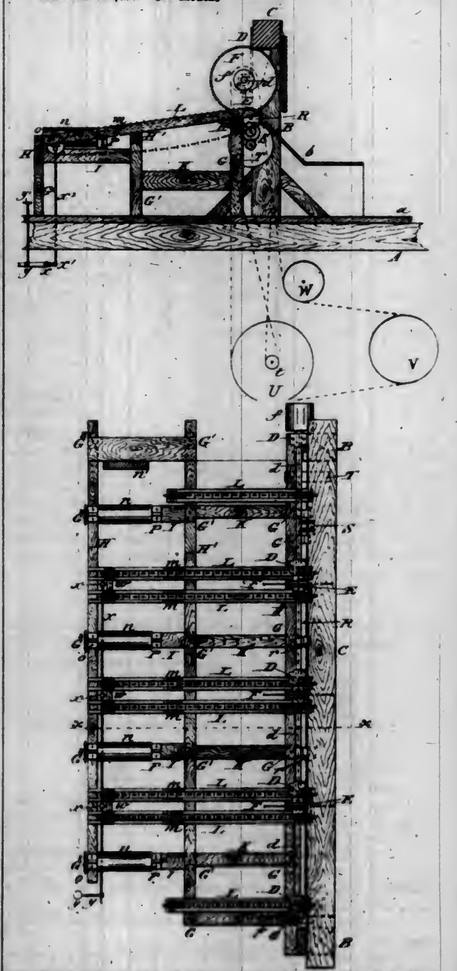


Claim.—1. The combination of the longitudinal casing designed to be secured at the bottom of a window, the curtain-roller arranged within the casing, the curtain unrolling upward from the bottom of a window, the hanger designed to be secured to the top of a window, the pulley arranged in the hanger, the pawl pivoted in the hanger, and the chain provided with open links and having one end secured to the free upper end of the curtain and passing around the pulley, any one

of the links of the chain being adapted to be engaged by the pawl, substantially as described.

2. In a curtain-fixture, the combination of the casing 1, having its ends provided with bearings, the curtain unrolling upward from the bottom of a window, the roller arranged within the casing and journaled within said bearings, the hanger adapted to be secured to the top of a window and provided with a pulley, the pawl pivoted between the sides of the hanger and provided with a V-shaped tooth, and the chain having flat open links and connected to the free upper end of the curtain and passing over the pulley, any one of the links being adapted to be engaged by the pawl, substantially as described.

482,798. WINDOW SHADE OR SCREEN. MELROSE McK. KILLINGER, Battle Creek, Nebr., assignor to Fannie A. Grinnell, Wytheville, Va. Filed Apr. 18, 1891. Serial No. 389,478. (No model.)



Claim.—1. In a curtain-fixture, the combination, with the window, of the brackets mounted adjustably on the lower sash, a spring-actuated curtain-roller mounted in the brackets, a curtain or screen wound on the same and leading upward, a hanger secured to the top of the window and provided with a roller and with a pawl, and the chain passing over the roller and arranged to be engaged by the pawl and having one end secured to the end of the curtain, whereby the curtain-fixture can be arranged at any part of a window and be adjusted both upward and downward therefrom, substantially as described.

2. In a curtain-fixture, the combination, with a window, of the brackets adjustably secured to the lower sash, a spring-actuated curtain-roller mounted in the brackets, a curtain or screen wound on the roller and leading upward to the top of the window, and means located at the top for securing the curtain or screen in its adjustment, whereby the curtain-fixture is adapted to be arranged at any point of a window and be adjusted upward and downward therefrom independently of the sashes, substantially as described.

3. In a curtain-fixture, the combination of a window, the track-plates secured to one of the sashes, the brackets engaging the track-plates and being vertically adjustable on the sash, means for securing the brackets at any point of adjustment, a spring-actuated curtain-roller, a curtain or screen wound thereon, and means for securing the curtain in its adjustment, substantially as described.

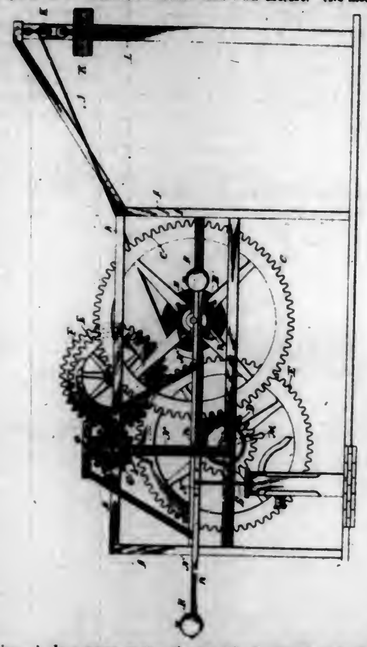
4. In a curtain-fixture, the combination of a window, the track-plates secured to one of the sashes and provided with a series of perforations, the brackets arranged on the track-plates and engaging the same and provided with spring-actuated bolts arranged to engage the said perforations, the curtain-casing connecting the brackets, a spring-actuated curtain-roller, a curtain or screen wound on the roller, and means for securing the curtain in its adjustment, substantially as described.

482,799. MACHINE FOR SAWING UP SLABS, &c. SAMUEL MAFFETT and ROBERT WEIR, Muskegon, Mich. Filed Aug. 27, 1889. Serial No. 322,096. (No model.)

Claim.—In a machine for cutting up slabs, edgings, and the like, the combination, with the main frame, consisting of the upright posts B B, the beam C, the posts G, G', and G², the stringers H, H', and H², and the girders I and K, of the saw-arbor *d*, mounted in brackets D, said saw-arbor carrying a series of saws F, the pulley *f* for operating said saw-arbor, the gutters L, which carry the feed-chains hinged at *m*, the feed-chains running on sprocket-wheels journaled on shafts secured to the main frame, the series of rollers *n*, which serve to carry the stock into the machine, journaled to the main frame and operated by suitable chain-wheels, as shown, stop *n'*, the table *b*, the foot-lever mechanism for raising the hinged sections of the gutters, and suitable gearing for operating the shaft R, all arranged substantially in the manner and for the purpose set forth.

482,800. PUMP-MOTOR. JOHN H. MILLER and JOHN H. OSWALT, Clayton, Ohio. Filed Apr. 8, 1892. Serial No. 428,406. (No model.)

as F, and two exterior clamps offset to fit over said lugs and projections above and below the same, each of said clamps having a recess adapted to receive either the head or nut of a fastening-bolt.



2. The combination of a rail of channel form provided with lugs on its vertical webs, an interior chair having projections, as F, two exterior clamps offset to fit over said lugs and projections, and a bolt passing through said clamps and chair and having its head and nut seated in recesses formed in said clamps between said lugs and projections.

482,804.

combination with a key inserted in a keyway between the lower surface of said brace and the top surface of the chair.

2. A rail-chair having a brace on one side bearing against the under side of the head of the rail and provided with a hook passing through a slot in the rail-seat, in combination with a key inserted in a keyway between the lower surface of said brace and the top surface of the chair

482,800. PUMP-MOTOR. JOHN H. MILLER and JOHN H. OSWALT, Clayton, Ohio. Filed Apr. 8, 1892. Serial No. 428,406. (No model.)

Claim.—1. In a pump-motor, the combination, with a train of gears, of a horizontal arm pivoted to the framework, a vertical slotted piece pivoted to the said horizontal arm, and springs limiting the vibration of said vertical slotted piece, as shown herein and described.

2. In a pump-motor, the horizontal arm N', pivoted to the frame of the machine, adjustable weights R on said arm, the vertical slotted piece N, the upper piece O, provided with springs P, in combination with crank-disk I and a train of gears actuated by a rope R and weight K', as herein described, and for the purposes set forth.

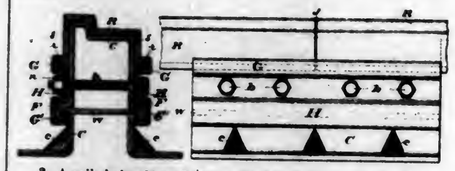
482,801. CHAIR FOR RAILROAD-RAILS. ARTHUR J. MOXHAM, Johnstown, Pa. Filed Sept. 30, 1891. Serial No. 407,274. (No model.)

Claim.—1. The combination of a channel-rail having side webs, an interior box-chair, and filling-pieces inserted on both sides of said chair between it and said webs.

2. The combination of a channel-rail having side webs terminating in interior angle-lugs, an interior chair having a seat for said rail, and filling-pieces inserted on both sides of said chair above said lugs and between the chair and said webs.

3. A rail-chair provided with offsets or projections, as *d*, and recesses, as *e*.

4. The combination of a channel-rail, a chair having projections, as *d*, and recesses, as *e*, and wedges inserted between the webs of said rail and the sides of said chair.



5. A rail-chair provided with projections, as *d*, recesses, as *e*, in its sides, and an interior brace, as F.

6. A rail-chair provided with projections, recesses in its sides, and an interior brace, in combination with a channel-rail and wedges shaped to fit into said recesses between the sides of said chair and the webs of said rail.

482,802. RAILROAD-RAIL CHAIR. ARTHUR J. MOXHAM, Johnstown, Pa. Filed Sept. 30, 1891. Serial No. 407,275. (No model.)

Claim.—1. The combination, with a rail of channel form provided with lugs on its vertical webs, of an interior chair having projections, as F, and two exterior clamps offset to fit over said lugs and projections above and below the same, each of said clamps having a recess adapted to receive either the head or nut of a fastening-bolt.

2. The combination of a rail of channel form provided with lugs on its vertical webs, an interior chair having projections, as F, two exterior clamps offset to fit over said lugs and projections, and a bolt passing through said clamps and chair and having its head and nut seated in recesses formed in said clamps between said lugs and projections.

3. A rail-chair of box form provided with an inserted horizontal stiffening-plate.

4. In combination with a rail-chair of box form having recesses in its sides, a horizontal stiffening-plate, as W, inserted in said recesses.

5. The combination, with a rail of channel form, of an interior chair, a horizontal stiffening-plate recessed in said chair, and two exterior clamps.

6. The combination of a rail of channel form provided with lugs on its vertical webs, an interior chair, an interior horizontal stiffening-plate for said chair, and two exterior clamps offset to fit over said lugs and each provided with a recess adapted to receive either the head or nut of a fastening-bolt.

7. The combination of a rail of channel form provided with lugs on its vertical webs, an interior chair having projections, as F, two exterior clamps offset to fit over said lugs and projections, and a horizontal stiffening-plate for said chair recessed therein.

8. The combination of a rail of channel form provided with lugs on its vertical webs, an interior chair having projections, as F, two exterior clamps offset to fit over said lugs and projections, a horizontal stiffening-plate for said chair, and a bolt or bolts passing through said clamps and chair and having their heads and nuts located within recesses formed in said clamps.

482,803. CHANNEL-RAIL AND CHAIR. ARTHUR J. MOXHAM, Johnstown, Pa. Filed Sept. 30, 1891. Serial No. 407,276. (No model.)

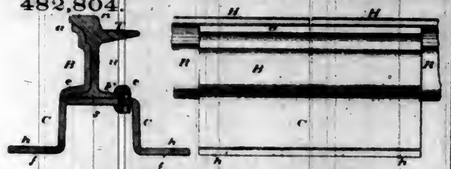
Claim.—1. In combination with a railroad-rail of channel form provided with inner lugs on its vertical webs, a chair shaped to fit under the head of said rail and over said lugs.

2. In combination with a railroad-rail of channel form provided with inner lugs on its vertical webs, a chair offset to fit over said lugs and an interior brace-plate for said chair.

3. In combination with a railroad-rail of channel form provided with inner lugs on its vertical webs, a chair offset to fit over said lugs and an interior brace-plate for said chair seated in recesses formed in the sides thereof.

4. In combination with a railroad-rail of channel form provided with inner lugs on its vertical webs, a chair offset to fit over said lugs and a brace-plate for said chair provided with lugs, as *a*.

5. In combination with a railroad-rail of channel form provided with inner lugs on its vertical webs, a chair offset to fit over said lugs and a brace-plate having stamped-out lugs, as *a*, secured to said chair by bolts passing through said stamped-out lugs and the sides of the chair.



482,804. RAILROAD-RAIL CHAIR AND PROCESS OF MAKING THE SAME. ARTHUR J. MOXHAM, Johnstown, Pa. Filed Sept. 30, 1891. Serial No. 407,277. (No model.)

Claim.—1. A rolled blank for making rail-chairs having an excess of metal on one of its surfaces adapted to be drawn out to form a portion of the finished chair.

2. The process of making rail-chairs, consisting in first forming a bar of metal into part of the shape of chair desired, and then drawing out a portion of said bar to form the remainder of the chair.

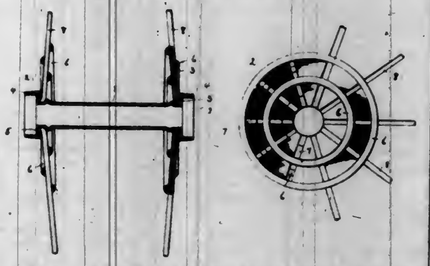
3. The process of making rail-chairs, consisting in first forming a bar of metal into part of the shape of chair desired, leaving a protrusion

482,804.

or mass of metal, and then drawing out said protrusion to form the remainder of the chair.

4. The process of making rail-chairs, consisting in first forming a bar of metal of a box shape having a lump or protrusion on its upper surface, and then drawing out said protrusion to form a rail-brace.

482,805. COMBINED RAILROAD-RAIL AND CHAIR AND METHOD OF MAKING THE SAME. ARTHUR J. MOXHAM, Johnstown, Pa. Filed Feb. 2, 1892. Serial No. 420,092. (No model.)



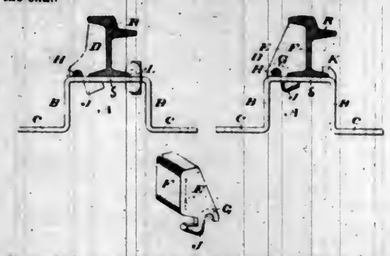
Claim.—1. As a new article of manufacture, a railway-rail and chair or support welded together, the junction of the rail and chair at the ends of the latter being made on curved lines.

2. As a new article of manufacture, a railway-rail and chair or support welded together, the ends of the chair at its junction with the rail having imparted thereto a concave form.

3. As a new article of manufacture, a railway-rail and chair or support welded together, said chair being enlarged in dimension at the points *c c* of its junction with the rail.

4. The method herein described of welding railroad-rails and chairs together, consisting in first forming a rail and chair each with a bead or bulb on a vertical web and then pressing out the metal of the chair at its ends into fillets or curves, thereby lengthening the chair at the weld, substantially as and for the purposes set forth.

482,806. WHEEL. THEODORE C. MUHL, Toledo, Ohio. Filed Aug. 17, 1891. Serial No. 402,823. (No model.)



Claim.—1. In a metal wheel, hub-disks formed of a single piece having a web, a central opening therein, a sand-band concentric with the same, and rings upon either side of the web concentric to the central openings, in combination with spokes passed between the rings and having their ends upset within recesses formed within the web.

2. A metal wheel formed of a thimble, a disk upon each end thereof, each disk comprising, in a single piece, a web, having a central opening for the insertion of the thimble, recesses formed concentrically of the central opening and leading thereto for the reception of the inner ends of the spokes, radial grooves extending from the recesses to the periphery, rings upon each side of the web, and spokes arranged, the ends being forced, at an angle into the recesses and resting upon the thimble.

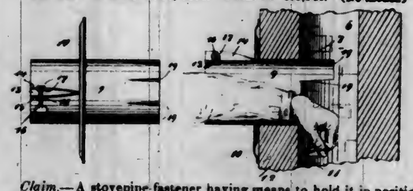
482,807. BRACE-CHAIR FOR RAILROADS. GEORGE MURRAY, Johnstown, Pa., assignor to the Johnson Company, same place. Filed May 5, 1890. Serial No. 350,686. (No model.)

Claim.—1. A rail-chair having a brace on one side bearing against the side of the rail and provided with a hook in its lower portion, in combination with a key inserted in a keyway between the lower surface of said brace and the top surface of the chair.

2. A rail-chair having a brace on one side bearing against the under side of the head of the rail and provided with a hook passing through a slot in the rail-seat, in combination with a key inserted in a keyway between the lower surface of said brace and the top surface of the chair

3. A rail chair having on one side a clamp for the foot of the rail and on the opposite side a brace bearing against the side of the rail and provided with a hook in its lower portion, in combination with a key inserted between the lower surface of said brace and the top surface of the chair.

4. A rail-chair of box form, having a brace on one side bearing against the side of the rail and provided with a hook in its lower portion, in combination with a key inserted between the lower surface of said brace and the top surface of the chair.



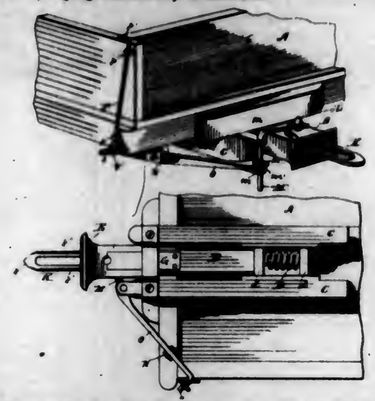
5. A rail-chair of box form, having a rail-brace on one side provided with a hook passing through a slot in the rail-seat, in combination with a key inserted between the lower surface of said brace and the top surface of the chair.

6. A rail-chair of box form, having a rail-brace on one side bearing against the under side of the head of the rail and provided with a hook passing through a slot in the rail-seat, in combination with a key inserted between the lower surface of said brace and the top surface of the chair.

7. A rail-chair provided with a rail-brace having vertical ribs and a face bearing against one side of the rail and secured to the chair by a hook and key.

8. A rail chair having a rail-brace on one side secured thereto by a hook and a key and provided on the opposite side with a clamp for the foot of the rail stamped out of the rail-seat.

482,808. STOVEPIPE-FASTENER. JOHN R. MCGORON, Terrace Park, Ohio. Filed Nov. 30, 1891. Serial No. 413,546. (No model.)

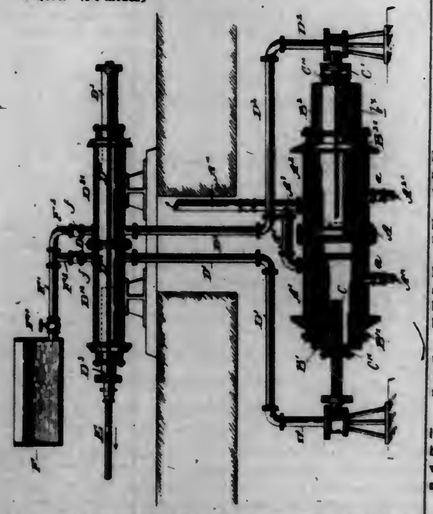


Claim.—A stovepipe-fastener having means to hold it in position in the chimney and being provided with the improved means to hold the stovepipe to it, which means are obtained by cutting a longitudinal slit in the fastener, and consisting of two vertical flanges which are formed by bending outwardly the cut edges of such slit, a reinforcing-nut connected to one of said flanges, and an adjusting-screw passing through this nut and connected to the other flange in a manner to prevent it from moving longitudinally, all as substantially shown and described.

482,809. CAR-COUPLING. JAMES F. PURSLEY, South Pittsburg, Tenn. Filed Dec. 19, 1891. Serial No. 415,649. (No model.)

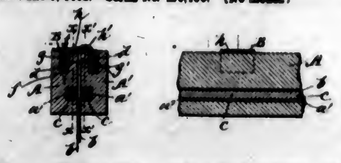
Claim.—1. The combination of a draw-head having a slot formed in its bottom, a spring-plate attached to the under side of the draw-bar and provided with an upwardly-extending lug which extends through the slot in the bottom of the draw-head, a link adapted to be secured between the top of the draw-head and the spring-pressed lug, and a coupling-pin, substantially as described.

2. The combination of a draw-head having a slot formed in its lower side, a spring-plate attached at one end to the under side of the draw-bar and normally lying flush therewith, a lug rigid with the free end of the spring-plate and extending through the slot in the draw-head, a link arranged within the draw-head, and a coupling-pin



adapted to be passed through the draw-head and link and fit in a recess in the spring-lug, substantially as described.

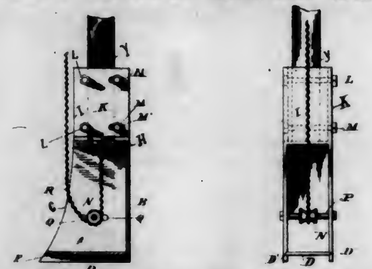
3. The combination of a draw-head having a slot formed in its lower side, near the forward end thereof, a flat spring-plate attached at one end to the draw-bar and provided at its free end with an upwardly-extending lug which extends through the slot in the draw-head, the forward end of such lug being curved and provided with a vertical groove or recess, a link, and a coupling-pin adapted to be passed through suitable apertures in the draw-head and the link and fit in the vertical groove or recess in the spring-lug, substantially as described.



4. The combination, with a draw-head and coupling-link, of a coupling-pin provided near its upper end with an annular recess, a rod fitted in suitable guides at one side of the draw-head and bent near its upper end to extend across the draw-head, the end of such bent portion being bifurcated and engaging the coupling-pin, a lever fulcrumed below the car and having one end engaging with the pin-supporting rod, and a vertical rod fitted in guides attached to the side of the car and having its lower end engaged with the lever, substantially as described.

482,810. HYDRAULIC MINING-PUMP. WILLIAM A. ROCKLIFF and JOHN P. FOLEY, Rumsey, Mont. Filed Mar. 8, 1892. Serial No. 424,196. (No model.)

Claim.—The combination of two cylinders, each having a closed end secured to the closed end of the other and opposite open ends provided with pistons, rods connecting the pistons of the two cylinders, and means for reciprocating said pistons with a system of piping connecting each of the closed ends of the said cylinders with a second pair of closed-end cylinders arranged at a lower level, each being provided with a hollow piston communicating with one of the first-mentioned cylinders, suction-pipes, one each for each closed cylinder, and discharge-pipes extending from each of said closed cylinders and provided with suitable check-valves, substantially as specified.



482,811. WINDOW-SCREEN. SAMUEL ROSBOOK, New York, N. Y. Filed June 9, 1892. Serial No. 436,130. (No model.)

Claim.—1. The expansible window-screen coupling and guide, consisting of a corrugated plate B, constructed of a form whereby it can be applied upon the channeled edges of an expansible window-screen and provided with a fastening-tongue, a guiding-tongue, and with a passage for a fastening-screw, and also with a flat bearing portion A and an inverted arch or crown shaped portion A', the said plate being fastened by one end to one of the channeled sections of the screen and loosely connected by one of its tongues to the other channeled section and serving for coupling and truly guiding said sections with a minimum of frictional contact, substantially as described.

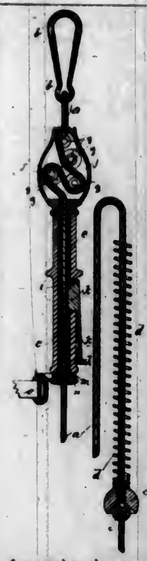
2. The corrugated plates B; having, respectively, a flat bearing portion A and an inverted arch or crown shaped portion A' and formed with fastening-tongues *g* and guiding-tongues *g'*, in combination with the sliding channeled sections A A' of an expansible window-screen, said sections receiving into their channels the tongues of the plate, and with fastening-screws having heads a little greater in diameter than the lower portion of the spaces between the side walls of the fastening-tongues, substantially as described.

482,812. SHOE FOR CISTERN-TUBING. EDWARD SAHLAND, Quincy, Ill. Filed Dec. 18, 1891. Serial No. 415,511. (No model.)

Claim.—1. In a shoe for cistern-tubing, a base formed of a hollow casting wider at the bottom than at the top, in combination with a socket portion provided with a movable side or clamping-plate, whereby the tubing is held removably in place, as set forth.

2. In a shoe for cistern-tubing, the combination of a hollow base provided with a movable bottom and a socket portion having a removable side containing oblong slots, as specified.

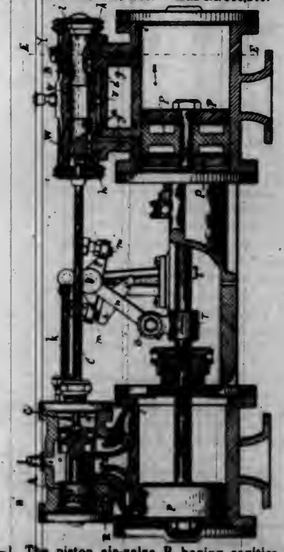
3. In a shoe for cistern-tubing, a hollow base portion having its lower end wider than the upper end and provided with a roller having an adjustable axis, in combination with a socket portion with an open bottom and a movable side or clamping plate provided with adjustable bolts, as and for the purpose set forth.



4. In a shoe for cistern-tubing, the combination of a hollow cast-metal base surmounted by a socket provided with a movable clamping side and bolts whereby various-sized tubing can be inserted in the manner and for the purpose described.

5. In a shoe for cistern-tubing, the combination of a hollow metallic base provided with a roller mounted on a shaft adjustable in the base and a socket portion on the base portion, said socket being provided with a removable side, and bolts for clamping said side in the manner and for the purpose substantially as described.

482,818. FIRE ESCAPE. MICHAEL SCHWARZ, Dresden, Germany. Filed Mar. 30, 1892. Serial No. 427,007. (No model.) Patented in Germany Dec. 22, 1890, No. 58,982; in France Feb. 27, 1891, No. 211,750; in England Mar. 12, 1891, No. 4,478; in Austria-Hungary Apr. 20, 1891, No. 606 and No. 13,156, and in Belgium June 17, 1891, No. 96,315.



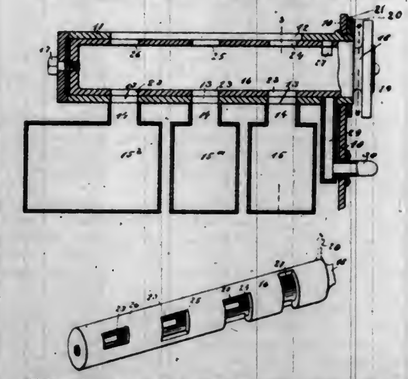
Claim.—In a fire-escape of the class described, the combination

482,818.

of the cylinder *e*, the case *f*, secured to the upper end of said cylinder and having a hinged cover *f'*, a winged nut and bolt for securing said cover in its closed position, a series of rollers *g*, pivoted in said case, a hand-brake *k*, pivoted at one end to the cylinder and provided with a brake-surface and a lever-handle *k*, an opening in the side of cylinder *e*, through which opening the brake-surface of the brake is adapted to project, a bracket *m*, adapted to be secured to the lower end of the cylinder by a securing-ring *n*, a belt *o*, secured to said bracket, a rope passing through the cylinder and around the rollers and out through an opening in the upper end of the case *f*, a snap-hook secured to the upper end of the rope, a weight *c*, secured to the lower portion of the rope, and a coiled spring encircling said rope and located between the weight and the lower end of the cylinder, all arranged for co-operation, as described.

482,814. STEAM-ACTUATED AIR PUMP. EDWIN SMEDLEY, Dubuque, Iowa. Filed Sept. 26, 1890. Serial No. 366,279. (No model.)

Claim.—1. The piston air-valve B, having cavities A A therein serving to open and close the ports *a a'* and *b b'*, and having an oil-hole through it to allow the free movement of the valve and to permit the air and oil to flow from one end of the valve to the other as the valve moves from end to end.



2. In combination with the valve-cage W, the piston air-valve provided with the exterior oil room or recess V for caging the oil, and with the interior passage *i*, as and for the purposes set forth.

3. In combination with the air-cylinder and piston and the described piston air-valve B, a main steam-valve directly connected to said air-valve, and an auxiliary steam-valve and actuating devices intermediate the air-piston and the auxiliary steam-valve, whereby the air-valve is adapted to be thrown by the main steam-valve prior to the movement of the air-piston.

4. In combination with the air-piston P and with the piston air-valve B, constructed and operated as described and having the passage *i* through it, the rocker arm or rod *l*, its adjusting-screws *m m'*, the lever *n*, having tappets *x x*, cross-head T, through which said lever slides, and air piston-rod T^3, carrying said cross-head, and connections intermediate the said rocker *l* and the piston air-valve B.

5. In combination with the air-piston P and with the piston air-valve B, constructed and operated as described and having the passage *i* through it, the rocker arm or rod *l*, its adjusting-screws *m m'*, the lever *n'*, having tappets *x x*, cross-head T, through which said lever slides, air-piston T^3, carrying said cross-head, arm *h*, connecting-rod *k*, auxiliary steam-valve S, main steam-valve A, and connecting-rod C.

482,815. MEASURING-FAUCET. CYRUS W. STEINERT, Harrisburg, Pa. Filed Dec. 1, 1891. Serial No. 413,689. (No model.)

Claim.—1. A measuring-faucet comprising a valve casing having a longitudinal slot on one side and a series of short slots on the other, a plurality of measuring-pockets connected with the valve-casing by means of the short slots, an outlet-pipe opening from the valve-casing, and a revoluble hollow valve held to turn in the valve-casing, the valve having on one side a series of longitudinally-aligning slots to register with the short slots of the valve-casing and on the opposite side a series of slots of graduated width adapted to register with the long slot in the valve-casing and with the outlet-pipe, substantially as described.

2. The combination, with the slotted valve-casing and the measuring-pockets connected therewith, of an outlet-pipe opening from the casing, a revoluble hollow valve held to turn in the casing and provided with slots adapted to register with the slots in the valve-casing and with the outlet-pipe, an indicating-dial arranged adjacent to one end of the valve, and a hand carried by the valve and adapted to move over the dial, substantially as described.

3. The combination, with the slotted valve-casing having an outlet-pipe opening therefrom and the measuring-pockets connected with the valve-casing, of the revoluble hollow valve having slots to register with the slots in the valve-casing and with the outlet-pipe, said valve having its outer end formed into a stem provided with a handle, an indicating-dial arranged adjacent to the stem, and a hand carried by the stem and adapted to move over the dial, substantially as described.

4. The combination, with the valve-casing having its opposite sides slotted, the measuring-pockets connected with the valve-casing, and the outlet-pipe opening from the valve-casing, of the revoluble hollow valve mounted within the casing, said valve having on one side a series of longitudinal slots and on the opposite side a series of slots of graduated width, substantially as described.

482,816. WHEEL-PLOW. EPHRAIM STOCK, Hailes Forks, Wyo. Filed Feb. 16, 1892. Serial No. 421,737. (No model.)

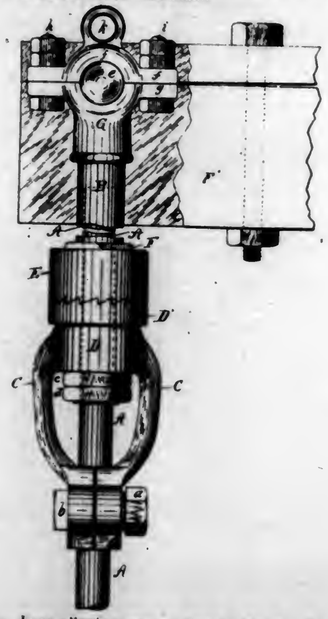
482,816.

Claim.—1. The combination, with a plow-beam carrying a plowshare, of a tongue having a bearing thereon pivoted to the said beam and a flexible coupling connected to the said beam and passing over the said bearing on the tongue, to which coupling draft strains may be applied, as described.

2. The combination, with a plow-beam carrying a plowshare, of a tongue having a bearing thereon pivoted to the said beam, a flexible coupling connected to the said beam and passing over the said bearing on the tongue, to which coupling draft strains may be applied, and means whereby the said plow-beam and tongue may be locked in any desired position, as described.

3. The combination, with a plow-beam carrying a plowshare, of a tongue having a bearing thereon pivoted to the said beam, a flexible coupling connected to the said beam and passing over the said bearing on the tongue, to which coupling-draft strains may be applied, a cross-bar having its one end secured to the tongue and its opposite end bent upwardly, a rack-bar contained in the said upwardly-bent end of the cross-bar, a wheel carried on the lower end of the said cross-bar, a segmental rack engaging the said rack-bar, means for locking the said rack in any desired position, an L-frame pivoted in the rear of the said cross-bar, one arm thereof being bifurcated and the opposite arm being provided with a suitable lock, and a wheel mounted within the bifurcated arm of the said frame, as described.

482,817. DOOR-FASTENER. WILLIAM W. TANNER and THEODORE W. BUSCH, Fremont, Mich., assignors of one-third to Joseph Gerber, same place. Filed Dec. 16, 1891. Serial No. 415,544. (No model.)



Claim.—1. In combination with a door, a casing and a projection on said casing, and an axially-divided knob attached to said door and engaging said projection, substantially as described.

2. In a door-fastening, a knob on the door engaging a fixed projecting block on the jamb, said knob being axially divided and having a stem passing through the door, and an outer knob secured to said stem, substantially as described.

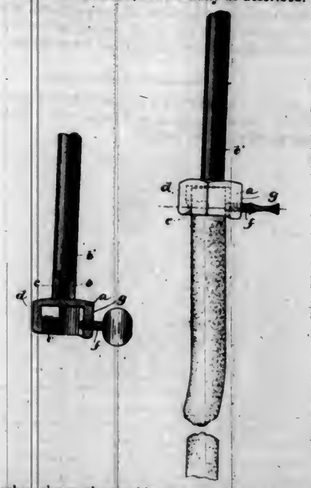
3. The combination, with a door and its casing or jamb, of a block having a concave rear and an inclined front side, an axially-divided knob engaging said block having a stem passing through said door, a pin inserted in said door and passing transversely through said stem, and a knob having an axial opening to receive the outer end of said stem and secured to the same, substantially as described.

4. As an article of manufacture, an improved door-fastening consisting of an axially-divided knob having a shouldered stem and a knob having an axial opening fitting said stem, substantially as described.

482,818. ADJUSTING APPARATUS FOR OIL-WELLS. GEORGE H. WADSWORTH and WILLIAM SHEMBLEY, Findlay, Ohio. Filed Sept. 26, 1891. Serial No. 406,964. (No model.)

Claim.—In an adjusting apparatus for oil-wells, the polish-rod A, the yoke C, and ratchet D E, in combination with the pipe B, ball and pitman *d* G, and the working-beam F, arranged substantially as and for the purpose set forth.

482,819. ELASTIC TIRE. CURT WAGNER, Oederan, Germany. Filed Jan. 28, 1892. Serial No. 419,543. (No model.)

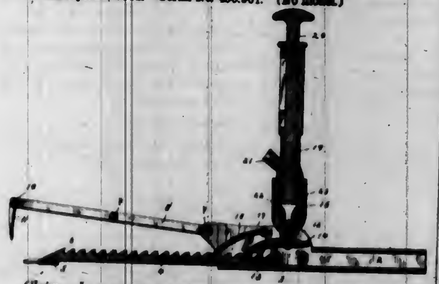


Claim.—1. The combination, with the semicircular rim or felly of a wheel provided at its upper lateral edges with bearing-surfaces, of a semicircular elastic tire having its ends seated upon said bearing surfaces of the tire and secured to the latter and a spring arranged intermediate the tire and felly and having alternate large and small convolutions, said spring forming a yielding support for the tire intermediate its ends, as described, for the purpose specified.

2. The combination, with a semicircular rim or felly of a wheel provided at its upper lateral edges with bearing-surfaces, of a semicircular elastic tire having its ends seated upon said bearing-surfaces of the tire and secured to the latter, a spring arranged intermediate the tire and felly and having alternate large and small convolutions, said spring forming a yielding support for the tire intermediate its ends, and a band engaging the larger convolutions of the spring and encircling the felly for the purpose of securing the said spring in place, as described.

482,820. CARBON-HOLDER. ERNEST P. WARNER, Chicago, Ill., assignor to the Western Electric Company, same place. Filed Apr. 21, 1892. Serial No. 430,067. (No model.)

Claim.—1. A carbon-clamp *a*, provided with the lips *e e* upon its inner surface, said lips being provided with contact-surfaces running in a horizontal direction, and a thumb-screw *f*, whereby the carbon held by said clamp may be aligned with the other member of a pair of carbons, substantially as specified.

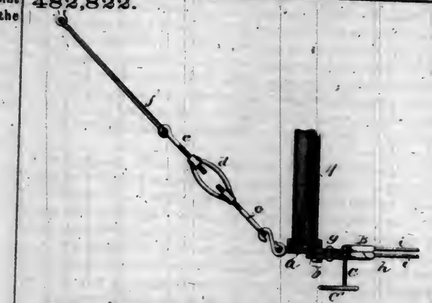


2. A carbon clamp of angular cross-section adapted to give three points of contact to the carbon, two of said contact-points being provided upon lips running in a horizontal direction, and to permit a swinging motion of said carbon in any direction, whereby the point of said carbon is brought in alignment with the other carbon of the pair and secured in that position, substantially as described.

3. In a carbon-clamp, the combination, with three points of contact for the carbon, of a recess above said contact-points, whereby a swinging motion of said carbon in any direction is permitted, substantially as described.

4. In a carbon-clamp, the combination, with three points of contact approximately in the same plane, of a recess above said contact-points, provided with a ceiling against which the carbon may rest.

482,821. CARPET-STRETCHER. JACOB ALBIN, Seymour, Ind. Filed Apr. 28, 1892. Serial No. 430,961. (No model.)

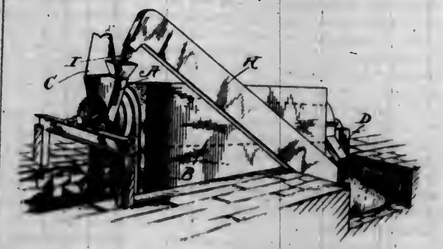


Claim.—In a carpet-stretcher, the combination of a frame with a tubular body and front side extensions open at the top and provided with forwardly-projecting overhanging ears, a ratchet-bar adjustably mounted in said body and having a comb at the front end thereof, a pair of arms secured to said overhanging ears and provided with depending spikes or spurs at their front ends in advance of the comb on the ratchet-bar, the said overhanging forwardly-projecting ears extending the outer ends of the said arms beyond the said comb, a socket pivotally mounted between the extensions of said body and having a bottom depending lug with a slot therein running parallel with the opening between said extensions, a push-pawl pivotally mounted in said slotted lug and having a rear finger-engaging extension, a stop-pawl in advance of said push-pawl and independent of the same and adapted to be raised from engagement with the ratchet-bar by the elevation of the said push-pawl, and an operating-lever embodying tacking mechanism, removably fitted in said socket, substantially as described.

482,822. CASH AND PACKAGE CARRIER APPARATUS. SAMUEL W. BARR, Mansfield, Ohio. Filed Mar. 14, 1892. Serial No. 424,935. (No model.)

Claim.—1. In a cash and package carrier apparatus, the combination, with a suitable support, of a pair of curved beads connected therewith, said beads running approximately parallel with each other, and track-wires leading to the beads, whereby the beads serve as tracks for the carrier to run upon, substantially as set forth.

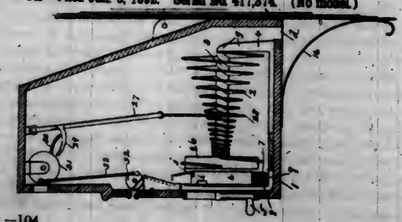
482,822.



2. In a cash and package carrier apparatus, the combination, with a pair of track-wires capable of being spread apart, of a support comprising a main plate and a pair of track-plates having curved outer edges along which the track-wires are supported, said track-plates secured to the main plate and forming a part of the track, substantially as set forth.

3. The combination, with a pair of track-wires capable of being spread apart, of a curved support along which both track-wires are supported in proximity to each other and in the same or approximately the same vertical plane, substantially as set forth.

4. The combination, with a main plate, of a pair of track-plates having curved outer edges secured to the main plate and secured together, said track-plates having hollow beads formed at their outer edges, track-wires passed through these beads, and a depending guard below the main plate and in a plane substantially parallel with the outer edges of the track-plates, substantially as set forth.



482,823. PROCESS OF DRYING AND DISINTEGRATING CLAY, &c. FRANKLIN D. CUMMER, Cleveland, Ohio, assignor to Eliza R. Cummer, same place. Filed July 25, 1891. Serial No. 400,744. (No specimens.)

Claim.—1. The process herein described of drying clay and similar material, and consisting, essentially, first, in heating and stirring the material until it is partially dried, and, second, piling the heated and partially-dried material, whereby the drying process is completed by means of the aggregate heat in the pile of material, substantially as set forth.

2. The process herein described of drying clay and similar materials, comprising, first, heating, stirring, and partially drying the material in any suitable mechanical drier; second, returning a portion of the heated material and mixing it with the green material to be heated, and, third, piling the heated and partially-dried material to evaporate the same to dryness by means of the accumulated heat in such pile of material, substantially as set forth.

482,824. NEWSPAPER-VENDER. ALBERT E. DAIS, Pittsburg, Pa. Filed Jan. 8, 1892. Serial No. 417,874. (No model.)

Claim.—1. In a vending apparatus, the combination of a case having a coin-inlet and a delivery-opening, a rotatable shaft having a helix arranged to deliver to the delivery-opening, a disk carried by said shaft and having the spaced converging slots, means, substantially as described, to convey the coins from the inlet-opening in the case to the slots in the coin-disk, and the coin-operated levers adapted to be operated by the coins in said coin-disk to release said levers from engagement with the coin-disk, substantially as described, for the purpose specified.

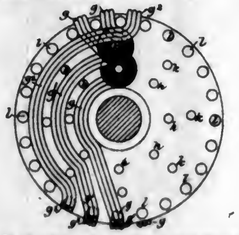
2. In a coin-actuated vending apparatus, the combination of a case having a coin-inlet and a delivery-opening, a shaft carrying a helix arranged to deliver articles to said delivery-opening, a coin-disk carried by the shaft to receive from the coin-inlet and having the spaced slots for coins of different denominations, a locking-lever arranged in the path of one coin in the coin-disk, another lever adapted to be operated by a coin of different denomination in the coin-disk and having means to release the locking-lever from engagement with the coin-disk, and a change-receptacle arranged to be automatically operated by the last-named lever, substantially as and for the purpose described.

3. In a coin-operated vending apparatus, the combination of a case having coin-inlets and a delivery-opening, a shaft carrying a helix to deliver to the delivery-opening, a coin-disk mounted on the shaft to receive from the coin-inlets and having the converging slots, which are spaced laterally on opposite faces of the disk, the locking-lever arranged to be actuated by a coin of one denomination in the coin-disk, another lever 9, adapted to be operated by a coin of different denomination in the coin-disk and having means for releasing the locking-lever from the coin-disk, a change-receptacle operated directly from the operating-shaft, and means actuated by the lever 9 to release the coin from the change-receptacle and permit the same to be discharged from the machine, substantially as described.

4. In a coin-operated vending apparatus, the combination of a case having coin-inlets and a delivery-opening, a shaft carrying a helix, a rotatable change-receptacle actuated by rotations of the shaft, a coin-disk carried by the shaft, a lever operated by a coin in the coin-disk, and a detent in the path of the coin-lever and normally confining the coins in the coin-holder, substantially as described.

5. In a coin-operated vending apparatus, the combination of a case having the coin-inlets and the delivery-opening, the shaft carrying a helix and a slotted coin-disk, a rotatable coin-holder geared to the shaft and having the discharge-slots, the locking-lever engaging said coin-disk, a releasing-lever arranged to be actuated by a coin of different denomination from the coin required to operate the locking-lever, and the pivoted strip 21, normally closing the slots in the coin-holder and arranged to be operated by the releasing-lever, substantially as described.

6. In a coin-actuated vending apparatus, the combination of a case having the slots, a shaft carrying a delivery-helix, a coin-disk normally locked by a coin-actuated lever, a swinging feeder carrying a trip-arm near its upper end, a roller having an arm sustained by the trip-arm of the feeder, and another roller linked to the first roller and arranged close to the coin-slot of the case, substantially as and for the purpose described.



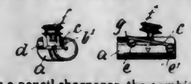
7. In an automatic newspaper-vending apparatus, the combination of a case having a coin-inlet and a newspaper-outlet opening, a shaft carrying a helix or worm, means for automatically delivering said papers, means for automatically delivering change simultaneously with said papers, and a feed-blade arranged between the divisions of the helix and adapted to be moved forward as the latter is rotated and support the papers carried thereby, substantially as herein described.

8. In an automatic newspaper-vending apparatus, the combination of a case having a coin-inlet and a newspaper-outlet opening, a shaft carrying a helix or worm, means for automatically delivering said papers, means for automatically delivering change simultaneously therewith, means for closing the coin-inlets when said case is exhausted of papers and exposing the words "All sold," and a feed-blade arranged between the divisions of the helix and adapted to be moved forward as the latter is rotated and support the papers carried thereby, substantially as and for the purpose set forth.

9. In an automatic newspaper-vending apparatus, the combination, with a case having a slot in one side and an opening at the bottom, of a shaft arranged within the case, a helix carried by said shaft and adapted to receive the papers between its several divisions and automatically discharge the same through the opening in the bottom of the case, a circular disk mounted on said shaft and having an opening extending entirely through the same, a spring-actuated lever adapted to lock the disk and release the same when a coin is dropped through said slotted disk and into the lever and the shaft is rotated, and a case to contain change, and means to deliver said change simultaneously with said paper, substantially as herein described.

10. In an automatic newspaper-vending apparatus, the combination, with a case having a slot in one side and an opening at the bottom, of a shaft arranged within said case, a helix carried by said shaft and adapted to receive the papers between its several divisions and automatically discharge the same through the opening in the bottom of the case, a circular disk mounted on said shaft and having an opening extending through the same, a disk having a thread thereon and rotary case containing a number of compartments for change, and means to open the lower end of said compartments to discharge said change simultaneously with said papers, substantially as herein described.

482,825. ARMATURE-WINDING FOR DYNAMO-ELECTRIC MACHINES. RUDOLF EICKEMEYER, Yonkers, N. Y. Filed Sept. 3, 1890. Serial No. 363,810. (No model.)



Claim.—1. In an armature-winding for dynamo electric machines, the combination, with an armature-core, of strands or lengths of insulated wire, each having one turn around appropriate portions of the core divided into separate and distinct sets, the strands in each set being shaped at the ends of the core in a predetermined form unlike the strands of the other set, and each set having locking-pins at the ends of the core, substantially as described.

2. In an armature-winding composed of strands of insulated wire crossing both ends of the core and covering appropriate portions of its face, the combination of locking-studs for securing said strands on the core and disks on said studs for separating the strands in planes parallel with the ends of the core.

3. In an armature-winding, the combination, with an armature-core, of specially-bent strands or lengths of insulated wire in single turns crossing at the ends of the core and covering appropriate portions of the face of said core and locking-pins which confine the strands at the ends of the core against centrifugal and rotative displacement, substantially as described.

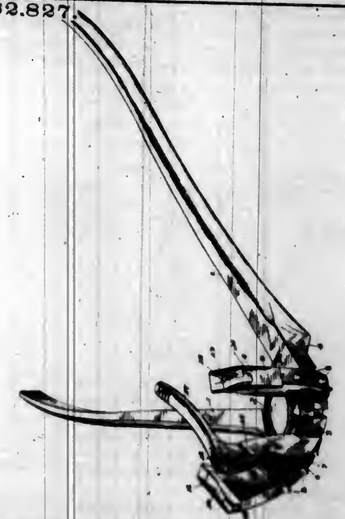
4. A winding for dynamo-electric-machine armatures, composed of strands or lengths of wire which are bent into various forms and constitute separate sets or series of strands, the strands of each set having a form peculiar to themselves, and all of said strands secured in place by pins in holes in the ends of the armature-core.

482,826. PENCIL-SHARPENER. CARL FABER, Nuremberg, Germany. Filed Apr. 1, 1892. Serial No. 427,418. (No model.)

Claim.—1. In a pencil-sharpener, the combination, with the body *a*, having a conical bore *b*, slot *b'*, and incline *d*, of the reversible blade *c* and the screw *f*, for the purpose as described.

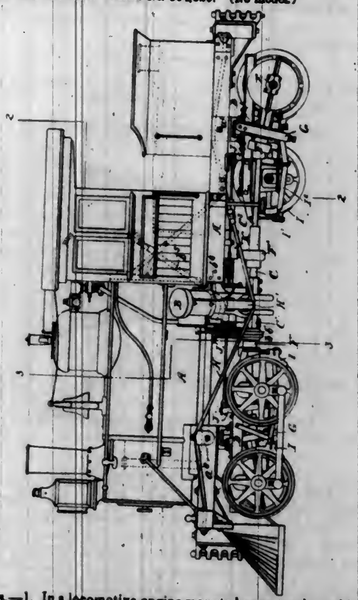
2. In a pencil-sharpener, the combination, with the body *a*, having a conical bore *b*, slot *b'*, and incline *d*, of the reversible blade *c*, the screw *f*, adjusting-screws *e* and *e'*, and stop *g*, the central hole in the blade *c* being wider than the threaded portion of screw *f*, substantially and for the purpose as described.

482,827. COMBINATION FENCE-TOOL. JOHN W. GALLANT, Delta, Colo., assignor of one-half to Peter Mundry, same place. Filed May 7, 1892. Serial No. 432,173. (No model.)



Claim.—1. In a tool of the character set forth, the combination of the handles having horizontally-disposed disks with notches therein and heads integrally formed therewith and extending upward at an angle therefrom and a gripping-lever mounted between said heads and pivotally connected to one of the same, substantially as described.

2. In a tool of the character set forth, the combination of heads and a gripping-lever movably mounted between the same and projecting rearwardly therefrom, substantially as described.



3. In a tool of the character set forth, the combination of heads having an opening extending therethrough and a gripping-lever mounted between said heads in line with said opening, substantially as described.

4. In a tool of the character set forth, the combination of reins or handles having horizontally-disposed disks integrally formed therewith and provided with notches, and heads rising vertically from said disks with spurs or points thereon and an opening extending therethrough, a gripping-lever mounted between said heads and projecting rearwardly therefrom, teeth secured in the upper portions of said heads, and means for securing said teeth in position, substantially as described.

482,827.

482,828. LOCOMOTIVE. CHARLES L. HEISLER, Dunkirk, N. Y. Filed May 25, 1891. Serial No. 394,020. (No model.)

Claim.—1. In a locomotive-engine mounted upon trucks and having a centrally-located longitudinal shaft connecting the trucks, the combination, with the boiler, of an engine-frame located, essentially, beneath the boiler and secured thereto, engines mounted thereon and arranged with their center lines at an angle to each other, and the boiler within the angle and passing the plane of the angle with its axis perpendicular to said plane, substantially as described.

2. In a locomotive-engine mounted upon trucks and having a centrally-located longitudinal shaft connecting the trucks, the combination of two engines arranged at an angle to each other and connected to the crank-shaft and having the eccentrics of both engines located at one side of the crank, substantially as described.

3. In a locomotive engine mounted upon trucks and having a centrally-located longitudinal shaft connecting the trucks, the combination of the engines arranged at an angle to each other and connected to the shaft and tumbling-shaft common to both engines, arranged within the angle formed by the engines, substantially as described.

4. In a locomotive-engine mounted upon trucks and having a centrally-located longitudinal shaft connecting the trucks, the combination, with the engines arranged at an angle to each other and connected to the shaft, of the eccentrics connected to the shaft at one side of the crank and the tumbling-shaft common to both engines, arranged within the angle formed by the engines, substantially as described.

5. In a locomotive-engine mounted upon trucks and having a centrally-located longitudinal shaft connecting the trucks, the combination, with the engines arranged at an angle to each other and connected to the longitudinal centrally located crank-shaft, of struts secured to the engine-frames and truss-rods bearing on the struts and connected to the frame of the locomotive, substantially as described.

6. In a locomotive mounted upon two pivoted trucks, the combination of the driving-engines for propelling the locomotive, a central driving-shaft which is independent of the inner driving-axles, but geared to the extreme or outside driving-axles, and connections between the outside driving-axles and the inner driving-axles, substantially as described.

7. In a locomotive-engine, the combination, with the main frame supporting the driving-engines, of two pivoted trucks supporting the same, gears connected with the outside axles of the trucks, a shaft-section connected to said gears and mounted on the truck, and connections between said shaft-sections and the driving-engines, substantially as described.

8. In a locomotive-engine, the combination, with the main frame and driving-engines mounted thereon, of the main shaft-section supported thereby, pivoted trucks supporting the engine, gear connections for the outside axles of the truck, a shaft-section mounted on the truck, and a floating shaft-section connecting the fixed section of the shaft with the section on the truck, substantially as described.

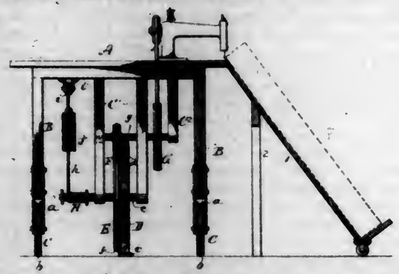
9. The combination, with the main frame and driving-engines carried thereby, of a fixed section of the main shaft connected thereto, a pivoted truck having gears connected with the outside axle, a shaft-section mounted on the truck, a floating shaft-section interposed between the fixed shaft-section and the section on the truck, and knuckle-joints connecting the shaft-sections, substantially as described.

10. In a locomotive-engine, the combination, with the pivoted truck, of a section of the driving-shaft mounted on the truck and connected by gearing to the outside axle, and a spring-support mounted on the truck for supporting said shaft-section, substantially as described.

11. In a locomotive having a pivoted truck, the combination, with the outside axle, of gears connected thereto, a section of the main driving-shaft connecting said gears, a yoke-piece connected to the bolster, and spring-supported bearings in said yoke-piece for the shaft-section, substantially as described.

12. In a locomotive, the combination, with the main frame, the driving-engines mounted thereon, and a short fixed section of the main driving-shaft secured thereto, of two trucks pivotally connected to and supporting the frame, gears connected to the outside axles of the trucks, a short shaft-section mounted on each truck and connected to the axle, a relatively-long floating shaft-section between each truck-section and the main fixed section of the shaft, and knuckle-joints connecting the shaft-sections, substantially as described.

13. In a locomotive-engine, the combination, with the truck, of a brake device consisting, essentially, of brake-shoes, rods connecting said brake-shoes, a U-shaped lever connected to said rods, and connections between said U-shaped lever and the brake-cylinder, substantially as described.



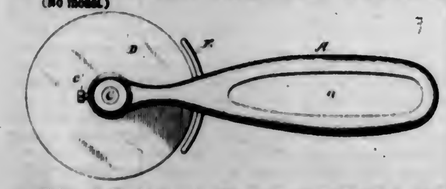
14. In a locomotive-engine, the combination, with the main frame, of a driving-engine supported thereon, the pivoted trucks supporting the same, the brake-shoes arranged on the inner sides of the wheel, a U-shaped-lever mounted on the truck and connected to the brake-shoes, and a brake-cylinder mounted on the engine and connected to the lever, substantially as described.

15. In a locomotive-engine, the combination, with the main frame, of the driving-engines mounted thereon, a longitudinal driving-shaft, trucks supporting the engine, shaft-sections mounted on the trucks and connected with the extreme axles, a floating shaft-section between the truck and the driving-engine, a brake mechanism mounted on the trucks, each having a U-shaped lever, tension-rods connected to the levers and passing above the apex of the engines, a brake-cylinder located on the frame, and connections between the brake-cylinder and tension rods, substantially as described.

16. In a locomotive-engine mounted upon trucks and having a centrally-located longitudinal shaft connecting the trucks, the combination of the boiler having a cylindrical shell inclosing the fire-box and ash-pan, located above the longitudinal central shaft and the engines arranged at an angle to each other and connected to the said shaft, substantially as described.

17. In a locomotive-engine having a longitudinal centrally-located shaft, a truck having a substantially U-shaped brake-lever, the lower ends of which are connected to the brake device, substantially as described.

482,829. CARRIAGE FOR CARRYING AND OPERATING SEWING-MACHINES. MELTIAH W. LAWRENCE, Gardiner, Me. Filed Oct. 28, 1891. Serial No. 410,058. (No model.)

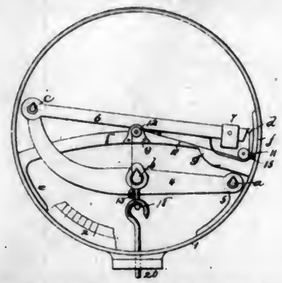


Claim.—1. The combination, with a carriage and tramway, of a wheel carried by the carriage and provided with peripheral projections adapted to engage the tramway, whereby the carriage is moved, means for automatically turning the wheel in one direction, a shaft actuated by the wheel, a sewing-machine, and belts for imparting motion from the wheel to the sewing-machine, substantially as set forth.

2. The combination, with a carriage and a rack-bar located on the floor, of a wheel carried by said carriage and having peripheral projections adapted to mesh with the rack-bar, a cord or rope wound upon the shaft of said wheel and carried over a pulley on the carriage, a weight secured to the free end of said cord or rope, and means for transmitting motion from said wheel to a sewing-machine on the carriage, substantially as set forth.

3. The combination, with a carriage and a sewing-machine located thereon, of a wheel having peripheral projections, a rack-bar, with which said wheel meshes, a cord or rope wound on the shaft of said wheel and passing over a pulley on the carriage, a weight secured to the free end of said rope or cord, a band-wheel on the same shaft with the first-mentioned wheel, a pulley carried by the carriage, a band passing over said pulley and band-wheel, a band-wheel carried by the same shaft with the pulley, and a strap for transmitting motion from said last-mentioned band-wheel to the sewing-machine on the carriage, substantially as set forth.

482,830. ROLLER-KNIFE FOR TRIMMING WALL-PAPER. DAVID S. MORGAN, Asheville, N. C. Filed June 17, 1891. Serial No. 396,652. (No model.)

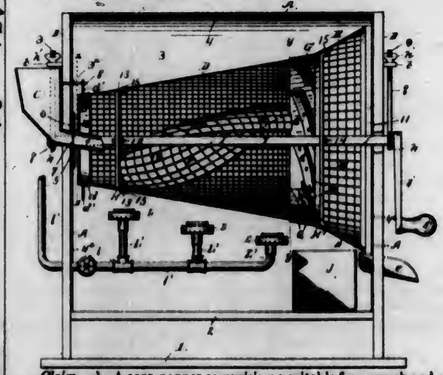


Claim.—1. The improved wall-paper cutter comprising the handle, the head B, perforated to receive the journal-pin, the journal-pin adjustably inserted in the perforation and provided with a head *c*, the circular cutting-blade mounted on said journal-pin between the heads B and *c*, and means for holding the journal-pin in different positions, said blade having a thickened hub and being plane upon one side and concaved from the hub to the periphery upon the opposite side, substantially as described.

2. The improved wall-paper cutter comprising the handle, the head B, having a boss *b*, the journal-pin C, inserted in the head and having a head *c*, and the revolving circular cutting-blade mounted upon the journal-pin, the said handle having a guard integral therewith and extending equally to either side thereof concentric with the blade, whereby the cutter may be used with either hand, substantially as described.

482,831. PENDULUM-SCALE. DAVID OLMSTED, Minneapolis, Minn. Filed Jan. 30, 1892. Serial No. 419,679. (No model.)

Claim.—1. The lever 4, provided near its middle portion with a stud *b* and pivoted at one end to a fixed support and having the other end curved upward, and the straight lever 6, pivotally connected to such curved end of lever 4 and having at or near its free end a weight, in combination with the curved fulcrum-beam 8, fixed transversely in the casing, an index-finger and means for operating it connecting with lever 6, and the platform-rod hung upon stud *b*, substantially as described.



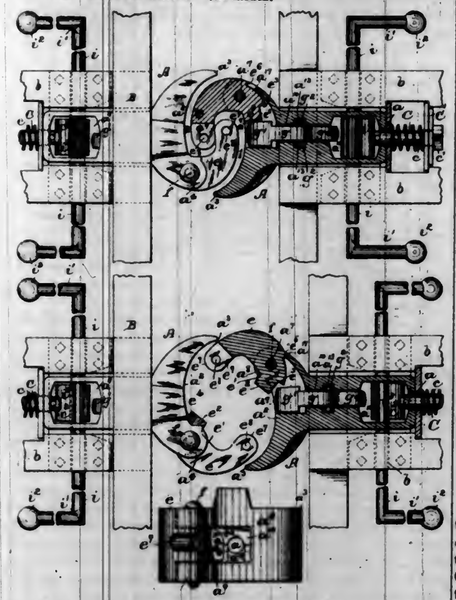
2. The curved lever 4 and the weighted straight lever 6, pivotally connected, as described, in combination with the curved fulcrum-beam 8, supporting-lever 6, said beam having supported thereon a shaft carrying a pulley and index-finger, a guide adjacent to the end of said beam, a cord attached to the end of lever 6 and passing over said guide and pulley, and a weight attached to the free end of the cord, substantially as described.

3. The curved lever 4 and weighted straight lever 6, pivotally connected, as described, in combination with the curved fulcrum-beam 8, the shaft 14, carrying grooved cone-pulley 12, an index-finger 16, supported on said beam 8, pulley 11, and a cord 10, attached to the end of lever 6, passing over pulleys 11 and 12 and having a weight attached to its free end, substantially as described.

4. In combination with lever 6, fulcrumed upon the curved beam 8, a suitably-supported rotary shaft carrying a cone-pulley and index-finger, a guide near the end of beam 8, and the weighted cord attached to the free end of lever 6 and passing over said guide and pulley, substantially as described.

482,832. CORN-POPPER. IDA M. PALMER, Kansas City, Mo. Filed Dec. 28, 1891. Serial No. 416,366. (No model.)

Claim.—1. A corn-popper comprising a suitable framework and a suitable revoluble popping-receptacle, a vibratory feed-hopper mounted upon the framework and carrying an outwardly-extending arm, and a number of projections carried by the popping-receptacle and successively engaging the arm to vibrate the hopper, substantially as set forth.



2. A corn-popper comprising a suitable framework, a suitable revoluble popping-receptacle mounted in said framework, a number of pendent hangers having adjusting-screws at their upper ends, and a shaft for the popping-receptacle, having its bearings in the lower ends of said hangers, substantially as set forth.

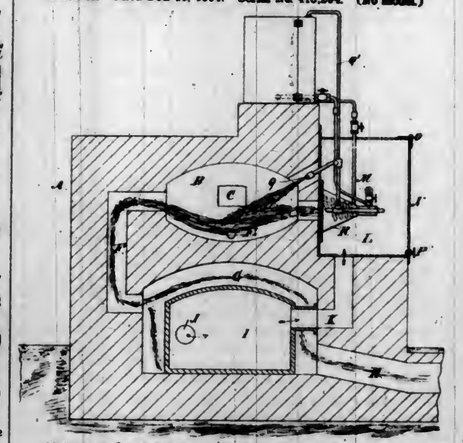
3. A corn-popper comprising a suitable framework having outwardly-extending brackets secured thereto, a suitable revoluble receptacle having a longitudinally-extending shaft, and a pair of pendent hangers having hooked bearings at their lower ends for the said shaft and externally screw-threaded at their upper ends, and a pair of adjusting-nuts surrounding said upper ends of the hangers and resting upon the brackets, substantially as set forth.

4. A corn-popper comprising a suitable revoluble popping-receptacle and a number of elongated guards or cheeks mounted in the discharge end of the receptacle and set obliquely to the longitudinal axis of said receptacle, the said cheeks or guards extending past each other at their adjacent ends and having said ends separate from each other by suitable spaces, substantially as set forth.

5. A corn-popper comprising a suitable revoluble popping-receptacle and a flared foraminous discharge-separator located at the discharge end of the receptacle, substantially as set forth.

482,833. CAR-COUPLING. THOMAS L. RIVERS, Newark, N. J., assignor of one-third to Jonas Thielemann, same place. Filed Apr. 27, 1892. Serial No. 430,866. (No model.)

Claim.—1. In a car-coupling, the combination of a draw-head provided with a longitudinal opening having guiding-surfaces a^{10}, provided with bearings a^{11}, a swinging jaw pivoted to said draw-head, provided at its inner end with a lug, a catch within the draw-head, pivotally and detachably arranged in the bearings therein, adapted to engage the swinging jaw, and means adapted to engage with one end of said pivoted catch to disengage its holding end from said lug on the swinging jaw, substantially as and for the purposes set forth.



2. In a car-coupling, the combination of a draw head provided with a longitudinal opening and slotted horizontally in one side, a pivoted jaw in said slot provided at its inner end with a lug adapted to project from the said opening in the draw-head and provided with a flat side and a cut-away and curved surface on said lug, a catch within the draw-head, pivotally and detachably arranged in bearings a^{10} therein, adapted to engage with said flat side of said jaw, but capable of being lifted from such engagement, and ride on said cut-away and curved surface, substantially as and for the purposes set forth.

3. In a car-coupling, the combination of a draw-head provided with a longitudinal opening and slotted horizontally in one side, a pivoted jaw in said slot provided at its inner end with a lug adapted to project into said opening in the draw-head and provided with a flat side a^9 and a cut-away and curved surface on said lug, a catch within said draw-head, pivotally and detachably arranged in bearings a^{10} therein, having a curved and weighted nose-piece g', adapted to engage with said flat side of the jaw, but capable of being lifted from such engagement, and said curved and cut-away surface being adapted to ride under said curved nose-piece and thereby raise said pivoted catch, substantially as and for the purposes set forth.

4. In a car-coupling, the combination of a draw-head provided with a longitudinal opening having guiding-surfaces a^{10}, provided with bearings a^{11}, a swinging jaw pivoted to said draw-head, provided at its inner end with a lug, a catch within the draw-head, pivotally and detachably arranged in bearings therein, adapted to engage with said swinging jaw, a shaft or rod arranged in bearings beneath said draw-head, a tripper on said rod, and operating-levers on either or both ends of said rod for causing the said tripper to lift the catch and disengage its holding end from the lug on the swinging jaw, substantially as and for the purposes set forth.

5. In a car-coupling, the combination of a draw-head having a U-shaped end, an opening a^9, a chamber a^{12}, provided with bearings a^{10}, an opening a^{11}, and ears a^5 and a^6, a swinging jaw pivoted between said ears, provided with a lug e', a flat side e^9, and a cut-away and curved portion, a catch g, provided with journal-pins pivotally arranged in said bearings in the draw-head, a weighted and curved nose-piece g' and a finger g^4 on said catch, and means adapted to engage with said finger and disengage said nose-piece from the flat surface e^9 on the lug on said swinging jaw, substantially as and for the purposes set forth.

482,834. LIQUID-FUEL FURNACE. GEORGE ROSE, Glasgow, Scotland. Filed Dec. 16, 1891. Serial No. 415,294. (No model.)

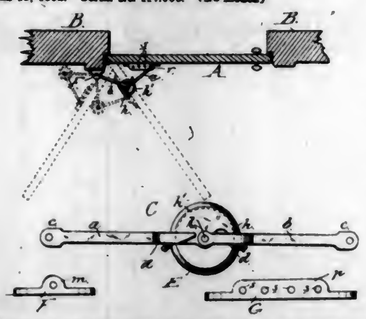
Claim.—1. In combination with a furnace B, a chamber G, through which the products of combustion pass to the stack, a closed chamber L, having a burner therein, and means for supplying air to the burner-chamber, consisting of a chamber I, located in the chamber G and having an air-inlet and an air-supply pipe from the chamber I to the burner-chamber, substantially as described.

2. In combination with the closed burner-chamber L, an air-supply leading thereto, a burner within the chamber, and supply-pipes for the burner, extending into the chamber, an opening in line with the burner, leading to the combustion-chamber, and a second opening from the chamber L to the combustion-chamber, with a steam-pipe located within the same and discharging a jet upon the main flame from the burner after it has entered the furnace, substantially as described.

482,835. WAGON END-GATE. GEORGE B. SHERR, Marengo, Iowa. Filed Dec. 22, 1891. Serial No. 415,900. (No model.)

Claim.—1. An improved wagon end-gate composed of a single piece of sheet metal having integral wings at its sides, an incline at its bottom and provided with means for connecting it with a wagon-box.

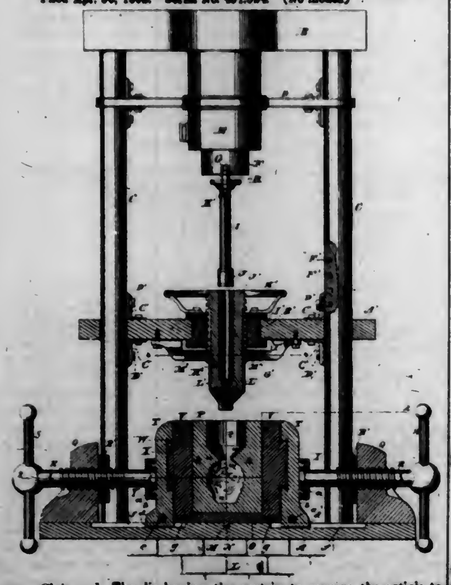
2. An improved wagon end-gate composed of a single piece of sheet metal doubled at its top and bottom edges to increase its strength and provided with means for connecting it with a wagon-box.



3. An improved wagon end-gate composed of a single piece of sheet metal doubled at its top and bottom edges, provided with reinforcing-pieces at its rear, and also with means for connecting it with a wagon-box.

4. An improved locking and supporting device for an end-gate and shoveling-board, comprising a flat metal strip extended around the rear of the end-gate, bent outward and perforated at its ends, a flat metal arm pivoted to each of the said ends, and flat metal arms doubled and adapted to admit the aforesaid arms between their ends and allow them to be pivoted therein and having their free ends formed into loops, a loop fixed to each side of the wagon-box and adapted to admit the said arms to be moved therein and to engage the said loops on the ends of the arms and support the device when used as a shoveling-board, and a hook secured to each side of the wagon-box, adapted

to admit and retain the free ends of the doubled arms and thereby secure the end-gate to the wagon, substantially in the manner set forth, for the purposes stated.



5. An improved wagon end-gate and shoveling-board comprising an end-gate formed of a single piece of metal doubled at its top and bottom, having its bottom edge inclined forward, for the purposes stated, reinforcing-pieces on its rear surface, and the locking and supporting devices, all constructed and combined substantially as set forth in the specification.

482,836. DOOR-CLOSER. ELI M. WYANT, Waterloo, Iowa. Filed Jan. 13, 1892. Serial No. 417,966. (No model.)

Claim.—The combination, in a door-closer, of two pivotally-united arms having forked inner ends, forming an open yoke or frame, the ends of one arm having the curved portions *k*, provided with lugs *h*, adapted to engage the ends of the other arm and form a limiting-stop, and a coiled spring in said yoke or frame having its opposite ends bearing against the arms, a plate adapted to be fixed to the door frame or casing and having one of the arms pivotally secured to it, a plate adapted to be secured to the door and having ears or lugs provided with a series of holes, and a removable bolt connecting the outer end of the other arm with said holes, whereby the tension and power of the spring are regulated, substantially as herein described.

482,837. MEANS FOR ORNAMENTING SHEET-METAL ARTICLES. BERNARD M. ADELL and WILLIE OSTRANDER, New York, N. Y. Filed Apr. 30, 1892. Serial No. 431,324. (No model.)

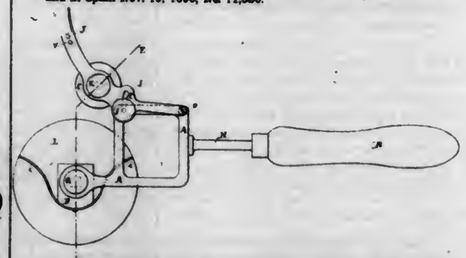
Claim.—1. The die having the matrix to receive the article to be treated, combined with the reciprocating threaded cylinder adapted at its lower end to enter the mouth of said die, the packing at the lower end of said cylinder to form a liquid-tight joint, the internally-threaded revoluble external sleeve engaging said cylinder, means for preventing vertical movement in said sleeve, the guide for preventing revolving motion in said cylinder, and means for exerting pressure upon the liquid within said article, substantially as and for the purposes set forth.

2. The die having the matrix to receive the article to be treated, combined with the reciprocating threaded cylinder adapted at its lower end to enter the mouth of said die, the packing at the lower end of said cylinder to form a liquid-tight joint, the internally-threaded revoluble external sleeve engaging said cylinder, the vertically-adjustable frame supporting said sleeve and preventing vertical movement therein during its rotation, the guide for preventing revolving motion in said cylinder, and means for exerting pressure upon the liquid within the said article, substantially as and for the purposes set forth.

3. The die having the matrix to receive the article to be treated and the inclined mouth leading to said matrix, combined with the hollow cylinder through which hydraulic pressure is applied, the nut on the reduced lower end of said cylinder and conforming to said inclined mouth, and the annular packing held in place by said nut and having the downwardly and inwardly inclined lip to engage the inclined flange on the article to be treated, substantially as and for the purposes set forth.

4. The die having the matrix to receive the article to be treated, combined with the reciprocating threaded cylinder, the nut on the reduced lower end of said cylinder, the packing held in place by said nut and having the annular downwardly-depending lip, the revoluble sleeve engaging said cylinder, the frame supporting said sleeve, the guide for the cylinder, and the plunger adapted to enter said cylinder, substantially as and for the purposes set forth.

5. The die having the matrix to receive the article to be treated, combined with the hollow reciprocating non-revoluble cylinder having packing at its lower end and adapted to engage the article within said die, the plunger in line with and adapted to enter said cylinder, and hydraulic apparatus carrying said plunger, substantially as and for the purposes set forth.



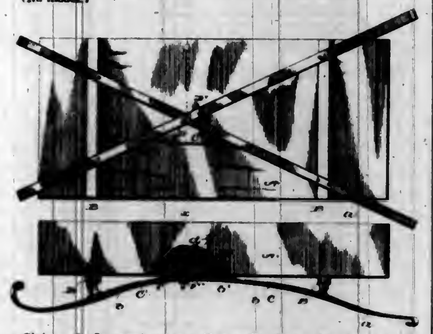
6. The die having the matrix to receive the article to be treated, combined with the adjusting pressure-screws R, in line with the sides of said die, the laterally-adjustable platens V, carried by said screws, the hollow cylinder in line with the said matrix and having packing at its lower end to form a liquid tight joint, and the hydraulic plunger within said cylinder, substantially as and for the purposes set forth.

7. The die to receive the article to be treated, the bed-plate, the screws in line with the sides of the die, the followers on said screws, the platens adjustable on said followers, the cylinder communicating with the interior of said article, and the plunger within said cylinder, substantially as and for the purposes set forth.

8. The die having the matrix to receive the article to be treated, the screws in line with the sides of the die, the followers on said screws, the guides for the followers, the platens on said followers, the cylinder communicating with the interior of said article, and the plunger within said cylinder, substantially as and for the purposes set forth.

9. The die, combined with the adjusting pressure-screws R in line with the sides thereof and mounted in the threaded bearings Q, and the laterally adjustable independent platens V, carried by the said screws and overlapping each other at one end, substantially as and for the purposes set forth.

482,838. CHOPPER. JOSEPH E. AUBAT, Clermont-Ferrand, France. Filed May 20, 1892. Serial No. 433,790. (No model.) Patented in France June 17, 1890, No. 206,354; in Belgium Nov. 10, 1890, No. 92,663, and in Spain Nov. 19, 1890, No. 11,520.



Claim.—1. In combination with a holding-frame, a series of stationary sleeves D, and a series of circular cutters held between the faces of adjacent sleeves and revolving thereon, substantially as described.

2. In combination with a holding frame and a series of revolving cutters, and a series of cleaners interposed between the cutters, said cleaners being supported on a stationary part of the frame at their central portions, with their outer ends free, substantially as described.

3. The combination, with the cutting devices, of a movable sharpening apparatus consisting of frame I and a series of grinders adapted to be put in contact with the cutters L when desired, substantially as specified.

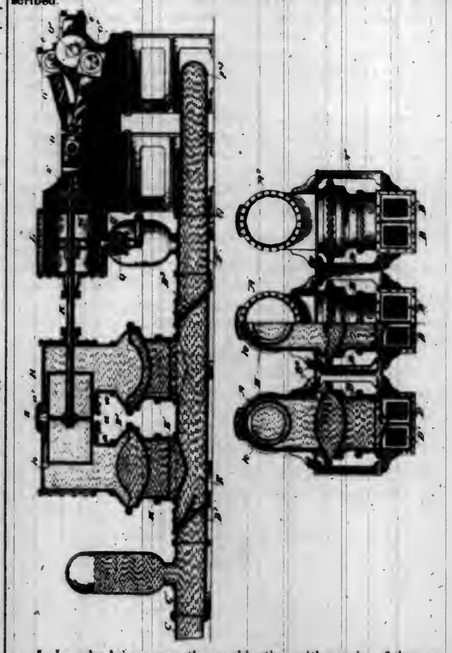
482,839. RUNNING-GEAR FOR VEHICLES. CHARLES M. ELY-DENBURGH, Riverhead, N. Y. Filed Oct. 20, 1891. Serial No. 409,314. (No model.)

Claim.—1. In running-gear, diagonally-disposed springs crossing each other below the body of the vehicle and normally held thereto by a flexible connection, said springs having supplemental plates secured to the main plates upon each side of the point of crossing, but having only a single thickness at the places where they cross, substantially as herein described.

2. In running-gear, diagonally-disposed curved springs consisting of the plates *a*, crossing each other at points near their centers and secured to the body of the vehicle at points between the crossing and outer extremities, said plates having supplemental leaves or plates secured to the main plates upon each side of the point of crossing, thereby leaving but a single thickness of each spring at the place where they cross.

3. In running-gear, the diagonally-disposed springs, each consisting of a main plate having supplemental plates or leaves secured to its surface upon each side of its upper surface between its central portion and ends, thereby leaving said central portion of but a single thickness, said central portion being united and joined to the body of the vehicle by a spring connection.

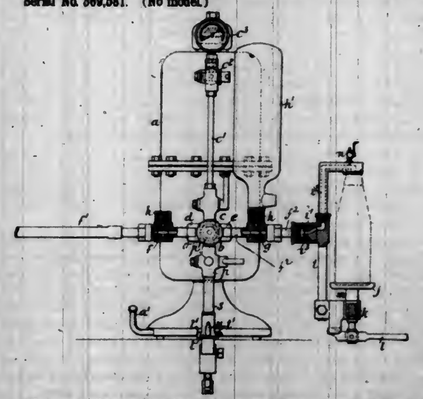
4. In running-gear, the body having the cross-bars, the diagonally-disposed springs secured to said bars and crossing each other near the center of the under side of the body, a bolt or pin passing loosely through said body and the crossed portion of the springs, a nut adjustable upon the threaded end of the bolt or pin, and a spring surrounding the bolt between its opposite ends and the bottom or floor of the body, whereby the crossed portions of the main spring are normally held against said bottom or floor, but yield under the influence of weight upon the body, substantially as herein described.



482,840. STEAM-PUMP. CALEB H. BOOTH, Dubuque, Iowa. Filed Jan. 8, 1892. Serial No. 417,413. (No model.)

Claim.—1. In a steam-actuated dredging-pump, the combination, with valved supply and discharge pipes, of three or more pump-cylinders arranged parallel and divided centrally and having pumping-chambers connected to their under sides at opposite ends, diaphragms in the pumping-chambers, forming closed chambers above, in which a suitable liquid is placed, plungers in the cylinders, exterior packing for the plungers located on the respective sections of the cylinders, and steam-actuated pistons connected directly with the plungers, substantially as described.

2. In a steam-actuated dredging-pump, the combination, with valved supply and discharge pipes, of a series of three or more pump-cylinders divided centrally and arranged parallel and having pumping-chambers at opposite ends, diaphragms secured across the pumping-chambers, plungers in the cylinders above the diaphragms, formed with air-storage compartments communicating with the interior of the cylinders, packing for the plungers, engaging the outer faces thereof and carried by the respective sections of the cylinders, and means for actuating the plungers, substantially as described.



3. In a steam-actuated dredging-pump, the combination, with the inlet and discharge pipes and valves in the pipes, of a horizontally-disposed pump-cylinder having pumping-chambers at opposite ends thereof, diaphragms across the pumping-chambers, and a plunger in the cylinder, having an air-storage compartment communicating with the interior of the cylinder above the diaphragm, substantially as described.

4. In a dredging-pump, the combination, with the suction and discharge pipes, of a pump cylinder having pumping-chambers at opposite ends thereof, flexible diaphragms across the pumping-chambers, a plunger in the cylinder, and an air-storage compartment communicating with the interior thereof above the diaphragm, substantially as described.

5. In a dredging-pump, the combination, with a series of three or more pumping-cylinders, each having pumping-chambers at opposite ends, of diaphragms across the pumping-chambers, valved suction and discharge pipes leading into the chambers below the diaphragms, plungers in the cylinder, air-storage compartments communicating directly with the interior of the cylinders above the diaphragm, steam-cylinders for each pump-cylinder, connections between the pistons thereof and the plungers, a crank-shaft, and pitmen connecting the cranks of the shaft with the steam-pistons, substantially as described.

482,841. APPARATUS FOR THE MANUFACTURE OF AERATED LIQUIDS. LUTHER G. CHINNERY and SWARTZ M. CHINNERY, London, England, assignors to Chinnery & Co., same place. Filed Oct. 26, 1890. Serial No. 369,581. (No model.)

Claim.—1. In combination with a vessel for compressed gas and

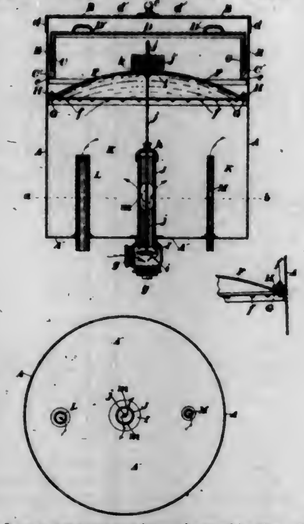
with devices connected thereto for filling bottles, a system of connecting pipes f' f^3 and their connections with the water-reservoir and the gas-reservoir, and a three-way cock in said pipe f^3, controlling the amount of gas to be mixed with the liquid and also the passing of the aerated liquid into the bottle or vessel to be filled, substantially as set forth.

2. In combination with the gas-vessel, the liquid-containing vessel, the pipes f' and f^3, cocks f and g and the device b, having five ways or passages, a separate device connected to each of said passages and a revoluble bottle-filler having the filling-tube i^3, connected with a stationary trunnion on a supply-tube having a passage i^3 therein, and whereby the rotation of the bottle-filler shall close the connection

482,843.

and the attaching-stirrups having pins on their lower sides adapted to said recesses, the openings of which lead laterally from the interior space of the shoe, substantially as described.

2. In combination, the shoe, the two front stirrups, the heel-stirrups, the plate *d*, connected to the front stirrups, and the straining-band *c*, passing around the hoof and the plate *d* and secured at its ends to the heel-stirrups, the said plate *d* being curved and extending from one front stirrup *b* to the other, substantially as described.



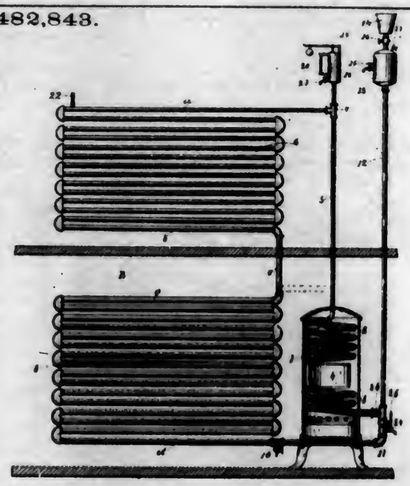
to them, of a plow-beam provided with a bar at its lower end, said bar being pivotally connected to the said bracket, and a bolt pivoted at one end to the mold board and having its other end adjustably connected with the plow-beam above the said bar, substantially as set forth.

with devices connected thereto for filling bottles, a system of connecting pipes f' f^3 and their connections with the water-reservoir and the gas-reservoir, and a three-way cock in said pipe f^3, controlling the amount of gas to be mixed with the liquid and also the passing of the aerated liquid into the bottle or vessel to be filled, substantially as set forth.

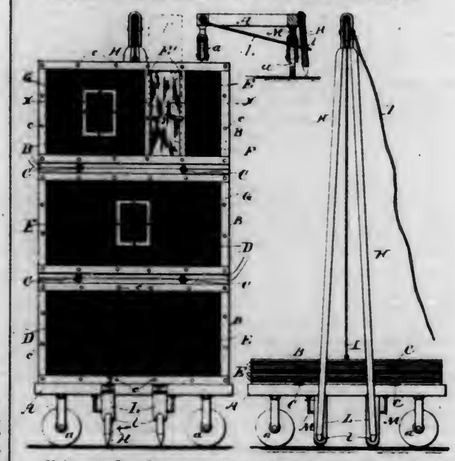
2. In combination with the gas-vessel, the liquid-containing vessel, the pipes f' and f^3, cocks f and g and the device b, having five ways or passages, a separate device connected to each of said passages and a revolvable bottle-filler having the filling-tube i^2, connected with a stationary trunnion on a supply-tube having a passage i^3 therein, and whereby the rotation of the bottle-filler shall close the connection between said passage and tube, substantially as and for the purposes set forth.

3. The combination, in a liquid-aerating apparatus, of a three-way cock for admitting to a mixing-vessel the liquid to be aerated, another three-way cock for admitting gas to the same vessel and for discharging the liquid after its aeration, and an intermediate five-way connection between said cocks communicating with them and also with the reservoir a and with the water-gage, as and for the purposes set forth.

482,842. PRESSURE-REGULATOR. GEORGE HARRIS, Chicago, Ill. Filed Mar. 21, 1891. Serial No. 385,912. (No model.)



Claim.—In a gas-pressure regulator, the combination, with a casing provided with a cover and having an inlet-pipe provided with a valve-seat and outlet-opening, of two rings secured to the interior thereof, the upper one of which is smaller in diameter than the casing and has its bottom turned outwardly and secured to the casing and forms with said casing an annular space for the reception of a liquid and the lower ring is provided with bolt-holes, a cylindrical closed top cover within the upper ring, a loose ring provided with bolt-holes to correspond with the holes of the lower ring, a flexible diaphragm between the two perforated rings, bolts through the perforated rings, for securing the diaphragm and the rings together, and a rod secured to the diaphragm having a valve at its lower end and weights upon its upper end on top of the diaphragm, substantially as set forth.



482,843. APPARATUS FOR PURIFYING AND AGING LIQUORS. CHRISTIAN HEINTZ, Buffalo, N. Y. Filed June 7, 1892. Serial No. 435,797. (No model.)

Claim.—In an apparatus for aging and purifying liquors, the combination of a substantially continuous vertically-arranged pipe a portion of which is formed into a coil, a stove surrounding the coiled portion of the pipe, a vertical filling-pipe communicating with said pipe at the lower end of the coil outside of the stove, a filling-vessel at the top of the vertical pipe provided with suitable cocks, and three cocks in the continuous pipe below the coil, two of which are liquid and air outlets, respectively, and the other one a stop-cock, the stop-cock being located between the air-outlet and the union between the vertical pipe and lower end of the coil and a thermometer and a safety-valve connected with the continuous pipe, substantially as set forth.

482,848.

482,844. FIRE-SHIELD. WILLIAM M. HERRINGTON, Wellsborough, Pa. Filed Feb. 9, 1892. Serial No. 420,902. (No model.)

Claim.—1. In a fire-shield, the combination, with the truck and its frame, of a series of frames containing fireproof material, two sheets of wire-netting surrounding the said material, the chain-hinges for connecting the frames together and to the truck-frame, the derrick, the pivoted arms wherein the derrick rests, and means for operating the said frames, substantially as and for the purpose set forth.

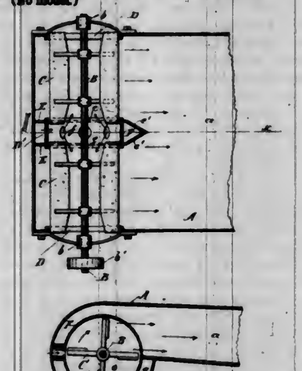
2. In a fire-shield, the combination, with the truck-frame, the arms pivoted thereto, and the derrick adapted to rest in apertures in the said arms, of a series of frames connected together and to the truck-frame, the fireproof material and netting surrounding the same, the grooved bars dividing the said material of one of the frames so as to leave an opening, and the fireproof-door adapted to slide in the grooves of the said bars over the opening, substantially as and for the purpose set forth.

3. In a portable fire-shield, the combination, with the truck, the truck-frame, and a series of frames containing fire-proof material and a wire-netting, of the fireproof-door F, the springs f, and the grooved bars in which the said door is operated, substantially as and for the purpose set forth.

482,845. HORSESHOE. WLADIMIR KONDAKOFF, Gatchina, near St. Petersburg, Russia. Filed Apr. 12, 1892. Serial No. 428,908. (No model.)

Claim.—1. In combination, the shoe having the dovetailed recesses e extending from the inner edge and closed on the outer edge

and the attaching-stirrups having pins on their lower sides adapted to said recesses, the openings of which lead laterally from the interior space of the shoe, substantially as described.



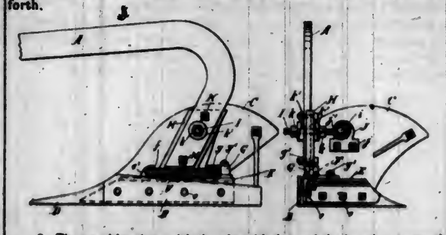
2. In combination, the shoe, the two front stirrups, the heel-stirrups, the plate d, connected to the front stirrups, and the straining-band c, passing around the hoof and the plate d and secured at its ends to the heel-stirrups, the said plate d being curved and extending from one front stirrup b to the other, substantially as described.

3. In combination, the shoe, the heel-stirrups a, one of which has a lug h at or near its free end and a second lug i in the rear of the same, the straining-band c, having a lug i' at its free end and arranged to lie adjacent to the lug i on the heel-stirrup, said band having, also, a perforation y in the rear of its lug i', adapted to lie over and permit the lug h to project through it when the lugs i and i' are brought adjacent to each other, and the means for holding the front of the shoe, substantially as described.

4. In combination, the shoe, the front and heel stirrups, the ribbed plate d, connected to the front stirrups, and the straining-band c, passing around the ribbed plate and secured to the heel-stirrups, substantially as described.

482,846. FAN AND REGULATOR FOR THRASHING-MACHINES. FRANK P. LANDIS, Waynesborough, Pa. Filed Apr. 2, 1892. Serial No. 427,520. (No model.)

Claim.—1. The combination, with the sections of the fan secured upon the fan-shaft, of a fan-casing provided with an outlet common to the said sections and inlets at the ends of the fan and between its sections and a perforated ring supported in the casing and arranged between the said fan-sections, substantially as set forth.

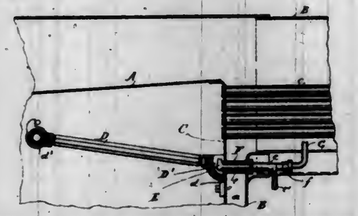


2. The combination, with the sections of the fan secured upon the fan-shaft, of a fan-casing provided with an outlet common to the said sections and inlets at the ends of the fan and between its sections, a ring provided with holes, and short pipes supporting the said ring in the casing and connecting the holes in the ring with the said inlets in the casing between the sections, substantially as set forth.

3. The combination, with the sections of the fan secured upon the fan-shaft, of a fan-casing provided with a single outlet common to the said sections and a ring encircling the adjacent ends of the fan-blades of each two sections, said ring being provided with holes between the sections for the admission of air, substantially as set forth.

482,847. PLOW. FRANK P. LANDIS, Waynesborough, Pa. Filed May 26, 1892. Serial No. 434,736. (No model.)

Claim.—1. The combination, with the plow-blades and the bracket secured to them, of a plow-beam provided with a bar at its lower end, one end of the said bar being hemispherical and pivoted in a lug at the front end of the said bracket, and the laterally-adjustable clip provided with fastening-bolts passing through slots in the rear end of said bracket and engaging with the rear end of the said bar, substantially as set forth.



2. The combination, with the plow-blades and the bracket secured to them, of a plow-beam provided with a bar at its lower end, said bar being pivotally connected to the said bracket, and a bolt pivoted at one end to the mold board and having its other end adjustably connected with the plow-beam above the said bar, substantially as set forth.

3. The combination, with the plow-blades and the bracket secured to them, of a plow-beam provided with a bar at its lower end, said bar being pivotally connected to the said bracket, a screw-threaded bolt passing through the plow-beam and provided with a spherical head, a socket pivotally connecting the said head with the mold-board, and a nut and a pair of wedge-shaped washers on the said bolt at each side of the plow-beam, substantially as set forth.

4. The combination, with the plow-blades and the bracket secured to them and provided with a lug at its front end, of the plow-beam provided with a bar at its lower end and having a hemispherical end pivoted in the said lug, a laterally-adjustable clip engaging with the other end of the said bar and secured to the said bracket, and a bolt provided with a spherical head pivoted to the mold-board and having its other end adjustably connected with the plow-beam above the said bar, substantially as set forth.

482,848. STEAM-BOILER ATTACHMENT. FRANK P. LANDIS, Waynesborough, Pa. Filed May 26, 1892. Serial No. 434,737. (No model.)

Claim.—1. In a boiler, the combination, with the outer shell, the fire-box provided with a tube-plate, and a series of tubes, of a water-tight tube passing through the shell and the tube-plate, a pipe passing through the said tube and provided with a nozzle inside the fire-box and having a handle for oscillating it outside the boiler, and a pipe provided with a valve and operatively connected with the aforesaid pipe and with the interior of the boiler, whereby a jet of steam may be directed across the ends of all the tubes, substantially as set forth.

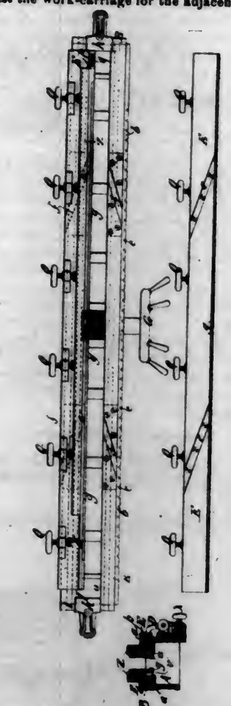
2. The combination, with a boiler provided with a series of horizontally-arranged fire-tubes, of a steam-nozzle arranged crosswise of the ends of the tubes inside the fire-box and means for oscillating said nozzle, whereby the steam may be directed across all the tubes, substantially as set forth.

3. The combination, with a boiler provided with a series of horizontally arranged tubes and a support for the baffle-plate, secured to the tube-plate below the tubes and having a recess D', of a steam-nozzle arranged in the said recess and directed crosswise of the ends of the tubes, whereby the steam may be directed across the tubes and the nozzle preserved from direct contact with the flame, substantially as set forth.

482,849. BLIND-STILE-MORTISING MACHINE. PIERRE H. LARCHER, Paris, France. Filed June 28, 1892. Serial No. 438,327. (No model.) Patented in France Feb. 2, 1891, No. 211,112; in Belgium June 12, 1891, No. 95,243; in England June 12, 1891, No. 10,008; in Germany June 15, 1891, No. 61,351; in Sweden June 17, 1891, No. 3,521; in Switzerland June 23, 1891, No. 3,631; in Italy June 25, 1891, No. 29,942; in Norway June 29, 1891, No. 3,236; in Turkey July 2, 1891, No. 233; in Tunis July 13, 1891, No. 36; in Spain July 20, 1891, No. 13,226, and in Austria-Hungary Oct. 10, 1891, No. 26,896 and No. 60,918.

Claim.—1. In a machine for mortising blind-stiles, the framework and the cutting-tool, in combination with a spacing-carriage movable

longitudinally intermittently to space the mortises, and a work-carriage for carrying the stile before the tool movably carried by said spacing-carriage, said carriages constructed with interengaging guideways adapted to permit the oblique movement of the work-carriage relatively to the other, stops for limiting such movement, a catch for locking the spacing-carriage in its respective positions, and means for moving said work-carriage whereby the latter can move obliquely before the tool to cut one mortise, and then the spacing-carriage can be shifted to adjust the work-carriage for the adjacent mortise.



framework and the mortising-tool, in combination with a spacing-carriage, as B, having a graduated rack, as b, of two work-carriages, as E E, for carrying the stiles before the mortising-tools, said spacing-carriage constructed with oblique guideways f f, the one for one work-carriage and the other for the other, and the one extending obliquely at one inclination and the other at a reverse inclination, and said work-carriages constructed with guideways, as e e, adapted to engage said guideways on said spacing carriage, whereby said work-carriages can move obliquely relatively to said spacing carriage and when so moved will alternately approach and recede from each other, said work-car-

joint and having an entrance for the bobbin at its face, for the purpose set forth.

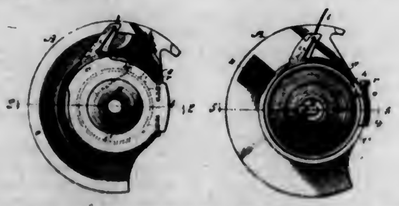
3. In combination with a rotary shuttle and a disk bobbin, a non-rotary bobbin-case within said shuttle permanently attached thereto by a swivel-joint, having an arm and a tension device attached to its periphery and provided with self-threading thread-guides, including a radial hole opposite the space between the bobbin-disks, and a slit extending to said hole from an opening in the outer edge of the bobbin-case, substantially as herein specified.

482,858. ORE-SEPARATOR. HORACE H. TAYLOR, San Francisco, Cal., assignor of one-half to Robert Pollard, same place. Filed Apr. 26, 1892. Serial No. 430,698. (No model.)

longitudinally intermittently to space the mortises, and a work-carriage for carrying the stile before the tool movably carried by said spacing-carriage, said carriages constructed with interengaging guideways adapted to permit the oblique movement of the work-carriage relatively to the other, stops for limiting such movement, a catch for locking the spacing-carriage in its respective positions, and means for moving said work-carriage whereby the latter can move obliquely before the tool to cut one mortise, and then the spacing-carriage can be shifted to adjust the work-carriage for the adjacent mortise.

2. In a machine for mortising blind-stiles and other similar uses, the framework and the cutting-tool, in combination with a spacing-carriage, as B, movable longitudinally intermittently to space the mortises, a work-carriage, as E, for carrying the stile before the tool carried movably by said spacing-carriage, interengaging guideways, as *f f*, on said carriages adapted to permit the oblique movement of the work-carriage relatively to the other stops, as *h h'*, for limiting such movement, said work-carriage constructed with a cog-rack, as *g*, pinion F, meshing with the latter for driving said work-carriage, and a catch between said spacing-carriage and said frame-work for locking the former in its respective positions, and consisting of a pawl on the one part and a graduated rack on the other part, whereby while said spacing-carriage is locked by said catch said work-carriage may be moved obliquely by said pinion to cut the mortise, and by adjusting said spacing-carriage the several mortises to be cut can be spaced, substantially as and for the purpose set forth.

3. In a machine for mortising blind-stiles and other similar uses, the framework and a pair of cutting-tools, in combination with a spacing-carriage movable longitudinally intermittently to space the mortises, and a pair of work-carriages for carrying the stiles before the tools movably carried by said spacing-carriage, the latter constructed with oppositely-inclined guideways, corresponding guideways provided on said work-carriages and adapted those of the one to engage one set of guideways on said spacing-carriage and those of the other the oppositely-inclined set thereon, whereby said work-carriages when moved relatively to said spacing-carriage travel obliquely relatively thereto, the one at one inclination and the other at a reverse inclination, stops for limiting said movements of said work-carriages relatively to said spacing-carriage, a catch for locking the latter in its respective positions, and means for simultaneously moving said work-carriages, whereby the opposing stiles of a blind can be carried, the one by each work-carriage, and be then simultaneously mortised to produce the opposite mortises for the one slat of a blind, substantially as set forth.



4. In a machine for mortising blind-stiles and for similar uses, the framework and the mortising-tool, in combination with a spacing-carriage, as B, having a graduated rack, as *b*, of two work-carriages, as E E, for carrying the stiles before the mortising-tools, said spacing-carriage constructed with oblique guideways *f f*, the one for one work-carriage and the other for the other, and the one extending obliquely at one inclination and the other at a reverse inclination, and said work-carriages constructed with guideways, as *e e*, adapted to engage said guideways on said spacing carriage, whereby said work-carriages can move obliquely relatively to said spacing carriage and when so moved will alternately approach and recede from each other, said work-carriages having cog racks, as *g g*, a pinion F, engaging the latter for driving said work-carriages simultaneously, means for locking said spacing-carriage in its respective positions, whereby when so locked the work-carriages can be moved to cut the mortises, and means for locking the work-carriages to the spacing carriage, whereby the latter can be moved through the work-carriages to adjust its position, substantially as and for the purpose set forth.

5. In a machine for mortising blind-stiles and for similar uses, the framework, and the mortising tools, in combination with a spacing-carriage B, having a central recess *u* and reverse inclined guideways, as *f f*, two work-carriages E E for carrying the stiles to be mortised having guideways, as *e e*, engaging those of said spacing-carriage constructed with cog-racks *g g* on their inner sides depending from said recess in the spacing-carriage, said guideways constructed to permit oblique movement of said work-carriages relatively to said spacing-carriage, the one at one inclination and the other at a reversed inclination, whereby when reciprocated said work-carriages approach and recede from each other, and a long pinion F beneath said spacing-carriage and meshing with said cog-racks for simultaneously driving said work-carriages, substantially as and for the purpose set forth, whereby as said work-carriages approach and recede from each other in operation their cog-racks traverse said pinion and said recess *u*.

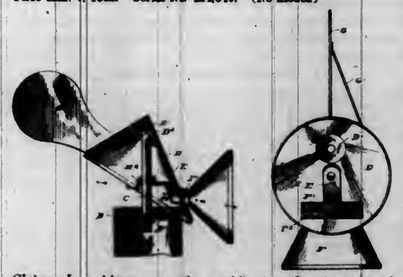
6. A machine for mortising blind-stiles and for similar uses, the framework and the mortising-tools, in combination with a spacing-carriage B, two work-carriages E E, movable obliquely thereon, means for driving said work-carriages, and adjustable stops, as *h h'*, for limiting the movement of said work-carriages relatively to said spacing-carriage, said stops constructed when said work-carriages contact with either of them to lock said work carriages to said spacing-carriage and thereby permit the movement of the latter by the continued action of the driving means for said work-carriages, substantially as and for the purpose set forth.

7. In a machine for mortising blind-stiles, the frame A and a pair of cutting-tools *k k*, adjustably mounted to be movable toward the work for cutting the mortises, in combination with the spacing-carriage B, carried on said frame, movable intermittently, constructed with opposed oblique guideways and having a graduated rack, as *b*, a pair of work-carriages E E, adapted to carry the two stiles of a blind having guideways engaging, respectively, those of said spacing-carriage and adapted to cause the work-carriages to simultaneously move in reversed angles, means for simultaneously moving said work-carriages, means for manipulating said tools, and the catch D on said frame and engaging said graduated rack for locking said spacing-carriage in its respective positions, substantially as and for the purpose set forth.

482,850. SHUTTLE FOR SEWING-MACHINES. ARTHUR M. LESLIE, Chicago, Ill. Filed July 19, 1886. Serial No. 208,486. (No model.)

Claim.—1. In combination with a disk bobbin, a rotary shuttle having an inner edge concentric with its center of rotation, and a non-rotary bobbin-case in two parts united to form a peripheral groove, within which said inner edge of the shuttle revolves, such case having a bobbin entrance and a suitable bobbin-retainer at its outer face, whereby the bobbin-case is permanently attached to the shuttle by a swivel-joint, the bobbin is completely isolated from the shuttle, and removing and replacing the bobbin alone are provided for, substantially as hereinbefore specified.

2. The combination, substantially as herein specified, of an annular rotary shuttle having its bore concentric with its axis of motion and a bobbin-case permanently attached within said bore by a swivel-joint and having an entrance for the bobbin at its face, for the purpose set forth.



3. In combination with a rotary shuttle and a disk bobbin, a non-rotary bobbin-case within said shuttle permanently attached thereto by a swivel-joint, having an arm and a tension device attached to its periphery and provided with self-threading thread-guides, including a radial hole opposite the space between the bobbin-disks, and a slit extending to said hole from an opening in the outer edge of the bobbin-case, substantially as herein specified.

4. In combination with a rotary shuttle and a disk bobbin, a cylindrical non-rotary bobbin-case having a radial threading-hole and a peripheral arm furnished with thread-guides, a tension-spring attached at one end to the periphery of the case, and a regulating-screw which is vertical in the working position of the parts, engaging said spring, substantially as herein specified.

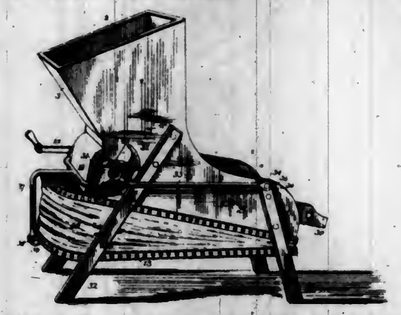
5. In combination with an annular rotary shuttle and a disk bobbin, a non-rotary bobbin-case within said shuttle permanently attached thereto by a swivel-joint and having an annular back-bearing for the bobbin in the form of a beveled inner flange, and an annular bobbin-retaining cap attached to the outer edge of said case by a hinge and correspondingly beveled, substantially as herein specified.

6. In combination with a non-rotary bobbin-case, a rotary shuttle having a body of dish shape, with its convex back permanently united by a swivel-joint with said case at the back of the latter, its peripheral edge central with reference to the face and back of the combined shuttle and case, and its concave face provided with an inclined loop-spreader extending from said peripheral edge to the face of the case for passing the needle-loops over the latter, substantially as herein specified.

482,851. CHIMNEY-CAP. WILLIAM A. PEARCE, Houghton, Mich. Filed Mar. 7, 1892. Serial No. 424,049. (No model.)

Claim.—In a chimney-cap, the combination of a tube or pipe having a rod extending vertically therefrom, a conical cap having an eccentric apex and mounted over said tube or pipe and rotatably supported by said rod and having the apex thereof nearer one side than the other to provide an oblique arrangement and a depending elongated sloping side, which projects over and below a portion of the said tube or pipe, said cap having a vane in connection with the upper shorter side thereof, and an elongated tubular neck of substantially rectangular form extending through the depending portion of the cap at an oblique angle to the top portion of the tube or pipe and having an elongated flaring funnel secured to the outer end thereof, whose lower edge depends below the lowermost portion of the cap to prevent passage of air under the edge of said cap, substantially as described.

482,852. BOOMERANG. CALVIN G. STEVENS, Watertown, N. Y. Filed May 4, 1891. Serial No. 391,587. (No model.)



Claim.—1. A toy missile having a bent body provided with a flat lower face and a slightly-convexed upper face with beveled edges, said faces being unbroken.

2. A toy missile comprising a bent body having a flattened lower face and convex upper face, and provided with vibrating strings secured to the arms.

3. A toy missile having a hollow bent body and beveled edges, the outer faces of said body being provided with perforations.

482,853. ORE-SEPARATOR. HORACE H. TAYLOR, San Francisco, Cal., assignor of one-half to Robert Pollard, same place. Filed Apr. 26, 1892. Serial No. 430,698. (No model.)

Claim.—1. In a separator of the class described, the combination, with the framework, the bellows, the superimposed hopper, the cut-off located between the discharge of the hopper and the bellows, an air-blast leading from the bellows, and the shaft for supporting the same to a point below the cut-off, of a riffle-frame located in front of the cut-off, a lever pivoted to the frame, connected with the bellows, and resting upon the cut-off-supporting shaft, and a cam on the shaft for raising and lowering the lever as said shaft rotates, substantially as specified.

2. In a separator of the class described, the combination, with the framework, the bellows, the air-blast leading therefrom, and the superimposed hopper, of the riffle-frame located under the hopper and in front of the blast, the transverse cut-off shaft, cams mounted thereon, a bail having a lateral offset extending in the path of the cams and having its front end pivoted to the framework, and connections between the lower movable member of the bellows and the bail, substantially as specified.

3. In a separator of the class described, the combination, with the framework, the bellows having its upper immovable member secured rigidly to the frame and provided with a perforation, a transverse bar mounted on the bellows and having a cavity communicating with the perforation and terminating in a discharge orifice or passage, and an upwardly-opening valve mounted in the cavity over the perforation, of means for operating the bellows, a superimposed hopper, a cut-off for the same, means for operating the cut-off, and a riffle-frame located in front of the cut-off and air-blast, substantially as specified.

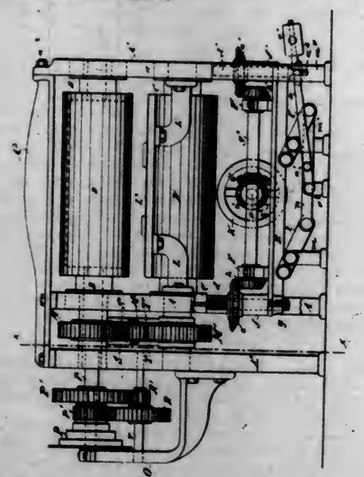
4. In a separator of the class described, the combination, with the opposite sides 1, having the supporting-legs, the hopper in the upper end of the same, and the bellows at the lower end of the frame and having its upper immovable member connected rigidly therewith, of the transverse cut-off shaft located between the bellows and hopper and having the rearwardly-curved cam-fingers 31 on the opposite ends of the same, the cut-off mounted on the shaft, the riffle-frame located under the cut-off, the U-shaped bail 33, embracing the side walls of the separator and pivoted at its front end to the opposite sides of the frame, the terminals 34 of said bail being upwardly bent, as at 40, to take over the shaft 7 and laterally bent, as at 41, and projecting into the path of the cam-fingers, said bail being further provided with the bent arm 37, and the bracket 39, pivoted, as at 38, to the lower end of the arm and at its inner end connected to the lower or movable member of the bellows, substantially as specified.

482,854. PHOTOGRAPHIC SHUTTER. JOHN K. THORNTON, Manchester, England, assignor of one-half to Edgar Pickard, same place. Filed Nov. 3, 1890. Serial No. 370,908. (No model.) Patented in England Sept. 27, 1886, No. 12,236.

Claim.—1. In a photographic shutter constructed with a spring-driven blind mounted upon a roller *a*, the combination, with a rotating disk D, geared to a pinion C and provided with a projecting stud *d*, of the movable adjustable stop-lever E, provided with the detent or stop *e* to engage with the said stud, substantially as and for the purposes described.

2. In a photographic shutter having a spring-driven blind, the combination, with the rotating disk D, carrying projecting pins or studs *c*, *c'*, and *d*, of the detent-lever E, provided with the detent *e*, which engages with the said studs, substantially as described.

3. In a photographic shutter, the combination, with the spring-driven blind A, winding-roller *a*, and pinion C, of the toothed disk having the projecting pin or stud *d*, the detent-lever E, having the detent or stop *e*, which engages with the projecting pin, and the pneumatic bulb F and bail G, by which the detent-lever is moved, substantially as described.



482,854.

4. In a photographic shutter, the combination, with the spring-driven blind A, winding-roller *a*, carrier-pinion C, and toothed disk D, having studs *c d d* upon its face, of the adjustable detent-lever E, with detent *e*, which engages with the said studs and the pneumatic bulb F and ball G substantially as described.

5. The combination of the spring-driven blind A, having aperture A', mounted in the case B on a spring-roller *a'* and winding-roller *a*, the pinion C, affixed to the end of the winding-roller, the toothed disk D, carrying studs *c d d*, the adjustable lever E, carrying detent *e*, which engages with the studs on the disk D and arrests the progress of the blind, and the pneumatic bulb F, operated by the ball G, which moves the detent-lever E to release the studs on the disk D, substantially as and for the purposes described.

482,855. MACHINE FOR DECORATING WOOD. ABRAM TILTON, Brooklyn, and AUGUST HORNEL, New York, N. Y. Filed Oct. 29, 1891. Serial No. 410,275. (No model.)

Claim.—1. In a machine for ornamenting wood and other surfaces, the combination of a standard divided in halves, which are pivoted to the base of the standard, with roller-bearings also divided in halves and attached to the respective halves of the standard, and an angle-piece of the upper cross-bar of the machine, by which angle-piece the halves of the standard and of the roller-bearings are held together, substantially as set forth.

2. In a machine for ornamenting wood and other surfaces, the combination of the adjustable rail E, having on its ends supporting-rods for the adjustable bearings of the feed-roller, with the lever-arms *l l'*, the connecting-rod *n*, connecting the said lever-arms with each other, and the weighted lever *o*, fulcrumed to the connecting-rod, substantially as set forth.

3. In a machine for ornamenting wood and other surfaces, the combination of pulley P, having pinion *p'* on shaft *p*, with gear-wheel R and pinion R' on shaft *r*, gear-wheel P' and pinion N on shaft *p*, gear-wheel M^2, links S S', attached to shaft *p* and the shaft of said gear-wheel, links T T', attached to shaft of feed-mill D' and the shaft of gear-wheel M^3, and gear-wheels M and M' of the rollers D and D', respectively, substantially as and for the purpose set forth.

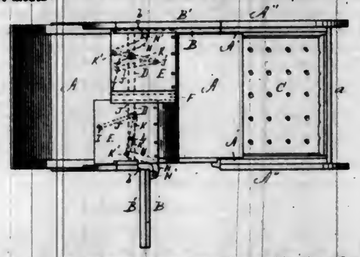
482,856. BICYCLE. ALFRED TREMBLAY, Holyoke, Mass. Filed Feb. 10, 1892. Serial No. 420,946. (No model.)

Claim.—1. In a system of leverage for imparting a rapid rotary movement to bicycles and other vehicles propelled by manual force, the combination of the levers 4 and 5, connecting-rods 7, 8, and 9, with the pitman-levers 6, pitmen 10, and arms 1 and 2, having central bearings, substantially as described.

2. In a manually-operated vehicle, the pedal 12, cranks 11, and pitmen 10, in combination with levers 4, 5, and 6, arms 1 and 2, and the connecting-rods 7, 8, and 9, substantially as described, and for the purpose specified.

3. In a manually-operated vehicle, levers 4 5 6, pitmen 10, cranks 11, pedals 12, with the drums 13 and connecting mechanism, substantially as described.

482,857. SHEARS. THOMAS M. UNDERWOOD, Baldwyn, Miss., assignor of one-half to John Rowan, same place. Filed June 29, 1892. Serial No. 438,438. (No model.)

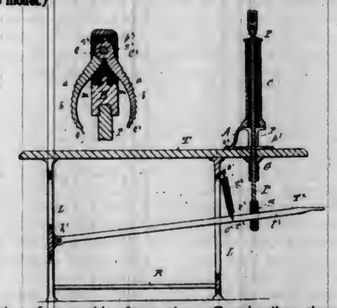


Claim.—1. In a barber's appliance, the combination, with the pivoted members of a pair of shears, of a screw-threaded pivot rod therefor, adjusting-nuts for said pivot-rod, an expansion-spring interposed between one of said members and an adjusting-nut, and a comb having one extremity held on the pivot-rod between the spring and adjusting-nut, substantially as specified.

2. In a barber's appliance, the combination, with the pivoted members of a pair of shears, of a screw-threaded pivot-rod therefor, adjusting-nuts for said pivot-rod on both sides of the shears, an expansion-spring interposed between one of said members and the adjacent nut, a comb having its rear extremity held on the pivot-rod between the said spring and nut, and a spring-clip provided with spaced vertical perforations on the forward extremity of the comb, substantially as specified.

3. In a barber's appliance, the combination, with the shears and its pivot-rod, of a comb having a plate provided with a plurality of perforations secured to its rear extremity, a spring between the shears and the said plate, and an adjusting-nut controlling the tension of said spring, substantially as specified.

482,858. TWO-SEATED CARRIAGE. FRANCIS H. VANIER and OVILA VANIER, Amesbury, Mass. Filed June 21, 1892. Serial No. 437,496. (No model.)

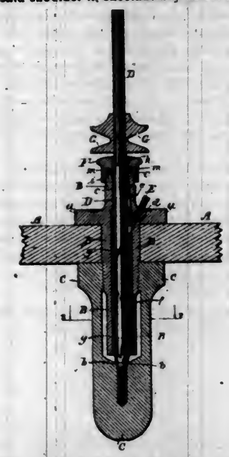


Claim.—1. In a two-seated carriage, the combination of a horizontally-sliding front seat, a door swinging in the side of the carriage-body, and connecting mechanism intermediate with said seat and door, whereby the opening of the door slides the said front seat forward and the closing of the door slides it rearward, substantially as described.

2. In a two-seated carriage, the combination of the horizontally-sliding front seat E, swinging door B, lever K, pivotally secured to the carriage-body, link J, pivotally secured at its opposite ends to the lever K and the seat, and link N, pivotally secured at its opposite ends to the lever K and the door, substantially as set forth.

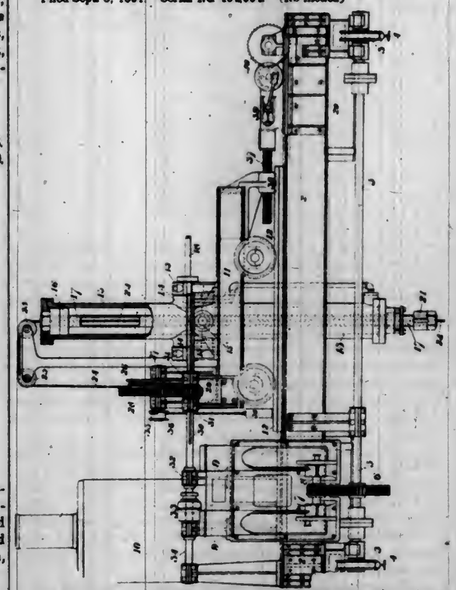
3. In a two-seated carriage, the combination of the central partition or upright H, provided with the longitudinally-placed bar F, grooved at F' on its opposite sides, the sides A', provided with the grooves *e*, the sliding front seat E, whose edges rest in said grooves, the swinging door B, and mechanism connecting said door and seat, whereby the opening and closing of the door slides the front seat forward and back, respectively, substantially as described.

482,859. MACHINE FOR TURNING COLLARS AND CUFFS. JAMES H. YOUNG, Troy, N. Y. Filed Jan. 4, 1892. Serial No. 416,930. (No model.)



Claim.—In a machine for turning cuffs and collars, the combination of a cylinder C, a reciprocative rod P, arranged within the cylinder and carrying a head H, the clutch-arms hinged to the head and formed with serrations on their outer edges, and a treadle connected to the lower end of the reciprocative rod to operate the rod and clutch, substantially as described.

482,860. SUPPORT FOR SPINNING-SPINDLES. JAMES BLAIR, Worcester, Mass. Filed July 27, 1891. Serial No. 400,780. (No model.)



Brief.—The invention resides in the particular construction of the bolster-bearing in combination with the removable cap covering the same.

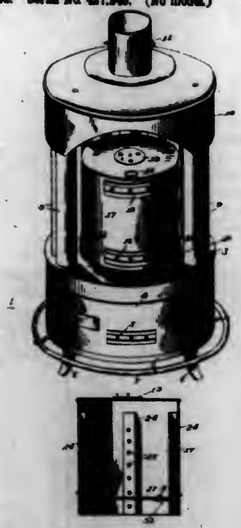
Claim.—1. The bolster-case B, having an internal bore and a reduced bearing *c* at its upper end, and the spindle D, extending through the internal bore of said bolster-case and turning in said bearing *c*, said spindle having a reduced portion forming a shoulder A at the bearing *c*, in combination with a cap F, removably secured to the upper end of the bolster-case and embracing the reduced portion of the spindle above said shoulder A, substantially as set forth.

2. The bolster case B, having bearing *c* and an annular recess with shoulder *i* at its upper end, and a spindle D, turning in said bearing *c*, in combination with a cap F, screwing onto the exterior of said bolster-case and embracing said spindle, said cap F having a downwardly-extending annular flange *m*, entering said recess and seating on said shoulder *i* substantially as set forth.

482,861. MILL APPLIANCE. JAMES A. BURNS, Homestead, Pa. Filed Sept. 3, 1891. Serial No. 404,664. (No model.)

Claim.—1. The combination, with a tongs-lifter having attachments for the tongs, of a flexible connection also connected with the tongs at a different point, a drum and weight by which the slack of the connection is taken up, and a motor connected with the drum and adapted to supply thereto power in addition to the power afforded by the weight, substantially as and for the purposes described.

2. The combination, with a tongs-lifter having attachments for the tongs, of a flexible connection also connected with the tongs at a different point, a drum and weight by which the slack of the connection is taken up, a motor connected with the drum and adapted to supply thereto power in addition to the power afforded by the weight, and a



clutch adapted to connect and disconnect the motor and drum, substantially as and for the purposes described.

3. The combination of a lifting-cylinder having a hollow piston-rod, a cord which passes through said piston-rod, a drum and weight by which the slack of the cord is taken up, and means for rotating the drum, substantially as and for the purposes described.

4. The combination of a lifting-cylinder having a hollow piston-rod, a cord which passes through said piston-rod, a drum and weight by which the slack of the cord is taken up, a shaft for rotating the drum, and a clutch for operating the shaft, substantially as and for the purposes described.

5. The combination of a lifting-cylinder having a hollow piston-rod, a cord which passes through said piston-rod, a drum around which the cord passes, a clutch arranged to engage the drum-shaft, a shaft upon which the clutch is mounted, said clutch-shaft having splined thereon a pinion and carrying a cam engaging a fixed cam-face, and a rack arranged to actuate said pinion, substantially as and for the purposes described.

482,862. STRAW-BURNER. GUSTAV A. BYOR, Edgar, Nebr. Filed Mar. 31, 1892. Serial No. 427,246. (No model.)

Claim.—1. In a trash burner or furnace, the combination of a base having an opening in the top thereof, a series of flues extending upward from said base, a dome supported by and connected with said flues, and a chamber or magazine removably fitted in the opening of said base, substantially as described.

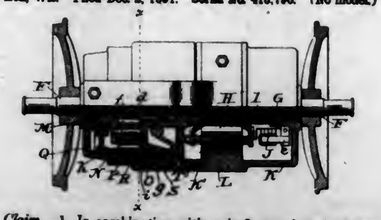
2. In a trash burner or furnace, a base having an opening in the top thereof, a series of flue-pipes projecting upward from said base, a dome mounted upon and connected with said flue-pipes and having a centrally-located smoke-pipe, and a magazine or burning-chamber removably fitted in the top of said base, the said flue-pipes extending only partially around the said base to form an entrance to the top thereof, substantially as described.

3. In a trash burner or furnace, the combination of a hollow base forming an ash-pit and having a series of collars projecting from the top thereof and surrounding a centrally-located opening, a dome having a series of collars depending therefrom, pipes detachably connected to the collars of said base and dome, and a burning-chamber having a detachable grate therein and removably mounted in said central opening of the base and communicating with the latter, substantially as described.

4. In a trash burner or furnace, the combination of a base, a dome, having the under front side thereof concaved at an upward incline toward the front, pipes detachably connecting said base and dome, and a burning-chamber located between said base and dome, the said concaved inclined portion of the dome permitting access to the top of the burning-chamber while the latter is in position, substantially as and for the purpose set forth.

5. In a trash burner or furnace, the combination of a base, a dome pipes detachably connecting said base and dome, tie-rods extending through said pipes and holding the parts together, and a burning-chamber removably mounted in said base and surrounded by said pipes, substantially as described.

6. A burning-chamber for a trash-burning furnace, having a series of internal flues and a grate in the bottom thereof, removably engaging said flues, substantially as described.



7. A burning-chamber for a trash-burning furnace, having a series of internal flues with apertures therein and a grate detachably connected to the lower ends of said flues and above the bottom of the chamber, substantially as described.

8. In a burning chamber or magazine for a trash-burning furnace, the combination of a series of internal flues, a grate having peripheral slots to take over the said flues, and sliding catches on said grate to engage the flues, substantially as described.

9. In a burning chamber or magazine for a trash-burning furnace, the combination of a series of internal flues extending partially upward into said chamber and having a series of openings or apertures therein and slots in the lower portions of the same, a grate having peripheral slots to take over the said flues, and sliding catches adapted to engage the slots in the lower ends of the flues, substantially as described.

10. In a trash burner or furnace, the combination of a base having an opening therein, a burning-chamber removably fitted in said opening and having internal flues and a bottom grate, a dome over the said burning-chamber, and a series of pipes connecting the base and dome, substantially as described.

482,863. ELECTRIC LOCOMOTIVE. CONRAD M. CONRADSON, Madison, Wis. Filed Dec. 2, 1891. Serial No. 413,790. (No model.)

Claim.—1. In combination with a shaft or axle to be driven and electric motor and gearing substantially such as shown and described interposed between the motor and the shaft or axle and adapted at the will of the attendant to positively lock together the rotating member of the motor and the shaft or axle, and thereby to cause the two to move as one, or to transmit motion from the rotating member of the motor to the shaft or axle through intermediate moving parts and at a different rate of speed from that of the rotating member of the motor.

2. In combination with an electric motor and with a shaft to be driven, intermediate gearing substantially such as described and shown for transmitting motion differentially from the moving member of the motor to the shaft, and a clutch adapted to lock together the moving member of the motor, the shaft, and the gearing and to cause said parts to rotate as one.

3. In combination with the shaft or axle, a sleeve encircling the same and provided with a pinion, an electric motor consisting of a fixed and a rotating member, said rotating member being secured to said sleeve, a pinion rotating with said sleeve, a second pinion meshing with the first and carried by a sleeve or head keyed to the axle or shaft, an annular gear-wheel encircling the shaft or axle and meshing with the second pinion, a fixed shell or head, and means substantially such as shown for causing the annular gear-wheel to be locked to the pinion-carrying head or sleeve or to the fixed shell or head at will, whereby the shaft or axle may be made to move at the same speed with or at a different speed from the movable member of the motor.

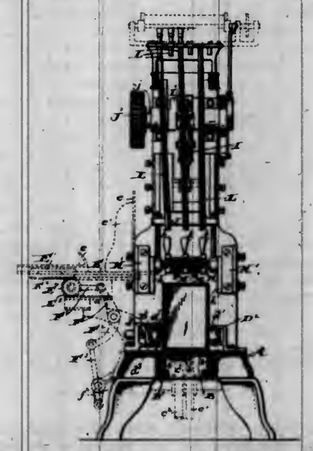
4. In combination with shaft or axle F, sleeve G, provided with pinion *d*, armature H, carried by said sleeve, field-magnet L, and means for supplying electric current to the armature, sleeve M, made fast to shaft or axle F, head or spider O, connected to sleeve M, pinion N, carried by sleeve M, and head O, fixed shell Q, and gear-wheel P, adapted to be thrown into engagement with head or spider O or with shell Q at will.

5. In combination with shaft or axle F, sleeve G, provided with pinion *d* and armature H, sleeve M and head O, pinion N, fixed shell Q, annular gear-wheel P, and electro-magnets R S, adapted to move the wheel P into engagement with spider or head O or with shell Q as one or the other magnet is energized.

482,864. SPLIT WHEEL. CONRAD M. CONRADSON, Madison, Wis. Filed Dec. 26, 1891. Serial No. 416,115. (No model.)

Claim.—In a split wheel, the combination, with a split rim, of a split hub arranged within the rim with its plane of division at an angle to the plane of division of the rim, with each hub-section overlapping

parts of both rim-sections, and bolts or screws for uniting the rim-sections to the hub-sections, all substantially as shown and described, whereby the bolts serve to mutually support the rim and hub sections and the ready replacement of either of the rim and hub sections is permitted without removing the wheel from its shaft.



482,865. SAFETY DEVICE FOR WINDOW-CLEANERS. RUDOLPH d'HEUREUSE, New York, N. Y. Filed July 2, 1891. Serial No. 398,214. (No model.)

Claim.—1. In a safety device for the purpose described, a guard A, provided with a back strap whose ends are secured to said guard, in combination with a body-belt, as B, provided with loops or eyes, as C, substantially as set forth.

2. In a safety device for the purpose described, a guard A and a back strap D, having one of its ends permanently secured to said guard and its other end detachably connected thereto, in combination with a body-belt provided with loops and eyes, substantially as set forth.

482,866. BOX-NAILING MACHINE. SAMUEL H. EDWARDS, Bayonne, N. J. Filed Apr. 27, 1891. Serial No. 390,596. (No model.)

Claim.—1. In a box-nailing machine, the combination of lid-feeding devices, reciprocating nail-holders and hammers, power devices for independently operating said lid-feeding devices and the nail-holders and hammers, and connecting mechanism between the power devices for operating the nail-holders and hammers and the devices for operating the lid-feeding devices to control the operation of the latter, whereby said lid-feeding devices may be automatically thrown out of operation when the action of the nail-holders and hammers is suspended.

2. In a box-nailing machine, the combination of lid feeding devices to automatically feed the lids above the boxes, reciprocating lid-supporters to receive the lids successively from said feeding devices and deposit them upon the box, nail-holders to bring the nails in position upon the lid, and hammers to drive the nails from said nail-holders into the lid and box.

3. In a box-nailing machine, the combination of lid-feeding devices, reciprocating nail-holders and hammers, power devices for independently operating said lid-feeding devices and the nail-holders and hammers, connecting mechanism between the power devices for operating the nail-holders and hammers and the devices for operating the lid-feeding devices to control the operation of the latter, a clutch to throw the power devices for operating the nail-holders and hammers into and out of operation, and intermediate mechanism controlled by the box in passing to the machine to operate said clutch, whereby the operation of the lid-feeding devices, nail-holders, and hammers is controlled by the box in passing into the machine.

4. In a box-nailing machine, the combination of lid-feeding devices to automatically feed the lids above the boxes, reciprocating lid-supporters to receive the lids successively from said feeding devices and deposit them upon the box, reciprocating nail-holders to bring the nails in position upon the lid, means to reciprocate said lid-supporters and nail-holders synchronously, and hammers to drive the nails from said nail-holders into the lid and box.

5. In a box-nailing machine, the combination of feeding devices to feed the boxes successively to the machine, reciprocating nail-holders to bring the nails in position upon the box, reciprocating hammers to drive the nails from said holders into the box, power devices to reciprocate said nail-holders and hammers, a clutch to throw said power devices into and out of operation, and intermediate mechanism controlled by the box in passing through the machine to operate said clutch and cause the nail-holders and hammers to reciprocate.

6. In a box-nailing machine, the combination of lid-feeding devices, nail-holders and hammers, power devices to operate the lid-feeding devices and the nail-holders and hammers independently, a clutch to connect said lid-feeding devices with the power devices for operating them, and clutch-shifting devices to operate said clutch, controlled by the power devices for driving the nail-holders and hammers.

7. In a box nailing machine, the combination of box-carriers to carry the boxes successively into the machine, nail-holders to hold the nails in position to be driven, hammers to drive the nails from the holders into the box, a support for a series of lids, a pusher to push the lids successively from said support over the top of the box and under the nail-holders and hammers, and power devices to reciprocate said pusher.

8. In a box-nailing machine, the combination of box-carriers to carry the boxes successively into the machine, nail-holders to hold the nails in position to be driven, hammers to drive the nails from the holders into the box, a support for a series of lids, a pusher to push the lids successively from said support over the top of the box and under the nail-holders and hammers, a rack and pinion to reciprocate said pusher, and means to operate said pinion.

9. In a box-nailing machine, the combination of box-carriers to carry the boxes successively into the machine, nail-holders to hold the nails in position to be driven, hammers to drive the nails from the holders into the box, a support for a series of lids, a pusher to push the lids successively from said support over the top of the box and under the nail-holders and hammers, a rotatable shaft, a pinion E^4, connection between said pinion and rotatable shaft to reciprocate the pinion, and racks E^5 E^3, between which said pinion is reciprocated, the pusher carrying one of said racks.

10. In a box-nailing machine, the combination of box-carriers to carry the boxes successively into the machine, nail-holders to hold the nails in position to be driven, hammers to drive the nails from the holders into the box, a support for a series of lids, a pusher to push the lids successively from said support over the top of the box and under the nail-holders and hammers, power devices to operate said pusher, a driving-shaft, a clutch to connect said power devices of the pusher and the driving-shaft, and means to operate said clutch controlled by the box in its passage through the machine.

11. In a box-nailing machine, the combination of carriers to carry the box to the machine, a pusher to feed the lids successively upon the box, nail holders to hold the nails in position to be driven, hammers to drive the nails, an intermittently-operating stop to arrest the box under the nail-holders and hammers, and a carrier to carry the nailed box from the machine.

12. In a box-nailing machine, the combination of nailing devices, a driving-shaft, a clutch to connect said driving-shaft with the nailing devices, a projection arranged in the path of the box in passing to the machine, and operating connections between said projection and the clutch to connect the driving-shaft with the nailing devices, whereby the nailing devices are intermittently connected with the driving-shaft when the box passes to the machine.

13. In a box-nailing machine, the reciprocating frame M', carrying the notched lid-supports M^2.

14. In a box-nailing machine, the combination of the adjustable bed-plate B, rollers D', carried upon arms *d*, pivoted to said bed-plate,

so as to be adjusted with it, and carriers C and C' for carrying the boxes to and from the bed-plate.

15. In a box-nailing machine, the reciprocating frame M', carrying the movable guides M^6 and the notched lid-supports M^9.

16. In a box-nailing machine, the combination of a reciprocating frame, pivoted lid-supporting hooks carried thereby, a pusher to push the lids successively to the pivoted supporting-hooks, nail-holders to hold the nails in position to be driven, and hammers to drive the nails.

17. In a box-nailing machine, the combination of a reciprocating frame and curved spring-pressed guides M^6 carried thereby, pivoted spring-pressed lid-supporting hooks M^9, movable with said reciprocating frame, and a pusher to push the lids successively to said hooks M^9, whereby when the reciprocating frame descends said hooks M^9 are pushed aside by the box and the lid is deposited thereon.

18. In a box-nailing machine, the combination, with a support for the box, of an intermittently-reciprocating frame, lid-supporters and nail-holders carried by said frame and reciprocating with it, intermittently-reciprocating hammers to drive the nails from said holders, and feeding devices to feed the lids successively to said lid-supporters under the nail-holders.

19. In a box-nailing machine, the combination, with a support for the box, of an intermittently-reciprocating frame, lid-supporters and nail-holders carried by said frame and reciprocating with it, intermittently-reciprocating hammers to drive the nails from said holders, nail-tubes to supply nails to said nail-holders, intermittently-operating nail-feeding devices to feed the nails to said nail-tubes, and feeding devices to feed the lids successively to said lid supporters under the nail-holders.

20. In a box-nailing machine, the combination, with reciprocating nail-holders and hammers, of vertically-reciprocating lid-holders located under said nail-holders and hammers, adapted to receive the lid and carry it down upon the box, and power devices to reciprocate said nail-holders and hammers and lid-holders.

21. In a box-nailing machine, the reciprocating frame M', carrying the spring-pressed guides M^6, having the curved extremities m' and the spring-pressed lid-supports M^9.

22. In a box-nailing machine, the reciprocating frame M', carrying the notched lid-supports M^9, having the curved extremities m^6, and the springs M^{10}, acting upon the lid-supports M^9 to press them outward.

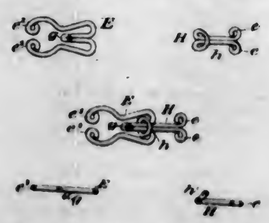
23. In a box-nailing machine, the combination of the pitmen I I, power devices to reciprocate said pitmen intermittently, cross-heads J J, carried by said pitmen I I, hammers O, carried by said cross-heads, cross-heads H H, carried by said cross-heads J J, but movable thereon, nail-holders K, and lid-supporters M, carried by said cross-heads H H.

24. In a box-nailing machine, the combination of the reciprocating nail-holders and hammers, power devices to reciprocate said nail-holders and hammers, a clutch to connect said power devices with the main driving-wheel, a lock to lock said clutch out of connection, a carrier for the box to carry it into the machine under the nail-holders and hammers, a pivoted stop in the path of said box, and connections between said pivoted stop and lock whereby the lock is released upon the passage of a box into the machine and the clutch is thrown into connection.

25. In a box-nailing machine, the combination of reciprocating nail-holders and hammers, power devices to operate them, a clutch to connect said power devices, a lock to lock said clutch out of operation, a bell-crank P^3, connected with said lock, a pivoted arm R, arranged in the path of the box in passing under the nail-holders and hammers, so as to be pushed aside by it, and a pivoted dog Q^2, moving with said arm R, adapted to actuate the bell-crank P^3 and withdraw the lock of the clutch, substantially as and for the purpose described.

26. In a box-nailing machine, the combination of the main driving-wheel, reciprocating nail-driving devices, a shaft *j*, from which said reciprocating nail-driving devices are operated, a clutch to connect the main driving-wheel and shaft *j*, a lock O^4 to lock said clutch out of operation, the cam O^3, carried by the shaft *j*, the spring-pressed bolt O^4, and the lever O^5, connected therewith, and mechanism to operate the lock O^4, controlled by the box in passing through the machine, all combined and operating substantially as and for the purpose described.

27. In a box-nailing machine, the combination of carriers to carry the boxes into and from the machine, power devices to drive said carriers, lid-feeding devices to feed the lids in succession upon the boxes, connections between the lid-feeding devices and the driving devices of the carriers to operate them synchronously, reciprocating nail-holders and hammers, and power devices to reciprocate said nail-holders and hammers intermittently and independently of driving of the carriers, and connecting mechanism between the clutch and the power devices for reciprocating the nail-holders and hammers to operate the clutch and disconnect the lid-feeders and driving devices of the carriers when the nail-holders and hammers cease operating.



28. In a box-nailing machine, the combination, with reciprocating nail-holders and hammers, of nail-tubes to supply the nails to the nail-holders, nail-feeding devices to feed the nails one at a time to the nail-tubes, a nail-supply pan for supplying the nails to said nail-feeding devices, and intermittently operating power devices to intermittently raise and lower said nail-supply pan.

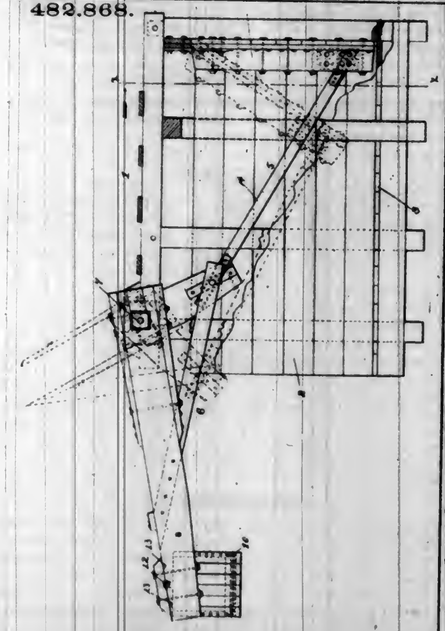
29. In a box-nailing machine, the combination, with reciprocating nail-holders and hammers, of tubes to supply the nails to the nail-holders, nail-feeding devices to feed the nails one at a time to the nail-tubes, a nail-supply pan hinged to said nail-feeding devices and adapted when raised to supply nails thereto, a crank-shaft and connections between said crank-shaft and pan, a main driving-shaft, gearing between said main driving-shaft and crank-shaft, and a clutch for disconnecting said gearing and main driving-shaft, intermittently connected with said driving-shaft.

30. In a box-nailing machine, the combination, with reciprocating nail-holders and hammers, of nail-tubes to supply the nails to the nail-holders, nail-feeding devices to feed the nails one at a time to the nail-tubes, a nail-supply pan hinged to said nail-feeding devices and adapted when raised to supply nails thereto, a crank-shaft and connections between said crank-shaft and pan, a main driving-shaft, gearing between said main driving-shaft and crank-shaft, a clutch for disconnecting said gearing and main driving-shaft, having a curved groove *z*, the bolt Y, finger V^4, and worm V', and worm-wheel V^3, combined and operating substantially as and for the purpose set forth.

31. In a box-nailing machine, the combination, with the hammers, of the nail-holders K, consisting of the main body portion K', the front portion K^2, formed with the nail-bore between them, the connecting-bolts for connecting said parts K' and K^2 together, the yoke K^5, and screw K^7, combined substantially as and for the purpose described.

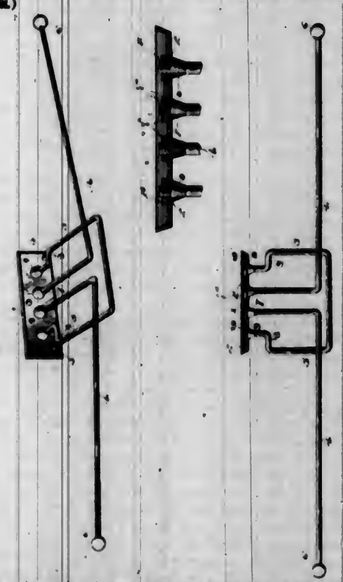
482,867. HOOK AND EYE. WILLIAM J. EDWARDS and FRANCIS R. BARCLAY, Youngstown, Ohio. Filed Mar. 18, 1892. Serial No. 425,497. (No model.)

Claim.—1. In a hook and eye, the combination of a substantially U-shaped eye the free ends of which are provided with means for securing it to a garment and the sides and walls thereof are contracted or bent inward toward each other intermediate their ends and bottom and the bottom or curved portion is provided with a tongue, and a hook the point of which is provided with an opening through which the tongue of the eye passes when the two are engaged, the distance between the contracted portion of the walls of the eye being less than the transverse diameter of the extended or open portion of the hook, whereby the walls of the eye must be sprung outwardly to permit of the passage of the hook between them, substantially as set forth.



2. In a hook and eye, the combination, with a hook the point of which is bent outwardly and rearwardly and is expanded or provided with an opening, of a substantially U-shaped eye the walls of which are contracted or bent inward or toward each other and the bottom or curved portion is provided with a tongue the end of which extends to the contracted portion and is bent downward below the plane of the eye, whereby the end of the tongue will occupy the plane of the hook when in position and must be raised above said plane when it passes through the opening of the hook, substantially as set forth.

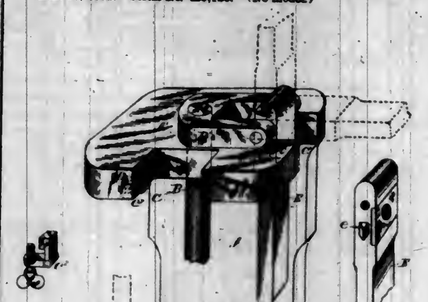
482,868. AUTOMATIC FLOOD-GATE. SYDNEY FLINN, Caddoa, Colo. Filed June 1, 1891. Serial No. 394,783. (No model.)



Claim.—1. The combination of a framework designed to lead from a canal, aqueduct, or the like, a flood-gate hinged at its top, and a weighted bell-crank-lever frame provided with an extension and fulcrumed at one of its angles on the frame and extending below its fulcruming-point and connected with the bottom of the gate, substantially as described.

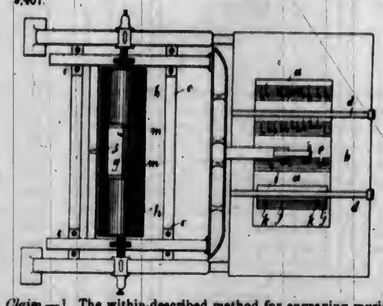
2. The combination of a frame-work, a flood-gate hinged at its top, a bell-crank-lever frame fulcrumed on the frame at one of its angles, a connecting-frame pivotally attached to the flood-gate and the lever-frame, and a weight attached to the bell-crank-lever frame, substantially as described.

482,868.



482,869. TOWEL-RACK. JOHN F. HUBER and GEORGE L. MARVIN, Central City, Nebr. Filed June 21, 1892. Serial No. 437,490. (No model.)

Claim.—A towel-rack comprising the base-plate adapted to be secured to a supporting-surface and provided with openings 2, a rectangular supporting-frame extending horizontally from the plate and having its sides bent inward at 8 and provided with shoulders and threaded and extending through openings 2, the L-shaped arms adapted to be supported in a horizontal position by the said frame and having their inner ends provided with shoulders and arranged in openings 2, and nuts arranged on the inner face of the plate and securing the arms and the frame to the same, substantially as described.



482,870. SWITCH-STAND. SAMUEL JOSH, Plain Dealing, La. Filed Mar. 16, 1892. Serial No. 425,123. (No model.)

Claim.—1. In a switch-stand, the combination, with the cap-plate having two or more locking-recesses in its edges formed with bolt-openings in the side walls thereof, of a lever secured to the switch-shaft, having a hinged connection, a lock on the hinged connection, having a beveled catch-bolt arranged to engage the sides of the recesses and enter the bolt-holes, and a removable plug in the bolt-hole of one of the recesses, substantially as described.

2. In a switch-stand, the combination, with the switch-shaft, of a cap having two or more looking-recesses formed with bolt-openings in their side walls, a hinged lever on the switch-shaft, a lock on the lever, and a movable plug fitted in one of the bolt-openings, substantially as described.

482,871. METHOD OF PRODUCING MUSIC OR LIKE ENGRAVINGS. CHARLES A. KER, Glasgow, Scotland. Filed Feb. 10, 1892. Serial No. 420,934. (No model.) Patented in England June 6, 1889, No. 9,407.

Claim.—1. The within-described method for engraving music or the like, consisting in punching or otherwise cutting out the musical or other sign upon a pattern-sheet of suitable material, then placing said sheet upon a table in an engraving-machine, then securing a sheet of suitable material upon a roller, then transferring the characters from the first sheet to the second sheet by means of a pantograph, and then removing the sheet from the roller and printing from said sheet, substantially as and for the purposes described.

2. In a machine for engraving music or the like, the combination, with a table for holding a pattern-sheet, of a roller for holding a sheet upon which the characters are to be transferred from the pattern-sheet upon the table, a transfer-sheet placed upon said roller, and means, substantially as described, for holding said transfer-sheet upon said roller while a pantograph is caused to transfer the characters from the pattern-sheet to said transfer-sheet upon said roller, said holding means permitting the transfer-sheet to be placed upon and removed from said roller, substantially as and for the purposes described.

482,872. INSULATOR. CHARLES T. LEE, Boston, Mass., assignor to the Johns-Pratt Company, Hartford, Conn. Filed Nov. 14, 1891. Serial No. 411,926. (No model.)

Claim.—1. An insulator comprising an insulation-block composed of a series of sheets of mica compressed and compacted together, the said block having a parallel-sided seat formed thereon, and a metallic shell or casing inclosing or partially inclosing the said block, tightly compressing the seat thereon, and held on the seat by frictional contact, for the purposes and substantially as set forth.

482,872.

2. An insulator comprising a core, a series of sheets of mica strung on said core and closely compressed and compacted together thereon, the said block having a parallel-sided seat formed thereon, and a metallic shell or casing inclosing or partially inclosing the mica on said core, tightly compressing the seat thereon, and held on the seat by frictional contact, for the purposes and substantially as set forth.

below the drum D, open at its lower end and provided with the perforated diaphragm *d*, said drum being imperforated below and perforated above said diaphragm, substantially as and for the purpose specified.

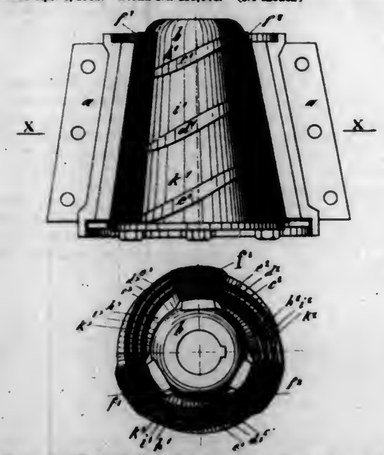
482,875. COIN-CONTROLLED VENDING APPARATUS. JOHN G. MACPHERSON, McKeesport, Pa. Filed May 27, 1892. Serial No. 434,597. (No model.)

adapted to engage with one or a series of projections on the delivery-slide, as and for the purpose described.

8. In a coin-operated vending apparatus, the combination, with a bed-plate and the delivery-slide, of the pivoted coin-holder, an endwise-movable puncturing-bar arranged in the path of the coin-holder, a detent adapted to retain the puncturing-bar and having a bell-crank in the path of a projection on the slide to release the detent from the puncturing-bar, and a locking mechanism normally engaged with the slide and adapted to be released upon the inward movement of the puncturing-bar, as and for the purpose described.

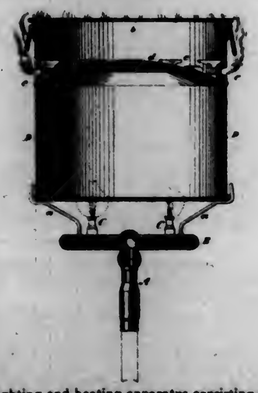
9. In a coin-controlled vending apparatus, the combination, with a

gases escaping about the stuffing-box of the same, a piston formed on an extension of the piston-rod of the compressor, ports located at opposite ends of the pump-cylinder, the one being connected with the induction-pipe of the compressor and the other with the pump-cylinder at the opposite end, and valves *a b*, controlling said ports, substantially as and for the purpose specified.



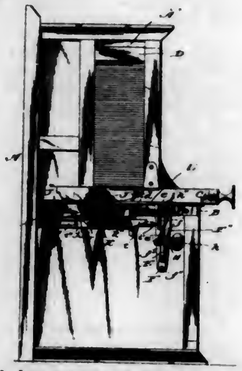
482,877. DIAL TRANSMITTER. FREDERICK PEARCE, New York, N. Y. Filed May 3, 1892. Serial No. 431,628. (No model.)

482,872.



2. An insulator comprising a core, a series of sheets of mica strung on said core and closely compressed and compacted together thereon, the said block having a parallel-sided seat formed thereon, and a metallic shell or casing inclosing or partially inclosing the mica on said core, tightly compressing the seat thereon, and held on the seat by frictional contact, for the purposes and substantially as set forth.

482,873. GRINDING-MILL. CARL C. L. LOCHT, Colberg, Germany. Filed Apr. 6, 1892. Serial No. 428,073. (No model.)



Claim.—A mill for coarse-grinding grain, consisting of a cast iron conical casing *a*, composed of two parts and provided with toothed steel blades inserted into dovetail grooves, in which casing revolves a cast-iron cone *b*, carrying also toothed steel blades *f*, which are inserted in such a manner that between each two blades always the same free deepened space is produced, which is divided by ribs *c' d' e'*, &c., conically running from above downward into several chambers, so that in consequence of the revolution of the cone the material to be treated passes from the first chamber of the first partition into the second chamber of the second partition, and so on, meeting only once each blade f_1 substantially as set forth, and shown in the accompanying drawings.

482,874. LIGHTING AND HEATING APPARATUS. JAMES D. LUTHER, Brooklyn, N. Y. Filed Mar. 15, 1892. Serial No. 424,959. (No model.)

Claim.—A lighting and heating apparatus consisting of the gas-pipe A, gas-ring B, having gas-nipple C and bracket *a*, all arranged below the drum D, open at its lower end and provided with the perforated diaphragm *d*, said drum being imperforated below and perforated above said diaphragm, substantially as and for the purpose specified.

482,875. COIN-CONTROLLED VENDING APPARATUS. JOHN G. MACPHERSON, McKeesport, Pa. Filed May 27, 1892. Serial No. 434,597. (No model.)

Claim.—1. In a coin-controlled vending machine, the combination, with an endwise-movable delivery-slide and locking means therefor, of a pivoted swinging coin-holder below the slide and arranged to allow the passage of the coin therethrough and a puncturing-bar or plunger adapted to be retracted by the impact of a coin in said coin-holder and arranged to release the locking mechanism of the slide, substantially as and for the purpose described.

2. In a coin-controlled vending-machine, the combination, with an endwise-movable delivery-slide and locking means therefor, of a pivoted swinging coin-holder below the slide and arranged to allow the passage of the coin therethrough and a puncturing-bar or plunger in the path of said coin-holder and adapted to be retracted only by the impact or pressure of the coin while contained within the coin-holder, substantially as and for the purpose described.

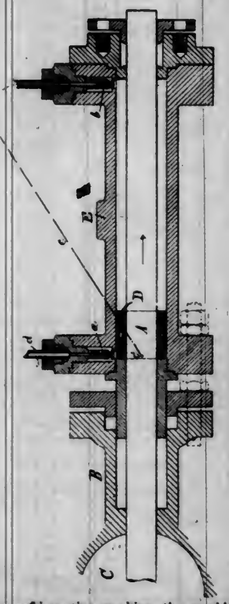
3. In a coin-controlled vending apparatus, the combination, with a delivery-slide, of a coin-holder arranged to be moved with the slide, a puncturing-bar or plunger in the path of the coin-holder and adapted to be retracted only by the impact or pressure of the coin therein, and an ejecting mechanism operating to strip the holder of the coin while the puncturing-bar is in its retracted position, as and for the purpose described.

4. In a coin-controlled vending apparatus, the combination, with a delivery-slide, of a coin holder adapted to move with the slide and having the coin-actuated locking means, a puncturing-bar in the path of the coin-holder, a detent operated by the slide to restrain the puncturing-bar while the slide and coin-holder are returned to their normal positions, and a locking mechanism operated by the plunger-bar on the inward thrust of the same and the coin-holder, as and for the purpose described.

5. In a coin-controlled vending apparatus, the combination, with a delivery-slide, of a swinging coin-holder movable with the slide, a puncturing-bar in the path of the coin-holder and adapted to be retracted by the impact or pressure of a coin in said holder, an ejector lever or bar having means to be operated by the slide, a detent for restraining the puncturing-bar while the ejector-lever is being operated, and a latch between the puncturing-bar and the ejector-lever, which permits the ejector-lever to be depressed only while the puncturing-bar is retracted, as and for the purpose described.

6. In a coin-controlled vending apparatus, the combination of a bed-plate having the coin-slot, the delivery-slide also provided with a coin-slot, the swinging coin-holder pivoted below the bed-plate in suitable bearings thereon and having a spring which normally holds the coin-holder in position to receive from said coin-slots, a balanced lever carried by the coin-holder and having one end thereof arranged in the path of the coin to be deposited in the coin-holder, a locking-pin connected to and movable by the balanced lever, a puncturing-bar in the path of the coin-holder, and locking devices operated by the puncturing-bar, as and for the purpose described.

7. In a coin-operated vending apparatus, the combination, with a bed-plate and the delivery-slide, of the pivoted coin-holder arranged to receive from the coin-slots in said plate and slide, an endwise-movable puncturing-bar guided on the bed-plate and arranged in the path of the coin-holder, and a pivoted lever arranged to be operated by the retracted movement of the puncturing-bar and having the locking-pin adapted to engage with one or a series of projections on the delivery-slide, as and for the purpose described.

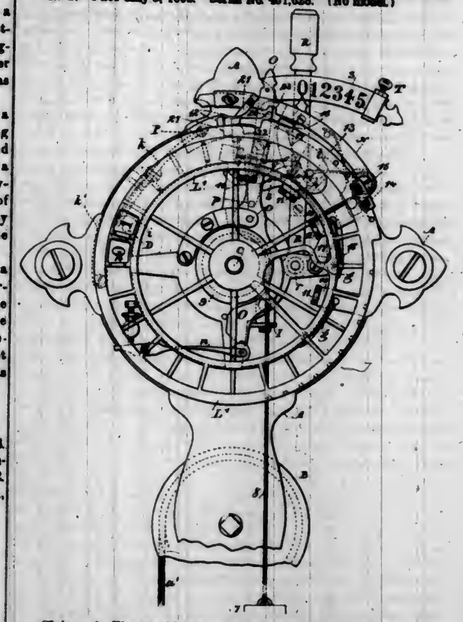


8. In a coin-operated vending apparatus, the combination, with a bed-plate and the delivery-slide, of the pivoted coin-holder, an endwise-movable puncturing-bar arranged in the path of the coin-holder, a detent adapted to retain the puncturing-bar and having a bell-crank in the path of a projection on the slide to release the detent from the puncturing-bar, and a locking mechanism normally engaged with the slide and adapted to be released upon the inward movement of the puncturing-bar, as and for the purpose described.

9. In a coin controlled vending apparatus, the combination, with a bed-plate and the delivery-slide, of the pivoted coin-holder, a puncturing-bar in the path of the coin holder, a detent for the puncturing-bar, and an ejector arranged to clear the coin from the coin-holder and having an operating-piece in the path of a tooth on the slide, as and for the purpose described.

10. In a coin-controlled vending apparatus, the combination of a slotted bed-plate, a slotted delivery-slide, a pivoted coin-holder having a pressure-spring to hold the same in line with the coin-slots in said plate and slide, a locking mechanism carried by the coin-holder, a puncturing-bar in the path of the coin-holder and having the safety-latch, and an ejector-bar adapted to be restrained by the safety-latch of the puncturing-bar and having means to be operated by the slide only when the puncturing-bar and the latch are retracted, as and for the purpose described.

11. In a coin-controlled vending apparatus, the combination of a bed-plate, a slide, a pivoted coin-holder, an endwise-movable puncturing-bar having the lateral stud *n*, the ejector-lever likewise having the stud *n'*, a latch movable with the puncturing-bar and adapted to be freed from the stud of the ejector-bar when the puncturing-bar is retracted, a detent for engaging the puncturing-bar, and independent operating mechanisms for the puncturing bar and the ejector-lever, as and for the purpose described.



482,876. GAS-COMPRESSOR FOR REFRIGERATING-MACHINES. BERNHARD H. MÜNSTER, Hastedt, near Bremen, assignor to Wilhelm Oesenbrück and Adolf Oesenbrück, Hemelingen, Germany. Filed May 19, 1892. Serial No. 433,514. (No model.) Patented in Germany Sept. 1, 1891, No. 62,318.

Claim.—1. In a refrigerating-machine, the combination of the compressor, a pump-cylinder arranged in line with the compressor-cylinder to receive the gases escaping about the stuffing-box of the same, a piston formed on an extension of the piston-rod of the compressor, a port opening into the end of the pump-cylinder toward the compressor-cylinder and connected with the induction-pipe of the latter, and a valve *a*, controlling said port, substantially as described.

2. In a refrigerating-machine, the combination of the compressor, a pump-cylinder arranged in line with the compressor, to receive the gases escaping about the stuffing-box of the same, a piston formed on an extension of the piston-rod of the compressor, ports located at opposite ends of the pump-cylinder, the one being connected with the induction-pipe of the compressor and the other with the pump-cylinder at the opposite end, and valves *a b*, controlling said ports, substantially as and for the purpose specified.

482,877. DIAL TRANSMITTER. FREDERICK PEARCE, New York, N. Y. Filed May 3, 1892. Serial No. 431,628. (No model.)

Claim.—1. The combination, in a dial transmitter, of a primary dial containing indicating-numbers, a shaft carrying the same, gearing and a weight to rotate the same in one direction, a clutch mechanism to connect and disconnect the dial, a revolving circuit-closing cylinder, a stop-lever and mechanism connecting the same with the clutch, and a projection upon the dial to move the stop-lever in one direction and disconnect the clutch and allow the dial to be returned to its normal position, and a projection upon the dial to move the stop-lever in the opposite direction to couple the same to the clock mechanism for the repetition of the signal, and a weight or spring to return the dial to its normal position, substantially as set forth.

2. A series of dials for a dial transmitter, each dial having indicating-numbers on a portion of its face and the front dial having openings through which to observe the numbers upon the dials in the rear, latches by which the dials can be held in their proper relative positions, mechanism for rotating the dials in one direction and a circuit-closing device simultaneously rotated, a weight for returning the dials to their normal positions, a stop-lever and a finger upon the outer dial for moving the stop-lever in one direction, a clutch mechanism operated by the stop-lever to disconnect the dials from the rotating mechanism, and an arm or damper moved by the stop-lever to stop the fly of the motor, and a projection upon the dial to return the stop-lever to its normal position and allow the motor to rotate at the termination of the back movement of the dials, and a circuit-closing mechanism for breaking the electric circuit during the return movement of the dials, substantially as set forth.

3. The combination, with the rotating mechanism in a dial transmitter, of a series of dials, latches for holding the dials in their proper relative positions as they may be set for giving the desired signals, a revolving cylinder for closing the electric circuits, a battery-closing device, and projections upon their respective dials for acting upon the battery-closing device to break the electric circuit during one rotation of the circuit-closing cylinder between the signals given for one dial and those for the next dial, substantially as set forth.

4. The primary dial and a shaft with which it is connected, a grooved hub for the primary dial, a weight and cord connected with the grooved hub for returning the primary dial to its normal position, a motor for revolving the dial-shaft, and a clutch mechanism for con-

secting the shaft to the motor, a circuit-closing cylinder and its springs, one or more secondary dials loose on the shaft of the primary dial, and latches for holding the secondary dials in their proper relative positions, a circuit-closing arc and projections upon the dials to actuate the same, and circuit connections, substantially as specified, whereby the connections to the battery are broken between the transmission of the signals for one dial and the signals for the next dial, substantially as set forth.

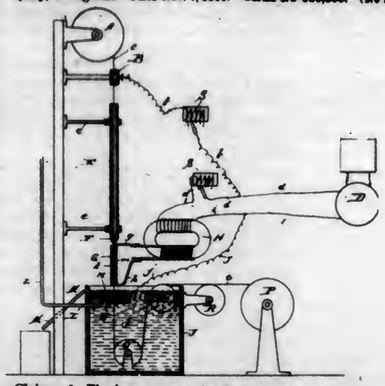
5. The combination, with the electric circuits and circuit-closing devices in a dial transmitter, of a primary dial, the shaft with which it is connected, a weight and cord for returning the dials to their normal positions, a clutch for connecting the dials with the motor, a stop-lever, and a finger upon the outer dial or margin-wheel for acting upon the stop-lever in one direction, a projection upon the primary dial for acting upon the stop-lever in the other direction, a latch for holding the primary dial at the end of its return movement, and mechanism actuated by the motor for withdrawing the latch when the instrument is set in motion, substantially as set forth.

6. The combination, in a dial transmitter, of dials, mechanism for adjusting and holding the dials in their proper relation one to the other, a motor for giving motion to the dials in one direction, a weight and cord for returning the dials to their normal positions, a clutch for connecting the dial shaft to the motor, a stop-lever acted upon by the dials, first in one direction to disconnect the clutch mechanism and in the other direction to connect such clutch mechanism, a hand-lever, a rack upon the same, and a pawl upon the stop-lever for returning the hand-lever to its normal position, projections upon the hand-lever and stop-lever, respectively, for acting upon the fly of the motor for stopping and starting the apparatus, substantially as set forth.

7. The combination, with the dials in a dial transmitter and mechanism for moving such dials and returning them automatically to their normal positions, of circuit-closing devices actuated by the motor and a battery-closer acted upon by the dials, substantially as set forth, whereby the circuit is closed by the starting of the dials, interrupted between the signals for one dial and the signals for the next dial interrupted during the return of the dials to their normal positions, and again automatically closed as the dials are set in motion, substantially as set forth.

8. The combination, with the primary dial and the shaft with which it is permanently connected, of a motor-and-clutch mechanism for moving such dial, a cord and weight for returning the dial to its normal position, one or more secondary dials and latches for holding the dials in their respective positions when adjusted, an outer dial or margin-wheel, a stop-lever and a finger upon the margin-wheel for moving the stop-lever in one direction, and a projection on the primary dial for moving the stop-lever in the other direction, a battery-closing arc, an insulated wedge and circuit-closing springs, and a projection upon the arc extending out over the dials, there being projections upon the dials and upon the margin-wheel for raising the battery-closing arc and breaking the circuit to give the margin or pause between one signal and the next, or between one set of signals and their repetition, there being a projection upon the stop-lever for holding up the circuit-closing arc during the return movement of the dials, substantially as set forth.

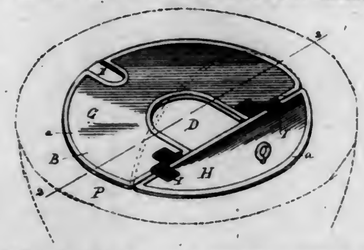
9. The combination, in an electric signaling-machine, of dials, means for rotating the same, rotary circuit-closing devices and circuit connections, a circuit-closer having two contacts and receiving its motion from the dials, and double connections for simultaneously connecting the battery and external circuits or the reverse, substantially as set forth.



10. The combination, with the primary and secondary dials and the mechanism for rotating the same and the disconnecting coupling, of a weight to return the dials to their normal positions, and a dash-pot to regulate the speed of movement, substantially as set forth.

482,878. CAR-MOVER. CHARLES W. PIERCE, Union City, Ind. Filed June 20, 1892. Serial No. 437,360. (No model.)

Claim.—A car starter and mover comprising the two side pieces having the connecting-web and adapted to straddle the head of the rail, one of the lower ends of the side pieces being in rear of the other, lugs on the lower ends of the side pieces at their inner faces, adapted to engage the head of the rail, one of said lugs being in advance of the other, and a lever fulcrumed between the upper ends of the side pieces and having the lower end reduced for engaging the rim of the car-wheel, for the purpose described.

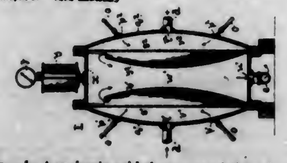


482,879. METHOD OF AND APPARATUS FOR TEMPERING WIRE. FRED PURDY, Englewood, assignor to the American Spring Company, Chicago, Ill. Filed Nov. 7, 1889. Serial No. 329,533. (No model.)

Claim.—1. The improvement in the tempering of wire, consisting in heating the wire by means of a current of electricity passing through it and equalizing the heat by moving the wire through a heated tube and then chilling the wire, substantially as set forth.

2. In apparatus for tempering wire, a dynamo or other source generating an alternating electric current, in combination with a heating-tube G, electric connections from said dynamo to said tube, and other connections adapted to carry the current from the dynamo to the wire, substantially as set forth.

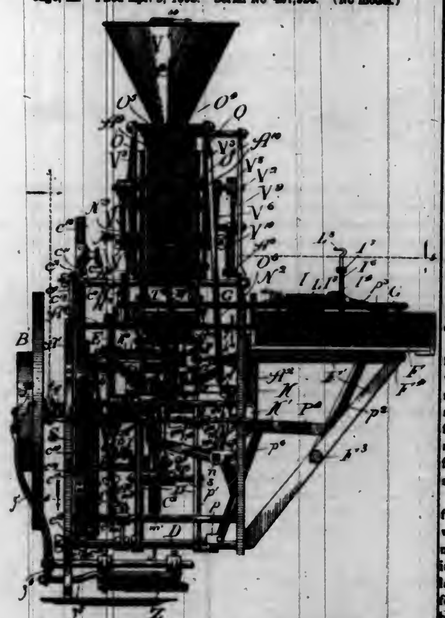
482,880. COVER FOR MELTING-POTS. JAMES A. ST. JOHN, St. Louis, Mo. Filed Oct. 14, 1891. Serial No. 408,653. (No model.)



Claim.—1. A floating cover for molten metal, consisting of plates and an interposed filling of refractory material, substantially as and for the purposes described.

2. A sectional floating cover for molten metal, formed with openings for the passage of moving parts, said sections being hinged together, substantially as and for the purposes described.

3. The combination, with a melting-pot, of a floating cover therefor, consisting of plates and an interposed filling of refractory material, substantially as and for the purposes described.



482,881. APPARATUS FOR CHARGING BEER WITH CARBONIC ACID. JOHN B. STOBAUGH, Newark, N. J. Filed Sept. 26, 1891. Serial No. 406,953. (No model.)

Claim.—1. A carbonic-acid charger consisting of a casing with an interposed diaphragm, forming an inlet-chamber for the liquid to be impregnated and an outlet-chamber, the part of the casing forming the inlet-chamber being provided with a series of carbonic-acid nozzles inclined inwardly toward the center, said nozzles being arranged at equal distances from each other and at equal distances from a central inlet-opening, substantially as shown and described.

2. A carbonic-acid charger consisting of a casing with interposed foraminous diaphragm or diaphragms, forming an inlet chamber or chambers for the liquid to be saturated and an outlet chamber, the inlet-chamber being provided with means, substantially as shown and described, for the introduction of carbonic acid and the outlet-chamber with one or more deflectors, substantially as specified.

482,882. CIGAR-BUNCHING MACHINE. NICOLAS STROTZ, Chicago, Ill. Filed Apr. 5, 1892. Serial No. 427,926. (No model.)

Claim.—1. In a cigar-bunch machine, the combination, with bunch-rolling mechanism, of an initial receptacle for the filler, reciprocating between its long-filler-receiving position and its discharge position in the machine, engaging and releasing means for engaging the receptacle when it reaches the discharge position and reciprocating the same in the direction of the rolling mechanism, and means for discharging the filler therefrom to the bunch-rolling mechanism, substantially as described.

2. In a cigar-bunch machine, the combination, with bunch-rolling mechanism, of a carriage, an initial receptacle for the filler, mounted in the carriage to have limited independent movement therein and reciprocated by the carriage between its receiving and discharge positions, and means for reciprocating the receptacle in the carriage when in the discharge position toward and from the bunch-rolling mechanism, substantially as described.

3. In a cigar-bunch machine, the combination, with bunch-rolling mechanism, of a carriage formed with a relatively-movable section, a receptacle for filler, mounted in said movable section, means for reciprocating the carriage into and out of the machine, and reciprocating means for engaging said movable section when the carriage enters the machine and moving it toward the bunch-forming mechanism, substantially as described.

4. In a cigar-bunch machine, the combination, with bunch-rolling mechanism, of a carriage formed of relatively-stationary and extensible sections, an initial receptacle for filler, mounted in said extensible section, a support extending into the machine and laterally thereof upon which said relatively-stationary section of the carriage reciprocates, a support upon which the extensible section of the carriage reciprocates, terminating at one side of the machine, and reciprocating means engaging the said extensible section as it leaves its support and moving it toward the bunch-forming mechanism, substantially as described.

5. In a cigar-bunch machine, the combination, with the movable bunch-rolling table, forming-belt, and bunch-roller, of a frame in which the bunch-roller is journaled, provided with cam-shaped ends affording guides which project beyond the roller, and a reciprocating frame carrying a binder-tensioning rod which moves upon the said guides in the movement of its frame, and initial movement of the rolling-table to engage and press the binder against the forming-belt, substantially as described.

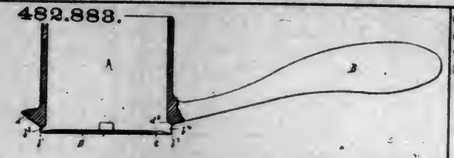
6. In a cigar-bunch machine, the combination, with the bunch-rolling mechanism and final receptacle for the bunch, of a movable carrier operated from the driving-power of the machine to transfer the bunch from the bunch-rolling mechanism to the final receptacle and comprising a frame provided with a stationary and a pivotal jaw, the jaws affording between them a receptacle for the bunch, a spring upon the frame maintaining the jaws normally closed, a projection upon the pivotal jaw, a stationary stop in the path of said projection near the bunch-rolling mechanism, and a stop for the pivotal jaw near the final receptacle, whereby the pivotal jaw is opened by contact of its projection with one stop in the movement of the carrier to the bunch-rolling mechanism and locked in its closed condition when the carrier is moved to the final receptacle, and ejecting mechanism for discharging the bunch from the carrier into the final receptacle, substantially as described.

7. In a cigar-bunch machine, the combination, with the bunch-rolling mechanism and final receptacle for the bunch, of a carrier operated from the driving-power of the machine to transfer the bunch from the rolling mechanism to the final receptacle, comprising a frame provided with opening and closing jaws, affording between them a shaper for the bunch, an ejector from the carrier-frame, having a stem and reciprocal through the said shaper, and means for actuating the said ejector to discharge the bunch from the shaper to the final receptacle, comprising a longitudinally-movable and vertically-oscillating bar operated from the driving-power of the machine and having a projection engaging and releasing the ejector-stem, substantially as described.

8. In a cigar-bunch machine, the combination, with the bunch-forming mechanism, of a vertically-disposed mold-board, a frame in which the mold-board is yieldingly supported at its lateral edges to move freely in an upward direction and be resisted in its movement in a downward direction, an adjustable stop c^{12} at the base of said frame for the mold-board to rest upon when first inserted in the frame, intermittent raising mechanism for the mold-board, and means for transferring the bunch from the rolling mechanism to the mold-board, substantially as described.

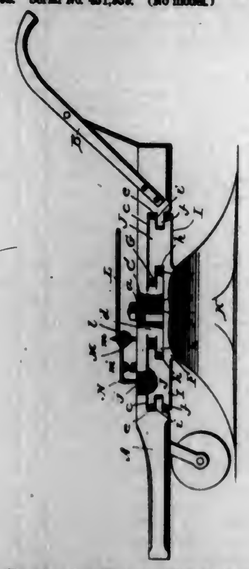
9. In a cigar-bunch machine, the combination, with the bunch-forming mechanism, of a vertically-disposed mold-board, a frame in which the mold-board is yieldingly supported at its lateral edges to move freely in an upward direction and be resisted in its movement in a downward direction, guide projections c^{13} on the said frame, overlapping the face of the mold-board, intermittent raising mechanism for the mold-board, and means for transferring the bunch from the bunch-rolling mechanism to the mold-board, substantially as described.

10. In a cigar-bunch machine, the combination, with the bunch-forming mechanism, of a vertically-disposed mold-board, a frame in which the mold-board is yieldingly supported at its lateral edges to move freely in an upward direction and be resisted in its movement in a downward direction, a counter-balance, an intermittent raising mechanism for the mold-board, and means for transferring the bunch from the bunch-rolling mechanism to the mold-board, substantially as described.



11. In a cigar-bunch machine, the combination, with the bunch-rolling mechanism, initial receptacle for the filler, and mechanism for transferring the filler from the said receptacle to the bunch-rolling mechanism, of a reservoir for short filler, having a discharge-opening in its base, intermittingly-actuated mechanism for transferring short filler therefrom to the initial receptacle, comprising a box provided with wings which slide upon the base of said reservoir, open at its top and having a hinged base-plate, and a stationary strip across which the box moves, operating to engage and close the hinged base as the box moves to its filling position and to disengage the said base as the box arrives at its discharge position, substantially as and for the purpose set forth.

12. In a cigar-bunch machine, the combination, with the bunch-rolling mechanism and final receptacle for the bunch, of a carrier for transferring the bunch from the rolling mechanism to the final receptacle, pivotally mounted upon a rocking support, and means for turning the carrier on its pivot in the movement between its receiving and discharge positions, comprising a stationary rack and a gear connected with the carrier and traveling upon the rack, substantially as described.



482,888. ICE-SHAVE. JOEL STORER, Long Lake, Minn. Filed Nov. 7, 1891. Serial No. 411,130. (No model.)

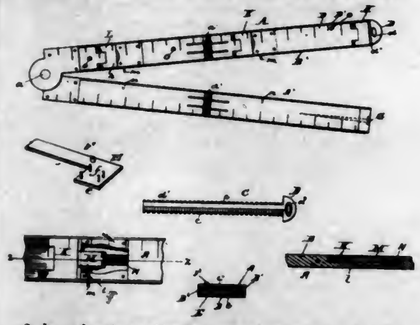
Claim.—In an ice-shave, the receptacle A, having the handle B and open at both ends and formed with lips d' d^3, said lips having their downward surfaces inclined outward and upward, in combination with blade D, forming the bottom of said receptacle, and with cutting-edges b' b^3, substantially as and for the purpose set forth.

482,883.

482,884. PLOW. CHARLES H. VANDERBURG, Florence, Oreg. Filed May 5, 1892. Serial No. 431,939. (No model.)

Claim.—1. The plow described, consisting of the beam having recesses and a vertical opening and socket, the plow having a boss, recesses, and tongues and wear-plates, the pivot-bolt, and the pivoted lever having a bent end to hold the plow in its adjusted position, and a spring acting on the lever, as set forth.

2. The herein-described plow, consisting of the beam provided with vertical opening *a*, socket *b*, and transverse grooves with tongues, the plow-body having threaded bars, a transverse cavity around said bars, with grooves to receive the tongues of the beam and with grooves to receive projections on the beam upon opposite sides of the socket therein, the pivot-bolt engaging the hole *a* in the beam and the opening in the socket, the stirrup on the beam, the lever pivoted on the stirrup and provided with coils engaging a coil of the stirrup with its end bent at right angles to the length of the lever, and a spring acting on the lever between its bent end and its pivot, all substantially as shown and described.

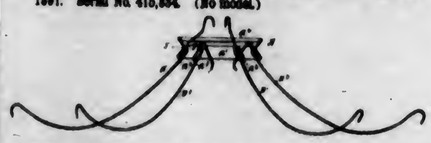


482,885. HARNESS-SNAP. THOMAS V. WALLACE, Monongahela City, Pa. Filed Nov. 21, 1891. Serial No. 412,660. (No model.)

Claim.—The herein-described snap-hook having shoulders on its opposite sides and rings adapted to close the opening of said hook, one of said rings being pivoted to the point of said hook on one side of said opening and the other ring pivoted to the hook on the opposite side of said opening, substantially as shown and described.

482,886. COMBINED RULER-GAGE AND CIRCLE-SCRIBER. LEWIS M. WEAVER and ZACHARIAS C. LESHER, Lock Haven, Pa. Filed Jan. 21, 1892. Serial No. 418,631. (No model.)

Claim.—1. In a ruler, the combination, with the two pivotally-connected sections, of a notched slide fitted in a socket formed in one of the sections and a spring-plate arranged in said socket and provided with projecting pins adapted to take into the notches in the slide to hold the same in any desired position, substantially as described.



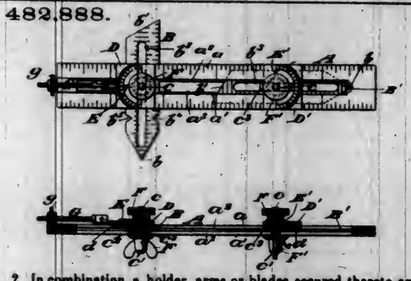
2. In a ruler, the combination, with the two sections pivotally connected together, each of said sections being composed of a central piece and metallic side plates or strips, of plates pivotally connected to the side plates and adapted to extend at right angles to the length of the ruler and means for normally keeping said plates in contact with the ruler, substantially as described.

3. In a ruler, the combination, with the two sections pivotally connected together, of a slide fitted in a socket in one of the sections and provided with an enlarged head having an integral lip or flange on one face, a plate pivotally connected to the ruler near one end and having a lip or flange formed on its free end and normally extending below the lip on the head of the slide, similar plates pivotally connected to the ruler at intermediate points of its length, and means for normally holding such plates against the ruler, substantially as described.

4. In a ruler, the combination, with the two sections pivotally connected together, of the gage-plates pivotally connected to one of the sections and adapted to fit in suitable recesses formed therein, and spring-pressed plates for holding the gage-plates against the ruler, said plates being provided with outwardly-extending pins or studs which are adapted to fit in suitable sockets in the other section when the sections are brought together, substantially as described.

482,887. SHADE-HOLDER. FREDERICK ADAMS, Allegheny, Pa., assignor to the Pittsburg Brass Company, same place. Filed Dec. 22, 1891. Serial No. 416,834. (No model.)

Claim.—1. In a shade-holder, the combination of a ring-shaped part having an outwardly-flaring lower portion provided with sockets, which are extended away from said part and provided with openings at the top and arms having tongues formed therein for removably engaging in said sockets, the said sockets being alternately large and small, and the said tongues being made to correspond, substantially as specified.

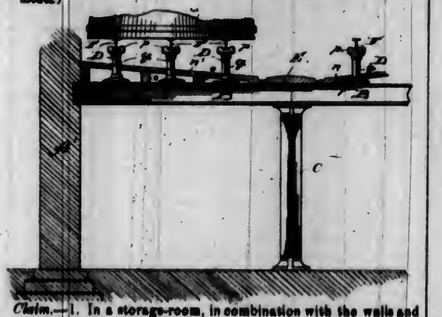


2. In a shade-holder, the combination, with a ring-shaped part having an outwardly-flaring lower portion provided with sockets, of arms having downwardly-extending tongues for removably engaging with said sockets, and portions extending above the sockets, substantially as specified.

3. In a shade-holder, the combination, with a ring-shaped part having an outwardly-flaring lower portion provided with sockets, of arms formed of wire having portions b b' b^3, the portions b b' being close together a short distance from the portion b^3, forming tongues parallel with the portions b^3 for engaging with said sockets, substantially as specified.

482,888. DOUBLE-BLADE BEVEL-GAGE. JOHN FOX, New York, N. Y. Filed Feb. 26, 1892. Serial No. 423,709. (No model.)

Claim.—1. In combination, a holder, arms or blades secured thereto and having an edgewise-tilting movement, a longitudinal movement, and a bodily movement along the holder, said blades being free to approach into engagement with each other in their bodily movement along the holder, and means for securing the blades in their several adjustments, substantially as set forth.



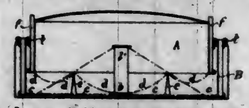
482,888.

2. In combination, a holder, arms or blades secured thereto and having an edgewise-tilting movement, a longitudinal movement, and a bodily movement along the holder, means for securing the blades in their adjustments, and an adjusting device comprising a nut and screw engaged with one of the blade-supports and with the holder for adjusting one of the blades bodily along the holder relatively to the other blade, substantially as set forth.

3. In combination, a holder consisting of two parallel sides fixed together and provided with longitudinal slots, arms or blades, supports for the arms or blades, said supports comprising spindles extending through the slots in the sides of the holder and through the blades, index-hands fixed to move with the blades as the latter are tilted edgewise, clamping-nuts on one side of the holder for locking the blade and index-hand in tilted adjustment, and clamping-nuts on the opposite side of the holder for locking the blades to the holder in their adjustments bodily along the holder, substantially as set forth.

482,889. CONSTRUCTION OF STORAGE-ROOMS. WILLIAM GRIMMER, Chicago, Ill. Filed Feb. 20, 1892. Serial No. 422,181. (No model.)

Claim.—1. In a storage-room, in combination with the walls and supporting-pillars or the like supporting-girders, shoes supported at intervals directly on the girders, and supporting-beams F for vats G or the like extending crosswise of the girders and seated on shoes thereon, substantially as described.

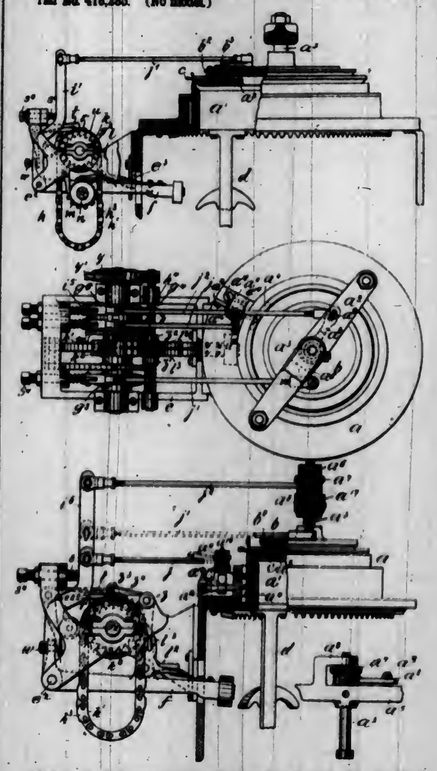


2. In a storage-room, the combination, with the walls and supporting-pillars or the like, of floor-girders supported thereon, shoes D, supported at intervals directly on the girders, supporting-beams F for vats G or the like extending crosswise of the girders and seated on shoes thereon, and a floor E, built on the girders around the shoes, substantially as described.

3. In a storage-room, the combination, with the walls and supporting-pillars or the like, of floor-girders B, supported thereon, shoes D, each having a base *r*, shaft *g*, and recessed head *p*, forming a seat supported at intervals in pairs directly on adjacent girders, supporting I-beams F for vats G or the like extending crosswise of the girders and seated in the recessed heads of said shoes, and a floor E, built on the girders around the shaft portions of the shoes, substantially as described.

482,890. BUILDING-BLOCK. CARL GRÜNZWEIG, Ludwigshafen-on-the-Rhine, Germany, assignor to Grunzweig & Hartmann, same place. Filed Aug. 7, 1891. Serial No. 401,961. (Specimens.)

Claim.—The method of manufacturing blocks, which consists in forming an aqueous solution of clay and tar to constitute a pulp, stirring the same to form a milky blue-white emulsion, adding cork chips, and molding and drying the product to cause an evaporation of the volatile components of the tar, substantially as specified.



482,891. GAS-HOLDER. KARL G. BARKHAUSEN, Hanover, Germany. Filed Jan. 9, 1892. Serial No. 417,679. (No model.)

Claim.—1. In a gas-holder, the combination, with the outer section B and the bell A, of a stationary central pillar inside the holder, a ring constructed to slide on the said pillar, a series of radial chains *d*, connecting the said ring with the periphery of the bell, and a second series of chains connecting the said ring with the periphery of the outer section B, substantially as set forth.

2. In a gas-holder, the combination, with the bell A, of a stationary central pillar inside the holder, a ring constructed to slide on the said pillar, a series of radial chains connecting the said ring with the periphery of the bell, and the supports *e*, arranged under the middle portions of the said chains, substantially as set forth.

482,892. AUTOMATIC CHAIN-MOTION FOR KNITTING-MACHINES. DAVID C. BELLIS, Elizabeth, N. J. Filed Dec. 28, 1891. Serial No. 416,285. (No model.)

Claim.—1. An automatic chain-motion for knitting-machines, provided with a pattern-chain drum having a feed-wheel, a pattern-chain, a rocker-arm, a feed-dog carried by said arm, a cam-wheel mounted on said arm and adapted to throw the feed-dog out of action, and a pawl for imparting rotary motion to said cam-wheel, substantially as and for the purposes set forth.

2. An automatic chain-motion for knitting-machines, provided with a pattern-chain, a bracket connected with the main frame of the machine, a pattern-chain drum and complemental feed-wheel connected with the bracket, a rocker-arm provided with a feed-dog and complemental cam-wheel, pawl-and-ratchet connections between said cam-wheel and bracket, and means for actuating the rocker-arm, substantially as and for the purposes set forth.

3. An automatic chain-motion for knitting-machines, provided with a tappet connected with a revolving member of the machine, a

rocker-arm in range of said tappet, a pattern-chain, a pattern-chain drum provided with a feed-wheel, a feed-dog and its complemental cam-wheel carried by said rocker-arm, and means for rotating said cam-wheel at every oscillation of the rocker-arm, substantially as and for the purposes set forth.

4. In an automatic chain-motion for knitting-machines, a pattern-chain drum provided with a feed-wheel, a pattern chain, a rocker-arm, a feed-dog, and a positively-driven cam-wheel carried by the rocker-arm, substantially as and for the purposes set forth.

5. In an automatic chain-motion for knitting-machines, a pattern-chain, a pattern-chain drum provided with a feed-wheel, a rocker-arm, an oscillating spring-actuated feed-dog on said rocker-arm, and a positively-driven cam-wheel carried by said arm and adapted to throw said feed-dog out of action, substantially as and for the purposes set forth.

6. In an automatic chain-motion for knitting-machines, a pattern-chain, a pattern-chain feed-wheel, a rocker-arm, a feed-dog carried by said arm and tending to engage the pattern-chain feed-wheel, a cam-wheel on said arm for throwing said dog out of action, a ratchet-wheel connected with the cam-wheel, and a spring-actuated pawl for operating said ratchet-wheel, substantially as and for the purposes set forth.

7. An automatic chain-motion for knitting-machines, provided with a pattern-chain drum provided with a feed-wheel, a pattern-chain, a rocking arm, a feed-dog on the rocker-arm, a counter-shaft provided with a finger for throwing the feed-dog out of action and with a radial arm, a cam-wheel engaging the radial arm, and an auxiliary feed-dog on the rocker-arm for actuating said cam-wheel, substantially as and for the purposes set forth.

8. In an automatic chain-motion for knitting-machines, a pattern-chain drum provided with a feed-wheel, a pattern-chain, a rocker-arm provided with spring-actuated feed-dogs, a rock-shaft provided with a finger engaging one of said feed-dogs, and a cam-wheel actuated by the other of said dogs for controlling the rock-shaft, substantially as and for the purposes set forth.

9. An automatic chain-motion for knitting-machines, provided with a pattern-chain drum having a feed-wheel, a pattern-chain, a rocker-arm provided with a feed-dog for operating said drum, a rock-shaft provided with a finger for throwing the feed-dog out of action, a radial arm on said rock-shaft, and a positively-driven drum or cam-chain for controlling the radial arm, substantially as and for the purposes set forth.

10. An automatic chain-motion for knitting-machines, provided with a tappet and complemental rocker-arm, a pattern-chain, a pattern-chain drum having a feed-wheel, a pattern-chain feed-dog on said rocker-arm, a rock-shaft having a radial arm, a finger projecting from said shaft into range of the feed-dog, a draw or cam chain for engaging said radial arm, and pawl-and-ratchet connections operated by said rocker-arm to feed said draw or cam chain, substantially as and for the purposes set forth.

11. In an automatic chain-motion for knitting-machines, a pattern-chain drum, a pattern-chain, a feed-dog adapted to operate a pattern-chain, a rock-shaft provided with two radial arms, a finger projecting from said rock-shaft into range of said feed-dog, a draw-chain engaging one of said radial arms, a cam-wheel engaging the other of said radial arms, and means for feeding said cam-wheel and draw-chain, substantially as and for the purposes set forth.

12. In an automatic chain-motion for knitting-machines, a rocking arm and its complemental tappet, a counter-shaft provided with a draw-chain drum, a draw-chain, pattern-chain drums keyed to said shaft and provided with star and feed wheels, a feed-wheel and a cam-wheel connected together and rotatably mounted on said shaft, a detent for engaging said star-wheel, feed-pawls connected with the rocking arm for operating said feed-wheels, a rock-shaft provided with two radial arms, respectively engaging the cam-wheel and draw-chain, and a finger projecting from the rock-shaft into range of the chain-drum feed-dog, substantially as and for the purposes set forth.

13. In an automatic chain-motion for knitting-machines, a pattern-chain drum and its complemental feed mechanism, a star-wheel connected with said drum, a detent adapted to engage the star-wheel, and a rocking arm in range of said detent, substantially as and for the purposes set forth.

14. In an automatic chain-motion for knitting-machines, a pattern-chain drum and its complemental feed mechanism, a star-wheel connected with said drum, a rocking arm provided with a lug, and a bell-crank detent having one of its arms in range of the lug and the other arm adapted to engage the respective teeth of the star-wheel, substantially as and for the purposes set forth.

15. In an automatic chain-motion for knitting-machines, a pattern-chain drum and its complemental feed mechanism, a star-wheel connected with said drum, a detent adapted to engage the respective teeth of the star-wheel, a rocking arm, and a set-screw connected with the rocking arm and having its point in range of said detent, substantially as and for the purposes set forth.

16. In an automatic chain-motion for knitting-machines, a pattern chain drum and its complemental feed-wheel, a star-wheel connected with said drum, a detent for engaging said star-wheel, and a rocking arm provided with a feed-dog and in range of said detent, substantially as and for the purposes set forth.

17. An automatic chain-motion for knitting-machines, provided with a pattern-chain, a chain-lever riding on said chain, a needle-cam ring, a system of levers connected with the needle-cam ring and operated by said chain-lever, a spring working in a sleeve in the frame of the chain-motion mechanism and adapted to engage the chain-lever, and a set-screw mounted in said sleeve and having the point thereof in engagement with said spring, substantially as and for the purposes set forth.

18. An automatic chain-motion for knitting-machines, comprising a pattern-chain, a chain-drum having feed and star wheels, a rocking arm provided with a feed-dog, a detent in range of said rocking arm and engaging said star-wheel, a latch engaging said star-wheel, means operated by said rocking arm for throwing said dog out of action, a chain-lever contacting with the pattern-chain, and a link connected with the chain-lever and adapted to be connected with the cam-rings of a knitting-machine, substantially as and for the purposes set forth.

19. An automatic chain-motion for knitting-machines, provided with a pattern-chain and its complemental feed mechanism, a chain-lever operated by said chain, a rotatable nut engaging the dial-spindle of the knitting-machine and provided with a radial arm, and a link connected with said chain-lever and radial arm, substantially as and for the purposes set forth.

20. An automatic chain-motion for knitting-machines, provided with a pattern-chain and its complemental feed mechanism, a rotatable nut engaging the dial-spindle of the knitting-machine and provided with a radial arm, and a link pivoted to the chain-lever and adjustably connected with said arm by means of a bolt engaging a slot in the arm, substantially as and for the purposes set forth.

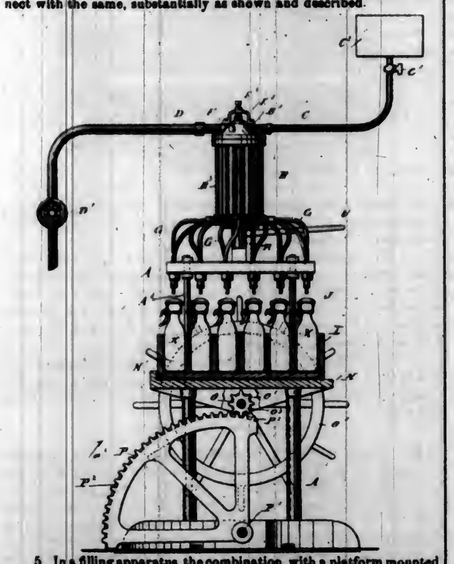
21. An automatic chain-motion for knitting-machines, provided with a pattern-chain and its complemental feed mechanism, a yoke provided with an arm and supported upon the bed of the knitting-machine, a nut rotatably mounted between said yoke and arm, a threaded dial-spindle afforded a range of end-play in apertures in said arm and yoke and engaging said nut, and means connected with said chain-lever for operating said nut, substantially as and for the purposes set forth.

22. A chain-motion for knitting-machines, provided with a rotatable nut engaging the dial-spindle of the machine, and connections between said nut and chain-motions, substantially as and for the purposes set forth.

23. An automatic chain-motion for knitting-machines, provided with a pattern-chain and its complemental feed mechanism, a chain-lever operated by said chain, a swinging arm engaging the vertically-ranging stitch-cam of the machine, a stem provided with a jaw engaging said swinging arm, a nut engaging said stem and provided with a radial arm, and a link connected with said chain-lever and radial arm, substantially as and for the purposes set forth.

24. An automatic chain-motion for knitting-machines, provided with a pattern-chain and its complemental feed mechanism, a chain-lever operated by said chain, a bracket provided with a fork and supported upon the bed of the machine, a swinging arm pivoted to said bracket and engaging the vertically-ranging stitch cams of the machine, a stem afforded a range of end-play in apertures in the fork and having a flat face in engagement with the bracket, a jaw on said stem for engaging the swinging arm, a nut rotatably mounted in said fork and engaging said stem, a radial arm on said nut, and a link connected with said radial arm and chain-lever, substantially as and for the purposes set forth.

25. An automatic chain-motion for knitting-machines, provided with a pattern-chain and its complemental feed mechanism, a chain-lever operated by said chain, a swinging arm engaging the vertically-ranging stitch-cam of the machine, a stem provided with a jaw engaging said swinging arm, a nut engaging said stem and provided with a radial arm, and a link pivoted to the chain-lever and connected with the radial arm by a nut engaging a slot in the radial arm, substantially as and for the purposes set forth.



482,898. BOTTLE-FILLING MACHINE. GEORGE CLAUS, Jr., Elizabeth, and ALBERT M. SCHOMBURG, Newark, N. J. Filed Oct. 15, 1891. Serial No. 408,836. (No model.)

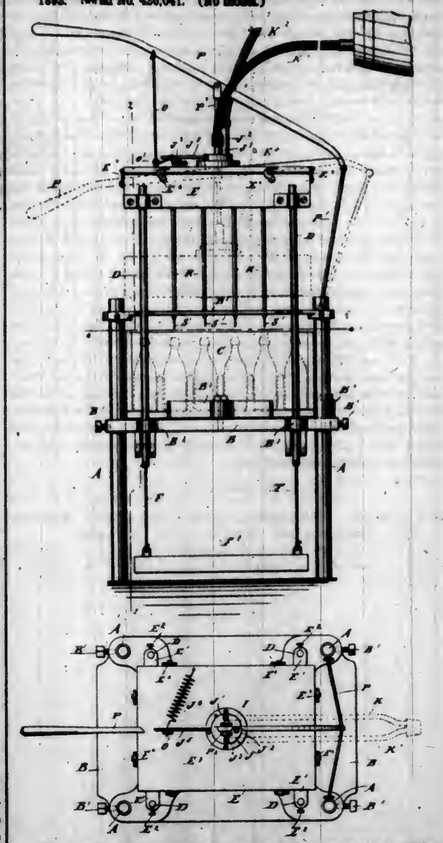
Claim.—1. In a filling apparatus, the combination, with a sirup-supply and a liquid-supply, of a measuring device, a valve mounted to turn in the said measuring device and adapted to alternately connect the said sirup-supply and the said liquid-supply, a fixed platform formed with bores connected with the said measuring device, and charging-pipes adapted to slide in the said bores and arranged to close the bores and to connect with the same, substantially as shown and described.

2. A filling apparatus comprising a sirup-supply, a liquid-supply, a head, a valve mounted to turn in the said head and adapted to alternately connect the latter with the said sirup-supply and the said liquid-supply, a base-plate provided with nozzles, and a series of tubes connecting the said base-plate with the said head, substantially as shown and described.

3. In a filling apparatus, a measuring device comprising a hollow base-plate, a head, tubes connecting the base-plate with the said head, a series of nozzles extending from the said base-plate, and pipes connected with the said nozzles, substantially as shown and described.

4. In a filling apparatus, a measuring device comprising a hollow base-plate, a head, tubes connecting the base-plate with the said head, a series of nozzles extending from the said base-plate and pipes connected with the said nozzles, a fixed platform formed with bores connected with the last-mentioned pipes, and charging-pipes adapted to slide in the said bores and arranged to close the bores and to connect with the same, substantially as shown and described.

5. In a filling apparatus, the combination, with a platform mounted to slide vertically and adapted to support the tray carrying the bottles, of a shaft mounted on the said platform, a pinion secured in the said shaft, and an eccentric segmental gear-wheel in mesh with the said pinion, substantially as shown and described.



6. In a filling apparatus, a measuring device comprising a hollow base-plate carrying outlet-nozzles, a series of tubes extending from the said hollow base-plate, a head connected with the said tubes, and a valve mounted to turn in the said head and adapted to alternately connect the said head with a sirup-supply and a liquid-supply, substantially as shown and described.

7. In a filling apparatus, the combination, with a platform mounted to slide vertically and adapted to support the tray carrying the bottles, of a shaft mounted on the said platform, a pinion secured in the said shaft, and an eccentric segmental gear-wheel in mesh with the said pinion and rims or annular flanges formed on the said pinion and gear wheel and in frictional contact one with the other, substantially as shown and described.

8. In a filling apparatus, the combination, with a sirup-supply and a liquid-supply, of a measuring device, substantially as described, a valve mounted to turn in the head of the measuring device and adapted to alternately connect the latter with the said sirup-supply and the said liquid-supply, a fixed platform formed with bores connected with the said measuring device, charging-pipes adapted to slide in the said bores and arranged to close the bores and to connect with the same, and a second platform mounted to slide toward and from the said fixed platform and supporting the tray carrying the bottles, the latter being in alignment with the said charging-pipes to engage and actuate the latter, substantially as shown and described.

9. In a filling apparatus, the combination, with a measuring device provided with a hollow base-plate, of a valve seated in the said base-plate and connected with the outside, and means for opening the said valve to let out air and gas from the said base-plate, and a spring for holding the said valve to its seat, substantially as shown and described.

482,894. BOTTLE-FILLING MACHINE. GEORGE CLAUS, Jr., Elizabeth, and ALBERT M. SCHOMBURG, Newark, N. J. Filed Mar. 23, 1892. Serial No. 426,041. (No model.)

Claim.—1. In a bottle-filling apparatus, the combination, with a filling-tank mounted to slide vertically and provided with single compartments formed by longitudinal and transverse partitions in the said tank, of an inlet-valve held on the cover of the said tank and controlling the filling of the several compartments, a filling-pipe extending from the bottom of each compartment, and a valve held in each filling-pipe and provided with a rod extending below the end of the said filling-pipe at the time the valve is seated on the upper end of the said filling-pipe, substantially as shown and described.

2. In a bottle-filling apparatus, the combination, with a filling-tank mounted to slide vertically and provided with single compartments formed by longitudinal and transverse partitions in the said tank, of an inlet-valve held on the cover of the said tank and controlling the filling of the several compartments, a filling-pipe extending from the bottom of each compartment, and a valve held in each filling-pipe and provided with a rod extending below the end of the said filling-pipe at the time the valve is seated on the upper end of the said filling-pipe, the said inlet-valve being adapted to close at the downward movement of the said tank to shut off the supply and connect the tank with the outer air while the valve in the filling-pipe opens when the tank moves into a lowermost position, substantially as shown and described.

3. In a bottle-filling apparatus, the combination, with a tank, of an inlet-valve held on the said tank and comprising a plate attached to the said tank and formed with inlet-apertures and a gas-escape aperture, which apertures lead to the interior of the tank, a valve-disk mounted to turn on the said plate, inlet-pipes held on the said disk and adapted to register with the said inlet-apertures, and a gas-escape pipe held in the said disk and adapted to register with the said escape-aperture at the time the other inlet-pipes register with their corresponding inlet-apertures, substantially as shown and described.

4. In a bottle-filling apparatus, the combination, with a fixed plat-

form adapted to support the tray carrying the bottles, of a counter-balanced filling-tank mounted to slide toward and from the said platform and provided with longitudinal and transverse partitions forming single compartments, filling-pipes secured on the bottom of the said tank, one for each compartment, the said pipes being adapted to pass into the bottles to be filled, a valve held on the upper end of each filling-pipe, and a rod extending from each valve through the corresponding filling-pipe to project below the end of the latter at the time the valve is seated, substantially as shown and described.

5. In a bottle-filling apparatus, the combination, with a fixed platform adapted to support the tray carrying the bottles, of a counter-

said chambers into the cooking-oven, substantially as described, and for the purpose set forth.

2. In a cooking apparatus, a hot-water chamber, a hot-air chamber surrounding the same, and a cooking chamber or oven arranged above and communicating with said chambers, in combination with means for regulating and cutting off the communication between the chambers, and a damper for controlling the admission of cold air into the hot-air chamber, or vice versa, as desired, substantially as hereinbefore described.

3. The cooker, substantially as hereinbefore described, consisting

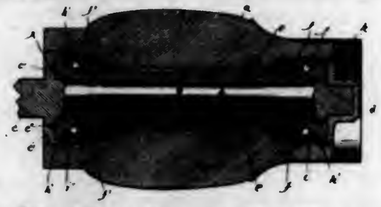
in line with the outer edge of the arm to which it is attached sufficiently to meet the line of the outer edge of the other arm and extended at the opposite side of said hinge into the angle formed by extending the main portion of the inner edges of said arms in direct lines meeting adjacent to said shaft, and the portions of said plates so extended having notches D, which register in line with the inner edge of one of said arms when the square is open, and a key hinged by one end to said inner edge and adapted to have the other end extend into said notches, substantially as shown and described.

2. In a square, the combination, with one of the arms of said

form adapted to support the tray carrying the bottles, of a counterbalanced filling-tank mounted to slide toward and from the said platform and provided with longitudinal and transverse partitions forming single compartments, filling-pipes secured on the bottom of the said tank, one for each compartment, the said pipes being adapted to pass into the bottles to be filled, a valve held on the upper end of each filling-pipe, and a rod extending from each valve through the corresponding filling-pipe to project below the end of the latter at the time the valve is seated, substantially as shown and described.

5. In a bottle-filling apparatus, the combination, with a fixed platform adapted to support the tray carrying the bottles, of a counterbalanced filling-tank mounted to slide toward and from the said platform and provided with longitudinal and transverse partitions forming single compartments, filling-pipes secured on the bottom of the said tank, one for each compartment, the said pipes being adapted to pass into the bottles to be filled, a valve held on the upper end of each filling-pipe, and a rod extending from each valve through the corresponding filling-pipe to project below the end of the latter at the time the valve is seated, and an inlet-valve held on the top of the said filling-tank and arranged to automatically close on the downward movement of the said tank, so that the supply is cut off at the time the valves in the filling-pipes open to discharge their contents into the individual bottles, substantially as shown and described.

6. In a bottle-filling apparatus, the combination, with a counterbalanced tank mounted to slide vertically, of a valve held on the said tank and provided with a disk mounted to turn and connected with the filling-pipes, a spring-pressed handle extending from the said disk, a rope connected with the said handle, and a lever for controlling the sliding motion of the said tank and connected with the said rope, substantially as shown and described.



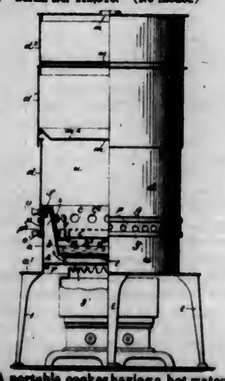
482,895. WHIP-CANE. MELANCTHON O. FELKER, Springfield, Ohio. Filed Apr. 8, 1892. Serial No. 428,257. (No model.)

Claim.—1. As an improvement in whip-canes, the combination, with a hollow open core of sheet metal wound in a spiral form with an open channel between the edges, substantially as shown and described, of a plug at the lower end within the core, a tip-ferrule of compressible metal at the lower end, having spiral grooves indented into the same while mounted on the end, whereby the plug resists the compressive action in forming the grooves and the latter maintain the tip-ferrule in place, and a whip end having a matching-ferrule adapted to screw upon said tip-ferrule for use as a whip and to be mounted within the core for use as a cane.

2. As an improvement in whip-canes, a special form of whip end, consisting of a tapering and spirally-wound sheet-metal core with open edges to give flexibility, a filling of rattan within said core to prevent the buckling of the core at the edges when bent extremely, an outer capping of overlapping layers, a rawhide tip extension inserted within said core and covering, a hollow open core adapted to receive said whip end and constitute the stock of the whip, wrapping-layers outside said stock to give body thereto, a stiffening-tube at the butt-end, a cap therefor, a stiffening-plug at the outer end of the stock to solidify the core, a tip-ferrule inclosing said end and layers and held thereon by indented spiral grooves, substantially as shown and described, and a matching ferrule secured to the whip end to mount the latter on the stock for use as a whip.

482,896. BALL-BEARING FOR VEHICLE-WHEELS. EDWARD S FRASIER, Aurora, Ill. Filed Mar. 19, 1892. Serial No. 425,634. (No model.)

Claim.—1. The combination, with a hub, of bushes *f f'*, a sleeve *g*, having collars *h h'*, and balls interposed between the collars *h h'* and the bushes *f f'*, substantially as described.



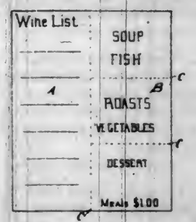
2. The combination, with a wheel-hub, of a non-rotary cylindrical sleeve on which the hub revolves, ball-bearings located at opposite ends of the sleeve, and collars secured to the ends of the sleeve and adjustable thereupon for the purpose of retaining the sleeve in position and preventing its displacement when the hub is removed from the axle-spindle, substantially as described.

3. The combination, with a hub having a sleeve *c* and bushes *f f'*, of a sleeve *g*, having collars *h h'* adjustably secured thereon, and balls interposed between said collars and the bushes *f f'*, substantially as described.

482,897. METHOD OF MAKING CHEESE. JOHAN D. FREDERIKSEN, Little Falls, N. Y., assignor of one-half to David H. Burrell, same place. Filed Jan. 30, 1891. Serial No. 379,633. (No specimens.)

Claim.—The herein-described method of treating milk or skim-milk for incorporating the albumen in the curd, which consists in heating the milk or skim-milk to a temperature at which the albumen is coagulated or thickened and prepared for incorporation with the curd, then cooling the milk to a temperature which admits of restoring to the sterilized milk the property of being curdled by rennet, then adding to it a starter or ferment to restore this property and allowing the same to act upon or develop in the milk, and then curdling the milk by adding the rennet, substantially as set forth.

482,898. COOKER. JOHN H. GARDNER, Providence, R. I. Filed Nov. 20, 1891. Serial No. 412,510. (No model.)



Claim.—1. A portable cooker having a hot water or steam chamber at the bottom, an annular hot-air chamber surrounding the walls of said steam-chamber, a cooking oven or compartment above the steam-chamber, and dampers for controlling the admission of steam and hot air or products of combustion, either combined or singly, from said chambers into the cooking-oven, substantially as described, and for the purpose set forth.

2. In a cooking apparatus, a hot-water chamber, a hot-air chamber surrounding the same, and a cooking chamber or oven arranged above and communicating with said chambers, in combination with means for regulating and cutting off the communication between the chambers, and a damper for controlling the admission of cold air into the hot-air chamber, or vice versa, as desired, substantially as hereinbefore described.

3. The cooker, substantially as hereinbefore described, consisting of the normally-stationary base portions *a b*, having apertured sides separated from each other to form the annular hot-air chamber *b*, the axially-movable collar or extension *d*, having an apertured pan *c*, secured thereto and fitting into the base portion *b* and forming a space b^2 between them, a cover or top for the collar, and a damper arranged to adjust the openings formed in the sides of the base *a*, all combined and adapted for operation substantially as set forth.

4. In a cooker provided interiorly with a hot-water chamber, a hot-air chamber, and a cooking chamber or oven and having adjustable openings communicating with said chambers for controlling the admission of steam and hot air into the said oven, the combination therewith of an exterior indicator or index arranged to show the relation of the several openings, substantially as hereinbefore described.

482,899. MEAL-CHECK. FRANK C. GELLENBECK, Chicago, Ill., assignor, by mesne assignments, to Charles R. Padgett and Charles C. Denton, same place. Filed Aug. 27, 1891. Serial No. 403,884. (No model.)

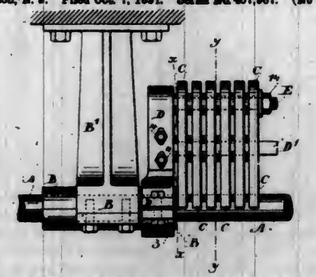
Claim.—1. The combination, with a menu-card, of two or more checks detachably secured thereto, two of said checks being designated, respectively, as "guest's check" and as "cook's check," so as to make the remainder incomplete as a bill of fare, and hence useless for another guest.

2. The combination of a menu-card having a bill of fare on its face, with a check or checks upon the reverse side thereof, and placed so that when removed the bill of fare will be mutilated, so as to make the remainder incomplete as a bill of fare, and hence useless for another guest.

482,900. FOLDING SQUARE. WILLIAM H. GOLDSBERRY, Chicago, Ill. Filed Nov. 10, 1891. Serial No. 411,456. (No model.)

Claim.—1. In a square, the combination of an arm A, an arm B, plates A' and B', applied to one side of said arms and overlapping and hinged to each other by the plate C and each extended past said shaft in line with the outer edge of the arm to which it is attached sufficiently to meet the line of the outer edge of the other arm and extended at the opposite side of said hinge into the angle formed by extending the main portion of the inner edges of said arms in direct lines meeting adjacent to said shaft, and the portions of said plates so extended having notches D, which register in line with the inner edge of one of said arms when the square is open, and a key hinged by one end to said inner edge and adapted to have the other end extend into said notches, substantially as shown and described.

2. In a square, the combination, with one of the arms of said square, of a clamp F, having a flexible body F', applied to one side of and along the edge of said arm, and having fingers F^2 extending around the edge of said square and resting normally in contact with the face of the arm opposite said body F', and the portions of said body F' supporting said fingers being normally curved away from said arm, substantially as shown and described.



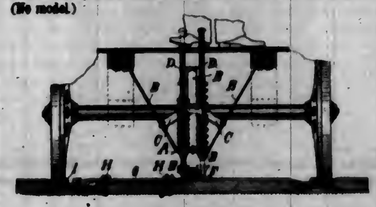
482,901. ART OF MOLDING. FRED E. GORDON, Allegheny, Pa. Filed Aug. 15, 1891. Serial No. 402,756. (No specimens.)

Claim.—1. As a new composition of matter, facing material for green-sand molds, consisting, essentially, of molding-sand containing a binding material, such as loam and finely-pulverized rosin thoroughly intermingled, substantially in the proportions specified.

2. In the art of green-sand molding, the improvement which consists in facing the mold by applying to the pattern a layer of thoroughly-intermingled molding-sand and rosin and then filling the flask with heap-sand, which forms a backing for the facing, substantially as and for the purposes described.

3. In the art of green-sand molding, the improvement which consists in dusting the pattern with lycopodium and then forming the mold, substantially as and for the purposes described.

482,902. MEANS FOR REDUCING FRICTION. GEORGE M. GUERRANT, New York, N. Y., assignor to himself and Theodore F. Young, Clinton, N. J. Filed Oct. 7, 1891. Serial No. 407,987. (No model.)



Claim.—1. The combination, with the shaft, arbor, or spindle, and the bearing for the same, of magnets with their poles in close proximity to the moving surface and means for holding and adjusting the position of such magnets around the shaft, whereby the direction in which the magnets act can be varied to lessen friction, substantially as specified.

2. The combination, with the shaft or other article, of a bearing for the same, having a circular projection around the shaft, a frame and clamps for securing the same to the circular projection, and permanent magnets supported by such frame, substantially as set forth.

3. The combination, with the shaft or other article, of a bearing for the same, having a circular projection around the shaft, a frame and clamps for securing the same to the circular projection, permanent magnets supported by such frame, and arms extending from the frame, and adjusting mechanism for varying the distance between the poles of the permanent magnets and the shaft, substantially as set forth.

482,903. STREET-RAILWAY-SWITCH APPLIANCE. JAMES P. HOLDSER, Spokane, Wash. Filed Jan. 11, 1892. Serial No. 417,703. (No model.)

Claim.—The combination, in an automatic street-railway-switch appliance, of a stirrup or frame bolted to the bottom of the car-frame, two vertical rebounding pedal-rods held thereby, said rods provided with antifriction bevel-rollers, and a wedge-shaped block or shoe connected with the switch-tongue by means of a horizontal bar and adapted to be operated by said pedal-rods, all substantially as set forth.

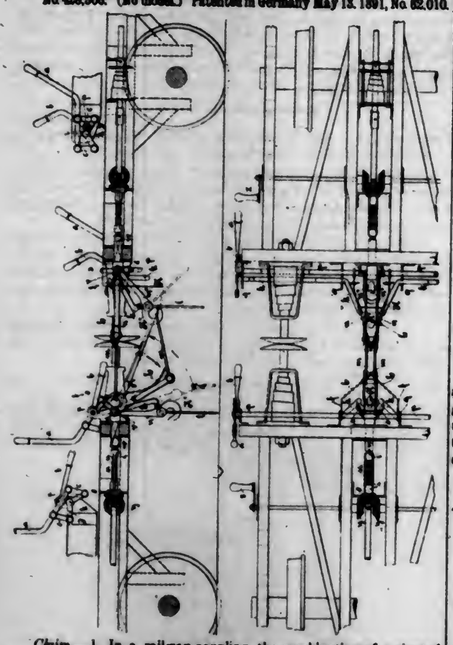
482,904. CAR-COUPLING. ROBERT KLEINERT, Breslau, Germany, assignor to Körner & Schulte, same place. Filed Apr. 8, 1892. Serial No. 428,308. (No model.) Patented in Germany May 13, 1891, No. 62,010.

walls of the chimney, the said projection being provided with slots or perforations which when taken together are substantially equal in area to the area of slots or perforations in the cover portion of said box, with a deflecting-slab supported upon uprights or legs situated at each corner of each flue and high enough above the flues to raise the said deflecting-slab a sufficient distance to form on all sides of the flue an opening equal to the area of said flue, substantially as set forth.

2. In a chimney cap or ventilator, the combination of a box consisting of a bottom portion A, suitably attached to the chimney and projecting beyond and overhanging the outer walls thereof, the said projection being provided with slots or perforations a^3, the box portion B supported on the bottom portion A, the cover portion C, and the deflecting-slab D, substantially as shown and described.

---

corrugated wires and bind the interlocking wires together and the wire of the spring into the corrugations of the interlocking wires, substantially as set forth.

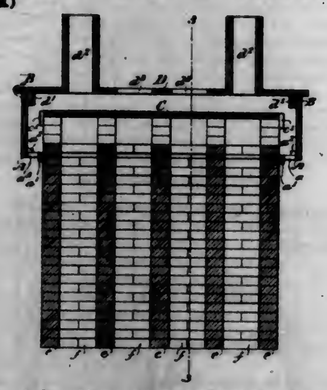


2. The combination, with a supporting-wire that is corrugated upon its horizontal or nearly horizontal portion, of a crossing key similarly corrugated and interlocking with the corrugations of the supporting-wire, and a wire spring having a nearly-circular coil at the smaller end thereof interwoven above and below the crossing wires and into the corrugations of the same, so that the respective parts are tightly wedged together, substantially as set forth.

3. The combination, with the upholstery-springs, of supporting-wire bristles and wound spirally around said cone, substantially as shown and described.

482,910. NUT-LOCK. CHARLES C. WEBSTER, Anniston, Ala. Filed Mar. 14, 1892. Serial No. 424,867. (No model.)

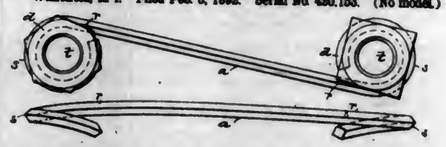
Claim.—The combination, in an automatic street-railway-switch appliance, of a stirrup or frame bolted to the bottom of the car-frame, two vertical rebounding pedal-rods held thereby, said rods provided with antifriction bevel-rollers, and a wedge-shaped block or shoe connected with the switch-tongue by means of a horizontal bar and adapted to be operated by said pedal-rods, all substantially as set forth.



482,904. CAR-COUPLING. ROBERT KLEINERT, Breslau, Germany, assignor to Körner & Schulte, same place. Filed Apr. 8, 1892. Serial No. 428,308. (No model.) Patented in Germany May 13, 1891, No. 62,010.

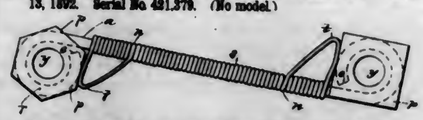
Claim.—1. In a railway-coupling, the combination of a pivoted link *n* with actuating cranked cross-shaft *k*, a pivoted loop *m*, actuating cross-shaft *p*, arms *f*, and chains *h*, substantially as specified.

2. In a railway-coupling, the combination of a pivoted link *n*, having studs *e*, with actuating cross-shaft *k*, a pivoted loop *m*, actuating cross shaft *p*, arms *f*, chains *h*, and with a pivoted hook R', having guide-flaps *s*, substantially as specified.



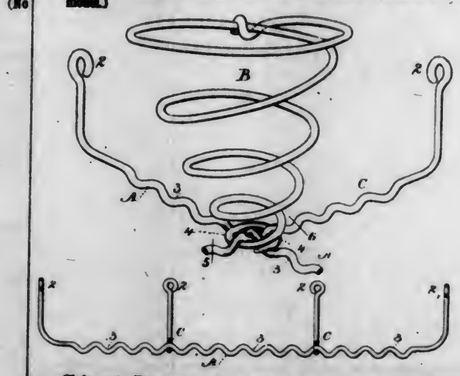
482,905. CHIMNEY CAP OR VENTILATOR. GEORGE M. MCCLOSKEY, Brooklyn, N. Y. Filed Jan. 11, 1892. Serial No. 417,895. (No model.)

Claim.—1. In a chimney cap or ventilator, the combination of a box the bottom of which projects beyond and overhangs the outer walls of the chimney, the said projection being provided with slots or perforations which when taken together are substantially equal in area to the area of slots or perforations in the cover portion of said box, with a deflecting-slab supported upon uprights or legs situated at each corner of each flue and high enough above the flues to raise the said deflecting-slab a sufficient distance to form on all sides of the flue an opening equal to the area of said flue, substantially as set forth.



2. In a chimney cap or ventilator, the combination of a box consisting of a bottom portion A, suitably attached to the chimney and projecting beyond and overhanging the outer walls thereof, the said projection being provided with slots or perforations a^2, the box portion B, supported on the bottom portion A, the cover portion D, having slots or perforations d^2, the said slots or perforations d^2 being substantially equal in area to the area of the slots or perforations a^2 when taken together, with the deflecting-slab C, supported within said box above the flues by means of legs or supports situated at each corner of each flue and of a height sufficient to raise the said deflecting-slab high enough to form an opening on all sides of the flue equal to the area of the flue, substantially as set forth.

482,906. NUT-LOCK AND BOLT-TIGHTENER. JOHN G. PERRY, Wakefield, R. I. Filed Feb. 3, 1892. Serial No. 420,153. (No model.)



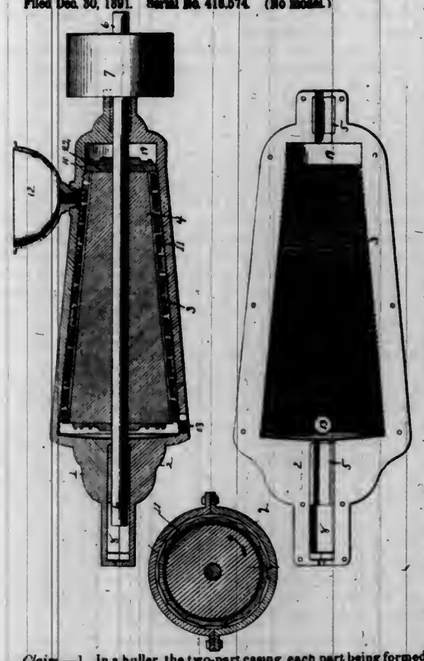
Claim.—A nut consisting of a metallic bar having a spring circle at each end and an intermediate section springing up to yieldingly engage the lower edge and corner of the nut, said bar having one or more inclined sloping faces in cross-section over which the corners of the nut will ride and depress the locking-bar when force is applied, substantially as set forth.

482,907. NUT-LOCK. JOHN G. PERRY, Wakefield, R. I. Filed Feb. 13, 1892. Serial No. 421,379. (No model.)

Claim.—A nut-lock and bolt-tightener having a metallic bar with its ends bent around and down to encircle the bolts and form stiff spiral springs, with a wire wound around the bar between the circled ends and bent to form loops or tongues having their outer ends on the inner sides of the circles raised above the plane of the circles to prevent the nut from turning back, substantially as and for the purpose set forth.

482,908. SPRING-SUPPORT FOR UPHOLSTERY. JOHN A. STAPLES, Newburg, N. Y. Filed Mar. 10, 1892. Serial No. 424,590. (No model.)

Claim.—1. The combination, with a wire spring in which the coil of wire is circular, or nearly so, at the smaller end, of corrugated interlocking crossing wires with which the nearly-circular end of the spring is interwoven, so as to wedge tightly above and below the respective corrugated wires and bind the interlocking wires together and the wire of the spring into the corrugations of the interlocking wires, substantially as set forth.

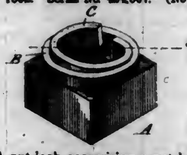


2. The combination, with a supporting-wire that is corrugated upon its horizontal or nearly horizontal portion, of a crossing key similarly corrugated and interlocking with the corrugations of the supporting-wire, and a wire spring having a nearly-circular coil at the smaller end thereof interwoven above and below the crossing wires and into the corrugations of the same, so that the respective parts are tightly wedged together, substantially as set forth.

3. The combination, with the upholstery-springs, of supporting-wires having corrugations throughout their nearly-horizontal portions and bent upwardly at the ends and terminating with eyes or connections by which the ends of the wires are secured to the wooden frame, the corrugations in the wires being adapted to receive the wires of the springs at the lower ends of such springs to prevent the springs slipping upon the wires, substantially as set forth.

4. The combination, with upholstery-springs, of supporting-wires crossing each other beneath the respective springs, such wires having corrugations sufficiently close together to allow the positions of the intersections to be varied to adapt them to the positions of the springs, and the corrugations forming receptacles for the coils of wire at the ends of the springs, whereby the springs are held in position by the corrugations of the wire, substantially as set forth.

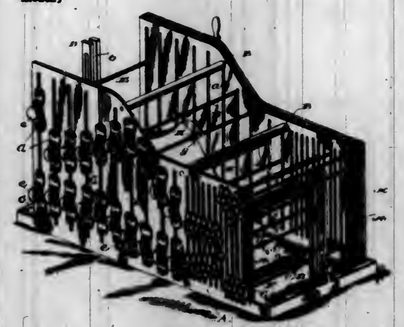
5. The combination, with the upholstery-springs, of supporting-wires having ends that are adapted to be secured to the seat-frame, the substantially horizontal portion of one or more of the crossing wires being corrugated to form receptacles for the coils of wire at the ends of the springs and with which wires the spring is interwoven, so as to bind tightly above and below the crossing wires and hold the wires and springs firmly together, substantially as specified.



482,909. COFFEE-HULLER. WILLIAM H. B. STOUT, Chicago, Ill. Filed Dec. 30, 1891. Serial No. 416,574. (No model.)

Claim.—1. In a huller, the two-part casing, each part being formed with grooves on its inner periphery, adapted to form a continuous spiral groove when the said parts are secured together, the ribs between said grooves having flat surfaces, whereby the ribs as an entirety are adapted to form a polygonal internal surface, substantially as shown and described.

2. In a huller, the combination, with the two-part casing, each part being formed with grooves on its inner periphery and adapted to form a continuous spiral groove when said parts are secured together, the ribs between the grooves having flat surfaces, whereby the same as an entirety form a polygonal surface, of a revoluble cone arranged between the parts of the casing and covered with flexible material bearing wire bristles and wound spirally around said cone, substantially as shown and described.



482,910. NUT-LOCK. CHARLES C. WRENSHALL, Anniston, Ala. Filed Mar. 14, 1892. Serial No. 424,867. (No model.)

Claim.—1. A nut-lock comprising a nut having a collar projecting from the face of the nut back from the corners thereof and around the bolt-opening for the reception of the washer or lock, and a split spring washer or lock seated in said collar and held therein by frictional contact against the wall of the collar, a portion of the washer on one side of its split projecting outside of the collar, substantially as and for the purposes described.

2. In a nut-lock, a nut having a recess formed in the body of the nut around the bolt-opening therein and provided with a collar projecting from its face around the opening for the bolt, the inner circumference of said collar coinciding with that of said recess, whereby a seat for a washer is formed partly in the body of the nut and partly in said collar, and a spring washer or lock located in said seat and having a portion projecting outside of the collar, substantially as and for the purposes described.

482,911. CONFORMATOR. ABRAHAM S. ADLER, Baltimore, Md. Filed Nov. 5, 1891. Renewed Aug. 24, 1892. Serial No. 443,944. (No model.)

Claim.—1 In a conformator, transversely-mounted vertically-slidable rods arranged in upper and lower series and adapted to delineate the outlines of a last introduced between them.

2. In a conformator, a frame vertically slotted, an upper and lower series of vertically-adjustable horizontal rods slidable in said frame, and a last or form adapted to be introduced between the rods of the upper and lower series.

3. In a conformator, a frame having a double series of horizontal rods mounted to slide vertically therein, the rods of one series occupying the upper part of the frame and those of the other series the lower portion of said frame, a form adapted to be introduced between said series of rods, and a diagram or sheet adapted to be brought into contact with the ends of the rods, whereby the outline of the inserted form is transferred to the diagram or sheet.

4. In a conformator, the slotted sides and the double series of rods adapted to be adjusted toward and from each other, in combination with standards at the opposite ends of the machine, rods adjustably fitted thereto, and a last or form suspended from said end rods between the double series of rods.

5. In a conformator, the slotted sides and the double series of rods held by friction and adjustably secured so that the rods of one series may be moved toward and from those of the other series, in combination with slotted end standards horizontally and vertically suspended from said latter rods between the double series of rods, and a diagram or sheet adapted to be brought against the ends of the double series of rods, whereby the outline of the last or form is transferred to the diagram or sheet.

6. In a conformator, the slotted sides and slotted end standards, the upper and lower series of transverse rods slidable from opposite ends of the slotted sides and having ends protruding, one of said ends having a spring and adjusting-nut and the others being pointed, and a

hinged platform or plate carrying a diagram or sheet adapted to be brought against the pointed ends of the rods, whereby the outline of an object inserted between the double series of rods is indicated upon the diagram or sheet.

7. In a conformator, the slotted sides, the transverse rods mounted therein in double series, one series occupying the upper portions of the slots and the other the lower portions thereof, blocks mounted to slide upon the rods of both series and having pins adapted to be adjusted against a form introduced between said double series of rods, the blocks on the lower series of rods having pins projecting, also, from their lower sides, and diagrams or sheets adapted to be pressed against the

Claim.—1. An insulator consisting of a cylinder of insulating material and a holder wherein the said cylinder is placed and loosely held, the said holder being shaped to partially inclose the cylinder, and thereby keep it in place, substantially as described.

2. An insulator consisting of a cylinder of insulating material and a holder wherein the said cylinder is placed and loosely held, the said holder being provided with lips or projections which partially inclose the cylinder, and thereby keep it in place, substantially as described.

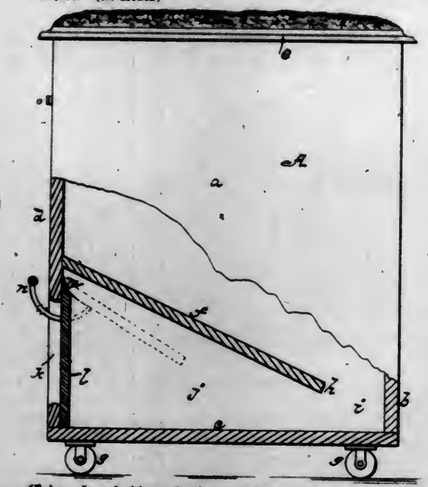
3. An insulator consisting of a cylinder of insulating material and a trough-shaped holder wherein the said cylinder is placed and loosely held, the said holder having lips or projections which partially inclose

Claim.—1. In a suspender-buckle, the combination of a rigid frame made rectangular, having side loops *a a* adjacent to the lower cross-bar of said rigid frame, a back plate clamped to the sides and lower cross-bar of the frame, and a swinging hook-carrying frame secured to the rigid frame by being passed through the loops *a a*, the transverse portion of said hook-carrying frame being bent out of line with the portion which engages with the loops, substantially as shown, and for the purpose set forth.

2. In a suspender-buckle, the combination of a rectangular wire frame A, having side loops *a a* adjacent to the lower cross-bar of said

swinging valve 5, also having a beveled edge, and a plate 3, located above the hinge, substantially as shown, and for the purpose set forth.

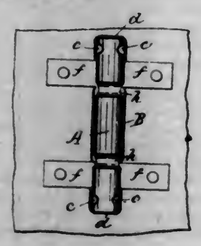
482,917. MACHINE FOR CUTTING LATH-YARNS. HENRY S. DIX, Chelsea, Mass., assignor to Sylvester B. Hinckley, same place. Filed Feb. 24, 1891. Serial No. 382,420. (No model.)



hinged platform or plate carrying a diagram or sheet adapted to be brought against the pointed ends of the rods, whereby the outline of an object inserted between the double series of rods is indicated upon the diagram or sheet.

7. In a conformator, the slotted sides, the transverse rods mounted therein in double series, one series occupying the upper portions of the slots and the other the lower portions thereof, blocks mounted to slide upon the rods of both series and having pins adapted to be adjusted against a form introduced between said double series of rods, the blocks on the lower series of rods having pins projecting, also, from their lower sides, and diagrams or sheets adapted to be pressed against the latter pins and the ends of the double series of rods, whereby correct outline of the inserted form is transferred to the diagrams or sheets.

8. In a conformator, the slotted sides and the double series of transverse rods slidable therein, a form adapted to be introduced between said series of pins and against which the rods are adjusted, and a hinged or pivoted plate at one side of the machine adapted to be brought against the ends of the rods, said plate having a yielding surface on which a diagram or sheet is placed.

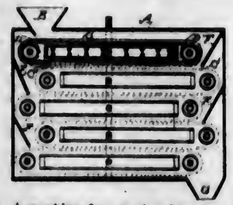


9. In a conformator having a double series of transverse rods vertically adjustable toward and from a last suspended between them, a diagram having parallel-numbered lines at opposite ends corresponding to the heel and toe portions of the last, whereby the length of the heel and toe is ascertained.

482,912. COMBINED STOOL AND COAL-RECEPTACLE. FREDERICK BORNEMANN, New York, N. Y. Filed Dec. 11, 1891. Serial No. 414,666. (No model.)

Claim.—In a fuel-box, the improved box A, having the inclined partition *f*, and the door *l*, hinged at *m* on the inner face of the front wall and provided with the handle *n*, said door serving the double purpose of closing the opening *k* and forcing the fuel rearwardly therefrom when pushed inwardly, thereby keeping the floor near the front opening clear of fuel, the handle also serving the twofold purpose of operating the door and moving the box from one place to another, all as shown and described.

482,913. INSULATOR. HERBERT H. BROOKS, Cambridge, assignor of one-half to Augustus T. Clark, Boston, Mass. Filed Oct. 26, 1891. Serial No. 409,781. (No model.)

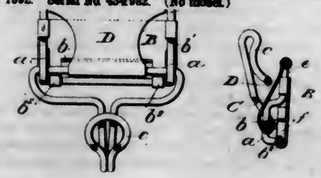


Claim.—1. An insulator consisting of a cylinder of insulating material and a holder wherein the said cylinder is placed and loosely held, the said holder being shaped to partially inclose the cylinder, and thereby keep it in place, substantially as described.

2. An insulator consisting of a cylinder of insulating material and a holder wherein the said cylinder is placed and loosely held, the said holder being provided with lips or projections which partially inclose the cylinder, and thereby keep it in place, substantially as described.

3. An insulator consisting of a cylinder of insulating material and a trough-shaped holder wherein the said cylinder is placed and loosely held, the said holder having lips or projections which partially inclose the cylinder, and thereby keep it in place, substantially as described.

482,914. BITUMINOUS-ROCK-REDUCING MACHINE. JOHN T. COCHRAN, Oakland, Cal. Filed Apr. 25, 1892. Serial No. 430,691. (No model.)



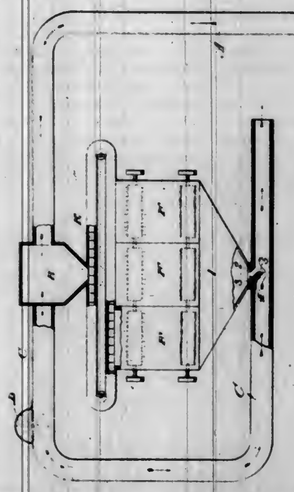
Claim.—1. A machine for treating bituminous rock, consisting of the exterior casing, a series of horizontal traveling carrying-belts, sprocket-wheels around which said belts pass, gears upon the outer projecting ends of the shafts of said wheels, whereby motion is communicated to them, a hopper in the top of the casing, through which material is delivered upon the upper belt, and a discharge-opening at the bottom of the casing, through which the material is delivered, substantially as herein described.

2. A machine for treating bituminous rock, consisting of a casing, a receiving-hopper at one end of the top, a discharge-opening at the opposite end of the bottom, a series of horizontal traveling belts situated one above the other, the receiving end of each lower belt extending beyond the discharge end of the belt above, and inclined guide-plates extending from the end of the casing to near the surface at the end of the receiving-belt, whereby the material is directed from one belt to another, substantially as herein described.

3. An apparatus for treating bituminous rock, consisting of a casing having a hopper at one end of the top, a discharge-opening at the opposite end of the bottom, a series of horizontal traveling belts situated one above the other and so arranged that the receiving end of each belt extends beyond the discharge end of the belt above, inclined guide-plates extending from the ends of the casing to near the surface at the receiving end of each belt, heating-pipes extending between the upper and lower surfaces of each belt, and a steam-supply pipe connecting with each series of pipes and having controlling-clocks, whereby the moving material may be heated and the temperature regulated, substantially as herein described.

4. A machine for treating bituminous rock, consisting of a series of horizontally-traveling belts passing around sprocket-wheels journaled within a casing, having a receiving-hopper at one end of the top and a discharge-opening at the opposite end of the bottom, the receiving end of each belt extending beyond the discharge end of the belt above, having an inclined guide by which the material is directed from one belt to the other, gear-wheels fixed upon the outer ends of the shafts which project through the side of the casing and engaging each other, so as to drive the alternate belts in opposite directions, a worm-wheel and screw and driving-shaft, whereby power is transmitted to move the belts simultaneously, and a heating apparatus consisting of closed steam-jackets disposed between the upper and lower surfaces of each belt, each being independently connected with the main supply-pipe, having clocks by which the amount of steam admitted to each jacket may be regulated, substantially as herein described.

482,915. BUCKLE. SHELDON E. COOK, Chicago, Ill. Filed May 31, 1892. Serial No. 434,982. (No model.)



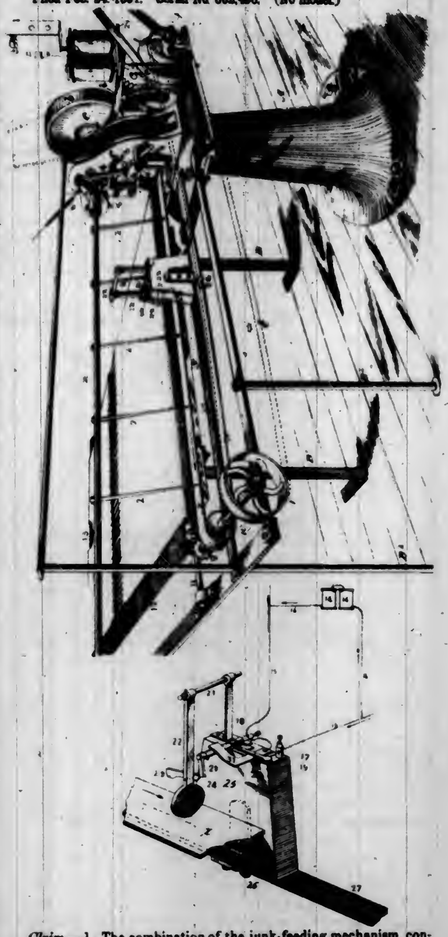
Claim.—1. In a suspender-buckle, the combination of a rigid frame made rectangular, having side loops *a a* adjacent to the lower cross-bar of said rigid frame, a back plate clamped to the sides and lower cross-bar of the frame, and a swinging hook-carrying frame secured to the rigid frame by being passed through the loops *a a*, the transverse portion of said hook-carrying frame being bent out of line with the portion which engages with the loops, substantially as shown, and for the purpose set forth.

2. In a suspender-buckle, the combination of a rectangular wire frame A, having side loops *a a* adjacent to the lower cross-bar of said frame, a back plate B, having portions which are adapted to be bent over the side pieces and cross-bar of the rigid frame, said back plate also having a forwardly-projecting serrated portion *b* above the lower cross-bar of the frame A, and a hook-carrying frame C, secured to the rigid frame by being passed through the loops thereof, the portion of said hook-carrying frame below the forwardly-projecting serrated portion of the back plate being bent out of line with the portions which engage with the loops, substantially as shown, and for the purpose set forth.

3. In a suspender-buckle, the combination, with a rectangular frame having loops or bent portions *a a*, a back plate B, rigidly secured thereto and provided with an outwardly-bent portion *b*, located above the lower cross-bar of the frame A, and a hook-carrying frame pivoted to the frame A and retained in engagement therewith by the back plate, of a plate D, attached to the transverse bar of the hook-frame and to the transverse bar of the frame A, substantially as shown.

482,916. PNEUMATIC FEEDER FOR COTTON-GINS. JAMES CORNELISON, Oakland, Ind. Ter. Filed Apr. 28, 1892. Serial No. 431,061. (No model.)

Brief.—The seed, after ginning, are blown away from the machine by the same blast of air that feeds the unginned cotton to the gins.



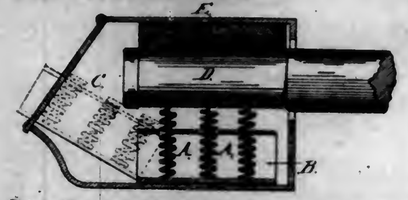
Claim.—1. In combination with a cotton-gin having a pneumatic conveyer for the cotton, an exhaust-chamber B, having a screen over the opening therein, which connects with the conveyer, and an opening for delivering the cotton from the conveyer to the gin, and an exhaust-fan for creating an air-current through the conveyer and through a discharge-pipe, said discharge-pipe being connected to the cotton-gin by a valved aperture, substantially as shown.

2. In combination with a cotton-gin having a pneumatic conveyer leading into an exhaust-chamber having a screen, means for delivering the cotton from the exhaust-chamber to the gin, and a pipe extending from the exhaust-chamber to the under side of the gin, the gin being connected by a chute to the aperture in the pipe C, said aperture having a swinging valve hinged to the side thereof, so that it will be brought to an inclined position by the exhaust-air impinging against the same, substantially as shown, and for the purpose set forth.

3. The combination, with a cotton-gin and an exhaust-pipe connected to each other by a chute and an aperture between the chute and exhaust-pipe, of a hinged valve 5 and a plate 3, located above said hinge, substantially as shown, and for the purpose set forth.

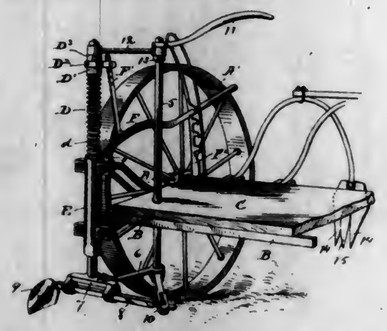
4. The combination, with a cotton-gin and an exhaust-pipe, of a chute connecting the same, an aperture 2, having a beveled edge, a swinging valve 5, also having a beveled edge, and a plate 3, located above the hinge, substantially as shown, and for the purpose set forth.

482,917. MACHINE FOR CUTTING LATH-YARNS. HENRY S. DIX, Chelsea, Mass., assignor to Sylvester B. Hinckley, same place. Filed Feb. 24, 1891. Serial No. 382,490. (No model.)



Claim.—1. The combination of the junk-feeding mechanism, consisting of a pair of driven groove-faced rolls and a driven carrying-belt, a junk-severing cutter, with means to actuate the same, a clutch mechanism by which the knife actuating devices may be rendered operative and inoperative, an electro-magnet arranged to operate the clutch-engaging devices, and an electric circuit connected with said magnet to render the same operative and provided with a circuit-breaker arranged to be actuated by contact therewith of the junk as it is advanced by the feeding device.

2. In a junk-cutting machine, the combination, with a feeding and severing mechanism, of the clearer, consisting of shaft *z*, having fingers 2, the arm 3, arranged on said shaft, the shaft *a*, arranged to be periodically rotated, and the cam 7, secured on said shaft *a* and arranged to act upon and depress the roll 6, and thereby actuate shaft *z*, all substantially as specified.



3. The combination of the grooved feed-rolls and junk carrying belt, the crank-shaft having the cutting-knife connected therewith and provided with an interlocking clutch, the electro-magnets, the armature thereof and the clutch-engaging key, and the electric circuit embracing said magnets and provided with a circuit-breaker with the actuator thereof arranged in the path of the junk as moved forward by said feeding devices.

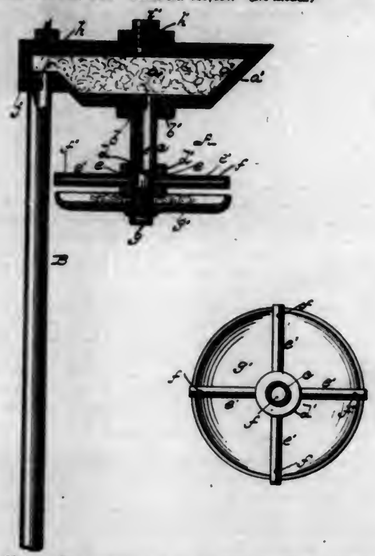
482,918. AXLE-LUBRICATOR. JOHN Q. FITCH, San Francisco, Cal., assignor of one-third to A. W. Sanborn, same place. Filed July 29, 1891. Serial No. 401,065. (No model.)

Claim.—The combination, with a journal having a bearing and an oil box or receiver beneath said journal, of one or more feeders consisting of fine wires twisted into a strand coiled into a spiral and an independent removable frame or support within said reservoir and removable therefrom through its end opening, said frame or support carrying the spirals in upright positions, with their lower ends resting upon its bottom, while their upper ends are maintained in constant yielding contact with the journal, substantially as herein described.

482,919. CULTIVATOR. JACOB GEDDERN, Cleveland, Ohio. Filed June 16, 1892. Serial No. 436,995. (No model.)

Claim.—1. In a cultivator, the combination, with a frame and a spindle supported therein and adapted to reciprocate up and down relative to the machine, said spindle carrying a cultivator-blade, of a rocking spindle also connected with the frame and with the cultivator-blade, whereby when the rock-spindle is rocked the blade is moved, substantially as set forth.

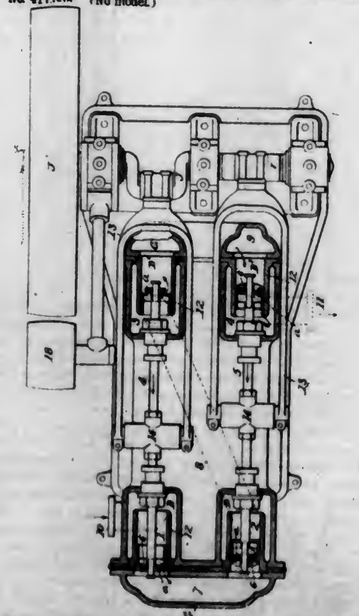
2. The combination, with a suitable frame or support, of a yieldingly-supported yoke connected therewith, a rod having sliding connection with the yoke and carrying a cultivator-tooth, and a rock-spindle connected with the rod and adapted to reciprocate the latter as the spindle is rocked, substantially as set forth.



3. The combination, with a frame or support, of a pair of spindles supported therein, one spindle constructed to reciprocate and having connected therewith a sliding tooth and the other spindle adapted to rock, the latter connected with the sliding tooth and adapted to slide the latter back and forth, substantially as set forth.

4. The combination, with a frame or support, of a pair of spindles connected together and capable of endwise movement and one adapted to rock and a cultivator-tooth having sliding connection with one spindle and the other spindle connected with this tooth, whereby to impart a sliding movement thereto when it is rocked, substantially as set forth.

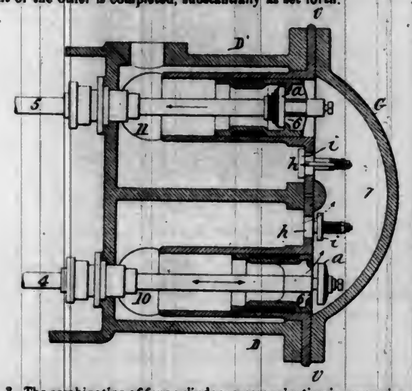
5. The combination, with a frame or support, a spindle having sliding connection with the frame, said spindle carrying a yoke, a bar sliding in the yoke and carrying a tooth, a spring for yieldingly sustaining and normally elevating the spindle, and a lever for adjusting this spindle and locking it in position, of a rock-spindle having connection with the sliding spindle, said rock-spindle connected with the sliding bar, and a lever for rocking this spindle, substantially as set forth.



6. Cultivating devices comprising a pair of shares slightly separated or divided at their lower ends and a cutter having a curved nearly-vertical forward edge located between these shares, the extreme lower ends of the teeth curving or projecting away from the blade, substantially as set forth.

482,920. VAPOR-BURNER. HARRY S. GILES, Philadelphia, Pa. Filed Oct. 31, 1891. Serial No. 410,417. (No model.)

Claim.—The combination, with a retort having the usual supply-pipe and a discharge-pipe leading from the bottom thereof, of a burner connected with said discharge-pipe and consisting of a tubular portion provided with laterally-extended tubes having perforations which are adapted to discharge upward toward the retort and a plug bearing a drip-cup and secured into the lower end of the tubular portion, substantially as described.



482,921. PUMP. MILAN W. HALL, Plainfield, N. J., assignor to Otis Brothers & Company, New York, N. Y. Filed Jan. 7, 1892. Serial No. 417,888. (No model.)

Claim.—1. The combination, in a pump, of four cylinders arranged and connected for the fluid to flow through the same successively,

valved pistons and piston-rods, each connecting two pistons of adjoining cylinders, and a crank-shaft having cranks at right angles, each connected with one of the piston-rods, substantially as set forth.

2. A pump with two pairs of connected cylinders having inlet and outlet ports and intermediate connecting-channels, a reciprocating valved piston in each of said cylinders, whereby to force the water in one direction through the same, and means, substantially as described, to move each piston to reverse the direction of one before the movement of the other is completed, substantially as set forth.

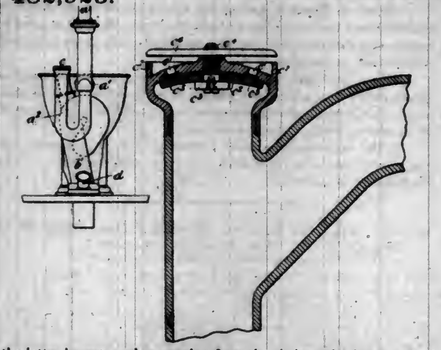
3. The combination of four cylinders communicating in succession, each having a piston with a port, and connections between the pistons in line with each other, and means for driving all the pistons, the valves of the pistons in line with each other opening in opposite directions, substantially as described.

4. The combination, in a pump, of two pairs of cylinders arranged and connected to permit the fluid to flow successively to the same, and valved pistons, those in line connected together, the valves in two pistons opening in one direction and those in the others opening in the opposite direction, substantially as described.

5. The combination, with the cylinders and pistons of a duplex or multiple pump and with the openings and valves with the pistons thereof, of auxiliary openings or passages between the ends of the cylinders and self-acting valves adapted to said openings, substantially as set forth.

482,922. PIPE-COUPLING. REINHOLD HERMAN, Crafton, Pa. Filed Nov. 27, 1891. Serial No. 413,252. (No model.)

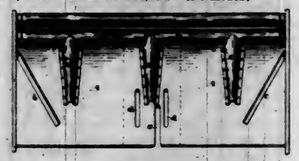
Claim.—1. In a pipe-coupling, the combination of two internally-threaded tubes, one provided with a concavo-convex flange and the other provided with a flange having a threaded perimeter, and a packing-block having a convex bearing surface supported by a thimble formed integral with the tube and flange, and an internally-threaded sleeve provided with an inwardly-projecting flange, substantially as set forth.



2. In a pipe-coupling the combination of two internally-threaded tubes, one provided with a concavo-convex flange and the other provided with a flange having a threaded perimeter, and a packing-block having a convex bearing-surface supported by a thimble formed integral with the tube and flange, and an internally-threaded sleeve provided with an inwardly projecting rim, the sleeve and one of the tubes being insulated from the other tube, substantially as set forth.

482,923. WATER-CLOSET. SIDNEY JEFFINGS and JOHN MORLEY, Lambeth, England. Filed June 6, 1892. Serial No. 436,063. (No model.)

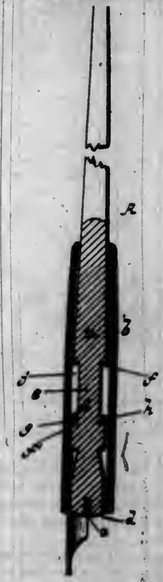
Claim.—1. In water-closets, the combination of a pan, a siphon-pipe leading from the pan, a water-supply pipe with two branches, one to the pan and the other to the long leg of the siphon, and an air-inlet valve in the upper part of the latter branch.



2. In water-closets, the combination of a pan, a siphon-pipe leading from the pan, a trap at the bottom of the long leg of the siphon, a water-supply pipe with two branches, one to the pan and the other to the long leg of the siphon, an air-inlet valve in the upper part of

482,928.

the latter branch, and an opening from the air into the lower end of the long leg of the siphon.

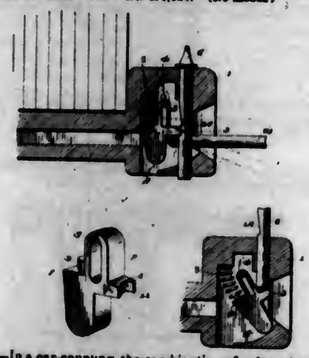


482,924. HARVESTER. MILTON KIMBERLIN, Nabb, Ind. Filed Sept. 29, 1890. Serial No. 366,609. (No model.)

Claim.—1. An improved attachment to the table of a grain-harvesting machine, which consists of supports for the straw as it is conveyed to the packers, consisting of curved sheets of suitable material, flanged to permit of their attachment to a wooden table, and cupped so as to project partially over the rollers of said table, all substantially as described.

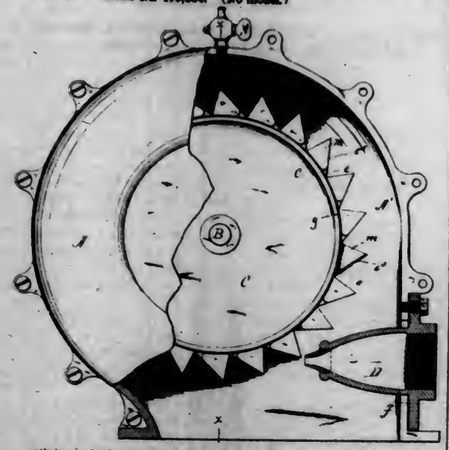
2. An improved attachment for grain-harvesters, consisting of the supports E, attachable by screws, bolts, or nails to the table of the harvester and constructed of material which is flexible and affords little friction, all as described.

482,925. PENHOLDER. GEORGE MCELWAIN, Englewood, Ill. Filed July 25, 1892. Serial No. 441,174. (No model.)



Claim.—1. The stem having the reduced portion and shoulders and the sleeve having the groove and the ring, said ring adapted to engage said shoulders, whereby the movement of the sleeve is limited, substantially as described.

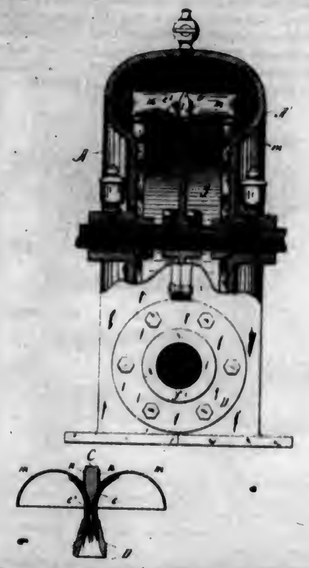
2. In a penholder having a movable sleeve, an inner annular groove, and a ring within said groove, in combination with the stem having shoulders adapted to engage said ring and limit the movement of the sleeve, substantially as described.



3. The penholder described, consisting of stem *a*, sleeve *b*, and ring *h*, said sleeve having groove *g* and the stem-shoulders *f f'*, all substantially as described.

482,926. CAR-COUPLING. BENJAMIN H. PAGES, Philippi, W. Va. Filed Apr. 27, 1892. Serial No. 430,837. (No model.)

Claim.—In a car-coupling, the combination of a draw-head, a pin-support provided at its front with a projection and having a longitudinal slot, a horizontal pivot-pin passing through the slot, a spring engaging the rear of the pin-support and forcing the same downward and outward, and a coupling-pin provided with a notch adapted to be engaged by the said projection, substantially as described.

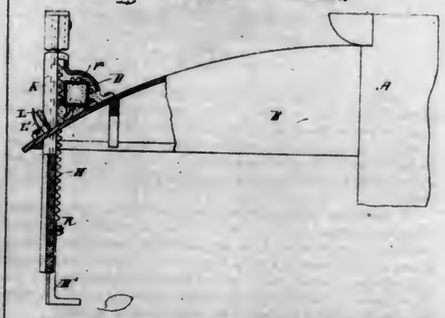


482,927. WATER-MOTOR. LEMUEL FOSTER, Providence, R. I., assignor to the Malden Machine Company, Boston, Mass. Filed Oct. 29, 1891. Serial No. 410,226. (No model.)

Claim.—1. In a water-motor, the combination of a serrated wheel whose teeth are formed with narrow forward edges and diverging sides, deflecting-wings, and a jet-nozzle having a double orifice, substantially as described.

2. In a water-motor, the combination of a serrated wheel the teeth of which have their sides inclined laterally, with deflecting-wings, and a jet-nozzle having a double orifice with converging jet-channels leading thereto, whereby converging jets are thrown upon the wheel, substantially as described.

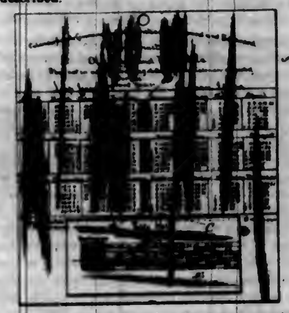
3. In a water-motor, a narrow serrated rimmed wheel formed of teeth having narrow edges and beveled sides, with deflecting-wings adjacent to the toothed periphery, and a jet-nozzle provided with jet-tubes arranged obliquely to each other, whereby jets are thrown obliquely against the teeth of the wheel and deflected laterally, substantially as described.



4. In a water-motor of the character described, a toothed motor-wheel the teeth of which form a narrow periphery, the forward edge of each tooth being narrower transversely than vertically and extending obliquely upward from the rim of the wheel in the plane of its disk, in combination with a jet-nozzle placed adjacent thereto, substantially as described, and for the purpose set forth.

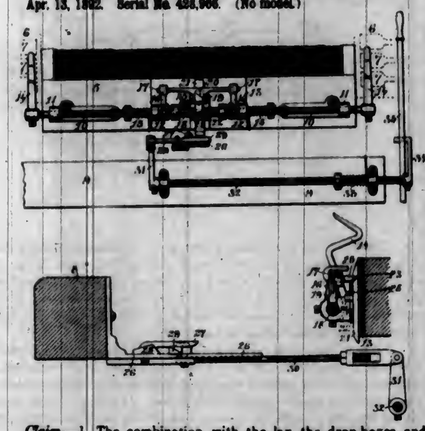
5. The combination of a motor-wheel with teeth having their sides laterally curved and adjacent curved deflecting-wings, substantially as described, and for the purpose set forth.

6. A water-motor wheel having a toothed periphery in which the sides of the teeth are inclined laterally, with deflecting-wings on its disk adjacent to said teeth, substantially as described.



482,928. SIGN FOR CARS. CHARLES S. REED, Boston, Mass. Filed Dec. 21, 1891. Serial No. 415,791. (No model.)

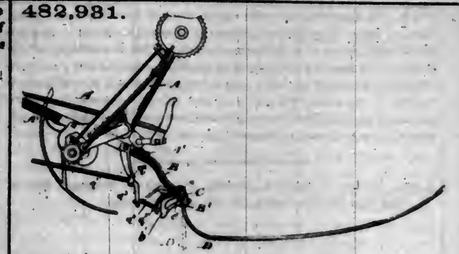
Claim.—In a car-sign device, the combination of a rotating prismatic sign-board having a pinion P, adapted to engage with and operate a movable rack H, and pointer R, connected to said rack with an auxiliary sign S, said auxiliary sign S and pointer R being so arranged as to indicate (to a person on the platform) which legend on the outside sign is displayed, substantially as and for the purpose set forth.



482,929. CALENDAR. CHARLES H. RENDELL and EDWIN S. PINNEY, Tulare City, Cal. Filed July 12, 1892. Serial No. 439,836. (No model.)

Claim.—1. In a calendar of the class described, the combination of a card having a central slot or slots and the days of the year marked upon opposite sides of said slot or slots and a card adapted to slide upon the back of the main card, said sliding card having the days of the week marked thereon in different columns, all substantially as shown and described.

2. In a calendar of the class described, the combination of a main card having a central slot or slots, the days of the ordinary year arranged upon one side of the slot or slots and the days of the leap-year arranged upon the opposite side of the slot or slots and in reverse order, the strips upon the rear face of the main card, and the sliding card having the days of the week arranged thereon in different columns, all substantially as shown and described.

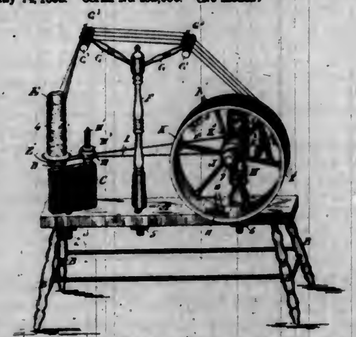


482,930. STOP-MOTION FOR LOOMS. JOHN J. SHANAHAN, Providence, R. I., assignor to the National Worsted Mills, same place. Filed Apr. 13, 1892. Serial No. 428,966. (No model.)

Claim.—1. The combination, with the lay, the drop-boxes, and the swell-fingers, the spring-operated rock-shafts 10 10, provided with the detector-fingers 14 14 and the arms 16 16, a pivoted latch-post having the transverse bar 17, adapted to be engaged by said arms 16 16, and a vertically-sliding plunger normally sustained by said latch-post, of the breast-beam 8, the picker-lever for controlling the picker-motion, a bracket-plate secured to the breast-beam, an arm pivoted to said plate and adapted to be engaged by said plunger when depressed, and mechanism intermediate said pivoted arm and the picker-lever, whereby said lever is operated, as described.

2. The combination, as hereinabefore described, with the breast-beam 8, the bracket-plate 26, provided with the guide-finger 27 and the beveled block 28, the arm 29, pivoted to such plate, the shipper-lever for controlling the picker-motion, and mechanism intermediate said pivoted arm 29 and the picker-lever, of the lay, the drop-boxes, swell-fingers in said boxes and detector-fingers pressing against said swells, a vertically-sliding plunger carried by the lay and adapted to engage the pivoted arm 29 when depressed, and means intermediate said plunger and the detector-fingers to support the same under normal conditions and adapted to release the same when the detector-fingers are pressed outward, as described.

482,931. SHEAF-CARRIER FOR SELF-BINDING HARVESTERS. JOHN F. STEWARD, Chicago, Ill. Filed June 24, 1891. Serial No. 397,343. (No model.)

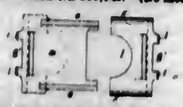


Claim.—1. A sheaf-carrier finger-joint consisting of a part secured to the broad vertical side of a bar, so as to leave a space between the said bar and said part, that the vertical axis of the finger may be free to swing at its lower end, said space at its upper end constricted to form a swivel-joint, in which the vertical axis of the finger may rock as well as turn, said finger having an arm extended from the part forming its axis to adapt it to receive a bar that shall connect said finger with others, said arm controlled between the axis of movement of the finger and the connecting-bar by a limiting-stop *e*, substantially as described.

2. A sheaf-carrier finger-joint consisting of a broad-faced bar and a joint-piece secured thereto, the vertical axis of the finger lying in a space between the joint-piece and the flat bar, the said joint-piece adapted to form a broad slot below and a constricted throat above, whereby the finger-joint may shift at the lower part of the bearing at the swivel-joint formed by the throat of said joint-piece; the said finger having an arm extending from its vertical axis and said joint-piece having a cam *d'* below the said arm and the stop *c* above said arm to aid in controlling the movement of the said arm and through it the movement of the finger, substantially as described.

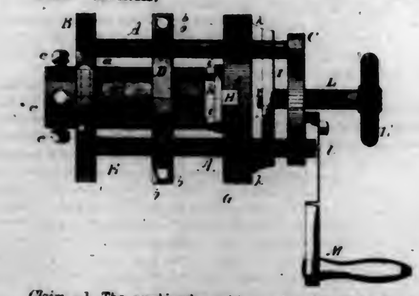
3. A sheaf-carrier finger-joint consisting of a supporting-bar having a broad side, a joint-piece so secured to said bar as to leave a space for the axis of the finger to turn and to slide at the lower part of the joint-piece, said finger having an arm extending from the vertical axis whereby the finger may be moved, a stop and cam as one piece with the said joint-piece adapted to control the arm of the said finger, consisting of the surfaces *c* and *d'*, the arm of the finger practically moving in a slot, but said slot cut away at one end, whereby when the finger is turned sufficiently far on its axis the arm part of the finger will have been moved sufficiently far to escape the action of the uppermost stop, so that it may be lifted upward and drawn out of the joint or by a reversal of the movement a new tooth may be substituted, substantially as described.

4. A sheaf-carrier finger-joint consisting of a broad-sided bar, a joint-piece secured to said bar, so as to leave a space between said bar and joint-piece for the axis of the finger to shift, said finger having an arm substantially at right angles to said axis, said joint-piece having integral with itself the stop and cam surfaces *c* and *d'*, substantially as described.



482,932. REEL FOR UNRAVELING TUBULAR-KNITTED GOODS AND WINDING THE YARN. NAPOLÉON TOURANGEAU, Montreal, Canada, assignor of one-half to Joseph Odilon Marceau, same place. Filed May 14, 1892. Serial No. 432,968. (No model.)

Claim.—1. The combination of the spindle-carrier C, having a socket-spindle E, the yarn-carrier having separating-guides G^2, and a reel or drum K, winding the yarn separately, as set forth.

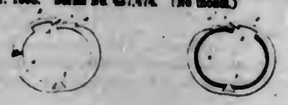


2. The combination of the reel or drum K for winding the yarns, having a series of peripheral grooves or channels to divide or separate the several yarns, a yarn-carrier having guides G^2, dividing or separating the yarns of knitted goods, a spindle-carrier C, having a sock-spindle E, on which to sleeve the knitted goods, and an endless driving-belt I, connecting the said reel and spindle, whereby the several yarns of a knitted fabric are simultaneously unraveled and separately wound upon said reel, substantially as set forth.

482,933. VEHICLE-SPRING. JEROME W. WETMORE, Erie, Pa. Filed May 18, 1891. Serial No. 393,145. (No model.)

Claim.—An adjustable bearing-plate for vehicle-springs, consisting of two separate parts adapted to be secured to the axle-tree, each said part being provided with similar vertical side plates *f*, recesses *g*, friction-rods *g*, and clips *i*, adapted to secure the said rods in the said recesses, one of the said parts being also provided with the horizontal side ribs *o* and the tongue *m*, adapted to rest on the top of the axle-tree, and the other said part being provided with the recess *l*, adapted to engage the said tongue, and the clips *k*, adapted to be bent over the said side ribs, substantially as set forth.

482,934. MACHINE FOR CUTTING THE ENDS OF SPINDLES. JAMES A. WILLIAMS, Walkerton, Ind. Filed Feb. 1, 1892. Serial No. 419,954. (No model.)

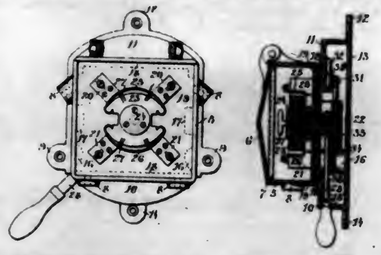


Claim.—1. The combination, with a series of rods or bars, of a disk secured at each end of said series of rods or bars, a sleeve loosely mounted in one of said disks and adapted to hold a spindle or similar device, a ring mounted to slide on said rods or bars, a screw for sliding said ring, a cutter carried by said ring, and means for revolving the machine independently of the sleeve, substantially as and for the purpose set forth.

2. The combination, with a series of rods or bars, of a disk mounted at each end of said series of rods or bars, another disk mounted on said rods or bars adjacent to the disk at one end of the device, a sleeve mounted loosely in said adjacent disks in such manner as to be incapable of longitudinal movement, a ring mounted to slide on the rods or bars, a cutter carried by said ring, means for manipulating the latter, and means for rotating the machine independently of the loose sleeve, substantially as set forth.

3. The combination, with a series of rods or bars, of disks located at the ends of said rods or bars, the disk at one end being made in separable sections and secured together, another sectional disk mounted on said rods or bars adjacent to the first-mentioned sectional disk, a sleeve loosely mounted in said sectional disks in such a manner as to prevent longitudinal movement of said sleeve, a sliding ring, a cutter carried thereby, a cross-bar carried by said sliding ring, a screw swiveled in said cross-bar and passing through a screw-threaded opening in the disk at the inner end of the machine, and an operating-wheel carried by said screw, and a handle for rotating the machine independently of the sleeve, substantially as set forth.

482,935. NUT-LOCK. JOHN W. WILLCOXON, Manassas, Va. Filed June 31, 1892. Serial No. 437,474. (No model.)



Claim.—1. The herein-described nut-lock, the same consisting of a ring split and having one of its terminals reduced to form a spring locking-tongue provided with a shoulder and its opposite terminal provided with a shoulder for engaging the same, the inner edge of the ring being reduced to form a cutting-edge, substantially as specified.

2. The herein-described nut-lock, the same consisting of a ring split and having one of its terminals reduced to form a spring locking-tongue provided with a shoulder and its opposite terminal provided with a shoulder for engaging the same, the inner edge of the ring being reduced to form a cutting-edge and provided diametrically opposite the spring-tongue with a reduction or recess to facilitate the closing of the ring, substantially as specified.

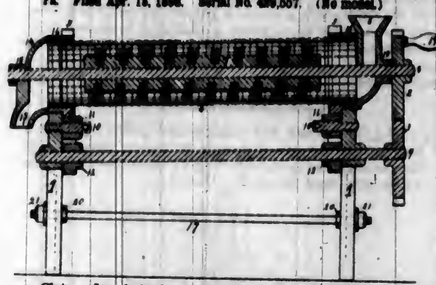
3. The herein-described nut-lock, the same consisting of a ring split and having one of its terminals reduced to form a spring locking-tongue provided with a shoulder and its opposite terminal provided with a shoulder for engaging the same, the inner edge of the ring being reduced to form a cutting-edge which diametrically opposite the spring-tongue is provided with a V-shaped recess, the inner corners of which meet when the ring is closed, substantially as specified.

4. The herein-described nut-lock, the same consisting of a ring-blank split to form opposite terminals and internally reduced to form an annular cutting-edge, one of said terminals being interiorly reduced to form a spring-tongue terminating at its front end in a locking-shoulder and the remaining terminal exteriorly reduced and provided with an inner front recess and in rear of the same with a higher or deeper shoulder, substantially as specified.

482,936. ELECTRIC SWITCH AND CASE. AUGUSTUS WRIGHT, Providence, R. I., assignor to the Hope Electric Appliance Company, same place. Filed May 31, 1892. Serial No. 434,882. (No model.)

Claim.—1. In a switching device, the combination, with the case 5, having the cover 6 hinged thereto, a depending plate 10, an upwardly-extending hood 11, a back 13, having the flange 15, and the lugs 16 and 17, extending from the inner surface of the case, of the partition or plate 19, formed of insulating material, and a switching device carried on said plate, as described.

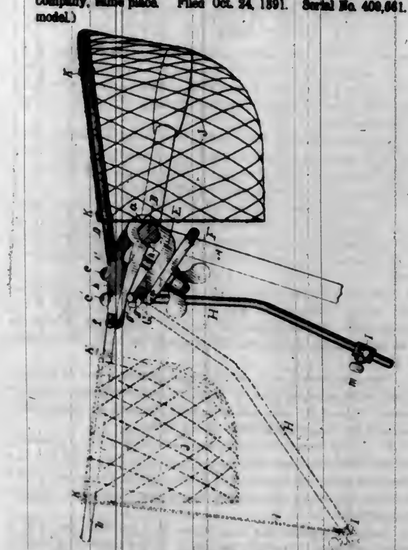
2. In an electric switching device, the combination, with contact-posts and a rotatable block carrying contact-plates, of a lever adapted to rotate said block, links pivoted to said lever, other links pivoted to the free ends of the first-mentioned links and to stationary studs, and a spring adapted to exert an inward pressure on the ends of the first-mentioned links, as described.



3. In an electric switching device, the combination, with posts carrying contacts, a block carrying connecting-plates, and a shaft suitably journaled, to which said block is secured, of the lever 28, secured to said shaft and having the extension 29, a link 30, pivoted to said extension, a link 31, pivoted to the free end of the link 30 and to a stationary stud, the link 34, pivoted to the lever, a link 33, pivoted to said link and to a stationary stud, and a spring 35, secured at its ends to the pivots A and B, as described.

4. In an electric switch, the combination, with a base, contact-posts secured thereto, a shaft journaled in a perforation in said base, a block having connection plates secured to said shaft, and a handle 37 for rotating the same, of a lever secured to said shaft at the end opposite the block, double links pivoted to the ends of said lever and to stationary studs, and means for exerting a contracting strain on the pivots connecting each pair of links, as described.

5. The combination, with the case 5, having a hinged cover, a depending plate 10, an upwardly-extending hood 11, a back 13, having the flange 15, and the lugs 16 and 17, extending from the inner surface of the case, of the insulating-partition 19, a switching device secured thereto and operated by a shaft journaled in a perforation in said partition, a lever 28, secured to the end of said shaft, an extension 29 on said lever, a link 30, pivoted to said extension, a second link 31, pivoted to the link 30 and to a stud on the partition, the link 34, pivoted to the lever 28, the link 33, pivoted to the link 34 and to a stud on the partition, and the spring 35, the ends of which are secured to



the pivots connecting the links 30 and 31 and 33 and 34, as and for the purpose described.

482,937. FRUIT-CLEANER. HENRY BARDSLEY and WALTER PARKINSON, Philadelphia, assignors of one-third to James Bardsley, Lyndell, Pa. Filed Apr. 18, 1892. Serial No. 429,507. (No model.)

Claim.—In a fruit cleaning machine, the combination of a tubular wire screen, provided at the end with hoops, each hoop formed with a supporting-tread and projecting gear-teeth, a frame at the ends, with stationary receiving and discharge heads for said screen and with bearings for treads, a central shaft provided with a driving crank-pinion and a spiral brush within said screen, a counter-shaft provided with pinions, one of which directly engages the crank-wheel, and two carrier pinions transmitting motion to the screen to revolve it in an opposite direction to that which the spiral brush revolves, substantially as set forth.

482,938. CHILD'S SEAT OR PARCEL-CARRIER FOR BICYCLES. MAURICE R. HOOD, Kalamazoo, Mich., assignor to the Kalamazoo Cycle Company, same place. Filed Oct. 24, 1891. Serial No. 409,661. (No model.)

Claim.—1. A child's seat or carrier for bicycles, having a seat part for the child to sit on, foot-rests or supports for the child's feet, and arm-rests or supports for the arms, the said parts adapted to be attached to a bicycle and made adjustable in such a manner that they can be set to carry the child either in front or behind the handle-bar, substantially as shown.

2. A child's seat for bicycles or other like vehicles, consisting of a frame attached to the bicycle and a net or bag hanging down from such frame for the child to sit in, the said net or bag having its outer edges on three sides secured to the said frame, while the edge of the net or bag on the fourth side is separate from the frame and depressed to near the level of the seat part, substantially as and for the purposes specified.

3. A child's seat for bicycles or other like vehicles, consisting of a frame attached to the bicycle and a hammock or swinging seat hanging down from such frame, which is adapted to swing independent of the frame, said hammock or seat so arranged that the child can sit squarely in it while its feet are hanging over one side, substantially as shown.

4. A child's seat for bicycles or other like vehicles, consisting of a circular and horizontally-projecting frame to encircle the body of the child and form arm-rests for the child and cords hanging down from the said frame to support the seat and child, the seat and child being free to swing independent of the said frame, substantially as specified.

5. A child's seat for bicycles or other like vehicles, made reversible, so that the front part of the seat can be set to form a back-rest and the back-rest can be set to form a seat, substantially as and for the purposes specified.

6. A child's seat for bicycles or other like vehicles, having a horizontally-projecting frame to encircle the body of the child and a net hanging down from such frame to form a seat for the child to sit in, the edge of the net on one side being separated from the frame to allow the child's legs to pass through between the net and frame, substantially as specified.

7. In a child's seat and carrier for bicycles, the elliptically-shaped frame D, net or bag J, and cord L, all adapted for use substantially as and for the purposes specified.

8. In a child's seat for bicycles, the combination of the swinging rod H, foot-rests I, and cords *l l*, substantially as and for the purposes specified.

9. A parcel-carrier for bicycles, consisting of a bag for carrying the parcels and a frame on the inside of the bag for supporting the bag and keeping the sides of the bag extended, the lower part of the bag adapted to hold and carry the parcel, while the upper part of the bag serves as a cover to come over the parcel, substantially as and for the purposes specified.

10. In a parcel-carrier for bicycles, velocipedes, or other like vehicles, the receptacle being a bag, a circular or elliptically-shaped frame for supporting the bag, consisting of a wire or rod bent around horizontally, the sides of the bag hanging down from the said frame to carry the load inside and below said frame, substantially as specified.

11. In a parcel-carrier for bicycles, velocipedes, or other like vehicles, a bag for the carrying-receptacle and a frame projecting from the handle-bar to support the bag, the said frame having a clip on its rear part to go over the handle-bar of the bicycle, in combination with a clip on the lower or opposite side of the handle-bar to clamp the handle-bar at one end and bear against the frame of the carrier or upper clip at its opposite end, and a bolt or screw passing through the said clips intermediate between their bearing-points on the handle-bar and each other to bind or clamp the clips together and against the handle-bar, substantially as specified.

12. In a parcel-carrier for bicycles, the combination of the carrier-bag J, upper clip C, supporting the frame for the bag, lower clip E, bolt G, and handle-bar B, all arranged and adapted for use substantially as and for the purposes specified.

13. In a parcel-carrier for bicycles, the receptacle being a bag, the combination, with the handle-bar and handle-bar post, of the two clips C and E, bolt or screw G, intermediate between the bearing-points of the clips, and the post brace F, having a finger *k* projecting from one side to bear against the post, all arranged and adapted for use substantially as specified.

14. In a parcel-carrier for bicycles, to be attached to and project outwardly from the handle-bar of a bicycle or other like vehicle, a post-brace to attach to the carrier-frame at one end of the brace and at its opposite end having projecting fingers *k k* to bear on opposite sides of the post to prevent the carrier from turning on the handle-bar in either direction, substantially as set forth.

15. In a child's seat or parcel-carrier for bicycles, the combination and arrangement of the clips C and E, post-brace F, and bolt G to pass through the clips and brace and bind them together against each other and the handle-bar, substantially as specified.

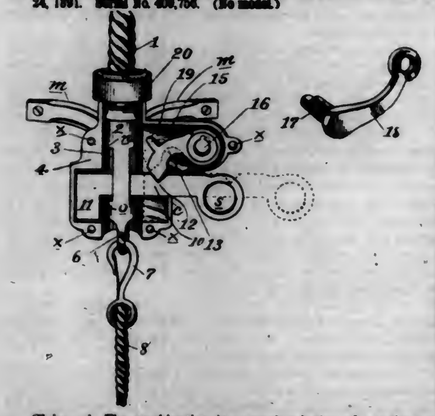
16. In a child's seat or parcel-carrier for bicycles, the combination of the clips C and E for clamping the handle-bar at one end and bearing against each other at their opposite ends, with a bolt or a screw intermediate between these bearing-points for drawing the clips toward each other and a projecting finger *k* to rest against the handle bar post, substantially as set forth.

17. In a child's seat or parcel-carrier for bicycles, a finger *k* to rest against the post, said finger provided with a slot *j* through one part for receiving a bolt to secure it to the carrier-frame, substantially as and for the purposes specified.

18. In a child's seat or parcel-carrier for bicycles, the circular or elliptically-shaped frame D, having its ends projecting outwardly from its major axis to be inserted between and held by the cross-bars *c c'* and *d d*, in combination with the said cross-bars, substantially as set forth.

19. In a child's seat or parcel-carrier for bicycles, the frame D, formed of a single wire or rod having its ends turned outwardly from the frame to be inserted into bearings in a casting or metallic piece

which is secured to the bicycle, the normal condition of the said ends of the frame D being such as to cause them to spread apart from their bearings, so that the spring-tension against the said bearings will be sufficient to hold the frame D in place and keep it from rattling, substantially as specified.



20. In a child's seat or parcel-carrier for bicycles, the frame formed of a single wire or rod which is bent around to have the two ends come nearly together, at which point the ends are turned outwardly to be inserted in bearings in a metallic piece, which is secured to the handle-bar or handle-bar post of the bicycle, the said bearings and frame so constructed that the frame can be set to stand in opposite directions to bring it either in front or behind the handle bar, substantially as specified.

21. In a child's seat or parcel-carrier for bicycles, the combination and arrangement of the bag J, frame D, clips C and E, and bolt or screw G, substantially as and for the purposes specified.

22. In a parcel carrier for bicycles, the receptacle being a bag having a cord L, running around through its upper edges to regulate the opening, a cleat *c'* for winding the cord L, around, and a frame projecting from the handle-bar to support the bag, substantially as set forth.

23. In a child's seat for bicycles, a clip E, having a groove *h* in one end to receive the handle bar and groove *g* in the opposite end to receive the foot-rest-supporting rod, substantially as set forth.

482,939. SECURING DEVICE FOR CABLES. WILLIAM F. BOSSERT, Utica, and JOHN H. FINDLAY, Ogdensburg, assignors to the Utica Electrical Manufacturing and Supply Company, Utica, N. Y. Filed Oct. 24, 1891. Serial No. 409,756. (No model.)

Claim.—1. The combination, in a securing device, of a stationary body having a vertical barrel, a holder to which a guy or supporting-cable is attached, adapted to enter the barrel as a sleeve, and a latch for engaging the holder, substantially as set forth.

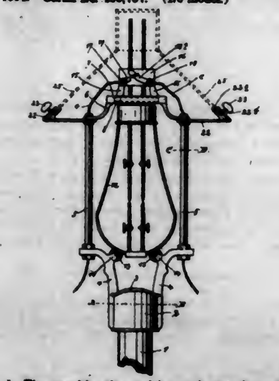
2. The combination, in a securing device, of a stationary vertical barrel, a holder to which a guy or supporting-cable is attached, adapted to enter the barrel as a sleeve, a latch for engaging the holder, and a catch for engaging the latch, substantially as set forth.

3. The combination, in a securing device, of a barrel, a holder to which a guy or supporting-cable may be attached and adapted to enter the barrel, and a latch for engaging the holder, having a downwardly-extending projection adapted to engage the holder, whereby the latch cannot be drawn until the holder is drawn down, substantially as set forth.

4. The combination, in a cable or guy supporting device, of the barrel 3, the holder 2, and the latch 10, having projection 11, substantially as set forth.

5. The combination, on a cable or guy securing device, of the fixed barrel, a holder adapted to enter the barrel and having a loop or eye at its lower end for receiving a snap or hook, a latch adapted to engage the holder, and a pawl or catch for engaging the latch, substantially as set forth.

6. The combination, in a cable or guy securing device, of a fixed vertical barrel, a holder adapted to enter the barrel as a sleeve, having hood adapted to engage and cover the upper end of the barrel, and a lock for securing the holder, substantially as set forth.



7. The combination, in a cable or guy securing device, of a fixed barrel 3, a holder 2, a latch 10, having projection 11, and pawl or catch 13, substantially as set forth.

8. The combination, in a cable or guy securing device, of a vertical fixed barrel 3, a holder 2, having loop 6, a latch 10, having projection 11, and catch 13, having a keyhole, substantially as set forth.

9. The combination, in a cable or guy securing device, of a casing forming a vertical barrel 3, a holder 2, adapted to run in the barrel and adapted to be secured to the rope or guy and having an opening 9, and loop 6, a latch 10, having projection 11, and catch 13, having a keyhole, substantially as set forth.

10. The combination, in a cable or guy securing device, of a casing forming a vertical barrel 3, a holder 2, adapted to be secured to the cable or guy and to enter the barrel and having an opening 9 and loop 6 and hood 20, a latch 10, having projection 11, and catch 13, having a keyhole, substantially as set forth.

482,940. FRAME FOR ELECTRIC-ARC LAMPS. WILLIAM F. BOSSERT, Utica, and JOHN H. FINDLAY, Ogdensburg, assignors to the Utica Electrical Manufacturing and Supply Company, Utica, N. Y. Filed Oct. 24, 1891. Serial No. 409,757. (No model.)

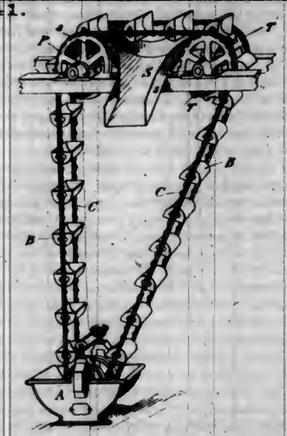
Claim.—1. The combination, with an electric-lamp frame, of insulators 13, adapted to engage and support the lower portion of the lamp, and a ring 7, adapted to surround the upper portion of the lamp and secure the same by means of insulating-pieces within the ring, substantially as set forth.

2. The combination, with an electric-lamp frame, of insulators 13, adapted to engage and support the lower portion of the lamp, and a clamping-ring adapted to surround the upper portion of the lamp and engage the same by insulators, substantially as set forth.

3. The combination, with an electric-lamp frame, of the lamp-hood and supporters therefor having a segmental portion on which the edge of the hood rests, and projecting lugs adapted to receive the edge of the hood, and a set screw for securing the hood, substantially as set forth.

4. The combination, with an electric-lamp hood, of a supporter therefor having a segmental portion 22^{a}, on which the edge of the hood rests, and projecting lugs 22^{d} and 22^{b}, adapted to receive the edge of the hood, and a set-screw for securing the hood, substantially as set forth.

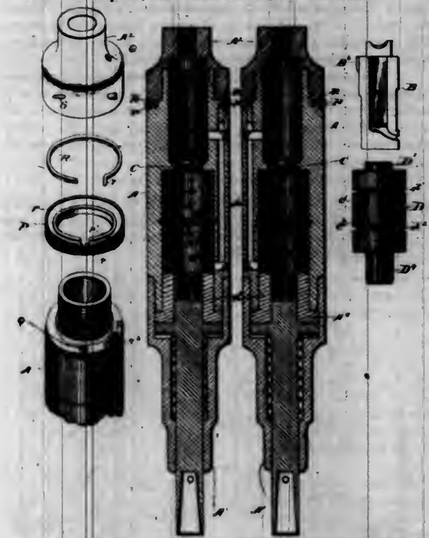
5. The combination, with an electric-lamp post frame, of a ring 7, surrounding the upper portion of the lamp, and insulators 9 and 9^{a}, projecting inside of the ring, and adjustable insulator 9^{b}, also projecting inside of the ring, substantially as set forth.



6. In a lamp frame, the combination of a socket 3, the arms 4 4, projecting therefrom, carrying insulators 13 13 and uprights 5 5, the ring-supporting arms 6, and the ring 7, surrounding the upper portion of the lamp and adapted to engage the same by insulators, substantially as set forth.

7. The combination, in a lamp-frame, of a socket 3, the arms 4, carrying insulators 13, hollow uprights 5 5, ring-supporting arms 6, engaging upon the upper ends of the uprights 5, and supporting-ring 7, which is adapted to surround and engage by adjustable insulators the upper portion of the lamp, switch-board 16 and the supports therefor, binding-post 17 and 18, and switch-lever 18^{a}, substantially as set forth.

482,941. BUCKET-ELEVATOR. JOSEPH CAVANAGH, Philadelphia, Pa., assignor to the Link-Belt Engineering Company, same place. Filed May 12, 1890. Serial No. 351,561. (No model.)



Claim.—In an endless-belt elevator, the belting and buckets of which are led off about horizontally from the head wheel or wheels, a chute composed of a vertically-curved portion located within the line of travel of the belting and buckets and adapted to receive and support in engagement with the buckets any discharge from them and

482,941.

so inclined portion adapted to deliver the load by the natural flow of the material along the bottom, substantially as shown and described.

482,942. PNEUMATIC TOOL. DANIEL DRAWBAUGH, Eberly's Mill, Pa., assignor to the Pneumatic and Electric Tool Company, New York, N. Y. Filed Apr. 30, 1892. Serial No. 431,294. (No model.)

Claim.—1. In a pneumatic tool, the combination of the cylinder, valve, air-port, beater, and projection, said ports being so arranged as that the projection closes the air-port before the beater reaches the extreme of its movement, forming an air-cushion around the projection and leaving the cross-sectional area of the projection open to the air-port, whereby the return movement may be initiated, substantially as described.

2. In a pneumatic tool, the combination, with the cylinder, valve, and air-port opening into the cylinder in line with the beater in its longitudinal movement, of the beater and co-operating projection for closing said port before the beater reaches the limit of its movement, whereby the area of the projection is available to initiate the return movement, substantially as described.

3. In a pneumatic tool, the combination, with the cylinder, valve, and air-port opening into the cylinder in line with the beater in its longitudinal movement, of the beater and the projection entering the air-port to close the same before the beater reaches the extreme of its movement, whereby an air-cushion is formed around the projection and the area of the projection is available to initiate the return movement, substantially as described.

4. In a pneumatic tool, the combination, with the cylinder, valve, and air-port opening into the cylinder in line with the beater and constituting a reduced portion of the cylinder, of the beater having the reduced end or projection entering said reduced portion of the cylinder to cut off the air-supply before the beater reaches the limit of its movement, whereby an air-cushion is formed around the projection, substantially as described.

5. In a pneumatic tool, the combination, with the casing having the cylinder and valve-chamber formed in alignment therein and the enlarged air-port in the wall between said cylinder and valve-chamber, of the beater having the projection entering said air-port to close the same before the beater reaches the limit of its movement, whereby an air-cushion is formed around the projection, substantially as described.

6. In a pneumatic tool, the combination, with the casing having the cylinder and valve chamber formed in alignment therein with the enlarged air-port in the wall between said cylinder and valve-chamber, the valve-casing in said chamber having the passage leading to said port and the valve, of the beater having the reduced end or projection entering said port before the beater reaches the extreme of its movement to close the same and form an air-cushion around the projection, substantially as described.

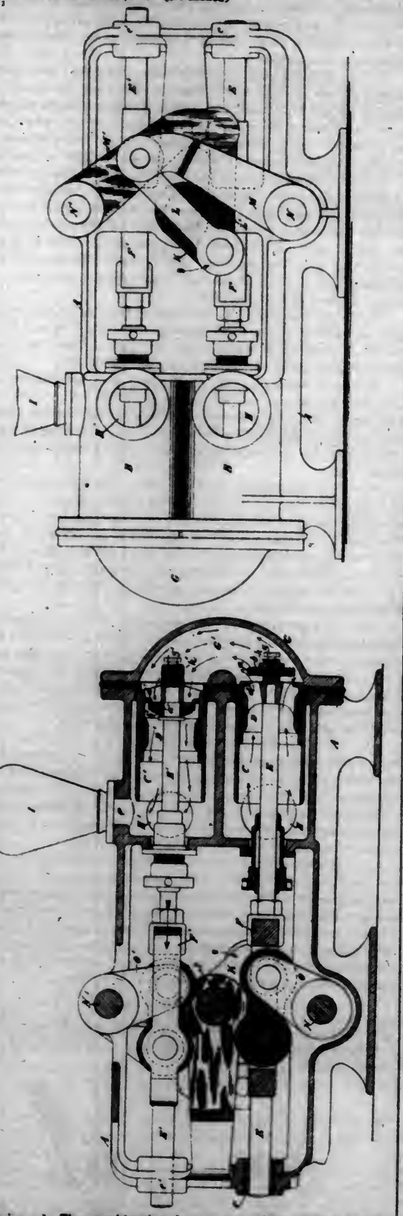
7. In a pneumatic tool, the combination, with the cylinder, beater, and valve controlling the air-passages for each other, respectively, of the annular pressure-groove in communication with the air-supply and surrounding the beater, substantially as described.

8. In a pneumatic tool, the combination, with the cylinder, valve controlling the beater, and beater controlling the valve, of the relatively small exhaust-ports in the beater and cylinder for the passages from the ends of the valve and the annular pressure-groove in communication with the air-supply and surrounding the beater, substantially as described.

9. In a pneumatic tool, the combination, with the cylinder, valve controlling the beater, passages leading from pressure to approximately the center of the cylinder and from there to the ends of the valve, and the relatively small exhaust-passages, of the beater having the ports and passages registering with said ports and passages in the cylinder and the annular pressure-groove into which the pressure-passage in the cylinder opens, whereby pressure on the beater is equalized, substantially as described.

10. In a pneumatic tool, the combination, with the cylinder, valve controlling the beater, the pressure-groove in the inner surface of the cylinder in communication with the pressure-supply, and passages and ports leading from said cylinder to opposite ends of the valve and to exhaust, of the beater having ports and passages for connecting the pressure groove and passages to opposite ends of the cylinder and the latter passages with exhaust, substantially as described.

11. In a pneumatic tool, the combination, with the cylinder, valve, and annular pressure-groove in the inner face of the cylinder in communication with the pressure-supply and ports and passages leading to opposite ends of the valve, of the beater having grooves adapted to register with the last-mentioned passages and supply-passages connecting the pressure-groove and grooves in the beater when at opposite extremes of its movement, substantially as described.



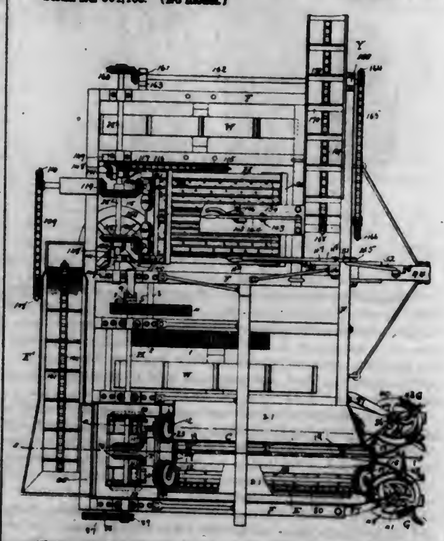
12. In a pneumatic tool, the combination, with the cylinder, valve, and annular pressure-groove in the inner face of the cylinder in communication with the pressure-supply and ports and passages leading to opposite ends of the valve and to exhaust, of the beater having grooves adapted to register with the passages leading to opposite ends of the valve and with the exhaust-passages and passages in the beater in communication with said grooves and adapted to register with the pressure-groove in the cylinder, substantially as described.

482,943. SULKY-PLOW. LOUIS S. PLAYAU, Pittsburg, Tex., assignor to B. F. Avery & Sons, Louisville, Ky. Filed June 22, 1892. Serial No. 437,560. (No model.)

Claim.—In a sulky-plow carriage, the combination, with the frame of the carriage and the axle of the furrow-wheel, of an inclined perforated portion or device *l*, the washers or collar-like devices arranged on either side of the part *l* and penetrated by the axle of the wheel, and means for clamping together rigidly the combined parts, all substantially as and for the purposes set forth

482,944. FORCE-PUMP. MILAN W. HALL, Plainfield, N. J., assignor to Otis Brothers & Company, New York, N. Y. Filed Mar 25, 1891. Serial No. 386,397. (No model.)

Claim.—1. The combination, in a pump, of two valved pistons working in alternation to propel a column of liquid and a driving-gear for imparting to each a comparatively slow working stroke and a quick return stroke, consisting of a driving crank-shaft, two rock-levers M M', connected each to the corresponding piston, and two links connecting said levers with the crank, whereby the levers are vibrated from the crank at varying speeds, substantially in the manner and to the effect specified.



2. The combination, in a pump, of two valved pistons working in alternation to propel a column of liquid and a driving-gear for imparting to each a comparatively slow working stroke and a quick return stroke, consisting of a driving crank-shaft and two rock-levers connected to the respective pistons and driven from the crank through interconnecting links, said levers having their axes arranged beyond the crank radius and the lengths of the lever-arms and links relatively to the crank radius and the distances between the respective axes being proportioned to bring the positions of the crank at the opposite extremes of the movement of either lever approximately one-third of a revolution apart, substantially as specified.

3. The combination, in a pump, of two valved pistons working in alternation to propel a column of liquid and a driving-gear for imparting to each a comparatively slow working stroke and a quick return stroke, consisting of a driving crank-shaft and two rock-levers connected to the respective pistons, arranged with their axes on opposite sides of the driving-shaft, and links connecting the crank with the respective levers, the lengths of the lever-arms, links, crank radius, and distance between axes being relatively proportioned to drive the respective levers on the working strokes of their pistons through an arc of about two-thirds of a revolution and to begin the working stroke of each at approximately one-sixth of a revolution before the termination of the working stroke of the other, substantially as specified.

4. The combination, in a pump, of two valved pistons working in alternation to propel a column of liquid and a driving-gear for imparting to each a comparatively slow working stroke and a quick return stroke, consisting of a driving crank-shaft, two rock-levers comprising each two lever-arms connected by a rock-shaft, one of said arms connected to the corresponding piston and the other arm of each lever connected to the crank by a link, the lengths of the lever-arms, links, crank radius, and distance between axes being relatively proportioned to drive each lever on the working stroke of its piston during approximately two-thirds of a revolution and to drive it on its return stroke within the period of working stroke of the other, whereby the durations of working strokes of the respective levers are made to overlap and the load of lifting the column of water is transferred successively from each piston to the other while the column is kept in uninterrupted flow, substantially in the manner specified.

5. The combination, in a pump, of the cylinder B, having the opening H at one side, a lining in said cylinder shorter and smaller in diameter than said cylinder and with its inner end extending over said opening and having an opening at the outer end, and a piston reciprocating in said lining and provided with an opening and valve, substantially as set forth.

482,945. CORN-HARVESTER. DANIEL W. HANSON and JOHN S. FARNHAM, Mineral, Ill.; Alice M. Hanson, administratrix of said Daniel W. Hanson, deceased, assignor to said Farnham. Filed Apr. 30, 1891. Serial No. 391,102. (No model.)

Claim.—1. In a corn-harvester, the combination, with drawing-rolls and snapper-rolls located within a rectangular frame, brackets projecting inwardly from said frame, eyes at the inner ends of said brackets in which the shafts of the rolls are journaled, and means for rotating the rolls, of guides 62, connected to shoes at the front ends of said frame and curving rearward and inwardly, their bodies being bifurcated and having elbows 63 standing forward of each eye and their rear ends 64 extending outwardly from the elbows and being secured to said brackets, substantially as described.

2. In a corn-harvester, the combination, with a rectangular frame, of drawing-rolls journaled therein and diverging toward their front ends, means for turning said rolls toward each other, snapper-rolls journaled in the frame above the drawing-rolls, and means for turning them in the opposite direction, the front ends of all said rolls being tapered, substantially as described.

3. In a corn-harvester, the combination, with a rectangular frame-work, a pair of inwardly-turning drawing-rolls journaled therein and having longitudinal ribs on their faces, and guides covering the said rolls, of a pair of outwardly-turning snapper-rolls located above the drawing-rolls and comprising flat bodies 79 and intermeshing gears 77, connecting said bodies, substantially as and in the manner set forth.

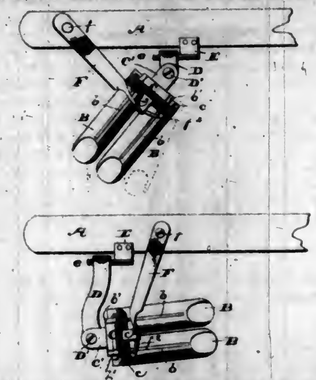
4. In a corn-harvester, the combination, with the inwardly-turning drawing-rolls having ribs on their faces and diverging toward their front ends, the guides leading to their front ends, the curved guides 92, partially covering said rolls, and the elevators E outside said curved guides, of the snapper-rolls S, located above and turning in opposite directions to said drawing-rolls, and intermeshing gears 74 75 between one of each pair of rolls, substantially as described.

5. In a corn-harvester, the combination, with a board 18, rotating sprocket-wheels at the extremities thereof, a guide 27 adjacent one side of said board and rising above the same, and a shield 21 above the board, having a depending edge 22, of an endless chain moving around said board and sprocket-wheels and L-shaped fingers pivoted at their angles to the upper sides of certain links of said chain, substantially as described.

6. In a corn-harvester, the combination, with a board 18, rotating sprocket-wheels at the extremities thereof, a shield 25 near the inner edge of said board, and an inclined shield 21 above the board and having a depending edge 22, of an endless chain moving around said board and sprocket-wheels and inside said shield and L-shaped fingers 19, pivoted at their angles to the upper sides of certain links of the chain, substantially as described.

7. In a corn harvester, the combination, with a pair of gatherers, a pair of rearwardly-moving chains, and means for moving said gatherers and chains in unison, of a pair of forwardly-inclined drawing-rolls rotating toward each other at greater speed than the machine progresses forwardly, a pair of oppositely-rotating snapper-rolls above said drawing-rolls and connected therewith by gearing, and elevators into which said snapper-rolls deliver, substantially as described.

8. In a corn-harvester, the combination, with a frame mounted on supporting-wheels, rotating gatherers, rearwardly moving stalk-chains, drawing-rolls and snapper-rolls beneath said chains, elevators beneath said rolls, and gearing from one of said driving wheels for driving all of said mechanisms, of a rear elevator into which said other elevators deliver, a husker, and connections from the other supporting-wheel for driving said rear elevator and husker, substantially as described.



9. In a corn-harvester, the combination, with the rearwardly-moving stalk-chains, the shields 21, covering the same, the frame F, supporting the whole, and the straps 37, projecting from said frame, of brackets 34, forwardly and outwardly inclined shafts 36, carried by said brackets and their upper ends being connected to said straps, gathering-wheels journaled on said shafts and carrying gear-wheels beneath them, and connections between said gear-wheels and the chain-driving shafts, substantially as described.

10. In a corn-harvester, the combination, with a main shaft M', driven from a supporting-wheel, a gear 118 on said shaft, an elevator E', driven through connections leading to an intermeshing gear 119 at one side of said gear 118, and at the other side thereof an intermeshing gear 120, driving a pair of husking rollers, of the gathering and stripping devices driven from the other supporting-wheel and delivering into said elevator, as and for the purpose set forth.

11. In a corn-harvester, the combination, with a main shaft M', driven from a supporting wheel, main gears 118 and 118' on said shaft, two pairs of husking-rollers driven by intermeshing gears 120 and 120' at one side of said main gears, an elevator E', driven by connections leading to a bevel-gear at the other side of the main gear 118, a bevel-gear 152, intermeshing with the other main gear 118', and a balance-wheel 150, mounted on the shaft of this bevel-gear, of the gathering and stripping devices driven from the other supporting-wheel and delivering into said elevator, as and for the purpose set forth.

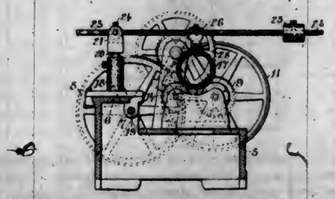
12. In a corn-harvester, the combination, with the gathering and stripping devices and an elevator leading therefrom, of a husker comprising a box 130, having longitudinal wires 134 in its upper side, inwardly-turning husking-rollers within said box, one of which has headed screws and the other cavities in its face, receiving said screws, the elevator delivering into the upper end of said box, and a delivery-elevator leading from the lower end thereof, as and for the purpose hereinbefore set forth.

482,946. TRUSS. CHARLES A. HARVEY, New York, N. Y. Filed Feb. 12, 1891. Renewed Mar. 4, 1892. Serial No. 423,729. (No model.)

Claim.—1. In a truss, the combination, with the pivotally-supported pad, of a spring having a segmental portion engaging a part connected with said pad and means for adjusting said pad laterally about a point concentric with the segmental portion of said spring, substantially as described.

2. In a truss, the combination, with the pivotally-supported pad provided with the wrist-piece and wrist-pin for securing the lateral adjustments of said pad, of a spring having a segmental portion concentric with said wrist-pin engaging a part connected with the pad, substantially as described.

3. In a truss, the combination, with the truss-band, of the artificial fingers supported therefrom, said fingers being adjustably secured to their supports and independently adjustable in respect to each other and to said supports, substantially as described.

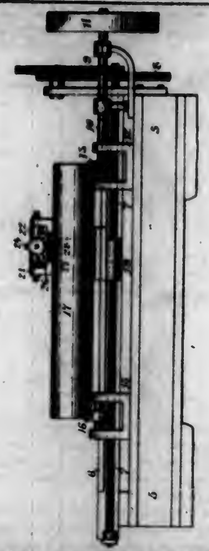


4. In a truss, the combination, with the truss-band, of the elastic artificial fingers supported therefrom, means for adjusting said fingers with respect to each other and their supports, and means for adjusting said supports with respect to said band, substantially as described.

5. In a truss, the combination, with the truss-band, of the block supported therefrom, the artificial fingers provided with attaching-ribs, and means for adjustably securing said ribs to said block, the adjacent faces of said ribs and block being provided with serrations, substantially as described.

6. In a truss, the combination, with the truss-band, of the block connected thereto by a wrist connection permitting the lateral adjustment of said block and the artificial fingers provided with attaching-ribs adjustably secured to said block, whereby said fingers may be adjusted independently with respect to each other and to said block and said block may be adjusted with respect to said band, substantially as described.

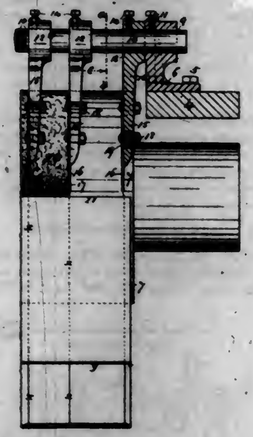
7. In a truss, the combination, with the truss-band, of the supporting plate provided with the pivot-pin, the wrist-piece engaging said pivot-pin, the block adjustably secured to said wrist-piece, the artificial fingers adjustably secured to said block, and a spring secured to said band and having a segmental portion engaging an ear secured to said block, substantially as described.



482,947. GROUNDING-MACHINE. JOHN HOPE, Providence, R. I., assignor to the John Hope & Sons Engraving and Manufacturing Company, same place. Filed May 20, 1892. Serial No. 433,653. (No model.)

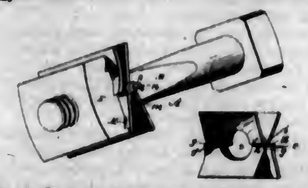
Claim.—1. In a grounding device, the combination, with two pairs of rotatable disks journaled in suitable bearings and a roll to be engraved, supported, and rotated thereby, of a traversing mechanism, a milling-tool supported thereby against the surface of the roll, and means for traversing said mechanism, as described.

2. In a ground-engraving machine, the combination, with the disks 13 and 14, journaled in the block 12, the disks 16, journaled in the



482,947.

block 15, said blocks being supported on a suitable base, and means for rotating one or more of said disks, of the worm 7, journaled in suitable bearings, a traversing mechanism carrying a milling-tool and provided with a threaded clamp for engaging said worm, and means for rotating said worm, as described.



3. In a ground engraving machine having a traversing engraving device operated by a worm-gear, the disks 13 and 14 and 16 16, suitably mounted and adapted to rotate the article to be engraved, and means intermediate the disk 13 and said worm whereby they are simultaneously rotated, as and for the purpose described.

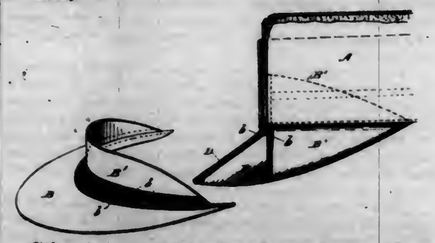
482,948. DEVICE FOR MANUFACTURING LINOLEUM FLOOR-CLOTH. THOMAS MITCHELL, Wimbledon, England. Filed June 27, 1892. Serial No. 438,123. (No model.)

Claim.—The combination, with the rolls of a calendering-machine, between which backing for the linoleum material passes, of opposite rigidly-located head-stocks 6, two parallel guide-rods 10, rigidly supported thereby, and a series of adjustable reversible heads 12, each provided with means for securing it where desired to be located on the guide-rods and with an adjustable and removable division-plate 18, accurately fitting the contour of the opposite calender-roll with a sufficient clearance for the backing fabric, as set forth.

482,949. NUT-LOCK. ALEXANDER P. NELMS, Georgetown, Tex. Filed Jan. 9, 1890. Renewed Feb. 26, 1892. Serial No. 422,857. (No model.)

Claim.—1. The nut-lock comprising the pair of interlocked washers, each having an opening for the bolt, a slit extending from the said opening to one edge, and the lips bent outward from the slit, the integral portion of each washer being arranged in the slit of the other, and thereby interposed between the lips, for the purpose set forth, substantially as described.

2. The combination, with the bolt and the nut, of a pair of interlocked washers having the central openings for the bolt-shank, the slits extending from said openings to opposite edges, and the lips formed by bending opposite sides of said slits beyond the planes of the washers and adapted to engage the base of the nut, substantially as described.



3. The combination of the bolt having the angular shank, the nut, and the pair of interlocked washers having angular openings for the bolt-shank and having lips to engage the base of the nut, substantially as described.

4. The combination, with the bolt and nut, of the pair of interlocked washers having the lips to engage the base of the nut and the wire loop or key between the said washers and forming the fulcrum therefor, for the purpose set forth, substantially as described.

5. The nut-locking device comprising the pair of interlocked washers having the slits on opposite sides, the lips bent outward from the slits, and the integral portions arranged between the respective pairs of lips, whereby the latter are prevented from being pressed inward to the planes of the washers, substantially as described.

6. The nut-locking device comprising the pair of interlocked washers, each having the slit on one side, the pair of lips, and the integral portion opposite the lips, the said integral portions of the washers being in the form of a compound curve, substantially as described.

482,950. HAT, CAP, &c. ADOLPH ROSENTHAL, Boston, Mass., assignor of three-fourths to Charles Rosenthal, Harry Goldstein, and Leopold Bash, same place. Filed Dec. 18, 1891. Serial No. 417,226. (No model.)

Claim.—1. As a new article of manufacture, a head-gear consisting of a body provided with the visor or brim B and protector B', the visor being curved on its inner edge to fit the body and hinged to the protector by a strip *b*, which is secured to the margins of the visor B and protector B', all substantially as and for the purpose set forth.

2. As a new article of manufacture, a head-gear consisting of a body provided with the visor or brim B and protector B', hinged together and incased in a bag-like covering D, having a flap *d*, the visor being fashioned on its inner edge to fit the body, the covering inclosing both the visor and protector, all substantially as and for the purpose set forth.

482,951. MEANS FOR UNLOADING GRAVEL-TRAINS. WILLIAM D. SPRATTON and JOHN H. DRAKE, Middletown, N. Y. Filed June 19, 1891. Serial No. 396,581. (No model.)

Claim.—1. The combination, with a train of flat cars, of a scraper adapted to be moved from end to end of the train while the engine moving the same remains stationary with relation to the car upon which it is mounted, a separate rope-drum engine located upon a car coupled to the train at the end opposite to that from which the plow

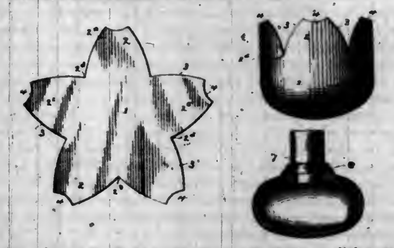
starts, and a rope connecting the scraper with the rope-drum, substantially as described.

2. In combination with a train of flat cars, a scraper adapted to be moved from end to end of the train, a rope-drum engine located upon a car coupled to the train, a rope connecting the scraper with the rope-drum, and a locomotive-engine whereby the whole may be moved to cause the scraper as it advances relatively to the train to occupy a determined position relatively to the track, substantially as described.

482,952. ATTACHING KNOBS TO SHANKS. FRANK A. WILMOT, Bridgeport, Conn., assignor to the Wilmot & Hobbs Manufacturing Company, same place. Filed Oct. 26, 1891. Serial No. 409,804. (No model.)

Claim.—The combination, with a knob having a central opening, of a shank having a tapering reduced end adapted to enter said opening and a shoulder surrounding the reduced end which bears upon the face of the knob when assembled, the tapering end acting as a wedge to center the shank and to prevent the knob from collapsing under the heat and pressure of welding, substantially as described.

482,953. KNOB. FRANK A. WILMOT, Bridgeport, Conn., assignor to the Wilmot & Hobbs Manufacturing Company, same place. Filed Oct. 26, 1891. Serial No. 409,805. (No model.)



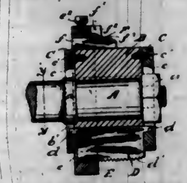
Claim.—1. A metallic knob consisting of a shank having a reduced end, a collar having at one end an opening to receive the reduced end of the shank and at the outer end, in its outer side, a groove, and a knob the edge of which is closed inward into said groove, substantially as described.

2. A metallic knob consisting of a shank having a reduced end, a collar having at one end an opening to receive the reduced end of the shank and at the other end, in its outer side, a groove, outwardly-extending lugs in said groove, and a knob the edge of which is closed inward into said groove and is provided with notches 11, which engage the lugs, substantially as described.

3. A metallic knob consisting of a shank having a reduced end, a collar having at one end an opening to receive the reduced end, and a shoulder 8, which forms a bearing for a sleeve 9, and at the other end, in its outer side, a groove, and a knob the edge of which is closed inward into said groove, substantially as described.

4. A knob consisting of an iron shank having a reduced end, a collar formed from high-grade metal, having an opening to receive the reduced end and a shoulder 8, a sleeve formed from high-grade metal, which bears against the shoulder and covers the shank, and a knob formed from a compound metal, consisting of an iron shell covered by a shell of high-grade metal, the edge of said knob being closed inward and caused to engage a groove 4 in the collar, substantially as described.

482,954. KNOB. FRANK A. WILMOT, Bridgeport, Conn., assignor to the Wilmot & Hobbs Manufacturing Company, same place. Filed Oct. 26, 1891. Serial No. 409,806. (No model.)



Claim.—1. A knob formed from a blank having radial arms the sides of which are convex curves intersecting at their inner ends, the metal at the tips being removed, leaving concave curves, so that when said arms are closed together the metal thereof will just form the inner face of the knob and will leave the shank-opening already formed, substantially as described.

2. The combination, with the shank and the collar, of a knob formed from a blank having radial arms the sides of which are convex curves intersecting at their inner ends, the outer ends of said arms being curved inwardly against the shank and rigidly secured thereto, substantially as described.

3. The combination, with a shank having a shoulder 7 and a collar 8, resting against said shoulder, of a knob formed from a blank having radial arms the sides of which are convex curves intersecting at their inner ends, the outer ends of said arms being curved inward against the shank and attached thereto, substantially as described.

482,955. PIPE-TAP. EDWARD M. WOLFE, Reading, Pa., assignor to the Reading Iron Company, same place. Filed Feb. 15, 1892. Serial No. 421,563. (No model.)

Claim.—1. In a pipe-tap, the combination, with the grooved stock B, having thread-cutters D, removably secured in the grooves, of the movable collar E, grooved to pass freely over the projecting thread-cutters, cutters F, seated in grooves in said collar, and set-screws for pressing said cutters F into gripping contact with the stock, substantially as set forth.

2. In a pipe-tap, the combination, with the stock B, provided with thread-cutters D, of the longitudinally-adjustable collar E, carrying cutters F, having cutting-edges f^2 and f^3 for facing and counterboring, respectively, substantially as set forth.

3. In a pipe-tap, the combination, with the stock provided with thread cutters, of a collar grooved to pass freely over the projecting thread-cutters, cutters F, having shanks entering grooves in said collar, heels bearing upon the face of the collar, and cutting-surfaces adapted to face and counterbore, and means engaging said shanks for forcing the cutters into gripping contact with the stock, substantially as set forth.

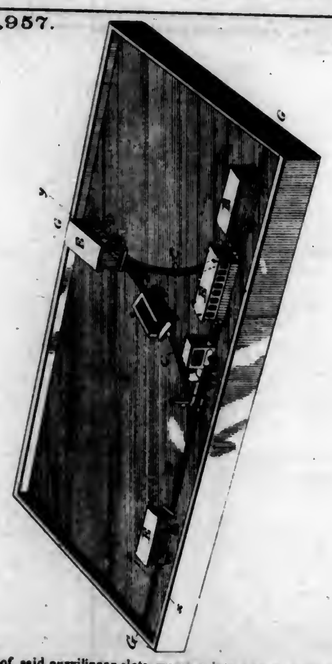
482,956. CASH-REGISTER. BENJAMIN F. WRIGHT, Hartwell, assignor of two-thirds to Amos G. Woolley and Edgar M. Woolley, Cincinnati, Ohio. Filed May 16, 1892. Serial No. 433,250. (No model.)

Claim.—1. In a registering device of the character described, the combination of the registering-wheels, the ratchet-wheels secured to them, the exposed stationary number-plate, the pivoted arm carrying a plate or shutter to cover or expose the number on said plate, the rod upon which said arm is pivoted, and the pawl pivoted upon the end of said arm opposite the shutter and engaging the teeth of the ratchet-wheel which carries the register, whereby the register is partially revolved by drawing down the shutter to expose the number on the number-plate, substantially as shown and described.

2. The combination, substantially as hereinbefore set forth, of the case, the exposed number-plate A^3 above it, the cash-drawer in the lower part of the case, a rod crossing the drawer, a series of registering-wheels within the case, ratchet-wheels secured to said registering-wheels, pivoted arms carrying shutters at one end to cover the numbers upon the number-plate when thrown up, and pawls at the opposite end to actuate the registers when the shutter is thrown down, the pawls pivoted to the shutter-arm and engaging the teeth of the registering-wheel ratchets, the rods upon which the shutter-arms are pivoted, the angle-lever also pivoted to the shutter-arms and having its long arm projecting in the path of the cross-bar in the drawer, and its short arm projecting under the rod upon which the shutter-arm is pivoted, whereby a registering-wheel is turned by throwing down the shutter-arm, and the shutter automatically returned to cover its number by drawing out the drawer.

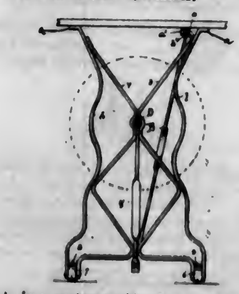
3. The combination of the ratchet-wheels, the registering-wheels secured thereto, the pivoted shutter, the number-plate corresponding to the numbers on the register-wheels, pivoted shutters to cover or expose the numbers on said plate, pawls engaging the teeth on the ratchet-wheels and carried by the pivoted shutters to turn the ratchet and register-wheel when the shutters are turned down, a transverse shaft carrying pawls rigidly secured to it and engaging the teeth of the ratchet-wheels to prevent their backward movement, a spring to hold the pawls in contact with the ratchet-wheels, a bell, and a knocker secured to the pawl-shaft to sound an alarm when the ratchets are turned, substantially as shown and described.

482,957. TOY. JOHN A. ALLEN, Philadelphia, Pa. Filed June 5, 1889. Serial No. 313,115. (No model.)



Claim.—1. In a puzzle or toy, the combination, with several blocks representing a locomotive and cars, of a base having a main track and two branch tracks diverging therefrom in reverse directions on the same side of the main track and uniting in a spur forming a Y, the spur being of sufficient length to hold only the locomotive or one car, substantially as described.

2. The combination, in a puzzle, of several blocks or figures, one of which represents a locomotive and the others cars, with a base having a main track and branches diverging therefrom in reverse directions on the same side of the main track and uniting in a spur to form a Y, said spur being of a length to hold only the locomotive or one of the cars, and the main track extending beyond the point of intersection of one of the diverging tracks therewith to hold the locomotive and one or more cars free of the Y, substantially as described.

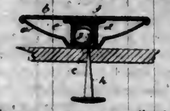


3. A game or puzzle consisting of a base with a rectilinear track or slot extending throughout the length of said base and opening out at the ends of the latter, a transverse track, slot, or spur opening out of one side of the base, curvilinear slots on one side only of the rectilinear slot and connecting the said rectilinear and transverse slots, the transverse slot being of a length to hold the locomotive or one car only, an inclosing guard or rail attached to the sides and ends of the slots, and cars having depending pins to move in said slots, substantially as described.

4. A game or puzzle consisting of a base with a rectilinear slot, curvilinear slots extending from said rectilinear slot and on one side only thereof, said curvilinear slots merging into a transverse rectilinear slot of a length to hold only one car or block, which may be the locomotive or another car, and cars or blocks having headed pins to move in said slots, substantially as described.

482,957.

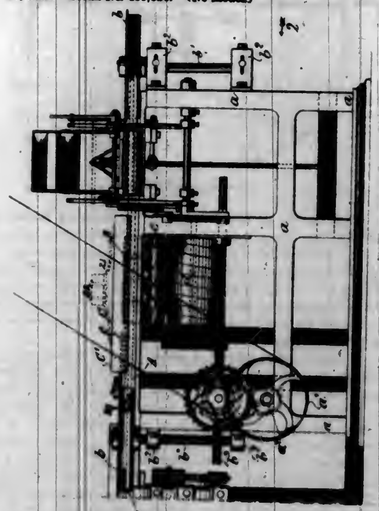
482,958. SEWING-MACHINE FRAME. BENJAMIN F. BELLOWS, Cleveland, Ohio, assignor to Edward T. Lufkin, same place. Filed Feb. 27, 1892. Serial No. 423,092. (No model.)



Claim.—1. In a sewing-machine frame, a side piece A, made up of the bent bars 1, 2, 3, and 4 and the vertical middle bar 5, the bars 3 and 4 being connected with the bars 1 and 2, respectively, at three points by means of rivets and with each other and the middle bar at two points by means of rivets, substantially as set forth.

2. In a sewing-machine frame, the sides made up of the bent bars 1, 2, 3, and 4 and the vertical bar 5, all riveted together, as described, the lower end of the bar 5 being provided with orifices, a treadle-rod passing through said orifices, and shoulders on said treadle-rod, combined with a brace consisting of the center piece b, two arms b^2 b^2, the lower end of each of which surrounds the treadle-rod and lies between one of the shoulders thereon and the adjacent piece 5, and two arms b' b', which pass through and are adjustably connected with ears formed by bending over the upper ends of the bars 3, substantially as set forth.

482,959. BUTTON. CHARLES A. BRYANT, Wakefield, Mass. Filed Mar. 7, 1892. Serial No. 424,035. (No model.)

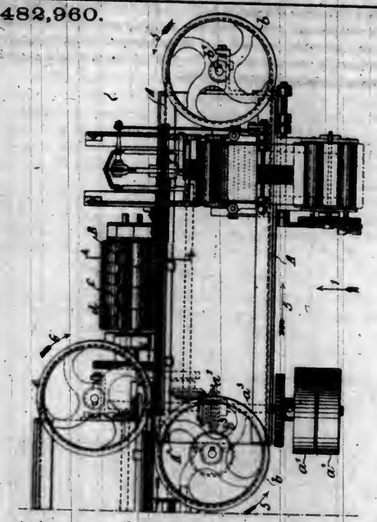


Claim.—1. A button having an aperture through its back, combined with a cup-shaped anvil secured within the button, the internal diameter of the cup being greater than the diameter of the aperture in the back of the button, and with a soft-metal ball arranged loosely in the recess in the anvil, substantially as described.

2. A button having an aperture centrally through its back, combined with a cup-shaped anvil, the internal diameter of the cup being greater than the diameter of the aperture in the back of the button, and the anvil secured within the button, the open side of the recess toward the aperture in the back of the button, but eccentric thereto, and a soft-metal ball arranged loosely in the recess in the anvil, substantially as described.

3. A button consisting of a front and a back, the back recessed at the center, and with a central aperture through it, combined with a cup-shaped anvil in length corresponding to the distance between the inside of the back of the button and the inside of the face of the button, the diameter of the recess in the anvil greater than the diameter of the aperture in the back of the button, with a soft-metal ball arranged loosely in the recess of the anvil, substantially as described.

482,960. MACHINE FOR COMBING FIBROUS MATERIALS. GEO. E. DOWNTHORPE and TAYLOR BURROWS, London, England. Filed Jan. 21, 1892. Serial No. 418,890. (No model.)



Claim.—1. In a combing-machine of the character described, the combination, with a suitable combing device, of an endless carrier for the fibrous material consisting of a plurality of bands carrying parallel rows of teeth on their upper edges, and a compressor plate or plates fitting between said parallel rows of teeth, and adapted to hold said fibrous material between said teeth while it is being combed, substantially as and for the purposes described.

2. In a combing-machine of the character described, the combination, with a suitable combing device, of an endless carrier for the fibrous material consisting of a plurality of bands carrying parallel rows of teeth on their upper edges, and a compressor plate or plates fitting between said parallel rows of teeth, with springs at the back of said compressor-plate, the said compressor-plate and springs being adapted to hold said fibrous material between said teeth while it is being combed, substantially as and for the purposes described.

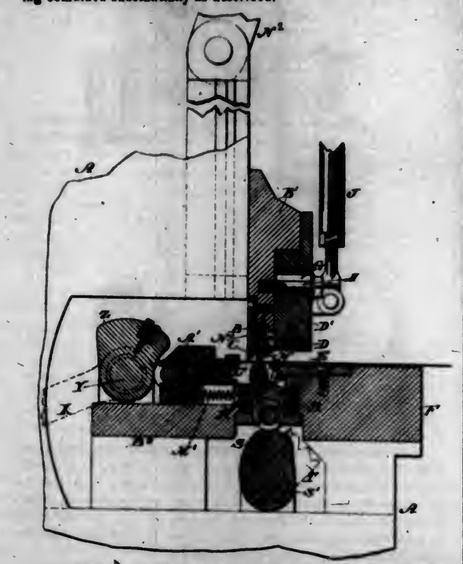
3. An apparatus for combing fibrous material, consisting, essentially, of two traveling carriers, with means for holding said fibrous material on said carriers, and two combing-rollers, the first traveling carrier engaging the tufts of fibrous material near the center of their length and the first combing-roller combing the one end of said fibrous material, and the second carrier also engaging the tufts of fibrous material near the center of their length and the second combing-roller combing the opposite end of said fibrous material, substantially as described.

482,960.

4. An apparatus for combing fibrous material, consisting, essentially, of a plurality of toothed carriers each carrying two parallel rows of teeth, compressor-plates fitting between said rows of teeth for holding the fibrous material on said carriers, and two combing-rollers having graded teeth, the one roller adapted to comb the one end of the tufts of fiber and the other roller adapted to comb the other end, substantially as and for the purposes described.

482,961. GAME-COUNTER. FREDERICK A. GILBERT, Boston, Mass. Filed July 5, 1892. Serial No. 438,931. (No model.)

Claim.—In a game-counter, the combination, with a disk-shaped body having its edges scalloped or otherwise roughened and constructed with a central chamber entering it from its upper face, which is encircled by a series of numbers, of a centrally-perforated rotatable disk having bearing upon the said face of the body, and constructed with a sight-opening in its edge to bring the said numbers into view and provided with an operating-finger offsetting from its edge, a locking-wheel having a regularly-indented periphery fixed to the inner face of the said disk and entering the said chamber in the body, a spring attached to the body and located in the said chamber and arranged to be engaged with the said wheel to lock the disk in place, and a screw passing through the disk and wheel into the body for coupling the parts together, substantially as set forth.



482,962. MACHINE FOR EDGE-CURLING SHEET METAL. WILLIAM J. GORDON and EDMUND D. GILBERT, Philadelphia, Pa. Filed Feb. 27, 1892. Serial No. 423,008. (No model.)

Claim.—1. A machine for the purpose named, having a frame with a table thereon, a movable die above said table, a stationary clamp-jaw on said bed, a clamp-jaw movable on the head of said die, a rising-and-falling bed below said table, and a horizontally-movable die in rear of said bed, said parts being combined substantially as described.

2. In a machine for the purpose named, a frame, a shaft journaled therein and having a cam thereon, a die guided in said frame, a clamp-jaw secured to the head of said die, rods pivoted to the head of said jaw, levers connected to the upper end of said rods and engaged by the cams on said shaft, a vertically-movable head, and a rising-and-falling bed, and a clamp secured to the table of the machine, said vertically-movable head being between the said die and its attached clamp, said parts being combined substantially as described.

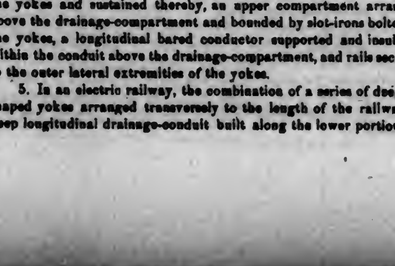
3. In a machine for the purpose named, a frame, a die movable in guides thereon, a table with a clamp-jaw secured thereto, a rising-

and-falling clamp-jaw above said table-clamp, a spring-controlled head between said die and upper clamp-jaw, a rising-and-falling bed, and a horizontally-movable die, said bed being adapted to move between said horizontally-movable die and the table clamp-jaw, said parts being combined substantially as described.

4. The bed Q and cam S for operating the same, in combination with an arm secured to the shaft of said cam, a link attached to said arm, means for raising said link, a shouldered dog pivoted to said arm, and a lug on the frame, with which the shoulder of the dog is adapted to engage, and means for throwing off said dog from said lug, substantially as described.

5. In a machine for the purpose named, a frame, a stationary and a vertically-moving clamp-jaw, a rising-and-falling bed, and a vertically-movable die with a connected spring-controlled head, and a horizontally-movable die, said stationary clamp-jaw and said horizontally-movable die having opposite concave faces, and said spring-controlled head being between the vertically-movable die and said vertically-movable clamp-jaw, said parts being combined substantially as described.

482,968. SUSPENDERS. EMIL GUTMANN, New York, N. Y. Filed Jan. 22, 1892. Serial No. 418,872. (No model.)



Claim.—1. In the process of manufacturing suspenders, saturating with rubber cement a length of the webbing adjacent to the end, exposing the saturated webbing and allowing the solvent to evaporate, punching or otherwise producing the holes *a'* therein, applying unvulcanized rubber, so as to fill and engage in such holes and also adhere to the saturated surfaces, and inclosing and vulcanizing the whole suspender-end, substantially as herein specified.

2. The process described for manufacturing suspenders, consisting in matching together and cementing the end of the webbing and a central piece of properly-shaped unvulcanized rubber, coating and saturating a sufficient length of the webbing adjacent to the end, applying one or more pieces of fabric for each buttonhole, cementing an additional sheet of unvulcanized rubber on each face, and inclosing and vulcanizing the whole suspender-end, all substantially as herein specified.

3. The suspender described, having the webbing A, with a portion adjacent to the end saturated with rubber, in combination with the rubber end B B' B² and with a reinforcing-piece of muslin D for each buttonhole applied between the sheets of rubber, so as to lie within the completed article, all substantially as herein specified.

482,964. ELECTRIC-RAILWAY CONDUIT. RUDOLPH M. HUNTER, Philadelphia, Pa., assignor, by mesne assignments, to the Thomson-Houston Electric Company, Boston, Mass. Original application filed Sept. 23, 1886, Serial No. 214,209. Divided and this application filed June 16, 1888. Serial No. 277,311. (No model.)

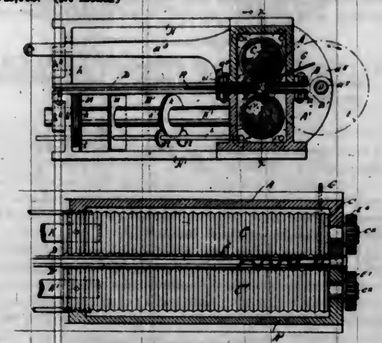
Claim.—1. In an electric railway, the road-bed formed of the main brackets arranged at intervals and to which the rails are secured, in combination with two longitudinal slot-irons bolted to said brackets and forming the side walls of the conductor-conduit, insulated supports secured rigidly with respect to the brackets, working conductors supported by said insulating-supports, a drainage-conduit located below the conductor conduit and formed of cement or masonry, with plank side walls between the brackets.

2. In an electric railway, a slotted conduit formed with a large drainage compartment or portion along its lower part and having its upper part provided with a longitudinal slot arranged above the drainage compartment or portion and open throughout its length into the drainage-compartment and having a longitudinal electric conductor arranged above the drainage compartment or portion, in combination with a series of deep U-shaped yokes extending from rail to rail below the drainage-compartment, rails and slot-irons supported by said yokes, a vehicle, and a depending current-collecting device extending down through the slot and making a traveling contact with the conductor and guided by the slot-irons.

3. In an electric railway, a slotted conduit formed with a large drainage compartment or portion along its lower part and having its upper part provided with a longitudinal slot arranged above the drainage compartment or portion and open throughout its length into the drainage-compartment and having a longitudinal suspended electric conductor arranged above the drainage compartment or portion, in combination with a series of deep U-shaped yokes extending from rail to rail below the drainage-compartment, rails and slot-irons supported by said yokes, a vehicle, and a depending current-collecting device extending down through the slot and making a traveling contact with the conductor and guided by the slot-irons and having a grooved roller making an underrunning contact with the conductor.

4. In an electric railway, the combination of a series of deep U-shaped yokes arranged transversely to the length of the railway, a deep longitudinal drainage-conduit built along the lower portions of the yokes and sustained thereby, an upper compartment arranged above the drainage-compartment and bounded by slot-irons bolted to the yokes, a longitudinal bared conductor supported and insulated within the conduit above the drainage-compartment, and rails secured to the outer lateral extremities of the yokes.

5. In an electric railway, the combination of a series of deep U-shaped yokes arranged transversely to the length of the railway, a deep longitudinal drainage-conduit built along the lower portions of



the yokes and sustained thereby, an upper compartment arranged above the drainage-compartment and bounded by slot-irons bolted to the yokes, a longitudinal bared suspended conductor supported and insulated within the conduit above the drainage-compartment, and rails secured to the outer lateral extremities of the yokes.

6. In an electric railway, a slotted conduit having an upper longitudinal compartment and a lower drainage-compartment opening into each other, in combination with a flexible suspended bared conductor in said upper compartment and insulated supports for said conductor arranged at intervals and protected within the conduit.

7. In an electric railway, the combination of a slotted conduit arranged along the railway, having yokes at intervals and slot-irons secured to the yokes, a conductor loosely supported within the conduit upon transverse insulating-supports sustained in position by the metal work of the yokes and slot-irons, a car or vehicle, and a current-collecting contact carried by the vehicle and making an underrunning contact with the conductor.

8. In an electric railway, a slotted conduit extending along the railway, having an upper electrical compartment and a lower drainage-compartment, a suspended and flexible conductor arranged within the electrical compartment at the upper part of the conduit, a traveling car, and a depending current-collecting device having an underrunning contact moving along the under side of the suspended conductor.

482,965. METHOD OF AND APPARATUS FOR COILING AND INSERTING WIRE. CALVIN JACKSON, Jacksonwald, assignor to Christian H. Bahl, trustee, Reading, Pa. Filed Mar. 31, 1890. Serial No. 345,995. (No model.)

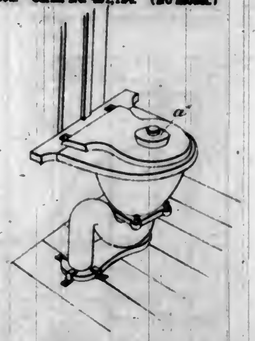
Claim.—1. In a wire-coil machine, the combination, with the geared rollers and a mandrel F, located between said rollers, of a forming device T, secured to the machine-frame and provided with a grooved concaved face arranged contiguous to said mandrel, substantially as set forth.

2. In a wire-coil machine, substantially as described, the combination, with one or more rollers supported in a fixed frame, of one or more similar rollers supported in a movable frame pivoted to the fixed frame, said rollers being geared with a gear-wheel having its center at said pivotal point, substantially as set forth.

3. In a wire-coil machine, substantially as described, the combination, with the fixed frame, the movable frame hinged thereto, and the rollers supported in said frames, of clamps adjustably secured to the meeting faces of said frames, the inner edges of said clamps being brought close to the wire coil and holding the material through which the coil is to be inserted, substantially as and for the purpose set forth.

4. In a wire-coil machine, substantially as described, a rotary flexible shaft suitably supported at the ends and having a series of circumferentially-grooved disks secured thereto, in combination with a series of supporting-plates arranged between said disks, substantially as set forth.

5. In a wire-coil machine, substantially as described, a flexible shaft suitably supported at the ends and having a series of circumferentially-grooved disks secured thereto, in combination with a series of supporting-plates arranged between said disks and one or more series of rollers for said grooved disks, strung upon wires or rods passing through said supporting-plates, substantially as set forth.

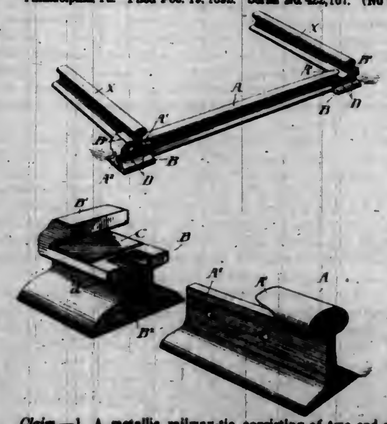


6. In a wire-coil machine, substantially as described, the combination, with straight roller supported in a suitable frame, of a curved extension of said roller, consisting of a flexible shaft having one end secured thereto, said shaft being provided with a series of disks and supported by a series of plates arranged between said disks, substantially as set forth.

7. The method of strengthening or uniting softer materials by means of wire, which consists, first, in forming the wire into a spiral coil, and, second, in permanently combining said coiled wire with the aforesaid material by rotating the coil and passing the pointed end thereof successively through a series of punctures made in the material, substantially as set forth.

8. The method herein described of continuously forming wire into a spiral coil and combining the same with a softer material, which consists, first, in simultaneously forming said wire into a spiral coil and advancing the pointed end of the same by means of exterior rotary pressure thereon, and, second, in simultaneously puncturing and inserting the coil into the material, substantially as set forth.

9. In a wire coiling and inserting machine, the combination of the geared rollers, the mandrel F, located between said rollers, a forming device T contiguous to said mandrel, and the clamps for holding the material through which the coil is to be inserted, all arranged and adapted to operate substantially as set forth.



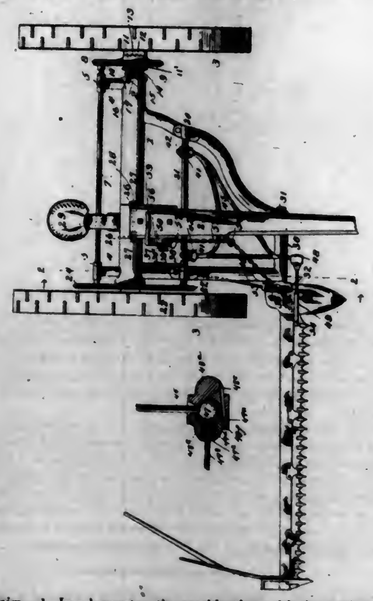
482,966. DISINFECTING AND DEODORIZING COVER FOR COMMODES, WATER-CLOSETS, &c. JAMES KINNEY, Detroit, Mich. Filed Feb. 11, 1892. Serial No. 421,134. (No model.)

Claim.—1. The combination, with a movable cover, of a receptacle for disinfectant secured thereto, said receptacle having inlet and outlet openings, suitable valves for controlling the outlet-openings, and a connection between said valves and a fixed point, whereby the valves are operated as the cover is opened and closed, substantially as described.

2. The combination, with a cover, of the receptacle containing the disinfectant, said receptacle having inlet and outlet openings, the latter being controlled by suitable valves arranged on a spindle, said valves adapted to be automatically operated, as said cover is raised and lowered, by a device comprising a rod mounted in bearings secured to said cover, said rod having one extremity connecting with the valves and the other extremity pivotally secured to the casing of the closet, substantially as and for the purpose described.

482,967. METALLIC RAILWAY-TIE. CHARLES B. MACNEAL, Philadelphia, Pa. Filed Feb. 19, 1892. Serial No. 422,167. (No model.)

Claim.—1. A metallic railway-tie consisting of two end pieces, each provided upon its outer side with a projecting overhanging brace



to fit over the outer flange of the rail, and a connecting cross-piece adapted for connection at its ends with the end pieces and provided adjacent to each end with a projecting undercut offset adapted to fit over the inner flange of the rail and located a substantial distance from the extreme end of the cross-piece.

2. In a metallic railway-tie, a wrought-iron cross-piece consisting of a section of a rail having the ends of the head portion cut away to form undercut projecting offsets adjacent to the ends of the tie.

3. In a metallic railway-tie, a cast-iron end piece B, having the inverted-T-shaped slot B^3 and the integral overhanging brace-piece B' and having its upper surface formed with rabbets to receive a rail-rest.

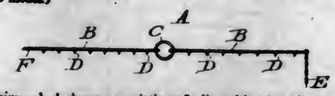
4. In a metallic railway-tie, the combination of the end portions having inverted-T-shaped slots and bolt-holds in their sides and the overhanging braces on their upper surfaces, with cross-pieces having ends of an inverted-T-shaped cross-section to fit the slots of the end pieces and provided with bolt-holes and the bolts for securing the end pieces and cross-pieces together.

482,968. HARVESTER. MARSHALL H. MELROSE, Piano, Ill. Filed Mar. 10, 1892. Serial No. 424,436. (No model.)

Claim.—1. In a harvester, the combination, with the cutting apparatus, a pitman leading therefrom, the main frame, and the rotating shaft journaled in said frame and having oppositely-disposed cranks, of a triangular lever, a ball at its forward angle, a socket embracing this ball, a headed plug in the socket into which said pitman is screwed, and on each crank a two-part box having a bearing loosely embracing the crank and a socket embracing a ball on the rear angle of the triangular lever, the parts being detachably connected by bolts, substantially as described.

2. In a harvester, the combination, with the main frame having rearwardly-extending boxes, expansive springs therein, T-shaped bearings whose shanks enter said boxes, and a counter-shaft journaled in the heads of said bearings and driven by chain belting connecting it with a sprocket-wheel on the main axle, of the cutting apparatus, connections, substantially as described, between the counter-shaft and cutting apparatus, clutch members on the meeting faces of one main wheel and the sprocket-wheel, and means for moving the latter longitudinally of the main axle, as and for the purpose set forth.

3. In a harvester, the combination, with the main frame having rearwardly-extending boxes, expansive springs therein, T-shaped bearings whose shanks enter said boxes, and a counter-shaft journaled in said bearings and driven by chain belting connecting it with the main axle, of a crank-shaft journaled in the main frame, chain belting between the counter and crank shafts, the cutting apparatus, and connections, substantially as described, between the crank-shaft and cutting apparatus, as and for the purpose set forth.



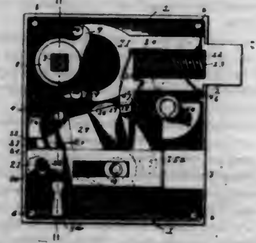
4. In a harvester, the combination, with the main axle, the main wheel journaled thereon and having a clutch member on its hub, a sprocket-wheel mounted on the axle and having a second clutch member, a spring bearing tilting members into engagement, and means for separating them, of a second shaft, connections between this shaft and the cutting apparatus, tubular boxes on the main frame, springs therein, T-shaped bearings, their shanks entering said boxes and their heads furnishing the supports for said shaft, and a sprocket on the latter connected by a chain belt with that on the axle, all substantially as and for the purpose set forth.

5. In a harvester, the combination, with the main axle carrying the main wheel, a clutch member on the latter, and a counter-shaft yieldingly supported by the main frame and having a sprocket, of a sprocket journaled on the axle and having a clutch member on its hub, a chain belt connecting the two sprockets, an expansive spring throwing the said members normally into engagement, a trip-lever pivoted to the main frame, and a rod connecting said lever with a yoke mounted loosely on the hub of the sprocket on the axle, as and for the purpose set forth.

6. In a harvester, the combination, with a rocking triangular lever having a ball at its front angle, of the cutting apparatus, a two-part box having registering holes, the inner part having a groove, a yoke standing in said groove with its ends passing through said holes, nuts on said ends connecting the parts, a pitman pivoted at one end to said cutting apparatus, and a headed plug swiveled in the outer part of said box and into which the shank of said pitman is screwed, as and for the purpose set forth.

7. In a harvester, the combination, with a rocking triangular lever having a ball at its front end and a box embracing said ball, of the cutting apparatus, an L-shaped pitman having its foot pivoted in said apparatus, and a headed plug swiveled in said box and into which the shank of said pitman is screwed, as and for the purpose apparent.

482,969. SKEWER OR NEEDLE FOR CLOSING FOWLS, &c. EMMA MUSSO, Vineland, N. J. Filed Apr. 28, 1892. Serial No. 430,966. (No model.)



Claim.—1. A skewer consisting of adjustably-hinged arms adapted to engage the walls of the openings in fowls, poultry, &c., and close said openings, substantially as described.

2. A skewer having arms with teeth thereon, said arms having means for adjustably connecting them at one end and means for adjustably securing the same on the other end substantially as described.

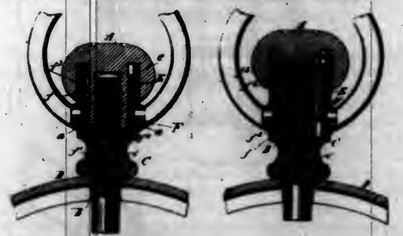
3. Skewers adjustably hung at one end on a ring and provided at the opposite ends with a fastening device, substantially as described.

482,970. LOCK. WILLIAM NEHRING, Evansville, Ind. Filed Sept. 23, 1891. Serial No. 407,040. (No model.)

Claim.—1. The combination, with a lock having a latch-bolt, a locking-bolt, and a suitable tumbler for the locking-bolt, of a pivoted lever engaging said tumbler and a cam adapted to engage said pivoted lever and latch-bolt and prevent the movement of both the locking-bolt and latch-bolt, substantially as and for the purpose set forth.

2. The combination of the latch-bolt, the locking-bolt, the tumbler for the locking-bolt, a pivoted lever engaging said tumbler, and a spiral spring having its respective ends engaged by said pivoted lever and the latch-bolt, substantially as and for the purposes set forth.

3. The combination of the latch-bolt, the locking-bolt, the tumbler for the locking-bolt, the pivoted lever, a spiral spring located between the latch-bolt and the pivoted lever, and a locking device, said tumbler being engaged by the pivoted lever and said locking device being adapted to prevent the movement of said pivoted lever, all substantially as set forth.



4. The combination of the latch-bolt, the locking-bolt, the tumbler, the pivoted lever engaged on one side by the tumbler, the spiral spring

located between the opposite side of said lever and the forward end of the latch-bolt, and the locking-cam mounted upon a suitable axis and adapted to be moved in front of the lever independently of the latch-bolt and also to be moved in front of said lever and behind the latch-bolt at the same time, substantially as and for the purposes set forth.

5. The combination of a lock having a bearing, a knob adapted to turn in said bearing, the socket in connection with said bearing, and the key mounted in said socket, said knob having an annular groove in which the end of the key fits, all substantially as and for the purposes set forth.

6. The combination of journaled bearings, the knob adapted to fit in said bearings and provided with an annular groove, one of said bearings being provided with a semi-annular flange adapted to fit in a groove in the knob and the other being provided with a socket, with a key in said socket adapted to enter the groove and the other knob, all substantially as and for the purposes set forth.

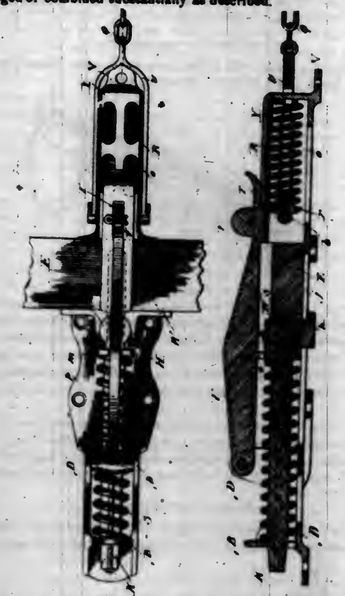
482,971. WATCH-CASE PENDANT. CHARLES ARTHUR, East Orange, assignor to the Newark Watch Case Material Company, Newark, N. J. Filed Oct. 26, 1891. Serial No. 409,819. (No model.)

Claim.—1. A watch-case pendant constructed with a winding-arbor threaded into the crown and a sleeve threaded onto said arbor and against the hub of said crown, thereby acting as a lock-nut, said sleeve being slitted to form spring-arms, substantially as described.

2. A watch-case pendant constructed with a winding-arbor threaded into the hub of the crown and a sleeve having a restricted neck threaded onto the winding-arbor and against the said hub of the crown, thereby acting as a lock-nut, and being slitted to form spring-arms, substantially as described.

3. In a watch-case pendant, the combination, with a pendant fitted internally with a flanged sleeve, of a winding-arbor threaded the greater part of its length, a crown having an elongated core, into which latter said arbor is threaded, and the sleeve F, threaded onto said arbor and provided with the shoulder f^2 to fit against said core, to operate in the manner and for the purpose substantially as described.

4. In a watch-case pendant, the combination, with the pendant having a flanged sleeve E fitted therein, of the arbor B, threaded the greater part of its length, a crown A, constructed with a long core *a*, into which said arbor is threaded, and a grooved and slitted sleeve F, having the restricted neck f', threaded onto said arbor and formed with the shoulder f^2, adapted to bind against the end of said core, substantially as and for the purpose described.



482,972. TEA-KETTLE. VOLNEY C. BAKER, Mount Morris, N. Y. Filed Mar. 3, 1892. Serial No. 423,673. (No model.)

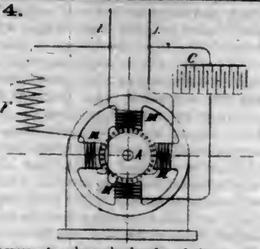
Claim.—A tea-kettle consisting of a sheet-metal body *a*, having formed integral with it a spout *d*, extending approximately the full length of the body and projecting in over the top of the kettle, a cover *b*, permanently fastened over the body and fitting closely around and secured to the portion of the spout projecting in over the kettle, and a handle secured thereto, substantially as described.

482,973. DRAFT ATTACHMENT FOR VEHICLES. HIRAM BARTON, Chicago, Ill. Filed Mar. 7, 1890. Serial No. 343,014. (No model.)

Claim.—1. In a spring-draft attachment, the combination of a slotted plate securely attached to the tongue of a wagon and provided with a perforated bracket or buffer made integral with the upper surface of the forward end thereof and having its rear face perpendicular to and at right angles with the central longitudinal line of such plate, a coil-spring, a head or bearing block provided with a convex rear face and also with an engaging shank projected from its front face and passing through the coil-spring and into the aperture in the perforated buffer or bracket and in which coil-spring and aperture such shank has freedom of movement and which head or bearing block has also freedom of movement on the upper surface of such plate while securely attached thereto by means of a bolt the stem of which is inserted from below through the slot in such plate up into the cylindrical section of such head or bearing block, and an evener provided with a vertical groove in the front face thereof to correspond with the convexity of the rear face of such head or bearing block, all arranged or combined substantially as described.

2. In a spring-draft attachment, the combination of the slotted plate *p*, attached to the tongue of a wagon, the perforated buffer B, the coil-spring S, the cylindrical chambered head H and its shank K, the bolt X, and the evener and evener-plate W, having a concave groove *g*, in which the head H fits, substantially as specified.

3. In a spring-draft attachment, the combination of the slotted plate *p*, provided with ears D D, the perforated buffer B, the casing Y, having the lug V on the upper surface thereof and all made integral with the upper surface of such plate, the coil-spring S, the cylindrical head or bearing block H, provided with a shank K, the bolt X, the evener-plate W, provided with a concave recess for the block H, the evener E, and top bar T, all arranged and combined substantially as set forth.



4. In a spring-draft attachment, the combination of the slotted plate *p*, attached to the tongue of a wagon and provided with the ears D D, the perforated buffer B, and the casing Y, having the lug V on the upper surface and the slots O O in the side walls thereof, the coil-spring S, the head or bearing block F, provided with the shank K and the ears *e e*, the bolt X, the evener plate W, the evener E, the top bar T, the spring R, the clevis-bolt *b*, the clevis U, and chain Q, attached to the frame of the wagon, all arranged and combined substantially as specified.

482,974. ALTERNATING-CURRENT MOTOR. OTTO T. BLATHY, Buda-Pesth, Austria-Hungary. Filed Dec. 7, 1891. Serial No. 414,500. (No model.)

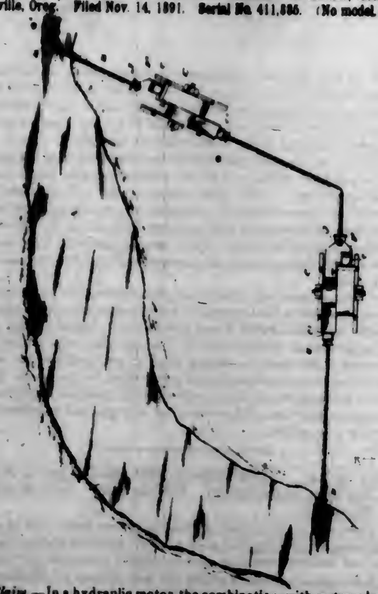
Claim.—1. A rotary-field alternating-current motor with two sets of field-magnet coils supplied from a source of simple alternating currents and self-induction coils and condensers connected up with the said field-magnet circuits, whereby the said currents are displaced in phase, as and for the purpose set forth.

2. A rotary-field alternating-current motor with two sets of field-

482,974.

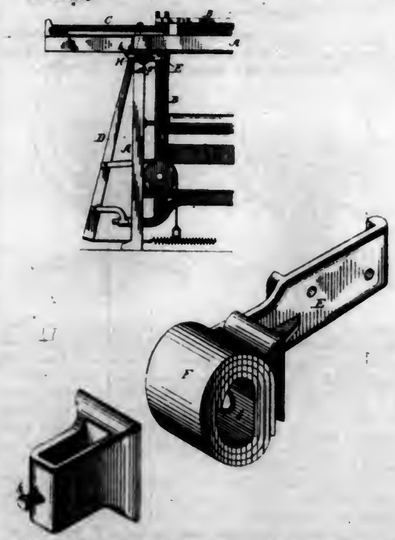
magnet coils forming two branch circuits of the supply-leads, with a self-induction coil included in one of the said branch circuits and a condenser in the other branch circuit.

482,975. GRIP FOR ROPES. THOMAS J. COPE, Philadelphia, Pa. Filed Feb. 3, 1892. Serial No. 420,646. (No model.)



Claim.—1. A grip for a cable, &c., consisting of a frame with side flanges thereon and automatically-tightening jaws which are mounted on guides secured to said side flanges, substantially as described.

2. A grip for a cable, consisting of a frame having side flanges with ears, rods secured in said ears, and jaws sliding on said rods, said rods being convergent, said parts being combined substantially as described.



3. A frame having longitudinally-extending flanges thereon, lugs on the inner sides of said flanges, rods connected with said lugs, and sliding jaws which are located within said flanges and provided with ears which are fitted on said rods, said parts being combined substantially as described.

482,976. HYDRAULIC MOTOR. MARTIN VAN BUSLEY, McMinnville, Oreg. Filed Nov. 14, 1891. Serial No. 411,886. (No model.)

Claim.—In a hydraulic motor, the combination, with water-wheels having end receiving and discharge openings, of the inclosed conducting flume or pipe adapted to conduct the water from one point of a stream over the land and to a lower point of the same stream and provided with a flared or funnel terminal at the receiving-point of said flume, a fender inclosing said funnel end, lateral receiving-passages projecting out of the path of said flume at certain intervals, upwardly-extending receiving-spouts communicating with said lateral passages and adapted to be connected with the receiving-openings of the water-wheels, supplemental discharge-spouts adapted to be connected with the discharge-openings of said wheels and communicating with the main portion of the flume, and an oscillating gate adapted to either direct the water through said lateral passages or uninterruptedly through said flume, substantially as set forth.

482,977. BUFFER FOR PICKER STAFFS OF LOOMS. EDWIN HAMILTON, Philadelphia, Pa. Filed Jan. 29, 1891. Serial No. 379,586. (No model.)

Claim.—The combination of the bracket E, adapted to be secured to the lathe of the loom, having a flange *e'* resting against the lathe, an extension *e*, and a seat *d*, projecting from said extension, said seat having rounded corners *f f*, a buffer F of a coil of leather, said buffer having an open center, with a bolt passing through the coil and through the seat, and a nut at the back of the seat and adapted to the bolt, substantially as described.

482,978. SUPPORT FOR PHOTOGRAPHS, PICTURES, AND ANALOGOUS ARTICLES. ANDREW HUNTER, Chicago, Ill. Filed Aug. 4, 1891. Serial No. 401,652. (No model.)

Claim.—1. The herein-described support for pictures or analogous articles, comprising a loop provided with means for attachment to the back of the picture or other article and a removable supporting arm or brace composed of a flat strip of metal having one end bent at an angle to the balance of the strip and adapted for insertion in said loop from the under side thereof, substantially as set forth.

2. The herein-described support for pictures or analogous articles, comprising a loop provided with means for attachment to the back of the picture or other article and a removable supporting arm or brace composed of a flat strip of metal having one end bent at an angle to the balance of the strip for engagement with said loop, said end being capable of further bending to vary said angle, as desired, to increase or decrease the distance between the said brace and the back of said article and alter the inclination of the latter from time to time, substantially as set forth.

3. The herein-described support for pictures or analogous articles, comprising a loop provided with a central raised portion and end portions coated with adhesive material and adapted to be attached to the back of the picture or picture-frame and an angular supporting arm or brace adapted to be engaged at its upper end with said central portion of the said loop, substantially as described.

482,979. STORAGE-BATTERY. EDWARD R. KNOWLES, Brooklyn, N. Y. Filed Oct. 15, 1891. Serial No. 408,834. (No model.)

Claim.—1. A support-plate for the absorptive material of a storage-battery, consisting of three parts, to wit: a central part, both of whose surfaces are divided by projections or ribs into a number of recesses or cavities, two outer parts, each of whose inner surfaces are divided by projections or ribs into a number of recesses or cavities, said recesses or cavities on the two outside parts being arranged to register with the recesses or cavities on the central part, so that when the three parts are put together the interior of the plate so formed will be substantially hollow and cellular in structure, all the parts being perforated and riveted together substantially as described.

2. A support-plate for the absorptive material of a storage-battery, consisting of three parts, to wit: a central part provided with a connecting-lug and downwardly-turned flanges and two outside parts, the downwardly-turned flanges holding the three parts together, substantially as described.

3. A support-plate for the absorptive material of a storage-battery, consisting of three parts, to wit: a central part, both of whose surfaces are divided by projections or ribs into a number of recesses or cavities and provided with a projecting rim or flange on both sides of and around its outer edge, two outside parts, each provided with a projecting rim or flange around its edge and upon its inner side, said rims or flanges upon the edges of the two outside parts being adapted to fit inside the rim or flange upon the edge of the central part, all the parts being perforated and riveted together substantially as described.

4. A support-plate for the absorptive material of a storage-battery, consisting of three parts, to wit: a central part provided with a connecting-lug and downwardly-turned brackets, both of whose surfaces are divided by projections or ribs into a number of recesses or cavities and provided with a projecting rim or flange on both sides of and around its outer edge, two outside parts, each of whose inner surfaces are divided by projections or ribs into a number of recesses or cavities and each provided with a projecting rim or flange around its edge and upon its inner side, said recesses or cavities on the two outside parts being arranged to register with the recesses or cavities on the central part, so that when the three parts are put together the inside of the plate will be substantially hollow and cellular in structure, said rims or flanges upon the edges of the two outside parts being adapted to fit inside the rim or flange upon the edge of the central part, all of the parts being perforated and riveted together substantially as described.

5. A support-plate for the absorptive material of a storage-battery, consisting of three parts, to wit: a central part provided with a connecting-lug and downwardly-projecting support-feet, both of whose surfaces are divided by projections or ribs into a number of recesses or cavities and provided with a projecting rim or flange on both sides of and around its outer edge, two outside parts, each of whose inner surfaces are divided by projections or ribs into a number of recesses or cavities and each provided with a projecting rim or flange around its edge and upon its inner side, said recesses or cavities on the two outside parts being arranged to register with the recesses or cavities on the central part, so that when the three parts are put together the inside of the plate will be substantially hollow and cellular in structure, said rims or flanges upon the edges of the two outside parts being adapted to fit inside the rim or flange upon the edge of the central part, all the parts being perforated and riveted together substantially as described.

6. A support-plate for the absorptive material of a storage-battery, consisting of three parts, to wit: a central part provided with a connecting-lug and downwardly-turned brackets, both of whose surfaces are divided by projections or ribs into a number of recesses or cavities and provided with a projecting rim or flange on both sides of and around its outer edge, two outside parts, each of whose inner surfaces are divided by projections or ribs into a number of recesses or cavities and each provided with a projecting rim or flange around its edge and upon its inner side, said recesses or cavities on the two outside parts being arranged to register with the recesses or cavities on the central part, so that when the three parts are put together the inside of the plate will be substantially hollow and cellular in structure, said rims or flanges upon the edges of the two outside parts being adapted to fit inside the rim or flange upon the edge of the central part, said rim or flange upon the central part being folded down over the rims or flanges upon the two outside parts, and all the parts being perforated and riveted together substantially as described.

7. A support-plate for the absorptive material of a storage-battery, consisting of three parts, to wit: a central part provided with a connecting-lug and downwardly-projecting support-feet, both of whose surfaces are divided by projections or ribs into a number of recesses or cavities and provided with a projection or flange on both sides of and around its outer edge, two outside parts, each of whose inner surfaces are divided by projections or ribs into a number of recesses or cavities and each provided with a projecting rim or flange around its edge and upon its inner side, said recesses or cavities on the two outside parts being arranged to register with the recesses or cavities on the central part, so that when the three parts are put together the inside of the plate will be substantially hollow and cellular in structure, said rims or flanges upon the edges of the two outside parts being adapted to fit inside the rim or flange upon the edge of the central part, said rim or flange upon the central part being folded down over the rims or flanges upon the two outside parts, and all the parts being perforated and riveted together substantially as described.

8. An element for a storage-battery, consisting of a perforated central support-plate, two perforated outside plates, two layers of absorptive material interposed between the outside plates and the central support-plate, and thin perforated sheets of metal interposed between the absorptive material and the outside plates, substantially as described.

9. An element for a storage-battery, consisting of a perforated central support-plate, two perforated outside plates, two layers of absorptive material interposed between the central support-plate and the outside plates, and perforated sheets of a metal which is easily oxidized interposed between the absorptive material and the outside plate, all being united together substantially as described.

10. In an element for a storage-battery, a perforated retaining-sheet of metal interposed between the surfaces of the metallic perforated support-plates and the absorptive material, substantially as described.

11. In an element for a storage-battery, a perforated retaining-sheet of a metal which is easily oxidized interposed between the surfaces of the metallic perforated support-plates and the absorptive material, substantially as described.

12. In a storage-battery, a combined separating and supporting piece for the electrodes, provided with cavities to separate plates of one electrode and shoulders to support plates of the other electrode, substantially as described.

13. In a storage-battery, a combined separating and supporting piece composed of a soft flexible non-conducting material, adapted to rest upon the bottom of the cell, said supporting piece being provided with separating-cavities and supporting-shoulders for the respective electrodes of the cell, substantially as described.

14. In a storage-battery, the combined supporting and separating piece X, having the grooves X' in its upper surface and the projecting flanges X" upon its inner surface, as and for the purpose set forth.

15. In a storage-battery, the combined separating and supporting piece X, having the grooves X' upon its upper surface and the flanges X" upon its inner surface, composed of a soft flexible non-conducting material, substantially as described.

16. In a storage-battery, the combination of a series of positive elements provided with side extensions, a series of negative elements provided with supporting-feet, and a separating and supporting piece interposed between the extensions on the positive elements and the feet upon the negative elements, substantially as described.

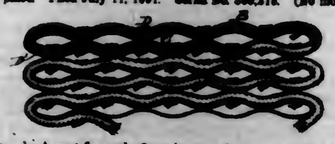
17. In a storage-battery, the combination of a series of positive elements provided with side extensions, a series of negative elements provided with supporting-feet and a separating and supporting piece composed of soft flexible non-conducting material, all being so united and arranged that the positive elements are supported by their side extensions upon and separated by the supporting-feet separated by the separating-piece, substantially as described.

18. In an electrical connector, the combination, with the cross-bar 1, of the cups 13, and a removable metallic cover 4, and means for locking, unlocking, and removing the same, substantially as described.

19. In an electrical connector, the combination, with the cross-bar 1, of the cup 13, provided with the flange 11 and slots 9 9, and a cover 4, provided with the ears 5 5, substantially as described.

20. In an electrical connector, the combination, with the cross-bar 1, of the cap 13, provided with the flange 11 and slots 9 9, a lining 3, and a cover 4, provided with the ears 5 5, substantially as described.

21. In an electrical connector, the combination, with the cap 13, provided with a rim 11 and slots 9 9, of a cover 4, provided with ears 5 5, and a rod 7, passing through said cover, said cover being held in place upon said rod by a stop 8, substantially as described.



22. In an electrical connector, the combination, with caps 13, provided with a rim 11 and slots 9 9, of a lining 3, a cover 4, provided with ears 5 5, and a metallic rod 7, passing through said cover, the end 6 of said rod being composed of a metal not attacked by mercury, said cover being held in place upon said rod by a stop 8, substantially as described.

23. In an electrical connector, the combination of a metallic conductor 7, provided with terminals 6 6 of a metal other than that of which 7 is composed, and cup 13, with covers 4 4 and stops 8 8, substantially as described.

24. In an electrical connector, the combination of a metallic conductor 7, provided with terminals 6 6 of a metal not attacked by mercury, and cups 13, with covers 4 4 and stops 8 8, substantially as described.

25. An element for a storage-battery, consisting of a metallic plate provided with a cavity or cavities for an active material, the metallic walls of said cavity or cavities being lined with an easily-oxidizable metal, as and for the purpose set forth.

482,980. MAT. WILLIAM M. MARSHALL, Philadelphia, Pa., assignor of three-fourths to Samuel W. Dunn, Harry L. Dunn, and John Shreeve, same place. Filed July 11, 1891. Serial No. 399,218. (No model.)

Claim.—1. A mat formed of sections, each section consisting of a loop of rigid material having surrounding rings of rope, and clamps connecting said sections, substantially as described.

2. A mat formed of sections, each of which is composed of a loop of rigid material having surrounding rings of rope extending to the outer edges thereof, and fastenings for said sections, said parts being combined substantially as described.

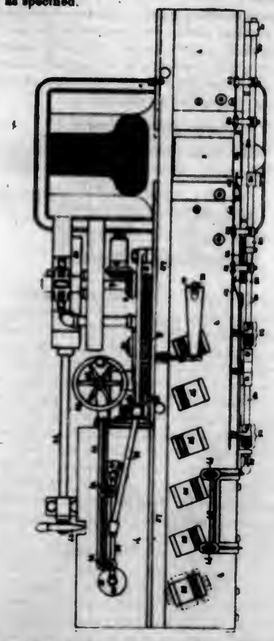
3. A mat formed of sections, each of which consists of a folded strip of rigid material of serpentine form and a surrounding ring or coil of rope, the opposite sides of each section being connected at points intermediate of its ends, substantially as described.

482,981. FEEDING DEVICE FOR CARD-PUNCHING PRESSES. JOHN P. OGDEN, Philadelphia, Pa., assignor to the A. M. Collins Manufacturing Company, same place. Filed July 24, 1891. Serial No. 400,547. (No model.)

Claim.—1. The combination of the tubular lifter, the arm to which said lifter is pivoted, means for raising and lowering and for swinging said arm, an air-exhausting device, and a valve located at the pivot-point of the arm and lifter, so as to be opened and closed as the arm swings, substantially as specified.

2. The combination of the tubular lifter, the swinging arm carrying the same, the exhausting device, and the valve at the junction of the arm and lifter, with a squaring device for the lifter at each end of its swing, substantially as specified.

3. The combination of the tubular lifter, the swinging arm, the exhausting device, the automatic cut-off valve, and leakage-ports in said lifter for permitting the card to drop when communication with the exhauster is closed, substantially as specified.



4. The combination of the tubular lifter, the swinging arm, the tubular shaft carrying the same, the exhaust mechanism communicating with said shaft, a grooved cam and engaging-pin, and means for raising and lowering the shaft, whereby said cam and pin cause a partial turning of the same, substantially as specified.

5. The combination of a punching-press with blank-feeding mechanism comprising feed-drums, a movable stop-pin for arresting the forward movement of the blank under the action of the drums, and reciprocating nippers for seizing the arrested blank and carrying it further forward, substantially as specified.

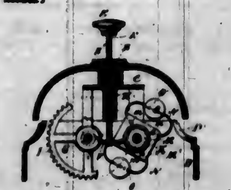
6. The combination of the feed-drums and stop-pin movable into and out of operative position with reciprocating nippers likewise movable into and out of operative position, substantially as specified.

7. The combination, in card-blank-feeding mechanism, of feed-drums, some of which are fixed and others in advance of the same, movable into and out of operative position, a movable stop-pin for the blank, and reciprocating nippers for engaging the blank and feeding it forward beyond the drums, substantially as specified.

8. The combination, in card-blank-feeding mechanism, of a set of feed-drums, a frame carrying the latter, a cam-bar for causing said frame to rise and fall, and means for reciprocating said cam-bar, substantially as specified.

9. The combination, in card-blank-feeding mechanism, of a set of feed-drums, a stop-pin, a frame carrying said drums, a cam-bar acting on said frame and on the pin, and means for operating said cam-bar, substantially as specified.

10. The combination, in card-blank-feeding mechanism, of a set of feed-drums and a stop-pin movable into and out of operative position, a set of swinging and reciprocating nippers, a cam-slide for acting on said nippers to hold them out of operative position, and means for operating said cam-slide, substantially as specified.

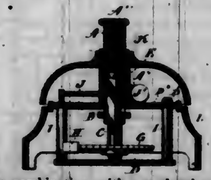


482,982. COLANDER FOR MASHING VEGETABLES. PHILLIP PATROL, Dayton, Ohio. Filed May 2, 1891. Serial No. 391,410. (No model.)

Claim.—1. The cylindrical colander having a perforate bottom and supporting-legs, the central shaft having propeller-arms near said bottom and supported in cross-bars below said bottom and in the top cross-piece, which is pivoted to one side of the colander to swing laterally and provided with a set-screw for securing the other end of said bar, said cross-piece having a swinging piece to complete the bearing-box, all the parts combined and arranged substantially as described.

2. The colander described, having cylindrical body and legs extending from near the top of the body to a distance below the bottom thereof, said body having a reticulated bottom and cross-bars below the same, a central shaft having arms with inclined surfaces just above the reticulated bottom, and a top cross-piece having a bearing-box for the said shaft, said cross-piece pivoted to the body at one end so as to swing sidewise and having a fastening device to connect the other end of the bar to the body, substantially as described.

482,983. BELL. EDWIN S. PIPER, Bristol, Conn., assignor of one-half to Frank Clayton, same place. Filed May 9, 1892. Serial No. 432,393. (No model.)



Claim.—1. In a bell, the combination, with the base and gong thereof, of a train, a manual connected with the same for actuating it in one direction, a spring for actuating the train reversely when the said manual is released, and one or more spring-mounted rotary bell-hammers which are thrown outward to strike the bell when the train is actuated and each consisting of a spring connected with a rotary member of the train and having the striker attached to its outer portion, substantially as described.

2. In a bell, the combination, with the base and gong thereof, of a train, a manual connected with the same for actuating it in one direction, a spring for actuating the train reversely when the said manual is released, and one or more rotary spring-mounted bell-hammers, each consisting of a striker and a bowed spring the ends of which are connected with the rotating member of the train, substantially as described.

3. In a bell, the combination, with the base and gong thereof, of a train comprising a driving and a driven shaft, a wheel and a coiled spring on the former, a push-rod adapted at its outer end for manual engagement, a chain wound one or more turns on the driving-shaft and connected thereto and to the inner end of the push-rod, a pinion on the driven shaft meshed into by the said wheel, a hub on the driving-shaft, and one or more spring mounted bell-hammers connected with the said hub and thrown outward for engagement with the bell when the driven shaft is rotated with sufficient speed, substantially as described.

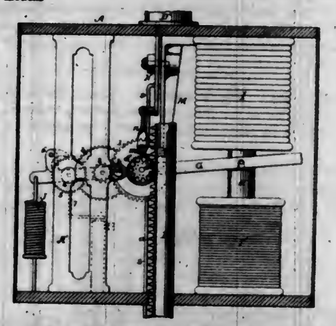
482,984. BELL. EDWIN S. PIPER, Bristol, Conn., assignor of one-half to Frank Clayton, same place. Filed May 9, 1892. Serial No. 432,394. (No model.)

Claim.—1. The combination, with a push-tube having its inner end constructed with one or more spiral slots and its outer end adapted for direct manual engagement, of an escapement-shaft having one end entered into the said slotted end of the tube and furnished with a pin which enters the slot or slots therein, a spring interposed between the outer end of the tube and the inclosed end of the shaft for recovering the tube after it has been pressed inward, a bell and a bell-hammer, connections between the said shaft and hammer, whereby the latter is actuated and rotary movement is imparted to the former by the inward movement of the tube, and means for supporting and guiding the said parts, substantially as described.

2. The combination, with a push-tube having its inner end constructed with one or more spiral slots and its outer end provided with a roughened cap forming a finger-piece, of an escapement-shaft having one end entered into the said slotted end of the tube and furnished with a pin which enters the slot or slots therein, a spring interposed between the said cap and shaft for recovering the tube after it is pressed inward, a bell and bell-hammer, connections between the said shaft and hammer, whereby the latter is actuated by the rotary movement imparted to the former by the push-tube, and means for supporting and guiding the said parts, substantially as described.

3. In a bell, the combination, with a push-tube having its outer end constructed with a cap forming a finger-piece and its inner end constructed with one or more spiral slots, of an escapement-shaft having one end entered into the said slotted end of the tube and furnished with a pin which enters the slot or slots therein, a spring interposed between the cap and shaft for recovering the tube after it has been pushed inward, an escapement-wheel mounted on the shaft, a pallet engaging with the said wheel, an arbor for the said pallet, a hammer-tail mounted in the said arbor, a hammer attached to the said hammer-tail, a bell, and means for supporting and guiding the said parts, substantially as described.

482,985. CLOCK-REGULATOR. WILSON H. PORTER, New Haven, Conn., assignor to the New Haven Clock Company, same place. Filed May 23, 1892. Serial No. 434,043. (No model.)

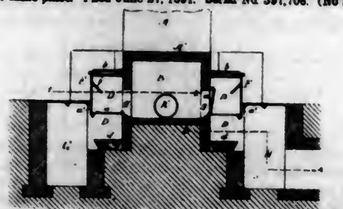


Claim.—1. In a clock, the combination, with a vertically-movable suspension-stud, of an eccentric located below the same and having its edge engaged therewith, a shaft on which the eccentric is mounted and by which it is turned, and a spring applied to the shaft for resisting its rotation, substantially as set forth.

2. In a clock, the combination, with a suspension-stud, of a vertically-movable carrying-plate in which the stud is mounted, an eccentric located below the stud and having its edge engaged therewith, a shaft having the eccentric mounted on its forward end, and a tension-spring applied to the shaft, substantially as described.

3. In a clock, the combination, with a frame adapted to be attached to a clock-movement, of a vertically-movable carrier applied to the said frame, a stud attached to the said carrier and adapted to have a pendulum suspended from it, a shaft mounted horizontally in the frame and projecting at its ends through the same, an eccentric mounted on the rear end of the shaft and having its edge engaged with the stud, and a tension-spring applied to the shaft to resist its rotation, substantially as described.

482,986. ELECTRIC-ARC LAMP. JAMES A. STUART, Philadelphia, Pa., assignor to himself and John Buchanan, same place, and Thomas Marrin, Brooklyn, N. Y. Filed July 30, 1891. Serial No. 400,127. (No model.)



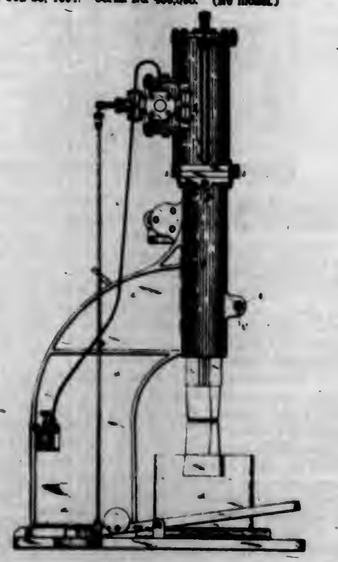
Claim.—1. The combination, in a duplex-carbon arc lamp, of the regulating-lever carrying a shaft with escapement mechanism, and a pair of pinions free to turn on the shaft in one direction, but provided with clutching mechanism for engaging the shaft when turned in the opposite direction, the two carbon-holders, one having a rack engaging with one pinion and the other having a rack engaging with the other pinion, and a locking-lever controlling the pinion of the second carbon-holder and engaging with the first carbon holder when its carbon has been burned out, so as to unlock the pinion of said second carbon-holder, substantially as specified.

2. The combination, in a duplex-carbon arc lamp, of the regulating-lever, its escapement shaft and pinions, the two carbon-holders, one having a rack engaging with one pinion and the other a rack engaging with the other pinion, the rack of the carbon holder of the first set being discontinued, so as to release its pinion when the carbon is burned out, and a locking-lever controlling the pinion of the second carbon holder and engaging with the first carbon-holder when the latter drops on releasing its pinion, so as to trip said lever and release the second carbon holder, substantially as specified.

3. The combination, in a duplex-carbon arc lamp, of the regulating-lever carrying an escapement-shaft, with pinions, the two carbon-

holders, one having a rack engaging with one of said pinions and the other a rack engaging with the other pinion, the rack of the first carbon-holder being discontinued, so as to release its pinion when the carbon is burned out, a locking-dog retaining the pinion of the second carbon-holder, and a lever connected to said dog and engaging with the first carbon-holder when the latter drops on releasing its pinion, substantially as specified.

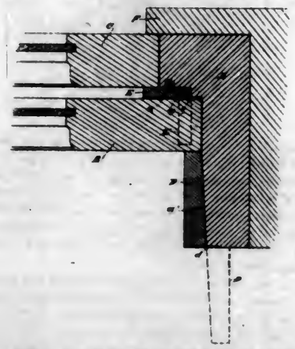
482,987. DRY CLOSET. CORNELIUS B. TOMPKINS, Elmira, N. Y., assignor to himself and William W. Tompkins and Stewart D. Tompkins, same place. Filed June 27, 1891. Serial No. 397,706. (No model.)



Claim.—1. The combination, in a dry-closet structure, of a draft-stack having at the base an enlarged foot inclosing a receiving-chamber, with lateral branch chambers receiving the deposits from the closets and communicating with said chamber, and an air-supply flue or chamber for said lateral branch chambers, substantially as specified.

2. The combination of the draft-stack having at the base an enlarged foot inclosing a receiving-chamber, lateral branch chambers receiving the deposits from the closets and communicating with said chamber, a flue or chamber for supplying air to said lateral branch chambers, and a stove or furnace discharging into or through the receiving-chamber in the enlarged foot at the base of the stack, substantially as specified.

3. The combination of the draft-stack having at the base an enlarged foot inclosing a receiving-chamber, lateral branch chambers receiving the deposits from the closets and communicating with said receiving-chamber through openings of contracted area, and an air-supply flue or chamber for said lateral branch chambers, substantially as specified.



4. The combination of the draft flue or stack having a receiving-chamber at the base, the lateral branch chambers communicating with said receiving-chamber and with an air-supplying flue or chamber, and partitions in said lateral chambers, partly horizontal and partly vertical and perforated in both portions, substantially as specified.

482,988. POWER-HAMMER. SAMUEL TRETHEWEY, Pittsburg, Pa., assignor to the Trethewey Manufacturing Company, same place. Filed Oct. 23, 1891. Serial No. 409,595. (No model.)

Claim.—An open-front steam-hammer having a base-plate carrying the anvil, and a hammer-frame formed of two separate stands extending up behind the anvil and at an angle thereto, then extending over the anvil, and together forming the guideway for the sliding head of the hammer and supporting the steam-cylinder above the same, said stands being each adjustably secured to the base-plate and adjustably connected at the upper end, where the stands may be adjusted to take up wear of the hammer-head or guideway, substantially as and for the purposes set forth.

482,989. WINDOW FRAME AND SASH. JAMES WILSON, San Francisco, Cal. Filed Apr. 1, 1892. Serial No. 427,396. (No model.)

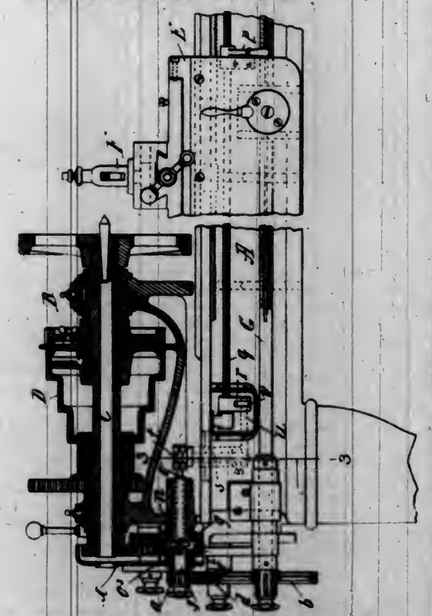
Claim.—1. In a window frame and sash, and in combination with pulley or frame stiles and sashes fitted thereto, parting-strips hinged to said stiles and adapted to be turned out of the way to permit the removal of the upper sash from the frame and spring-actuated catches for engaging and securing said strips, substantially as herein described.

2. In a window frame and sash, and in combination with pulley or frame stiles and sashes fitted thereto, the parting-strips and the inside stops, each hinged to the stiles, whereby they may be turned out of the way to permit the removal of the sashes from the frame, said inside stops having an inclined or beveled face engaging a like face on the frame, and spring-actuated catches for engaging the parting-strips, substantially as herein described.

3. In a window frame and sash, and in combination with the pulley or frame stiles having beveled or inclined inner faces, the inside stops hinged at their outer edges to the adjacent edges of said faces, substantially as herein described.

4. In a window frame and sash, the combination of the pulley or frame stiles having the offsets *a*, the parting-strips hinged to said stiles and adapted to be turned to or from the offsets, the catches seated in said offsets, and the latch-plates seated in open recesses in the parting-strips, substantially as herein described.

482,990. CASE FOR BLANKS. JOHN F. WILSOT, Kearney, Nebr. Filed July 11, 1892. Serial No. 439,631. (No model.)



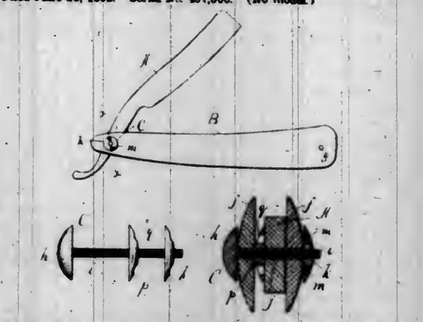
Claim.—1. In a case for blanks, the combination of a casing, a blank-receptacle, and a pivotal hinge secured to the blank-receptacle on the under and out side thereof, the bolt of such pivotal hinge extending through support thereof forward of the center of gravity of the blank-receptacle, and the front of such blank-receptacle forming a portion of the front of the casing, substantially as described.

2. In a case for blanks, the combination of a shell consisting of sides, top, and back and a front divided into two parts, and a blank-receptacle whereof the front consists of one of the parts forming the front of the shell, such blank-receptacle consisting of a bottom, side, and ends, and a pivotal hinge secured to the bottom of such blank-receptacle on the outside and forward of the center of gravity thereof, whereby in opening the blank-receptacle it will turn around a pivotal point underneath and outside of such receptacle, substantially as described.

3. In a case for blanks, the combination of a shell forming a casing, a blank receptacle, and a pivotal hinge, such pivotal hinge being placed underneath and outside of the blank-receptacle and forward of the center of gravity of such receptacle and contents, with an index-holder hinged to the upper edge of one of the sides of the blank-receptacle, an index contained in such holder, and division-sheets having marks thereon corresponding with the marks on the index contained in the blank-receptacle, substantially as described.

4. In a case for blanks, the combination of a shell consisting of sides, top, and back and a front divided into two parts, and a blank-receptacle whereof the front consists of one of the parts forming the front of the shell, such blank-receptacle consisting of a bottom, side, and ends, a stop on the back end of the blank-receptacle, adapted to come in contact with the stationary part of the front of the shell when the blank-receptacle is open, and a pivotal hinge secured to the bottom of such blank-receptacle on the outside and forward of the center of gravity thereof, whereby in opening the blank-receptacle it will turn around a pivotal point underneath and outside of such receptacle, substantially as described.

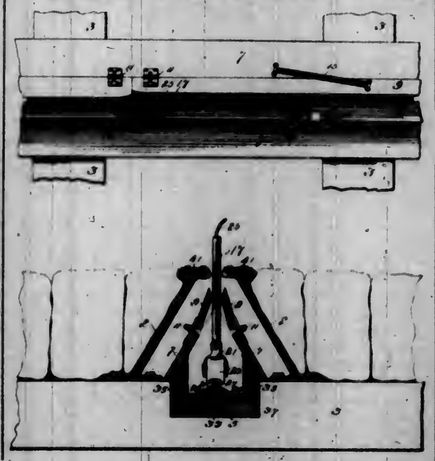
482,991. LATHE. CHRISTIAN H. BAUER, Holyoke, Mass. Filed Feb. 5, 1892. Serial No. 420,410. (No model.)



Claim.—1. In a lathe, in combination, the driving-spindle, a shaft, and the feed-screw geared to the latter, a pair of gear-wheels each loose on said shaft, and means for effecting the engagement of either of said gears with said shaft, and gearing between the driving-spindle and one of the said pair of gears for driving said shaft in one direction, and other gearing between the driving-spindle and the other of said pair of gears for reversely driving the shaft, substantially as described.

2. In a lathe, in combination, the driving shaft or spindle, the sleeve mounted for rotation, and a feed-screw shaft geared to the sleeve, a pair of gear-wheels each loosely mounted on the sleeve and each having an abutment member, gearing between the driving-spindle and said sleeve-supported gears for driving the latter in opposite directions, a collar adapted to slide along the sleeve and having a dog to engage the abutment-piece of either of said pair of gears, and a rod movable endwise within the sleeve and having a pin projecting through a slot which is formed through the sleeve and engaging said slide-collar, substantially as and for the purposes set forth.

3. In a lathe, in combination, the driving shaft or spindle having the gear *h* thereon, the rotatable sleeve having a slot a^3 and the gear *c*, and the feed-screw shaft G, having the gear *b*, and the intermediate gear *d*, connecting said gears *c* and *b*, the gears *f* and *g*, normally loose on the sleeve and each having an abutment-piece, as *m*, the dog-carrying slide-collar, and the rod *o*, having the pin o^2, projected through the sleeve-slot, engaging the collar, the gear *i*, in engagement with said gears *h* and *f*, and the gear i^2, mounted to rotate as one with said gear *i* and having the gear *k* between it and the gear *g*, and means for imparting endwise movements to said rod *o*, substantially as described.



4. In a lathe, the driving-spindle, the sleeve mounted for rotation, and a feed-screw shaft geared to the sleeve, a pair of gear-wheels loosely mounted on the sleeve and each having an abutment member, sets of gearing between the driving-spindle and said sleeve-supported gears for driving the latter, respectively, in opposite directions, the dog-carrying collar movable along the sleeve, and a rod movable endwise within the sleeve and having a pin projecting through a slot which is formed through the sleeve to engage the slide-collar, combined with the rock-shafts *q* and *s*, the latter having the arm *t*, engaging the rod *o*, and the crank-arm *u*, and said rock-shaft *q* having a handle-lever and the crank-arm *r*, and the link between said arms *r* and *u*, substantially as set forth.

482,992. RAZOR-PIVOT. JOHN G. BRUGER, Somerville, Mass. Filed June 20, 1892. Serial No. 437,308. (No model.)

Claim.—In a razor, the combination of two parallel handle-plates disposed apart from each other, a pivot-bolt passing through said handle-plates near one end of the handle, a nut on said pivot-bolt between said handle-plates, a razor-blade pivoted on said pivot-bolt between said nut and one of said handle-plates, and a nut on said pivot-bolt outside one of the handle-plates, the head of said bolt being outside the other handle-plate, and means for connecting the opposite ends of said handle-plates.

482,993. CLOSED-CONDUIT FOR ELECTRIC RAILWAYS. LEVI P. DUNCK, Minneapolis, Minn., assignor of one-eighth to William Hoggum, same place. Filed Sept. 10, 1891. Serial No. 405,273. (No model.)

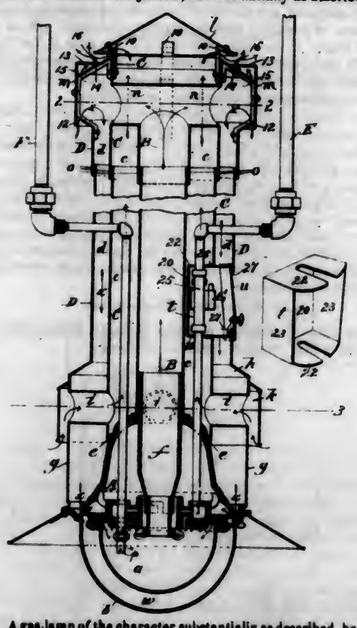
Claim.—1. The combination, with the main conduit provided with an opening through which a trolley-arm may extend, of a supplemental conduit arranged in said main conduit and provided with a series of hinged plates closing the opening in said supplemental conduit, said plates being arranged to break joints with one another, substantially as described.

2. The combination, with a main conduit provided with an opening through which a trolley-arm may pass, of a supplemental conduit arranged therein and provided with inclined outer walls and having an opening through which the trolley-arm may pass, an electric conductor arranged in said supplemental conduit, and a series of plates hinged to the walls of said supplemental conduit and arranged to meet at an angle beneath the opening in the main conduit and provided with beveled upper edges, whereby when said plates are brought together they form a sharp angle, so as to prevent dust, dirt, or water passing through the opening in the main conduit from lodging upon the edges of said plates.

3. The combination, with the main conduit provided with an opening through which a trolley-arm may pass, of a supplemental conduit arranged in said main conduit and provided with inclined outer walls and having an opening through which a trolley-arm may pass, an insulated conductor arranged in said supplemental conduit, and a series of plates hinged to the walls of the supplemental conduit and having beveled upper edges, whereby when said plates are closed they form a sharp angle beneath the opening in the main conduit, said plates being arranged to break joints with one another, substantially as described.

4. The combination, with the conduit provided with a slot adapted to permit a trolley-arm to enter therein, of a supplemental conduit arranged therein, with inclined outer walls and with a space between the outer walls of the supplemental conduit and the inner walls of the main conduit, and with a series of hinged plates secured to the walls of the supplemental conduit and provided with beveled upper edges forming when closed a sharp edge beneath the opening in the main conduit, said plates being arranged to break joints with one another, substantially as described.

5. The combination, with a conduit provided with the inclined walls 7, of the series of plates 9, provided with beveled upper edges, hinged to said walls 7 and arranged to close the opening in said conduit, said plates being arranged to break joints with one another and forming when closed a sharp upper edge, means for holding said plates normally in a closed position, and an electric conductor arranged within said conduit.



6. The combination, with the main conduit provided with a slot or opening adapted to permit a trolley-arm to enter therein, of a supplemental conduit arranged in said main conduit and provided with inclined walls 7, provided with a series of hinged plates 9, secured to the upper edges of said walls and forming when closed a sharp upper edge to said conduit, a suitable trolley-arm projecting through the opening in said conduits and having secured thereto a yoke 21, with a roll 23 journaled in said yoke, the length of said roll being greater than the distance between the upper edges of the slots of the supplemental conduit, and an insulated conductor arranged in said supplemental conduit with which said roll is adapted to make contact, substantially as described.

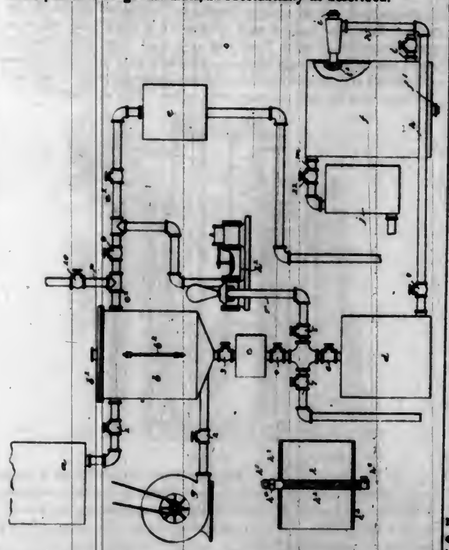
482,994. LAMP. LESLIE A. COUPER, Springfield, Mass. Filed June 3, 1891. Serial No. 394,980. (No model.)

Claim.—1. A gas-lamp of the character substantially as described, having the burner and outer casing D, the central draft-tube in communication with the burner and the intermediate casing C, closed at its bottom, but open at its top, whereby are constituted the annular chambers or passages *d* and *c*, surrounding the draft-tube, there being an inlet-flue leading to the upper portion of chamber *d* for the entrance of air and passage thereof to the burner, flues *i i*, laterally leading from the outside of the lamp to the intermediate air-jacket chamber at the bottom thereof, and one or more flues *n*, leading laterally, for exit from the upper end of the central draft-tube, substantially as and for the purposes described.

2. In a gas-lamp of the character substantially as described, a burner A and inclosures therefor comprising the casing *g*, upwardly continued in the shell D the shell C within the shell D, and the radial flues *i i*, provided with the hood *k*, the inner draft-tube in communication with the burner, having the radial flues *n n*, the outwardly-deflected flange 14 at the top of the tube C, the hood or band *m*, relatively arranged to constitute the inlet-flue 12 to the chamber *d*, and the exit-flue 16 for the products of combustion passing from the draft-flue, and the hood *l*, supported above the upper end of the tube C, substantially as described.

3. In a gas-lamp, in combination, the burner and inclosures therefor comprising the casing *g*, continued in the shell D, the shell C, concentrically within the shell D, and the inner draft-tube in communication with the burner and its upper end terminating in the radial flues *n n*, which pass through the casing C, radial flues *i i*, leading from the exterior of the casing *g* through the lower portion of the casing C and the hood *k*, the downwardly and outwardly deflected flange 14 at the top of the casing C, the band *m*, supported to surround said flange, separated therefrom and also from the upper end portion of the shell D to form in conjunction therewith the flues 12 and 16, and the hood *l*, and the said tubes D C and draft-tube B being formed in sections and jointed, all substantially as described.

4. A gas-lamp of the character substantially as described, having a burner, a central draft-tube, the outer annular passage or chamber for supplying air to the burner for combustion, and an intermediate annular air jacket or chamber between the draft-tube and the outer annular chamber, with an inlet-flue and an outlet-flue therefor, the gas-supply pipe passing into and downwardly through the intermediate air-chamber to the burner and provided with the gas-governor, and a fender-guard interposed between the governor and the draft-tube, substantially as described, and for the purpose set forth.



5. In a lamp, a burner at the bottom, a draft-tube leading upwardly therefrom, an annular passage or chamber surrounding the draft-tube and having at its top an inlet-opening and at its lower portion a communication with the burner and draft tube, and an outlet-flue leading laterally from the upper portion of the draft-tube, which terminates in proximity to the said inlet-flue of the outer annular passage, and a common shield or storm-guard inclosing both of said flues, substantially as and for the purposes set forth.

482,995. PROCESS OF EXTRACTING FAT FROM WOOL. WILLIAM T. CUTTER, East Lyme, Conn., assignor of two-thirds to Chas. J. Lose, same place. Filed Mar. 6, 1891. Serial No. 383,976. (No specimens.)

Claim.—1. The process of cleansing animal fiber, as wool, that consists in passing and repassing the initial quantity of naphtha at a regulated speed through the animal fiber that is inclosed in a vessel, then passing a current of hot air in a reverse direction through the mass of fiber, and then washing the mass by passing a current of water through it, all substantially as described.

2. The process of cleaning wool, that consists in confining a compressed mass of the material in a closed vessel, then passing a current of hot air at a temperature of about 250° Fahrenheit through the mass, and then saturating the mass with a suitable fat solvent and passing and repassing the initial quantity of the solvent at a regulated speed through the mass of wool, all substantially as described.

3. The process of cleansing wool, that consists in first drying the mass of wool, that is held in a suitable vessel, by passing a current of hot air therethrough and then subjecting the dried mass to repeated washings by a suitable fat solvent repeatedly passed through the mass, then driving off the excess of solvent by a current of hot air, and then washing out the potash salts and other deposited impurities from the mass of wool by means of a current of water at a suitable temperature passed through the mass, all substantially as described.

4. The process of cleansing wool fiber, that consists in first drying the mass of wool, that is held in a suitable vessel, by passing a current of hot air therethrough and then subjecting the dried mass to repeated washings by a suitable fat solvent repeatedly passed through the mass, then driving off the excess of solvent by a current of hot air, and then washing out the potash salts and other deposited impurities from the mass of the wool by means of a current of water at a temperature of about 100° Fahrenheit passed through the mass, all substantially as described.

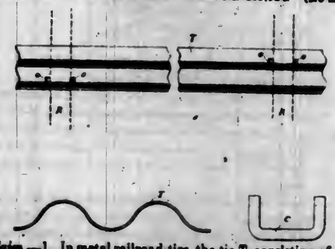
5. The process of extracting the fat from wool, which consists in subjecting the greasy wool to the action of a suitable solvent of fat in an inclosing receptacle and repeatedly percolating the same or initial charge of solvent through the wool, substantially as described.

6. The process of extracting fat from a fibrous material, which consists in subjecting a mass of such greasy fibrous material to the action of naphtha in an inclosing receptacle and repeatedly percolating the initial charge of solvent through the mass, substantially as described.

7. The process of extracting the fat from wool, which consists in percolating the fat solvent through greasy wool and thereby freeing it of foreign matter, then repeatedly passing this resulting solution so charged through the wool until the fatty bodies are dissolved out and taken up by the solvent and the suspended impurities are filtered out and deposited in the wool, all substantially as described.

8. The process of cleansing wool from grease and other foreign matters, which consists in subjecting wool in an inclosing receptacle to the action of a current of suitable solvent, then filtering the initial charge of solvent through the wool to dissolve out the fatty bodies and redeposit the suspended impurities in the wool and repeating the percolation of this initial charge of solvent until the fluid solution of fatty matters is substantially clear of suspended impurities, and then washing the wool to cleanse it of the deposited impurities, all substantially as described.

9. The process of clarifying a fatty solution obtained by passing a quantity of suitable fat solvent, as naphtha, through a mass of animal fiber, that consists in repeatedly filtering this solution of fat mixed with foreign matter through a mass of the same animal fiber, all substantially as described.

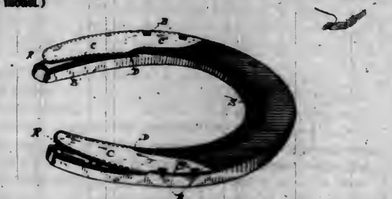


482,996. STIRRUP. ROBERT H. DAVIS, Dardanelle, Ark., assignor to himself and Reuben H. Cole, same place. Filed May 21, 1892. Serial No. 433,667. (No model.)

Claim.—A stirrup A, provided within its upper end with the suspension-bar B, parallel with its sides, and having cross-bars B' B' at its ends and spacing the sides of the stirrup a proper distance apart, and securing bolts or rods D, extending through the sides of the stirrup and longitudinally through the said cross-bars B', substantially as set forth.

482,996.

482,997. METAL RAILROAD-TIE. ROBERT R. DANIELS, Youngstown, Ohio. Filed Dec. 3, 1891. Serial No. 413,994. (No model.)

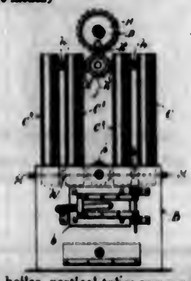


Claim.—1. In metal railroad-ties, the tie T, consisting of a sheet of rolled metal of suitable length, breadth, and thickness, having from end to end two parallel upwardly-arched corrugations and intermediate between them a similar but downward-arched corrugation, each less than a half-circle in transverse lines, which are everywhere upon a curve, except in the flanges which appear upon the side edges of the tie, substantially as described, and for the purpose expressed.

2. In metal railroad-ties that have two or more upwardly-arched longitudinal corrugations, the openings *o o*, appearing in groups of two aligned longitudinally with the tie and a suitable distance apart, each group located at opposite ends of the tie, but not in the same corrugation, substantially as described in the foregoing specification, and for the purpose therein expressed.

3. In metal railroad-ties, the tie T, formed of a suitable sheet of rolled metal, having from end to end two parallel upwardly-arched corrugations and an intermediate downwardly-curved corrugation, each less than a half-circle in transverse lines, which are everywhere upon a curve, except in the flanges which appear upon the edges of the tie, and in which tie upon the highest portions of the upwardly-arched corrugations appear the openings *o o* in groups of two at each end of the tie, but upon opposite corrugations, substantially as described, and for the purpose expressed.

482,998. SPRING-HEEL HORSESHOE. DANIEL C. DWYER, Wichita, Kans., assignor of two-thirds to Richard C. Stewart, Jr., and Wallace A. Stewart, same place. Filed May 31, 1892. Serial No. 435,130. (No model.)



Claim.—1. A horseshoe provided with the heel portions thereof rounded on their upper surface, with heel-springs welded to the shoe-body forward of said rounded portions and arranged extending rearwardly over said heel portions, being made on a plane on their upper surface with the shoe-body and rounded on their surface facing said heel portions, in combination with the rubber coverings or pads made to fit upon said springs and provided with a portion extending forwardly therefrom, adapted to be secured in position on a foot by means of the shoe-securing nails, substantially as and for the purpose set forth.

2. A horseshoe provided with heel-springs welded to the upper side thereof and arranged extending over the heel portions in the manner described, in combination with the rubber coverings made to fit upon said springs and provided with a portion extending forwardly

therefrom, adapted to be secured into position on a foot by means of the shoe-securing nails, substantially as and for the purpose set forth.

482,999. BOILER. WALTER B. FOWLER, Lawrence, Mass., assignor of one-half to Lewis Saunders, same place. Filed Mar. 24, 1892. Serial No. 426,222. (No model.)

Claim.—1. In a boiler, vertical tubes arranged in parallel series over the fire-box, inwardly-depressed heads welded into said tubes and provided with inwardly-projecting reinforcing-flanges, flues connecting the heads of each tube, and horizontal circulation-ducts opening through said flanges and connecting the tubes of adjacent series, substantially as described.

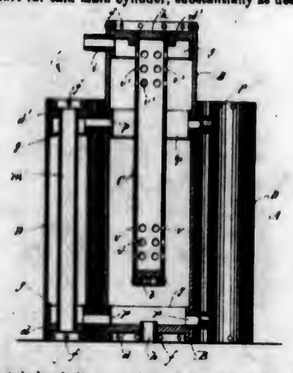
2. In a boiler, a horizontal tube disposed over the fire box, a supply-pipe opening through said box into said tube, a horizontal tube disposed vertically above said first tube, vertical circulation-tubes provided with flues and connected by horizontal ducts with said horizontal tubes, a steam-chest and discharge connected with said upper tube, and a pipe connecting one of said vertical tubes with the supply outside the boiler-casing, substantially as and for the purpose set forth.

3. In a boiler, two horizontal tubes arranged vertically in parallelism above the fire-box and having their corresponding heads connected by pipes outside the casing, in combination with a steam-chest connecting with the upper tube, a series of parallel vertical tubes provided with flues and having their ends respectively connected by horizontal ducts with said horizontal tubes, a supply-opening through the fire-box into the lower horizontal tube, a pipe connecting a vertical tube with the supply outside the casing, and a pipe connecting the supply with the horizontal tube connection, substantially as described.

4. In a tubular boiler, a supply leading through the casing and entering one of the circulation-tubes centrally over the grate, in combination with a pipe tapping one of the circulation-tubes above the supply and connecting therewith outside the casing, substantially as and for the purpose set forth.

5. In a boiler, two horizontal circulation-tubes arranged vertically in parallelism above the boiler and having corresponding heads connected by pipes outside the casing, a cylindrical steam-chest arranged vertically in parallelism with the upper tube and connected therewith, a drain for the chest, opening into one of said outside pipes, a supply for the tubes, and a discharge for the chest, combined substantially as described.

6. The fire-box and casing, in combination with the horizontal tubes *i j*, connected by pipes *p k* outside said casing, the series of vertical tubes C^2 C^3, provided with flues and connected by ducts A^3 A^2 with the horizontal tubes, the steam-chest connected with the tube *j*, a supply for said tubes, and a discharge for said chest, substantially as described.



7. The fire-box and casing, in combination with the tubes *i j*, connected by pipes *p k* outside said casing, a series of vertical tubes, as C^2 C^3, connected by ducts with the tubes *i j*, the chest connected with said tube *j*, a drain opening into the pipe *k*, the supply 16, opening centrally into the tube *i*, the pipe *r*, connecting a vertical tube with said supply, a pipe connecting the pipe *p* with said supply, and a discharge for the chest, all being arranged to operate substantially as described.

483,000. BOILER FOR MARINE ENGINES. WALTER B. FOWLER, Lawrence, Mass., assignor of one-half to Lewis Saunders, same place. Filed March 24, 1892. Serial No. 426,223. (No model.)

Claim.—1. In a tubular boiler, a main cylinder, a series of supplemental cylinders, circulation-ducts connecting said supplemental cylinders with the main cylinder, and a pipe pendent within said main cylinder and provided with circulation-openings near its top and bottom, substantially as and for the purpose set forth.

2. In a tubular boiler, a main cylinder having its ends closed by inwardly-depressed heads, through which the supply and discharge ports, respectively, open, and a tube pendent within said cylinder from one of said heads, said tube having its ends closed and provided with circulation-openings in its walls adjacent said ends, substantially as and for the purpose set forth.

3. A tubular boiler for marine engines, comprising a series of tubes arranged around a main cylinder and connected thereto by circulation-ducts, the ends of said cylinders and tubes being closed by inwardly-depressed heads flush with said ducts, flues connecting the heads of each tube, a tube pendent within said main cylinder from one of its heads and provided with circulation-openings, and a supply and discharge port for said main cylinder, substantially as described.

4. In a tubular boiler, a main cylinder provided with a supply and discharge port and having its ends closed by inwardly-depressed heads, in combination with a perforated pipe projecting into said cylinder from one of said heads and having closed ends, substantially as and for the purpose set forth.

5. In a tubular boiler, a main cylinder provided with inwardly-depressed heads having reinforcing-flanges, a supply and discharge port for said cylinder, a perforated pipe projecting into said cylinder from one of said heads, a series of supplemental cylinders shorter than and arranged around said main cylinder and connected therewith by radial circulation-ducts, inwardly-depressed flanged heads secured in said supplemental cylinders, and flues opening through said heads, all being arranged to operate substantially as described.

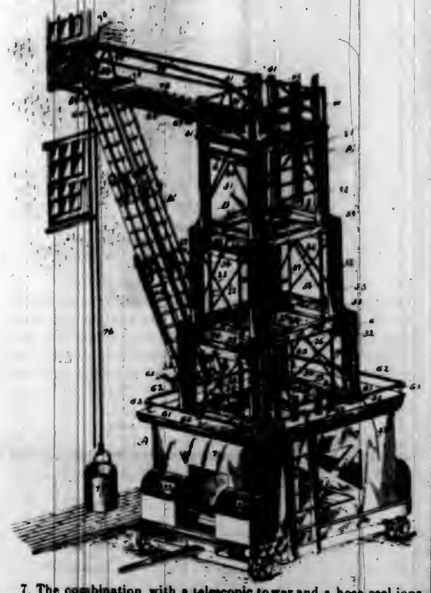
6. The main cylinder B, having closed ends, the shorter circulation-tubes D, provided with flues, and the horizontal ducts *p*, connecting said tubes and cylinder, in combination with the tube C, pendent from the upper cylinder-head, said tube having closed ends and its walls perforated above and below the top of the circulation-tubes, substantially as and for the purpose set forth.

7. A boiler-tube provided with an inwardly-depressed head having a reinforcing-flange welded onto said tube, having an enlarged space between the end of said tube and head, substantially as described.

8. The tube D, in combination with the head *d*, having the flange *g* secured around said tube and forming the space *x*, and the duct *p*, opening into said space, substantially as described.

483,001. COMBINED WATER-TOWER AND FIRE-ESCAPE. FRANK M. HUGHES, Milford, Mass. Filed May 14, 1892. Serial No. 432,905. (No model.)

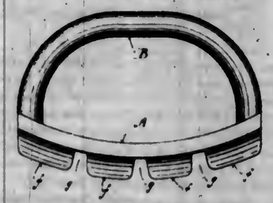
Claim.—1. In a telescopic tower composed of sections having sills and plates, as described, spring-actuated bracket-carrying posts revolubly mounted in the sills and plates of the sections intermediate the base and upper sections, whereby the brackets in one section are made to aid in the support of the section next above, substantially as described.



2. In a telescopic water-tower, a series of fire-hose extending up through the floors of the movable sections, each hose being provided with a fixed collar which rests on the floor of the section in which it is desired the hose shall terminate, whereby the hose will be elevated in the elevation of the tower, and a hose-reel journaled in the base-section, substantially as described.

3. The combination, with a telescopic tower, of a series of fire-hose suspended from the movable sections of the tower and extension-ladders pivoted at their lower ends to the base-section and carrying hooks at their upper ends which engage with the upper section of the tower, whereby as the tower is elevated the hose will be elevated and the ladders extended.

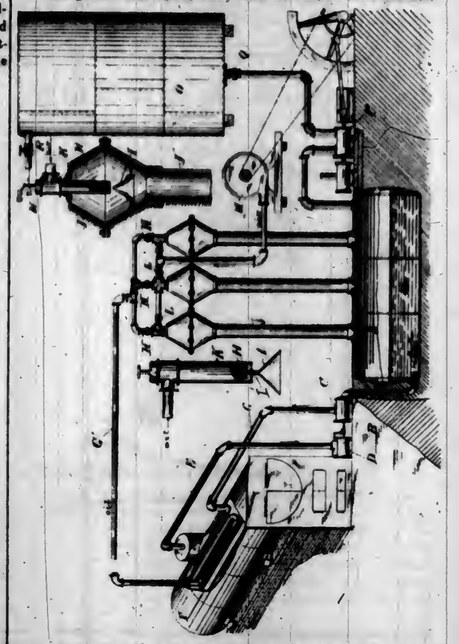
4. The combination, with the portable tower, of two or more ladders pivoted to said tower and a movable bridge supported at one end by the tower and at the other end by the ladder.



5. The combination, with the telescopic tower, of fire-hose suspended from the movable sections of the tower, extension-ladders pivoted to opposite sides of the tower, and a movable bridge supported at one end by the tower and at the other end by one set of ladders, substantially as described, and for the purposes stated.

6. The combination, with the telescopic tower, of extension-ladders pivoted to said tower and a movable bridge supported at one end by the tower and at the other end by the ladders, said bridge consisting of longitudinal beams provided with means for engaging with the ladders and a folding floor.

7. The combination, with a telescopic tower and a hose-reel journaled in the base-section thereof, of a series of fire hose suspended from the movable sections of the tower and adapted to be wound on the reel, extension ladders pivoted to the base-section of the tower on opposite sides, a knockdown bridge supported at one end by the tower and at the other end by the ladders on one side of the tower, a bucket or like receptacle, a rope attached thereto, and a sheave attached to the bridge, over which the rope is passed, substantially as described, and for the purposes set forth.



488,002. MEAT-TENDERER. FRANK B. JORDAN, Auburn, Me. Filed Feb. 8, 1892. Serial No. 420,708. (No model.)

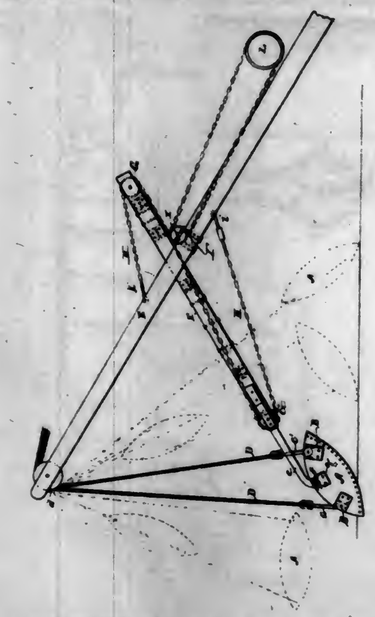
Claim.—1. A meat-tenderer comprising a vertically-curved body and a handle, partitions in said body forming slots, and a series of short longitudinal blades disposed integrally with the partitions and the rear and front portions of the body, said blades having spaces formed between their ends, said spaces extending from the cutting-edge of the knife to the body the full depth of the blade, so that each blade is separate from all other blades.

2. A meat-tenderer comprising a vertically-curved body and a handle, partitions in said body forming slots, and a series of short longitudinal blades having their cutting-edges disposed in arc of a circle, each blade being disposed integrally with the partitions and the front and rear portions of the body, said blades having spaces formed between their ends, said spaces extending from the cutting-edge of the knife to the body the full depth of the blade, so that each blade is separate from all other blades.

488,003. APPARATUS FOR CARBURETING AIR. JAMES E. MENDENHALL, Springfield, Ohio, assignor of one-half to Charles E. Funk, Chicago, Ill. Filed Apr. 1, 1892. Serial No. 427,337. (No model.)

Claim.—1. In a carbureting apparatus, the combination, with an oil-tank and the steam-chamber of a boiler adjacent to said tank, of conducting-pipes from said tank passing through said steam-chamber and having branches at the outer end thereof, a carburetor connected to each branch and consisting of a carbureting-hood receiving the oil from said branch and mounted upon the oil-tank, with which it communicates in order to return the surplus oil thereto, a distributer mounted within each carburetor below the oil-entrance, an air-pipe adjacent to the oil-entrance and directed toward the said distributer, means to force a blast of air through said air-pipe in order to diffuse and scatter within the hood the heated oil received by said distributer, a storage-tank for the vapor, and a compressor located between the oil-tank and the storage-tank to transfer the vapor from the former to the latter, while the surplus oil returns to the oil-tank for further use.

2. In a carbureting apparatus, the combination, with an oil-tank and the steam-chamber of a boiler adjacent to said tank, of conducting-pipes from said tank passing through said steam-chamber and having branches at the outer end thereof, a carburetor connected to each branch and consisting of a hood or chamber, a conical distributer mounted within said hood, an oil-inlet to the carburetor, an air-pipe surrounding said oil-inlet and directing the blast of air against the said distributer, means to produce the air-blast, a storage-tank, and a compressor mounted between said storage-tank and hoods and having pipes connecting it with said hoods and storage-tank, respectively, whereby the heated oil is vaporized and stored under pressure.



483,004. EXCAVATING DEVICE. THOMAS McBRIDE, Philadelphia, Pa., and BENJAMIN FISHER, Kincardine, Canada. Filed Mar. 14, 1892. Serial No. 424,907. (No model.)

Claim.—1. An excavating-scoop open at both ends and pivotally secured between arms of a main operating bifurcated lever, said scoop being pivotally connected near each end to bails, said bails being connected to chains which raise or lower the ends of the scoop, as described, whereby the scoop can be filled and emptied from each end.

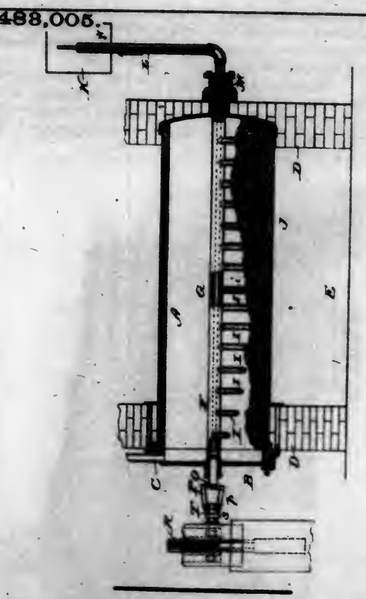
2. In an excavating-scoop of the character described, the bails pivoted near each end, said bails being connected to operating-chains which pass over sheaves in the outer end of the gaff of a derrick and to suitable operating-drums, whereby the chains can be operated singly or in unison.

3. In an excavating-scoop open at both ends, a main operating-lever to force the scoop into the material to be excavated, bifurcated at the front end and pivoted to the sides of the scoop, and bails provided at each end of said scoop and connected with suitable operating-

chains, the rear end of said operating-lever being adapted to slide back and forth on suitable frame-rollers in the arm of the gaff of the derrick, as shown.

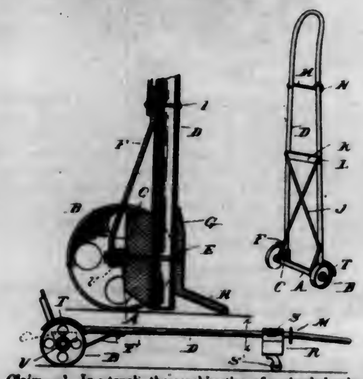
4. In an excavating device of the character described, a scoop open at both ends, supported at both ends by ropes or chains, and an operating-lever pivoted to the sides of the scoop, said operating-lever being provided with sheaves, around which is passed a chain, said chain being operated by suitable mechanism for moving the lever back and forth to force the scoop into the material to be excavated.

5. In an excavating device of the character described, a scoop open at both ends, supported at both ends by ropes or chains passing over the end of a gaff, an operating-lever pivoted to the sides of the scoop, said operating-lever being provided with sheaves at each end, sheaves mounted on the gaff, a sprocket-wheel, and an operating-chain secured to the gaff, passing over sheave at lower end of lever, thence over one of the sheaves on gaff, thence to sprocket-wheel, thence around second sheave on gaff, thence around on sheave on upper end of lever, and thence to the gaff, where it is secured, substantially as described.



488,005. APPARATUS FOR THE MANUFACTURE OF GAS.

THOMAS McDOUGALL, Philadelphia, Pa., and EMERSON FRYER, Kincardine, Canada. Filed Mar. 14, 1892. Serial No. 424,902. (No model.)



Claim.—1. In an apparatus for the manufacture of gas, a closed retort having mounted therein and journaled in the ends thereof a hollow shaft adapted to be revolved or rocked, hollow projections or teeth formed on said shaft and communicating with the interior thereof, one end of said shaft having a hollow journal and connected by means of said hollow journal with a pipe communicating with the tank for supplying a cooling medium thereto, a pipe extending through the hollow shaft, and the pipe connecting said shaft with the cooling-supply, and pipes open at both ends, extending into the hollow projections independent of the interior pipe of the hollow shaft, substantially as described, and for the purpose set forth.

2. In an apparatus for the manufacture of gas, a closed retort having mounted therein and journaled in the ends thereof a hollow shaft adapted to be revolved or rocked, hollow projections or teeth formed on the said shaft and communicating with the interior thereof, one end of said shaft having a hollow journal and connected by means of said hollow journal with a pipe communicating with a tank for supplying a cooling medium thereto, a pipe extending through the hollow shaft, and the pipe connecting said shaft with the cooling-supply, a fire-chamber, and an eduction-pipe connecting with the tank at one end and passing over the retort and entering the fire-chamber, substantially as described, whereby a circulation of the cooling medium is provided within the raking device and the heat generated therein utilized to aid combustion.

488,006.

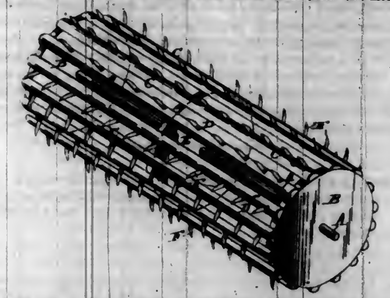
488,006. TRUCK. ANTHONY NIEBLING, Belleyville, Ill. Filed Apr. 22, 1892. Serial No. 430,210. (No model.)

Claim.—1. In a truck, the combination of a wheeled axle, a frame formed of metal bent into a tapering U shape, the bent portion forming the handle and having its ends secured to the opposite axle, and a nose-piece secured to the ends of the frame, substantially as described.

2. In a truck, the combination of a wheeled axle, a frame formed of pipe bent into a tapering U shape, having its ends secured to blocks on the axle, the nose-piece secured to the ends of the frame, the braces F, and cross-brace K, substantially as described.

3. In a truck, the combination, with the wheeled axle, the tapering U-shaped frame having its ends secured to the axle, and a nose-piece, of the hook M, having the eye N, engaging one arm of the frame, having its hooked end adapted to engage with the other arm of the frame, substantially as and for the purpose described.

4. In a truck, the combination, with the wheeled axle, of the U-shaped frame secured thereto, the cross-braces J, and cross-brace K, and the detachable apron O, substantially as described.

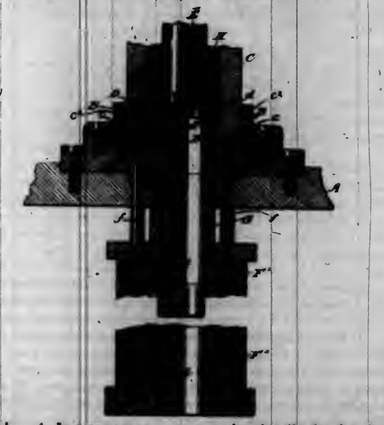


5. In a truck, the combination of the wheeled axle, the tapering U-shaped frame secured thereto, and a detachable cross-bar adapted to be secured to the upper end of the frame and the caster on the under side of said cross-bar, substantially as described.

6. In a truck, the combination of a wheeled axle, a tapering U-shaped frame secured thereto, and the cross-bar R, having the upwardly-hooked ends S at each end and the caster S', the hooked ends S being adapted to engage over the end of the frame and be wedged thereon, substantially as and for the purpose described.

7. The combination of the axle, the wheels centrally apertured to receive the axle, and a soft-metal bushing in the wheel to form a journal-bearing therefor, substantially as described.

488,007. ROLLER FOR CLOD CRUSHERS OR PULVERIZERS.



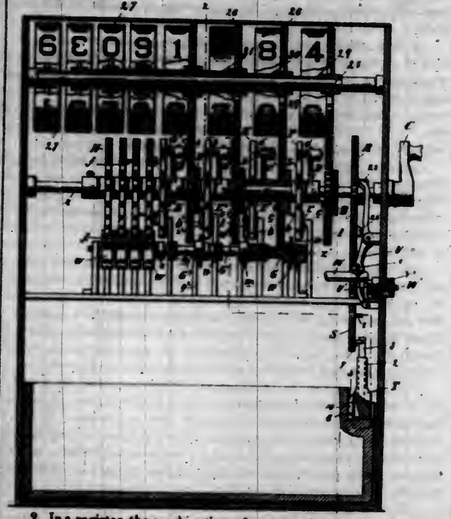
CHARLES H. HOELLE, Bucyrus, Ohio, assignor of one-half to Henry Albright, same place. Filed Jan. 30, 1892. Serial No. 419,806. (No model.)

Claim.—In a clod crusher or pulverizer, the combination, with the axle A, the solid heads or disks B B, and the intermediate disk E, of the parallel bars C, convexed on their outer faces, forming a swell or bulge c, and the backwardly-slanting teeth or knives F, secured to said bars at an angle to the axis of the heads or disks B B, substantially as and for the purpose described.

488,008. DIE FOR DRAWING SHEET METAL.

ROWIN HORTON, Maywood, assignor to himself, and Oliver W. Horton, Chicago, Ill. Filed Apr. 26, 1892. Serial No. 430,468. (No model.)

Claim.—1. In a compound or reverse drawing-die for drawing shapes successively in opposite directions, the combination, with a punch, of an annular drawing-die and a female drawing-die furnished with a recess or enlargement at its inner periphery to free the walls of the drawn shape from friction or bending during the reverse drawing operation, substantially as specified.



2. The combination, with the punch or male die E, with annular drawing-die D, having outer drawing-face *d* and inner drawing-face *d'*, of the hollow die-block C, having inner drawing-face *c'* and enlargement or relief-space *c²* beyond said drawing-face *d'*, substantially as specified.

488,009. CASH REGISTERING AND ADDING MACHINE.

CHARLES PAINE, New York, N. Y. Filed Feb. 20, 1890. Serial No. 341,103. (No model.)

Claim.—1. In a register, the combination of an actuating-shaft, adding-wheel and setting-wheel, both loosely sleeved upon said shaft, a setting device for rotatorily adjusting said setting-wheel, a movable connection between said shaft and adding-wheel, actuated by said setting-wheel, a stationary stop for dissolving the connection, and a carrying mechanism actuated after said dissolution, substantially as described.

488,009.

2. In a register, the combination of an actuating-shaft, a series of totalizing adding-wheels and setting-wheels, all of which are loosely sleeved upon said shaft, setting devices for rotatorily adjusting said setting-wheels in relation to the amount to be registered on the adding-wheels of lowest denominations, a connection between said shaft and adding-wheels actuated by said setting-wheels, a fixed stop for dissolving the connection, and carrying mechanism actuated after said dissolution, substantially as described.

3. In a cash-register, the combination, with an actuating-shaft and means by which the shaft is actuated, of adding wheels loosely mounted on the shaft, setting-wheels loosely mounted on the shaft adjacent to the adding-wheels, means actuated by the setting-wheels for forming connections between the shaft and adding-wheel, movable rack-bars for rotating the setting-wheels, means for dissolving the connection, and carrying mechanism actuated subsequent to the dissolution, substantially as described.

4. In a cash-register, the combination, with the actuating-shaft and adding-wheels loosely mounted thereon, of a setting device consisting of wheels mounted on the shaft, having inclined bearings thereon rotatorily adjustable beside said adding-wheels, rack-bars for independently adjusting said setting-wheels, pawls carried by said shaft and actuated by said bearings, and stationary stops for moving the pawls back into the path of the bearings, substantially as described.

5. In a cash-register, the combination, with the casing, the actuating-shaft, and adding-wheels carried by the shaft, of a setting device consisting of wheels having inclined bearings thereon and rotatorily adjusted on the shaft beside said adding-wheels, rack-bars for adjusting said setting-wheels, mechanism carried by said shaft actuated by said bearings to engage said adding-wheels, handles on said racks, indexes having corresponding numbers to the number on the adding-wheel, fixed stops for disengaging the said mechanism, and carrying mechanism independently supported relative to and actuated by the shaft, substantially as described.

6. In a register, the combination of an actuating-shaft, a series of adding-wheels on the same, and setting means loosely sleeved upon said shaft, a setting device for rotatorily adjusting said setting means in relation to the adding-wheels of lowest denomination, a movable connection between said shaft and adding-wheels, carried by the shaft and actuated by said setting-wheels, and carrying mechanism for the adding-wheels, located to one side and operated subsequent to the operation of the adding-wheels, substantially as described.

7. In a register, the combination of an actuating-shaft, a series of adding wheels and a setting-wheel, all of which are loosely sleeved upon said shaft, a setting device for rotatorily adjusting said setting-wheel in relation to the adding-wheel of lowest denomination, a movable connection carried by the shaft between said shaft and adding-wheel, actuated by said setting-wheel, a stop for dissolving said connection, and carrying actuating mechanism on said shaft in the rear of said connection for acting after the dissolution of said connection, substantially as described.

8. In a register, the combination of a rotary shaft, a series of adding-wheels upon said shaft, engaging mechanism carried by the shaft and intermediate between the said shaft and each of said wheels, con-

ting mechanism adapted to throw said engaging means into engagement differentially, and a lock for such setting mechanism during the rotation of the actuating-shaft, substantially as described.

9. In a cash-register, the combination, with an actuating-shaft, of a series of register-wheels loosely mounted thereon, a series of setting-wheels loosely mounted on the shaft, pinions on the setting-wheels, engaging means carried by the shaft and actuated by the setting-wheels, means for actuating the setting-wheels by engagement with the pinions, a lock for said actuating means, and a connection between the lock and actuating shaft, substantially as described.

10. In a register, a rotary actuating-shaft, an adding-wheel and a setting-wheel journaled upon said shaft, a pinion secured to said setting-wheel, setting mechanism and a lock applied to the setting mechanism during the movement of the actuating-shaft, and means for disengaging said lock at the completion of such movement, substantially as described.

11. In a register, the combination, with the actuating-shaft, adding-wheels loosely mounted thereon, and setting mechanism, of a pawl carried by said shaft arranged to engage one of said wheels, a movable lug carried by the setting mechanism, engaging the pawl for throwing the pawl into engagement with the adding-wheel, and a stationary stop with which the pawl engages for throwing the pawl out of engagement with the adding-wheel, substantially as described.

12. In a register, the combination, with the actuating-shaft, adding-wheels loosely mounted thereon, and setting mechanism, of a pawl carried by said shaft adapted to engage with one of said wheels, a movable lug carried by said shaft and controlled by the setting mechanism for throwing the pawl into engagement with the wheel, and a stationary stop for throwing the same out of engagement with the said wheel, substantially as described.

13. In a cash-register, the combination, with a rotary actuating-shaft, of a series of adding-wheels loosely mounted thereon, means rigid on the shaft for moving said wheels as the shaft is turned, a stationary stop arranged to disengage said means prior to the complete revolution of the shaft, and a carrying mechanism actuated by the moving means during the continued movement of the shaft subsequent to the movement of the wheels, substantially as described.

14. In a cash-register, the combination, with a rotary shaft carrying a series of adding-wheels, means for causing an independent and limited rotation of the wheels, and a carrying mechanism, of an intermediate connection rigid on the shaft for actuating said carrying mechanism, substantially as described.

15. In a cash-register, the combination, with an actuating-shaft, of adding-wheels loosely mounted thereon, a pawl mounted on a suitable arm rigid on the shaft, a rotary setting mechanism on the shaft, an inclined bearing on the setting mechanism, engaging the pawl, and stationary means for forcing the pawl back, substantially as described.

16. In a cash-register, the combination of a sleeve G, having the spurs *m m*, the mutilated pinions *n n*, and the arms *o o*, in combination with an adding-wheel having finger *k* and an arm having teeth *l* engaging said pinion, substantially as described.

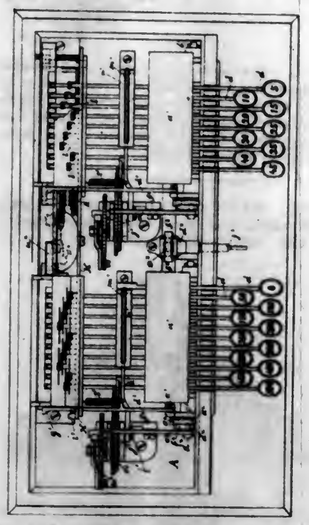
17. In a cash-register, the combination, with a shaft carrying a series of two or more adding-wheels rotating freely thereon and a movable series of segmental spur gear-wheels rigidly fixed on the shaft alternately with the adding-wheels, of an arbor parallel to the shaft and carrying the mechanism by which each higher adding-wheel is caused to make one-tenth of a revolution whenever the adding-wheel next below it has made a complete revolution, substantially as described.

18. In a cash-register, the combination, with a register-actuating shaft carrying a crank, of means for setting the register, a lock for said means, a sliding pin arranged in the path of the crank, and means for locking the pin in the path of the crank and simultaneously unlocking the setting means, substantially as described.

19. In a cash-register, the combination, with the actuating means, of a cash-drawer, a lock for the drawer, means actuated by the actuating means for unlocking the drawer, and a stop on the drawer-lock, engaging the unlocking means for preventing the movement of the actuating means, substantially as described.

20. In a cash-register, the combination, with the register-actuating means, of a cash-drawer, a lock therefor, means actuated by said actuating means for unlocking the drawer, and means carried by the drawer-lock for preventing the movement of the actuating mechanism when the drawer is unlocked, substantially as described.

21. In a cash-register, the combination, with the register-actuating means and means for setting the register, of a lock for the setting means, a lock for the actuating means, and mechanism for alternately actuating the locks, substantially as described.



22. In a cash-register, the combination, with an actuating-shaft, of adding and setting wheels mounted loosely thereon, movable means carried by the shaft, actuated by the setting-wheels to engage the adding-wheels, a carrying mechanism, and means on the carrying mechanism alternately actuated directly by the adding-wheels and shaft, substantially as described.

23. In a cash-register, the combination, with the adding-wheels and a shaft for actuating the same, of a carrying mechanism independent of the shaft, means on the carrying mechanism engaged by the adding-wheels, and a fixed projection on the shaft, engaging the carrying mechanism subsequent to the engagement of the same and adding-wheels, substantially as described.

24. In a cash-register, the combination, with an actuating-shaft and registering mechanism, of a carrying mechanism independent of the shaft, means actuated by the shaft to set the carrying mechanism, and means on the shaft for actuating the carrying mechanism subsequent to the setting thereof, substantially as described.

25. In a cash-register, the combination, with the registering means, of a totalizing-register-actuating means, a setting device for the totalizing-register-actuating means, and means operated by the operation of the register to actuate the totalizing-register-actuating means, substantially as described.

488,010. CASH INDICATOR AND REGISTER. EDWARD B. PARKHURST and FOSTER HAM, Woburn, Mass., assignors to the National Cash Register Company, Dayton, Ohio. Filed July 5, 1888. Serial No. 279,049. (No model.)

Claim.—1. The combination, with the key-levers *d*, having ratchets *c*, of the pawl *e*, the hook-latch *h*, and bar J, provided with notches h^3, whereby the latch *h* is operated, substantially as shown and described.

2. The combination, with the pivoted key-levers, of the pivoted table *o'*, the arm *c'*, rigidly connected with said table, and the laterally-sliding rod *d'*, having a beveled end, said rod being arranged to reciprocate in substantially a straight line and to co-operate at its beveled end with the corresponding beveled end of the stop-bolt H, substantially as shown and described.

3. In a cash-register having register-wheels which are moved as a key is depressed, a device for locking the register-wheel at the completion of the stroke of the key, consisting of a locking-lever, as e^3, its cam-actuating lever *w*, the arm *c'* for actuating the cam-lever, and the key-levers which operate said cam-lever when a key is depressed, substantially as shown and described.

4. The combination, in a cash register and indicator, of the pivoted key-levers *d* and the locking-bar J and its operating mechanism, whereby as a key is depressed the locking-bar is moved over the unoperated keys, locking them from operation, substantially as shown and described.

5. The combination, in a cash register and indicator, of the pivoted key-levers *d*, the locking-bar J, the bolt n^6, its actuating-bolt b^2, the arm p^3, and the spring-actuated bell-hammer lever A^3, substantially as shown and described.

6. The combination, in a cash register and indicator, of the pivoted key-levers *d*, the locking-bar J, the bell-crank lever I^3, the pin n^3, and the arm p^3, substantially as shown and described.

7. The combination, in a cash register and indicator, of the bolt e^3, the spring-impelled locking-bolt h^3, the forward end of which when projected engages a notch in said bolt e^3, the hollow threaded key j^3, adapted to be screwed onto the threaded shank of the bolt h^3, and the arm p^3, for the purposes and substantially as shown and described.

8. In a cash register and indicator, the combination, with an operating-key provided with a rack having a projection at one end, of a pawl arranged to engage said rack when the key is partially operated and to be disengaged therefrom by the projection at the end of the rack when the key has been fully operated, a latch for holding the pawl out of engagement with the rack while the key is being reset, and a trip for said latch, substantially as and for the purpose described.

9. The combination, with the bar J and the spring-impelled lever A^3, which carries the bell-hammer, of the pawl n^3 and means, substantially as described, for freeing it from the bar J as the drawer G is opened.

10. In a cash register and indicator, the combination, with an operating-key provided with a rack having a projection at its lower end, of a pawl arranged to engage said rack as the key is operated and the rack lifted and to be disengaged therefrom by the projection at the lower end of the rack when the key has been fully operated, a latch for holding the pawl and rack out of engagement while the key is being reset, and a trip for said latch, substantially as and for the purpose described.

11. In a cash register and indicator, the combination, with an operating-key pivoted between its ends and provided on its lower side in rear of its pivotal point with a rack having a projection at its lower end, of a pawl arranged to engage said rack as the key is operated and the rack lifted and to be disengaged therefrom by the projection at the lower end of the rack when the key has been fully operated, a latch for holding the pawl and rack out of engagement while the key is being reset, and a trip for said latch, substantially as and for the purpose described.

12. In a cash register and indicator, the combination, with a series of operating-keys, each provided with a rack having a projection at one end, of a bar extending across the entire series of keys and arranged to engage and act as a pawl for each one of said racks when its key is partially operated and to be disengaged from said rack by the projection on the latter when the key has been fully operated, substantially as and for the purpose described.

13. In a cash register and indicator, the combination, with a series of operating-keys, each provided with a rack having a projection at one end, of a bar extending across the entire series of keys and arranged to engage and act as a pawl for each one of said racks when its key is partially operated and to be disengaged from said rack by the projection at the end of the latter when the key has been fully operated, a latch for holding said bar and rack out of engagement while the key is being reset, and a trip for said latch, substantially as and for the purpose described.

14. In a cash register and indicator, the combination, with a series of operating-keys pivoted between their ends and each provided on its lower side in rear of its pivotal point with a rack having a projection at its lower end, of a bar extending across the entire series of keys and arranged to engage and act as a pawl for each one of said racks when its key is partially operated and to be disengaged from said rack by the projection at the lower end of the latter when the key has been fully operated, a latch for holding said bar and rack out of engagement while the key is being reset, and a trip for said latch, substantially as and for the purpose described.

15. In a cash register and indicator, the combination, with the registering-wheel *r'* and registering-lever *k'*, of the series of pivoted operating-keys *d*, provided with the racks *c*, having the projections *g*, and the pawl-bar *e*, extending across said keys and arranged to engage their racks when the keys are partially operated and to be automatically disengaged therefrom by the projections *g* when the keys have been fully operated, substantially as and for the purpose described.

16. In a cash register and indicator, the combination, with the registering-wheel *r'* and registering-lever *k'*, of the pivoted keys *d*, provided with the racks *c*, having the projections *g*, the pawl-bar *e*, a latch for said bar, and a trip for said latch, substantially as and for the purpose described.

17. In a cash register and indicator, the combination, with the registering-wheel *r'* and the operating-keys *d*, of the pivoted locking-lever e^3, actuated at the full operation of each key to engage the ratchet of the registering-wheel and lock the latter from further movement, substantially as and for the purpose described.

18. In a cash register and indicator, the combination, with the registering-wheel *r'*, the operating-keys *d*, and the pivoted table *o'*, extending across the keys, of the pivoted lever e^3, connected with and actuated by the movement of said table to engage the ratchet of the registering-wheel and lock the latter at the full operation of any key, substantially as and for the purpose described.

19. In a cash register and indicator, the combination, with the registering-wheel *r'*, the operating-keys *d*, and the pivoted table *o'*, extending across the keys, of the pivoted lever e^3, an arm projecting from the table *o'*, and a slot-and-pin connection between said arm and the forward end of said lever, whereby upon the operation of any key the rear end of said lever is caused to engage the ratchet of the registering-wheel and lock the latter from further movement, substantially as and for the purpose described.

20. In a cash register and indicator, the combination, with a registering-wheel and a series of keys for actuating the same, of a locking device mediately connected with and actuated by said keys and arranged to lock said wheel upon the full operation of a key and hold it from movement until said key has been reset to its normal position, substantially as and for the purpose described.

21. In a cash register and indicator, the combination, with a registering-wheel and a series of keys for actuating the same, of a locking device mediately connected with and actuated by said keys and arranged to engage said wheel upon the full operation of a key and lock it from movement until said key has been reset to its normal position and to be disengaged from and unlock said wheel when the key has been so reset, substantially as and for the purpose described.

22. In a cash register and indicator, the combination, with a registering wheel actuated by a series of keys, of a device for preventing the turning of the registering-wheel by successive partial operations of a key after the latter has been once fully operated but not reset to its normal position, said device consisting of a pivotal lever mediately connected with and actuated by the operating-keys and arranged when a key is fully operated to engage the ratchet of the registering-wheel and lock the latter until said key is reset to its normal position, substantially as and for the purpose described.

23. In a cash register and indicator, the combination, with the registering-wheel *r'* and the operating-keys *d*, of the pivoted lever e^3 and the arm *w* for actuating said lever, said arm being mediately connected with the operating-keys and arranged to be moved by the full operation of any one of them to cause the lever e^3 to engage and lock the registering-wheel and upon the resetting of said key to its normal position to disengage said lever from the registering-wheel and unlock the same, substantially as and for the purpose described.

24. In a cash register and indicator, the combination, with the registering-wheel *r'* and the operating-keys *d*, of the pivoted lever e^3, the arm *w*, and a cam-slot in one and a pin on the other for connecting said arm and lever, said arm *w* being mediately connected with the operating-keys and arranged to be actuated by the full operation of any one of them and to be reset by the complete resetting of said key, substantially as and for the purpose described.

25. In a cash register and indicator, the combination, with the registering-wheel *r'*, and the operating-keys *d*, of the pivoted table *o'*, extending across said keys, the arm *c'*, moving with said table, the arm *w*, loosely pivoted by the side of the arm *c'* and connected thereto by a slot and-pin connection, and the pivoted lever e^3, connected to and actuated by the arm *w*, substantially and of for the purpose described.

26. In a cash register and indicator, the combination, with the operating-keys and the money-drawer, of a locking-bar extending across the keys and mechanism interposed between said bar and money-drawer, whereby said bar is actuated by the movement of the drawer to lock and unlock the keys, substantially as and for the purpose described.

27. In a cash register and indicator, the combination, with the operating-keys and the money-drawer, of a spring-pressed locking-bar extending across the keys, a latch for holding said bar in its normal position against the resistance of its spring, and a trip for said latch operated by the opening of the money-drawer, whereby when the money-drawer is opened the locking-bar is moved over and locks the unoperated keys, substantially as and for the purpose described.

28. In a cash register and indicator, the combination, with the operating-keys and the money-drawer, of a spring-pressed locking-bar extending across the keys, a latch for holding said bar in its normal position against the resistance of its spring, a trip for said latch operated by the opening of the money-drawer, and a device actuated by the closing of the drawer to restore the locking-bar to its normal position, substantially as and for the purpose described.

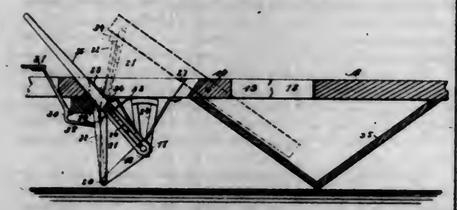
29. In a cash register and indicator, the combination, with the operating-keys, a money-drawer arranged to be partially propelled from the case when released, and a locking device for holding the drawer in its closed position and arranged to be actuated by the operation of the keys to release the drawer, of a locking-bar extending across the keys, and mechanism interposed between the money-drawer and bar for actuating the latter by the movement of the former, whereby upon operating a key the money-drawer is released and partially propelled from the case and the locking-bar is moved to lock the unoperated keys and prevent the resetting of the operated key, substantially as described.

30. In a cash register and indicator, the combination, with the operating-keys, a money-drawer arranged to be partially propelled from the case when released, and a locking device for holding the drawer in its closed position and arranged to be actuated by the operation of the keys to release the drawer, of a spring-pressed locking-bar extending across the keys, a latch for holding said bar in its normal position against the resistance of its spring, a trip for said latch operated

by the opening of the money-drawer, and a device actuated by the closing of the drawer to restore the bar to its normal position, whereby upon operating a key the money-drawer is released and partially propelled from the case and the locking-bar is moved to lock the unoperated keys and prevent the resetting of the operated key until the money-drawer is closed, substantially as described.

31. In a cash register and indicator, the combination, with the operating-keys d and the money-drawer C, of the spring-pressed locking-bar J, the latch u^3, and the trip for said latch actuated by the drawer C, substantially as and for the purpose described.

32. In a cash register and indicator, the combination, with the pivoted operating-keys d and the money-drawer C, of the spring-pressed locking-bar J, the latch u^3, the trip for said latch, the bell-crank arm P, the arm p^3, secured to the drawer C, and the bolts b^3 n^3, interposed between said arm and the trip c^3, and bell-crank arm P, substantially as and for the purpose described.



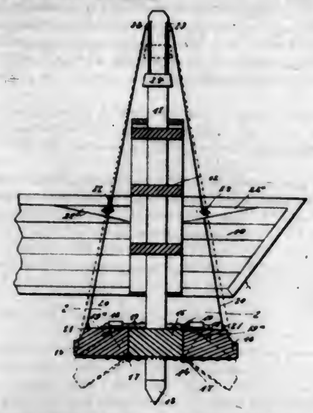
33. In a cash register and indicator, the combination, with the operating-keys d and the pivoted table d', extending across said keys, of a bolt having a projection engaging said table and a lock applied to said bolt for locking the table and keys from operation, substantially as and for the purpose described.

34. In a cash register and indicator, the combination, with the operating-keys d and the pivoted table d', extending across said keys, of a bolt extending up beside said table and having a hook or head projecting over the same and a lock applied to said bolt for holding it in position with its head over the table d' to lock the latter and the keys d from operation, substantially as and for the purpose described.

35. In a cash register and indicator, the combination, with the operating-keys d and the pivoted table d', extending across said keys, of the bolt c^3, having a head c^3 extending over the edge of said table, and the lock A^3, engaging the bolt c^3, substantially as and for the purpose described.

36. In a cash register and indicator, the combination, with a registering mechanism and the operating-keys, of a series of stops for preventing the operation of two or more keys simultaneously and a locking device for preventing the operation of a single key until the previously-operated one is reset to its normal position, substantially as and for the purpose described.

488,011. GRAIN-DUMP. JOHN P. PETERSON, Worthington, Minn. Filed June 24, 1892. Serial No. 437,906. (No model.)



Claim.—1. In a grain-dump, the combination, with a platform provided with openings therein and dump-timbers pivoted in said openings, of a shaft beneath the platform and provided with arms connected with the dump-timbers, a lever for operating the shaft, and locking-latches pivotally connected with the arms of the said shaft and engaging the platform, substantially as and for the purpose set forth.

2. In a grain-dump, the combination, with a platform elevated from the ground and provided with parallel openings therein and dump-timbers fulcrumed in said openings, of a shaft journaled beneath the platform near one end of the dump-timbers, counterbalance-arms projecting from the shaft and connected with the dump-timbers near their ends, a spring-pressed lever attached to the shaft, latches connected with the shaft, keepers connected with the platform and receiving the latches, and a trip-lever adapted for engagement with the latches, as and for the purpose set forth.

3. In a grain-dump, the combination, with a platform supported above the ground and provided with longitudinal openings, a dump-timber fulcrumed in each of the openings, and a trough or pit located beneath one end of the dump-timbers, of a shaft journaled beneath the dump-timbers, arms connected with the shaft, said arms having link connections with the dump-timbers, a lever connected with the shaft, whereby the latter is turned, keepers carried by the platform, latches supported from the shaft and adapted to enter the keepers, and stirrup-brackets attached to the dump-timbers and also adapted to receive the latches, and a shifting-lever fulcrumed to a fixed support and adapted for engagement with the latches to trip them from their keepers into the stirrup-brackets of the dump-timbers, as and for the purpose set forth.

488,012. FOOT FOR DREDGE-ANCHORS. WILLIAM PIKE and HORMAN MCDAIRMID, Sault de Ste. Marie, Mich. Filed Mar. 29, 1892. Serial No. 426,945. (No model.)

Claim.—1. The combination, with the anchor-foot, of an apron hinged to the middle section of the foot and extending over the adjacent leaves, substantially as described.

2. The combination, with the anchor-post, of a foot secured thereto and provided with swinging leaves, substantially as described.

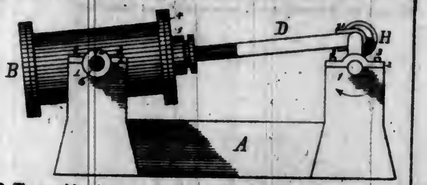
3. The combination, with the anchor-post, of a foot comprising a rigid middle section secured to the post and swinging leaves hinged to the middle section, substantially as described.

4. The combination of the anchor-post, the anchor-foot having hinged leaves thereon, and a cross-bar secured to the post and extending into the path of the leaves, substantially as described.

5. The combination of the anchor-post, the foot having swinging leaves, open-topped boxes secured to the leaves, and a cross-bar secured to the rigid portion of the foot and extending into the path of the boxes, substantially as described.

6. The combination of the anchor-post, the foot having swinging leaves, cables secured to the leaves and extending upward to the top of the post, and the counter-balance secured to the cables, substantially as described.

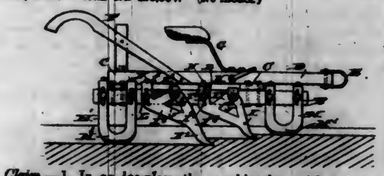
488,018. PACKING FOR PISTON OR OTHER RODS. FRANK PIRON, Sidney, N. Y. Filed May 2, 1892. Serial No. 431,472. (No model.)



Claim.—In a metallic-ring packing, the combination, with an outer ring having a peripheral opening and an interior recess, of a series of inner rings fitting in said recess and each having a lug on its periphery projecting outwardly into the peripheral opening in the outer ring, said inner rings being cut or separated, the cuts being so arranged as to break joints in adjacent rings, whereby a strong support is afforded the outer ring and the crushing in thereof by pressure prevented, substantially as specified.

488,014. STEAM-ENGINE. JAY W. POWERS, Chicago, Ill. Filed Apr. 9, 1892. Serial No. 428,503. (No model.)

Claim.—1. The combination, in a steam-engine, with the cylinder having inlet and outlet ports and passages and a longitudinally-chambered piston-head within said cylinder having inlet and outlet ports, of a longitudinally-grooved valve operating within said piston-head and with but in advance of the same and a shaft connected both with said piston-head and valve, substantially as described, whereby both the piston-head and valve will be acted upon by the steam and both transmit motion to said shaft, as specified.



2. The combination, in a steam-engine, with the cylinder having entrance and exit ports, a tubular piston-rod, and a valve operating within the chamber in said piston-head and having its rod extending through said piston-rod, of a crank-shaft, to the crank portion of which the outer end of said piston-rod is connected, and an eccentric mounted on the crank portion of said crank-shaft and having the outer end of the valve-rod connected to it, said eccentric being mounted on said crank so as to be in lead of the throw thereof, substantially as described, and for the purposes specified.

3. The combination, in an engine, with the oscillating cylinder having hollow trunnions, one of which forms the entrance and the other the exit port for the steam, said cylinder also having passages, one leading from the entrance-port and the other to the exit-port, and its inner wall pierced to form a port leading from its entrance-passage to its interior, of a chambered piston-head operating within said cylinder and having suitable steam passages and ports, a longitudinally-grooved valve within said piston-head, and a crank-shaft connected with and operated by said piston and valve.

4. The combination, in a steam-engine, with the cylinder having inlet and outlet ports, of a longitudinally-chambered piston-head within said cylinder, said piston-head having exterior steam-passages always in communication with the inlet-port of the cylinder and also having entrance and exit ports, a longitudinally-grooved valve within said piston-head, and a shaft to which said piston-head and valve are independently connected, substantially as described, and for the purposes specified.

488,015. ICE-PLOW. HAMILTON FRAY, Cove, N. Y. Filed Mar. 30, 1892. Serial No. 426,957. (No model.)

Claim.—1. In an ice-plow, the combination, with a frame provided with longitudinal beams, of cutting-blades held on each of the said beams, clips resting on top of each beam, and a bolt supported in the ends of the said clip and extending transversely through the said beam, the said bolt forming a pivot for the cutting-blade, substantially as shown and described.

2. In an ice-plow, the combination, with a frame having longitudinal beams, of a U-shaped clip resting with its middle part on top of the said beam, a bolt held in the ends of the said clip and extending transversely through the said beam, and a cutting-blade pivoted on the said bolt and adapted to be vertically adjusted at its free upper end on the said beam, substantially as shown and described.

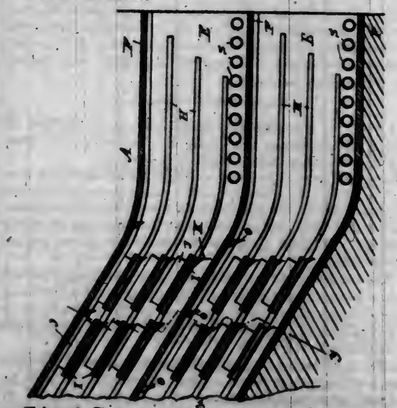
3. An ice-plow provided with a cutting-blade having an extension and a brace connecting the ends of the extension with each other, so as to form a triangular frame for the point of the cutting-blade, substantially as shown and described.

4. In an ice-plow, the combination, with a clip held on the top of a longitudinal beam and a bolt extending transversely and supported in the ends of the said clip, of a cutting-blade provided with a point, a triangular frame supporting the said point and pivoted on the said bolt, an upward-slotted extension supported on the said triangular frame, and a transverse arm extending from the upper end of the said extension, substantially as shown and described.

5. In an ice-plow, the combination, with a clip held on the top of a longitudinal beam and a bolt extending transversely and supported in the ends of the said clip, of a cutting-blade provided with a point, a triangular frame supporting the said point and pivoted on the said bolt, an upward-slotted extension supported on the said triangular frame, a transverse arm extending from the upper end of the said extension, and means, substantially as described, for vertically adjusting the said extension of the triangular frame, as set forth.

488,016. HORSE-COLLAR PAD. ROBERT O. RANDALL, Joplin, Mo. Filed May 4, 1892. Serial No. 431,778. (No model.)

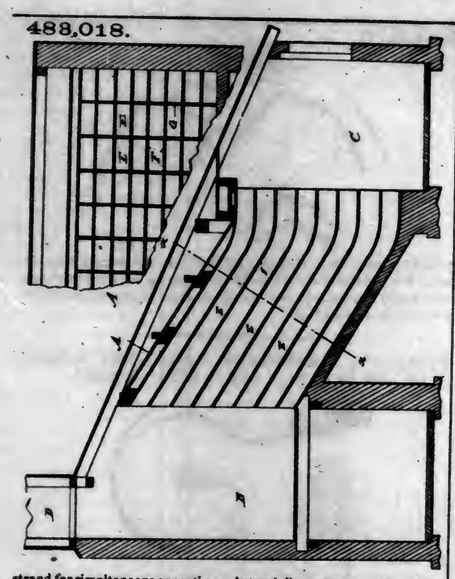
Claim.—A horse-collar fastener comprising the plates 1, having one side bent downwardly and inwardly, forming curved jaws, provided with teeth and with slots near their centers, the upwardly-projecting flanges at the inner ends of said plates, one of which is provided with a slot and a pivoted spring-actuated arm and the other with a hook adapted to be passed through said slot and engage with the spring-arms, the laterally-adjustable plates having one side or end bent downwardly and inwardly, and the screw-threaded pin and thumb-nut, substantially as described.



488,017. LAWN-SPRINKLER. NICHOLAS L. RESEY, Los Angeles, Cal. Filed Nov. 30, 1891. Serial No. 413,569. (No model.)

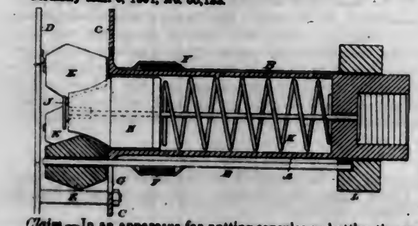
Claim.—1. The herein-described nozzle, comprising the casing or shell having a smooth interior bore and the plug adjustably arranged in said bore, said plug comprising a shank portion projecting beyond the upper end of the shell and terminating in a head or flange, said shank being tapered inwardly and having at its lower portion a series of radial vertical wings or flanges separated from each other by tapered grooves or channels, substantially as specified.

2. The combination, with the pipe base or support having the elbow-coupling B, of the casing or shell having a threaded engagement with said socket and formed with a smooth interior bore, and a plug adjustably arranged in said bore, said plug comprising a shank portion projecting above the upper end of said shell and terminating in a head or flange, said shank being tapered inwardly and having at its lower portion a series of radial vertical wings or flanges separated from each other by tapered grooves or channels, substantially as specified.



488,018. DRYING-STOVE FOR BRICKS OR OTHER MATERIALS. ALBERT SCHAAF, Halle, Germany. Filed Aug. 16, 1890. Serial No. 362,055. (No model.)

Claim.—1. The combination, with the drying-flue, of a series of transverse depending connected curtains therein and means for simultaneously operating said curtains, substantially as shown and described.



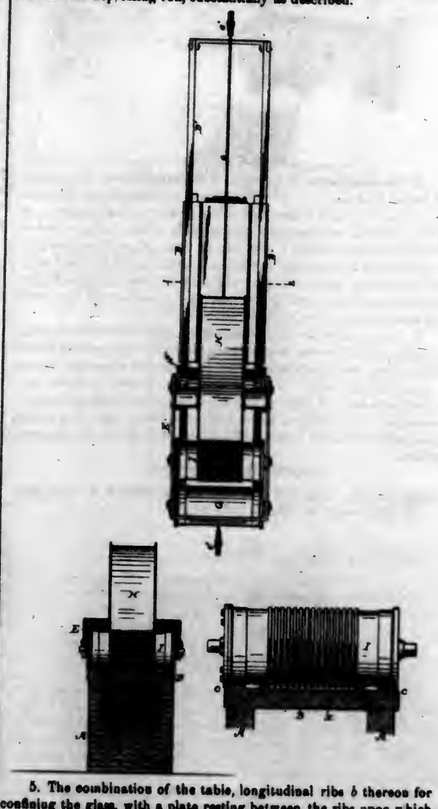
2. The combination, with the drying-flue, of a series of depending transverse curtains, a strand extending through the flue over said curtains, and the short cords P, connecting all of the curtains with said

488,018.

strand for simultaneous operation, substantially as shown and described.

488,019. APPARATUS FOR FIXING CAPSULES ON BOTTLES. CARL SCHERER, Langen, Germany. Filed Sept. 1, 1891. Serial No. 404,412. (No model.) Patented in England Feb. 17, 1890, No. 2,550; in Belgium Feb. 28, 1890, No. 89,547; in France May 8, 1890, No. 208,726; in Austria-Hungary June 20, 1890, No. 8,949 and No. 21,970, and in Germany Mar. 6, 1891, No. 55,122.

Claim.—In an apparatus for putting capsules on bottles, the combination, with a rotating holder, of the springy bodily-movable pressing parts or rollers having shoulders spirally arranged on their peripheries and the movable part J, having body H, provided with slanting surfaces, substantially as set forth.



488,020. MACHINE FOR EMBEDDING WIRE-NETTING IN GLASS. FRANK SHUMAN, Philadelphia, Pa. Filed July 6, 1892. Serial No. 439,146. (No model.)

Claim.—1. The combination, in a machine for manufacturing wire-glass, of the table upon which the molten glass is poured, a roller for smoothing out said molten glass, a carrier for the wire or wire-gauze, situated back of the smoothing-roller, and a finishing-roller for closing the openings in the glass made by the wire or wire-gauze, substantially as described.

2. The combination of the bed for the glass, the carriage, the first smoothing-roller, a ribbed roller, and a finishing-roller for smoothing the glass after the ribbed roller has passed over it, with a chute or guide for the wire, situated between the first roller and the ribbed roller, substantially as specified.

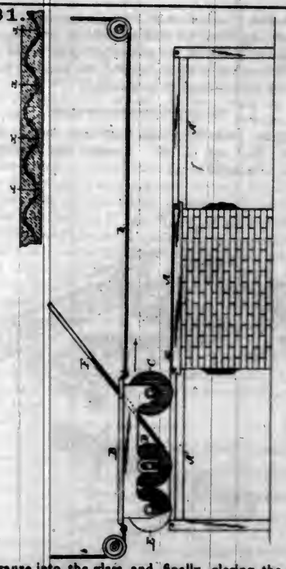
3. The combination of the furnace, the table mounted above the furnace, a carriage, three rollers mounted thereon, the first roller being the first smoothing-roller, the second roller having ribs for depressing the wire into the glass, and the third roller being the final smoothing-roller for closing the openings formed by the ribbed roller, with mechanism by which the carriage is drawn over the table, substantially as described.

4. The combination of the table, a heating device therefor, rails on the table, rails at each end of the table in line with the said rails on the table, the carriage, two smoothing-rollers thereon and a central depressing-roller for the wire and a chute upon which the wire is mounted, said chute being situated between the forward smoothing-roll and the depressing-roll, substantially as described.

5. The combination of the table, longitudinal ribs *b* thereon for confining the glass, with a plate resting between the ribs upon which the glass is rolled, with rollers for smoothing the glass and for forcing the wire into the glass, substantially as described.

6. The combination of the table, a device for heating the same, longitudinal ribs on the table, longitudinal rails on the outer edge of the table, rails at each end of the table aligning with the rails on the table, a carriage, mechanism for drawing the carriage over the table, said carriage having a primary smoothing-roll and a finishing smoothing-roll and a central ribbed roll, a chute carried by the carriage, with heating appliances for the rolls, so that they will not chill the glass during the process of rolling, substantially as specified.

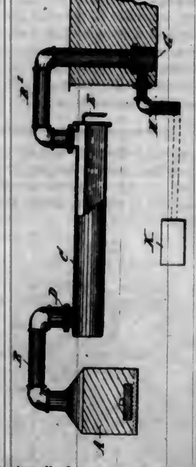
7. The combination of the table, the rails, the carriage, the forward smoothing-roll and the rear smoothing-roll, a central ribbed roll, an inclined chute for the wire, with a trigger holding the wire in the chute, substantially as specified.



8. The combination of the furnace, the table mounted thereon, rails on the table, ribs to prevent the glass from spreading, rolls adapted to the rails, the forward roll and rear roll being smoothing-rolls, ribs on the central roll, each of said rolls being hollow and having removable heads, with cores in said rolls adapted to be heated, with a chute for the wire, said chute being situated between the forward roll and the ribbed roll, substantially as specified.

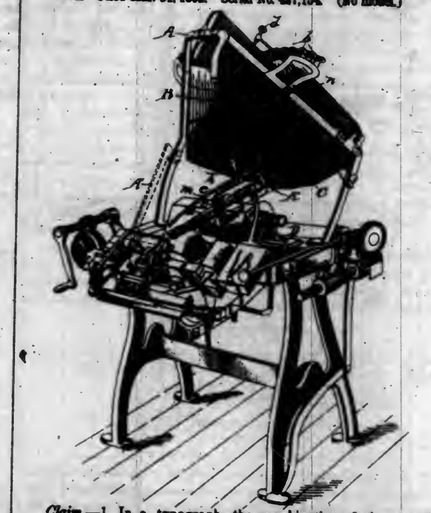
9. The combination of the table, the carriage, supporting-rolls therefor, with a ribbed roll mounted loosely in bearings on the carriage, substantially as and for the purpose set forth.

488,021. PROCESS OF EMBEDDING WIRE-NETTING IN GLASS. FRANK SHUMAN, Philadelphia, Pa. Filed July 6, 1892. Serial No. 439,147. (No specimens.)



Claim.—1. The process herein described of making wire-glass, said process consisting in, first, preparing a sheet of molten glass; second, mounting thereon wire or wire-gauze; third, pressing the said wire or wire-gauze into the glass, and, finally, closing the openings made by the wire, substantially as described.

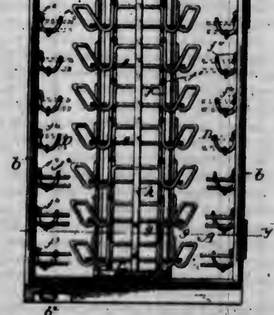
488,021.



2. The process herein described of making wire-glass, said process consisting in, first, rolling the glass into a sheet; second, placing upon the glass the wire or wire-gauze, impressing portions of the wire-gauze deeply into the glass, thus corrugating the same, and, finally, rolling the glass and embedding the wire therein, substantially as described.

488,022. APPARATUS FOR BLEACHING CANE-JUICE. AUGUST F. BLANKENEY, New Orleans, La. Filed June 6, 1892. Serial No. 435,666. (No model.)

Claim.—The herein-described apparatus for bleaching cane-juice, comprising a sulphur stove or retort, a water-chamber, a pipe leading from the stove or retort to the water-chamber, the solution-tank, the pipe B', leading from the water-chamber to the solution-tank and having the openings G, a pump arranged in a casing, and a pipe leading from the pipe B', adjacent to the discharge end thereof, to the pump-casing, all substantially as and for the purpose set forth.

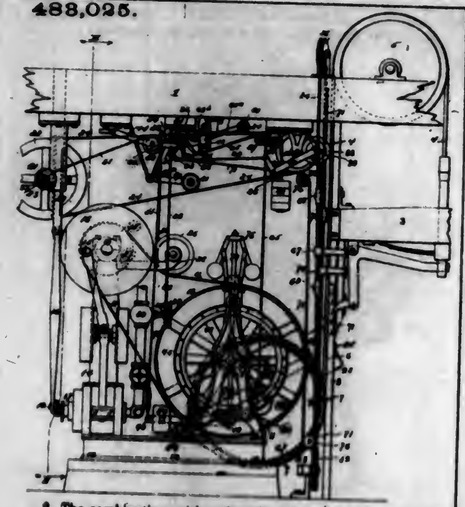


488,023. TYPOGRAPH ATTACHMENT. JAMES SLOCUM, Holly, Mich. Filed Mar. 31, 1892. Serial No. 427,154. (No model.)

Claim.—1. In a typograph, the combination of the movable frame, the movably-mounted spacers, the mobile arm or stop adapted to engage said spacers, and means for connecting said arm or stop with the movable frame, whereby said spacers are restored simultaneously with the actuation of said frame.

2. In a typograph, the combination of the tilting frame, the movably-mounted spacers, the arm or stop movably mounted and adapted to engage said spacers, and the spring connecting said arm or stop with the tilting frame, substantially as specified.

488,024. RIBBON AND SHOW CASE. EDWIN STEWART, Albion, Ill. Filed Oct. 31, 1891. Serial No. 410,480. (No model.)



Claim.—The show-case provided with a series of basket-like receptacles, each consisting of a single strand of wire formed in a number of bail-like bends and intermediate loops slipped upon pins projecting from supports within the case, and means to hold said receptacle firmly in position upon their supports, substantially as set forth.

488,025. SAFETY ATTACHMENT FOR ELEVATORS. ANDREW A. STOLTENBERG, St. Louis, Mo. Filed May 18, 1892. Serial No. 433,467. (No model.)

Claim.—1. The combination, with a throttle-valve of an elevator-engine, of a weighted cord connected with the valve-stem and adapted to close the valve by the stretching of the weighted cord, the bracket having a downward projection formed with a depression, the rock-shaft 30, having a detent normally engaging the weighted cord in the depression, a pulley bearing against a part of the mechanism liable to sag or break, and an arm upon the rock-shaft, with which the pulley is connected, substantially as described.

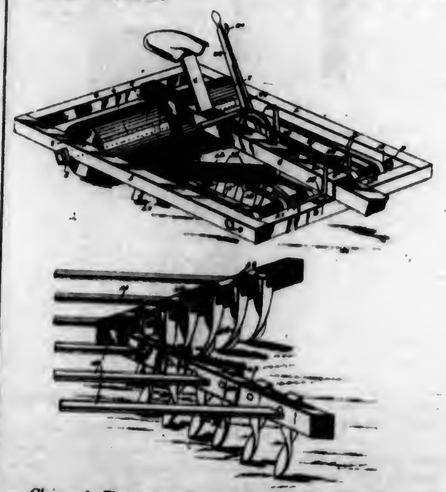
488,025.

3. The combination, with a throttle-valve of an elevator-engine, of a weighted cord connected with the valve-stem and adapted to close the valve by the stretching of the weighted cord, the rock-shaft 30, having a detent normally engaging the weighted cord, a pulley bearing against a part of the mechanism liable to sag or break, an arm upon the rock-shaft, with which the pulley is connected, a brake mechanism having a weighted brake-lever, a lever provided with a pulley, a catch on the rock-shaft normally engaging the pulley-lever, and a cord passing over the pulley and secured to the brake-lever, substantially as described.

3. The combination, with a hoisting-cable, of a hinged arm, a pulley upon the hinged arm, bearing against the cable, the bracket having a downward projection formed with a depression, a rock-shaft having an arm connected with the hinged arm, a throttle-valve, a weighted cord connected with the valve-stem and adapted to close the valve by the stretching of the weighted cord, and a detent on the rock-shaft normally engaging the weighted cord in the depression, substantially as described.

4. The combination, with a hoisting-cable, of a hinged arm, a pulley upon the hinged arm, bearing against the cable, a rock-shaft having an arm, a detent, and a catch, a throttle-valve, a weighted cord connected with the valve-stem and adapted to close the valve by the stretching of the weighted cord, a brake mechanism having a weighted brake-lever, a lever provided with a pulley and a cord passing over the lever-pulley and secured to the brake-lever, the hinged arm being connected with the arm on the rock-shaft, the weighted cord being normally engaged by the detent, and the pulley-lever being normally engaged by the catch, substantially as described.

5. The combination, with the throttle-valve of an elevator-engine, of a weighted cord attached to the stem of the throttle-valve and adapted to close the valve when stretched, a rock-shaft having a detent normally engaging the cord and having an arm 75 and a cord 71 attached thereto, having a portion adjacent to the travel of the car provided with a projection 72, and a projection 70 on the car, adapted to engage with said projection 72, substantially as and for the purpose set forth.

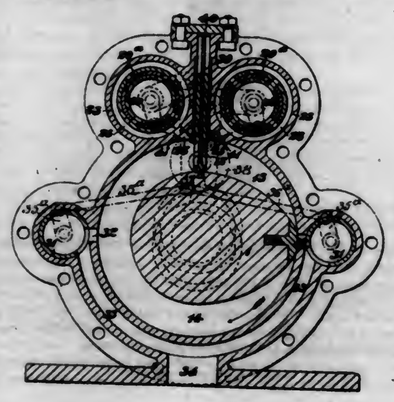


6. The combination, with the throttle-valve of an elevator engine and the elevator mechanism, of a weighted cord connected with the throttle-valve and adapted to close the valve under the influence of the weight, the bracket having a downward projection formed with a depression, and a rock-shaft 30, having a detent adapted to lock the weighted cord in the depression, and an arm connected with part of the mechanism liable to sag or break, substantially as described.

7. The combination, with the throttle-valve of an elevator-engine, of the weighted cord 36, connected with said valve, the rock-shaft 30, having a detent 32, a hook 43, and an arm, the lever 44, normally engaged by the hook, a weighted brake-lever, a cord connecting the brake-lever to the lever 44, an operating-cord attached to the arm, and a lever provided with a pulley, substantially as described.

8. The combination of a throttle-valve, a weighted cord connected to the valve-stem, a rock-shaft 30, having a detent 32 and trip-arms, the tripping-cords, the hoisting-cables 4, the reversing-cord 24, the drive-belt, the hinged arms, and pulleys journaled on the hinged arms, substantially as described.

9. The combination of a throttle-valve, a weighted cord connected to the valve-stem, a rock-shaft 30, having a detent 32, a hook 43, and trip-arms, tripping-cords, the hoisting-cables 4, reversing-cord 24, the drive-belt, the hinged arms, the pulleys journaled on the hinged arms, the weighted brake-lever 49, the cord 51, the lever 44, and the pulley upon the lever 44, substantially as described.



488,026. AGRICULTURAL MACHINE. JOHN F. THOMPSON, Fulton, Ky. Filed Apr. 11, 1891. Renewed May 21, 1892. Serial No. 433,907. (No model.)

Claim.—1. The combination, with the rectangular framework, the harrow-sections, and the rear axle, of the standard rising from the axle, the draft-beam connected at its rear end to the standard and secured to the front cross-bar of the frame, a pair of ground-wheels mounted removably on the axle, and a series of interposed sleeves mounted on the axle between the wheels and standard, substantially as specified.

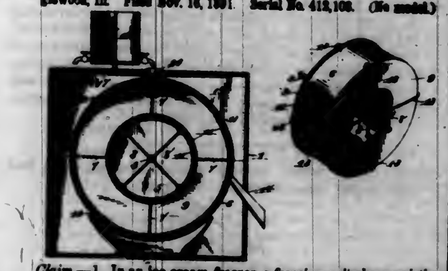
2. In an agricultural machine, the combination, with the rectangular framework, the transverse shaft located at the front end thereof, the series of graduated arms loosely mounted on the shaft, and the tooth-carrying heads connected to the arms and independent of each other, of the centrally-cranked rock-shaft journaled in bearings in the front end of the framework and terminating beyond the bearings at its ends in curved spring-arms connected to the graduated arms, the pivoted operating-lever, and the rod connecting the same with the crank of the rock-shaft, substantially as specified.

488,027. ROTARY ENGINE. EDWARD TOWLSON, Norwich, England, assignor to William Tomkins Sturgess and Edward Towlson, same place. Filed Sept. 18, 1891. Serial No. 406,133. (No model.) Patented in France Mar. 18, 1892, No. 220,942, and in Belgium Mar. 19, 1892, No. 96,897.

Claim.—1. In a rotary engine, the combination of a cylinder, a driving-shaft and a piston carried thereby, an abutment arranged to work in close contact with said piston, a cut-off valve at each side of said abutment, a reversing-valve concentric with each cut-off valve, an exhaust-valve at each side of said cylinder, means for operating said reversing and exhaust valves simultaneously, and means for operating said cut off valves, substantially as described, for the purpose specified.

2. In a rotary engine, the combination of a cylinder, hollow cylindrical bosses fixed therein, a driving-shaft having a collar extending between the inner ends of said bosses, a piston arranged to revolve around said bosses and carried by said collar, an abutment, a cut-off valve at each side of said abutment, a reversing-valve concentric with each cut-off valve, and means for operating said valves, substantially as described, for the purpose specified.

3. In a rotary engine, the combination of a cylinder, a driving-shaft, a rotary piston carried by said shaft, an abutment, a cut-off valve at each side of said abutment, a reversing-valve concentric with each cut-off valve, an exhaust-valve at each side of said cylinder, a pivoted plate provided with a handle and connected to said exhaust and reversing valves for operating the same simultaneously, and a pair of eccentrics on the driving-shaft for operating the cut-off valves, substantially as described.



4. In a rotary engine, the combination of a cylinder, a driving-shaft, a rotary piston carried by said shaft, an abutment arranged to slide in a steam-chamber and to act against said piston, one or more passages for admitting steam to said chamber to act against the outer end of said abutment, a reversing and a cut-off valve at each side of said abutment, an exhaust-valve on each side of said cylinder, a wrist-plate connected to said exhaust and reversing valves for operating the same simultaneously, and a pair of eccentrics on the driving-shaft for operating the cut-off valves, substantially as described, for the purpose specified.

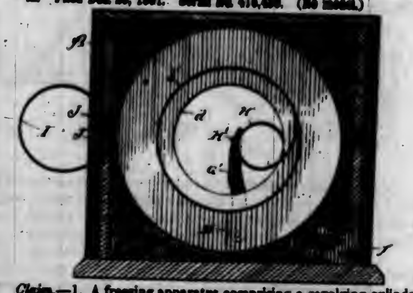
5. In a rotary engine, the combination of a cylinder, a driving-shaft, a rotary piston carried by said shaft, an abutment arranged to slide in a steam-chamber and to act against said piston, a reversing and a cut-off valve at each side of said abutment, an exhaust valve on each side of said cylinder, a wrist-plate connected to said exhaust and reversing valves for operating the same simultaneously, a pair of eccentrics on the driving shaft for operating the cut-off valves, steam-passages for connecting each of the cut-off valve chambers with the steam-chamber in which said abutment slides, cocks for controlling said steam-passages, and connections between said cocks and the mechanism for operating said reversing-valves, substantially as described and shown, for the purpose specified.

6. In a rotary engine, the combination of a cylinder, a driving-shaft, a piston carried by said shaft, a sliding abutment, a reversing and a cut-off valve on each side of said abutment, exhaust-valves on each side of said cylinder, exhaust-passages, such as 33, concentric with said cylinder, having a common outlet and controlled by said exhaust-valves, and means for operating said reversing, cut-off, and exhaust valves, substantially as described, for the purpose specified.

7. In a rotary engine, the combination, with a cylinder having stationary bosses therein, a rotary piston, and an abutment, of two independently-operated oscillating cut-off valves, two oscillating reversing-valves, each arranged concentrically with one of said cut-off valves, two oscillating exhaust-valves, and reversing mechanism comprising a plate provided with crank-pins connected by lever mechanism to said reversing and exhaust valves and with a hand-lever, said valves and reversing mechanism being arranged substantially as described and shown, for the purpose specified.

488,028. ICE-CREAM FREEZER. CHARLES T. VAN SICKLEN, Englewood, Ill. Filed Nov. 16, 1891. Serial No. 412,108. (No model.)

Claim.—1. In an ice-cream freezer, a freezing-cylinder consisting of an inner and outer annular wall, annular removable heads for the cylinder, a shaft, bearings for the shaft, and spokes radiating from the shaft and connected with the inner wall, substantially as specified.



2. In an ice-cream freezer, the freezing-cylinder consisting of inner and outer annular walls, opposite annular heads for the same, partitions connecting the walls at intervals, a shaft, bearings for the shaft, and spokes between the shaft and inner wall, substantially as specified.

3. In an ice-cream freezer, the freezing-cylinder consisting of inner and outer annular walls, opposite annular heads for the same, reticulated wire partitions connecting the walls at intervals, a shaft, bearings for the shaft, and spokes between the shaft and inner wall, substantially as specified.

4. In an ice-cream freezer, a freezing-cylinder consisting of inner and outer annular walls, opposite annular heads having inner and outer wire rings, rings secured to the ends adjacent to each of the former rings, rubber packing-rings located between the wire rings, clamps for the heads, a central shaft, and spokes between the shaft and inner cylinder, substantially as specified.

5. In an ice-cream freezer, the combination, with the double cylinder, its shaft, spokes, and annular covers, of the series of hook-shaped clamps pivoted to the spokes and adapted at their free ends to clamp upon the outer edge of the cylinder, substantially as specified.

488,029. ICE-CREAM FREEZER. BELLE P. VOLLARD, Chicago, Ill. Filed Dec. 28, 1891. Serial No. 416,490. (No model.)

Claim.—1. A freezing apparatus comprising a revolving cylinder provided with an ice-chamber, a space or receptacle inside the cylinder for substances to be frozen, and a space or receptacle outside the cylinder for substances to be frozen, substantially as described.

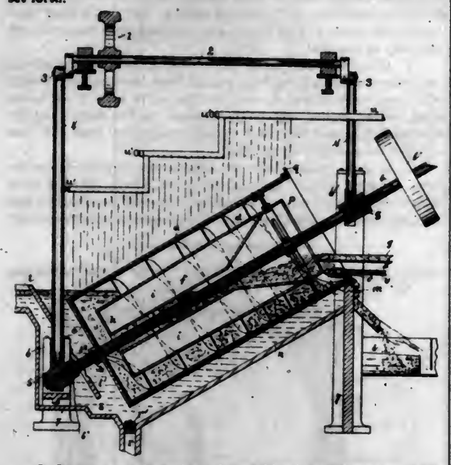
2. A freezing apparatus consisting of a revolving annular cylinder both of whose internal and external surfaces are adapted to receive the substance to be frozen, whereby the frozen material may be removed from one surface while it is being frozen upon the other, and vice versa, thus maintaining a continuous production, substantially as described.

3. In a freezing apparatus, the combination of a cylinder provided with a chamber D and revolving within a suitable case, and a scraper H for removing the contents of such chamber, supported at one end by the cylinder and at the other by means of a swinging arm attached to the case, substantially as described.

4. In a freezing apparatus, the combination of a case provided with an opening J, a drawer to contain the freezing mixture placed within such case, a cylinder revolving in the case and dipping into the drawer, and a substantially cylindrical scraper I, adapted to be inserted through the opening J, contacting with the exterior of the cylinder and removing the frozen substance therefrom, substantially as described.

5. In a freezing apparatus, the combination of a cylinder revolving in a suitable case provided with an opening, and a plate pivotally supported in the case and adapted to act as a scraper to remove the frozen substance from the exterior of the cylinder and when not used as a scraper to close the opening to prevent warm air from entering the case, substantially as described.

488,030. ROTARY PULP-STRAINER. THEODOR VOLSTORF, Berlin, Germany. Filed Oct. 11, 1889. Serial No. 326,710. (No model.) Patented in Germany Sept. 4, 1889, No. 51,736; in England Sept. 14, 1889, No. 14,494; in France Sept. 14, 1889, No. 200,765; in Switzerland Sept. 27, 1889, No. 1,446; in Belgium Sept. 30, 1889, No. 87,897, and in Austria-Hungary Jan. 2, 1890, No. 40,260 and No. 64,962.



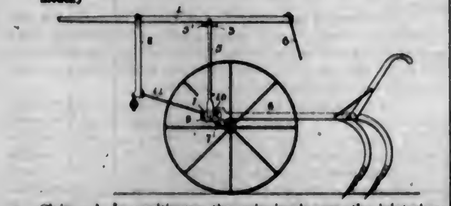
Claim.—1. In a paper-pulp strainer, the combination of the tank *n*, the straining-cylinder *a*, closed at its lower end and supported on an incline in said tank, the worm *k* within said cylinder, means for supplying the pulp into said straining-cylinder, and means for imparting a rotary motion to said cylinder and worm, as herein set forth.

2. In a paper-pulp strainer, the combination of the tank *n*, the inclined cylinder *a*, and the worm *k* with a central conveyer-passage for leading the material to be treated to the bottom of the cylinder, as herein set forth.

3. In a paper-pulp strainer, the combination of the tank *n*, the in-

cined cylinder *a*, and the worm *k* with the central cylinder *d* and conveyer-passage *f*, as herein set forth.

4. In a paper-pulp strainer, the combination of the tank *n* and the inclined cylinder *a*, supported on spindle *b* by suitable bearings, with a central air-chamber for relieving the weight of the bearings, as herein set forth.

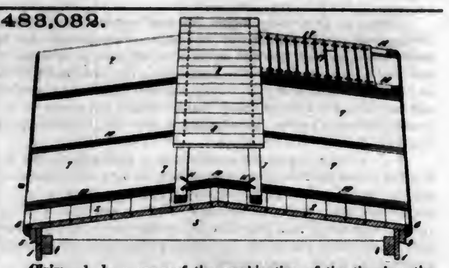


5. In a paper-pulp strainer, the combination of the tank *n*, the inclined cylinder *a*, supported on suitable bearings in the tank *n*, and a worm *k* inside of said cylinder with a central conveyer passage *f* and a float between said passage and the worm, as herein set forth.

6. The combination, with a rotary paper-pulp strainer and a tank in which the strainer operates, of a conveyer spiral or worm *k*, having its upper termination of suddenly-increased pitch, so as to meet the mouth of the strainer at a right angle, as herein set forth.

7. The combination, with a rotary strainer and a tank in which the strainer operates, of a conveyer spiral or worm *k* of gradually-decreasing pitch from its lower to its upper end, as herein set forth.

483,031. CULTIVATOR. EDGAR WAGER and SAMUEL H. ARMSTRONG, Canton, Ill. Filed July 1, 1892. Serial No. 438,689. (No model.)

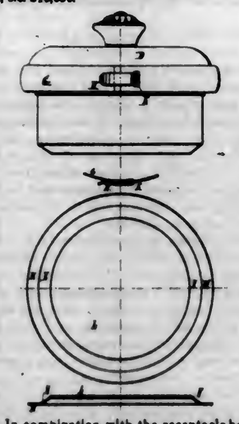


Claim.—1. In a cultivator, the swinging hanger, the joint-piece pivoted in the foot of the hanger, said joint-piece being provided with a rearward extension having a wheel-axle situated at the rear of the pivot of the joint-piece, and the beam pivoted in said joint-piece, whereby the weight of the pole, hanger, and connected parts tends to raise the shovels, substantially as set forth.

2. In a cultivator, the swinging hanger, the joint-piece pivoted in the foot of the hanger, said joint-piece being provided with a rearward extension having a wheel-axle situated at the rear of the pivot of the joint-piece, and the plow-beam pivoted in said joint-piece, whereby the weight of the pole, hanger, and connected parts tends to raise the shovels, and a series of holes, and a draft-rod adapted to engage said holes, substantially as set forth.

3. In a cultivator, a pivoted hanger having a bifurcated lower end, a joint-piece pivoted in the said lower end of the hanger and having an extension provided with a wheel-axle, the pivot of the joint-piece passing through the extension and the arms of the bifurcated hanger, and a plow-beam having a yoke embracing said joint-piece and pivoted thereto, substantially as set forth.

483,032. CAR-ROOF. JOHN C. WARD, St. Louis, Mo. Filed Mar. 30, 1892. Serial No. 426,924. (No model.)



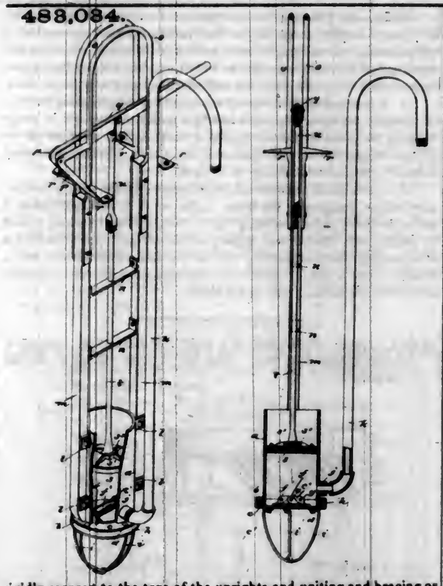
Claim.—1. In a car-roof, the combination of the tie-wires, the double ridge-pole, straps secured to the ridge-pole and through which the tie-wires pass, and running-boards secured to the ridge-poles, substantially as and for the purpose set forth.

2. In a car-roof, the combination of two ridge-poles extending longitudinally of the car-body, one on each side of the apex of the roof and suitably held thereto, and transverse running-boards secured to the ridge-poles, substantially as and for the purpose set forth.

3. In a car-roof, the combination of the metal sheets, tie-wires for holding the sheets in place, washers having enlarged openings through which the ends of the tie-wires pass, and wedges for holding the wires in the washers, substantially as and for the purpose set forth.

483,033. JAR. ACHILLE WEISSENTHANNER, Paris, France. Filed Dec. 17, 1891. Serial No. 415,493. (No model.) Patented in France Jan. 9, 1891, No. 210,636.

Claim.—1. In combination with the receptacle having a horizontally-projecting flange and a rim extending upwardly therefrom, said rim having an inclined shoulder on its outer side, a cover having a horizontal flange and an inner annular recess, the diaphragm having a horizontal rim and an inclined shoulder extending up therefrom, the gasket in the annular recess of the cover, having an inner inclined face adapted to the inclined shoulder on the diaphragm, and the concaved collar embracing the horizontal flanges of the receptacle and cover, substantially as described.



2. In combination, the receptacle having the upwardly-extending rim and the horizontal flange, said rim having an outer inclined face, the diaphragm having the horizontal outer rim adapted to the flange of the receptacle and an inclined shoulder adapted to the inclined face of the rim, the cover having the inner annular recess and the outer horizontal flange, and the gasket fitting in the said recess and having an inner inclined side, substantially as described.

483,034. PUMP. ALVIN H. WOODARD, Mansfield, Ohio. Filed Apr. 11, 1892. Serial No. 428,622. (No model.)

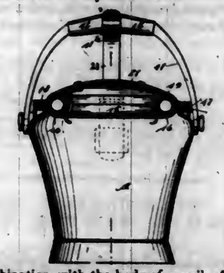
Claim.—The pump-cylinder, the uprights *n n*, rigidly secured thereto, the piston, and the piston-rod, combined with the yoke *o*,

483,034.

rigidly secured to the tops of the uprights and uniting and bracing or stiffening them and provided with laterally-projecting feet *r* to support the pump in the well, and the handle pivotally connected to and between the yokes and guided by them, substantially as described.

483,035. BUNG. MARK ANTHONY, Berkeley, and WILLIAM C. RAYMER, Oakland, Cal. Filed Jan. 21, 1892. Serial No. 418,849. (No model.)

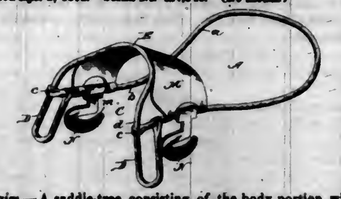
Claim.—1. In a bung, the combination, with the bushing A, having an interior shoulder or flange *c* near its inner end and an annular bead on the upper face of said flange, of the plug having the segmental engaging inclined ways or guides in said bushing, said plug having a diametrically-reduced portion at its inner end below a shoulder *a*, and an annular packing-ring held between said flange *c* and the shoulder *d* and engaged by said bead, substantially as specified.



2. The combination, with the bushing having an interior rabbet near its upper end, of the plug fitting in said bushing and having means whereby it is locked therein, said plug having a flanged head seated flush in said rabbet, and a socket or seat G in the said head, said seat or socket having the lower right-hand corner of each wall formed with a recess or under-cut *g*, substantially as specified.

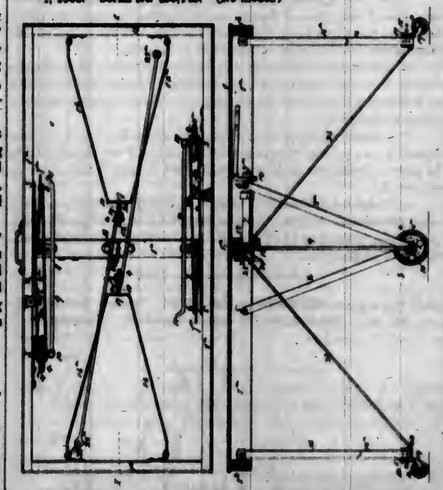
3. In a bung, the combination, with the bushing, of the rotary plug locking therein, said plug having an angular socket or seat G in its outer end, beveled under-cuts or recesses *g* in the lower right-hand corner of each wall, and a wrench having an angular head H', adapted to enter said socket, and a bearing I above said head, said bearing having its angles cut obliquely and adapted to engage said under-cuts or recesses, substantially as specified.

483,036. SANITARY PAIL. CHARLES BARON, New York, N. Y. Filed Mar. 24, 1892. Serial No. 426,249. (No model.)



Claim.—1. The combination, with the annular trough-like seat-section 15, provided with an external flange 17 to rest upon the upper edge of a pail, and the tubular annular cushion resting in the concavity of the said section, of the outer or lid section 13, having a horizontal flange resting upon the flange 17, and the spring on the under side of the section 13 and engaging the inner convex margin 16 of the section 15, substantially as set forth.

2. A sanitary pail comprising the body A, having a hinged bail 11 and a socket or loop 10, a sectional cover for the body, swinging at right angles to the bail and having a stationary handle 23 on its upper side, over which the bail swings to lock the cover on the body, and the strap 22, hinged to the cover and removably entering the said loop or socket, substantially as set forth.



3. The combination, with the body of a pail, of a cover, the said cover being constructed in two sections, a seat-section of ring-like contour and a cushion secured to the same, and a lid-section provided with a spring upon its under face, capable of engaging with the inner surface of the seat-section when the two sections of the cover are brought to an engagement, substantially as shown and described.

483,037. SADDLE-TREE. RICHARD C. RARRY, Montreal, Canada. Filed Apr. 2, 1892. Serial No. 427,540. (No model.)

Claim.—A saddle-tree consisting of the body portion with forwardly-extending branches formed of a single piece of wire and having a bridge-loop with integral leg-loops secured to the ends of the branches, an arched gullet connected to said branches, and the hinged strap-hooks interposed between the connected ends of said gullet, substantially as and for the purposes specified.

483,038. BIER. GEORGE BOOLEY, Poplar Bluff, Mo. Filed June 1, 1892. Serial No. 435,146. (No model.)

Claim.—1. A truck having legs hinged to its top and adapted to stand out from the top in working position or fold flat on the same, movable braces hinged to the legs and having eyes at their free ends for connection with the top, and a central stud beneath the top, adapted for engagement of the brace-eyes, and supporting-wheels on the legs, substantially as set forth.

2. A truck having legs hinged to its top and adapted to fold flat upon the top or to stand out in working position, braces hinged to the legs and having eyes for attachment to the top, a stud at the under side of the top, adapted to engage the eyes, and a catch 24, locking the eyes upon the stud, all constructed and arranged substantially as set forth.

3. A truck having side legs composed of inclined bars 2 and 2', one of them hinged to the truck-top and the other to a link 7, hinged to the truck-top, the leg being adapted to stand out in working position or fold flat against the bottom of the truck-top, and a spring-catch 14, engaging the leg and adapted to hold it in either working or folded position, substantially as set forth.

Claim.—1. A mechanical movement for converting reciprocating into rotary motion, comprising a shaft having a socket on one end, a reciprocating bar working in said socket, and a crank-arm pivotally connected at its outer end with the end of said bar and having its center eccentric to the center of the said shaft, substantially as set forth.

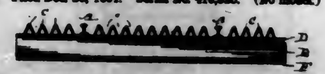
2. A mechanical movement for converting reciprocating into rotary motion, comprising a shaft having a socket on one end, a reciprocating bar working in said socket, a crank-arm, a wrist-pin pivotally connecting the bar and crank-arm, and a link or pitman connected to said wrist-pin, substantially as set forth.

3. A mechanical movement for converting reciprocating into rotary motion, comprising the frame A, the shaft B, having a pulley J and a socket C, a reciprocating bar D, sliding in said socket, a shaft

wheel, the said bar having a series of rests for the shanks of the tools to be ground, substantially as shown and described.

10. A tool-rest for grinding-machines, comprising a bar and a tool-supporting plate having a forked end engaging the said bar and means for attaching the plate to the bar, but permitting a swinging motion of the plate, substantially as shown and described.

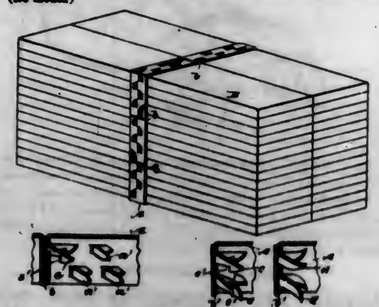
11. A tool-rest for grinding-machines, comprising a bar and a tool-supporting plate having a forked end engaging the said bar, means for attaching the plate to the bar, but permitting a swinging motion of the plate, and set-screws adapted to abut on the edge of the said plate to limit the swinging motion of the latter, substantially as shown and described.



Claim.—1. The combination of a rotary tubular spindle, a flier attached thereto and provided at its upper end with a pair of grooved rolls standing at opposite sides of the path of a wire passing through said spindle, the groove of one roll having one side substantially at a right angle to the axis of the roll and the other side oblique thereto, a guide arranged to deliver thread or fibrous material to the wire at a point just above said rolls, and means for feeding the wire between said rolls and through the spindle, as set forth.

2. The combination of a rotary tubular spindle, a flier attached thereto and provided at its upper end with a pair of grooved rolls standing at opposite sides of the path of a wire passing through said spindle, the groove of one roll having one side substantially at a right

2. A truck having legs hinged to its top and adapted to fold flat upon the top or to stand out in working position, braces hinged to the legs and having eyes for attachment to the top, a stud at the under side of the top, adapted to engage the eyes, and a catch 24, locking the eyes upon the stud, all constructed and arranged substantially as set forth.

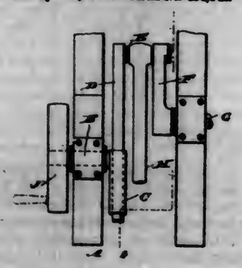


3. A truck having side legs composed of inclined bars 2 and 2', one of them hinged to the truck-top and the other to a link 7, hinged to the truck-top, the leg being adapted to stand out in working position or fold flat against the bottom of the truck-top, and a spring-catch 14, engaging the leg and adapted to hold it in either working or folded position, substantially as set forth.

488,039. SURFACE CATTLE-GUARD. JOHN S. BERRY, Tyler, Tex. Filed Dec. 26, 1891. Serial No. 416,235. (No model.)

Claim.—A cattle-guard comprising a series of parallel triangular bars tapered at their ends and provided with lateral perforated horizontal flanges, the plates D D, to which said flanges are secured, the cross-tie supports, and the solid plank flooring upon which said ties rest, said flooring being some distance below the guard-bars, substantially as specified.

488,040. BARBED STRAP FOR BUNCHING LUMBER. HOWARD C. HUNT, Clipper Mills, Cal. Filed May 9, 1892. Serial No. 432,261. (No model.)



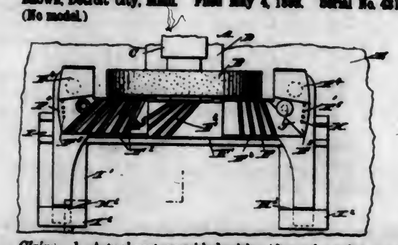
Claim.—1. A sheet-metal bunching-strap comprising a band and two rows of barbs formed thereon projecting from the same side of the band, the end barbs being shaped to interlock with the bunched material when driven thereto, substantially as described.

2. A sheet-metal bunching-strap comprising a band, integral barbs formed in two parallel staggered rows thereon, and two opposite barbs at each end, adapted to interlock with the bunched material, substantially as described.

3. A sheet-metal bunching-strap comprising a band, integral barbs formed in two parallel staggered rows thereon, and two opposite barbs at each end, whereon locking-shoulders are formed, substantially as described.

4. A sheet-metal bunching-strap comprising a continuous strap cross-channeled at intervals, integral barbs formed in two parallel staggered rows thereon, and two opposite barbs at each cross-channel, substantially as described.

488,041. MECHANICAL MOVEMENT. PETER A. ROSSITT, Merced, Cal. Filed Apr. 30, 1892. Serial No. 431,342. (No model.)



Claim.—1. A mechanical movement for converting reciprocating into rotary motion, comprising a shaft having a socket on one end, a reciprocating bar working in said socket, and a crank-arm pivotally connected at its outer end with the end of said bar and having its center eccentric to the center of the said shaft, substantially as set forth.

2. A mechanical movement for converting reciprocating into rotary motion, comprising a shaft having a socket on one end, a reciprocating bar working in said socket, a crank-arm, a wrist-pin pivotally connecting the bar and crank-arm, and a link or pitman connected to said wrist-pin, substantially as set forth.

3. A mechanical movement for converting reciprocating into rotary motion, comprising the frame A, the shaft B, having a pulley J and a socket C, a reciprocating bar D, sliding in said socket, a shaft G, parallel with shaft B and having a crank-arm F, provided with a wrist-pin, pivotally connecting it with the said reciprocating bar, a treadle I, and a link or pitman H, connecting the treadle I and the said wrist-pin, substantially as set forth.

488,042. TOOL-REST FOR GRINDING-MACHINES. DARWIN L. BROWN, Detroit City, Mich. Filed May 4, 1892. Serial No. 431,796. (No model.)

Claim.—1. A tool-rest provided with a bar adapted to extend across the face of the grinding-wheel and formed at each end with a shoulder for resting the shank of the tool thereon while grinding a belly surface on the tool, substantially as shown and described.

2. A tool-rest provided with a bar adapted to extend across the face of the grinding-wheel and formed with grooves or channels for the reception of the tool-shanks, the said grooves or channels being arranged at angles to the face of the wheel, substantially as shown and described.

3. A tool-rest for grinding-machines, provided with a bar formed at the middle with an offset and provided on its top surface with channels or grooves for the reception of the tool-shanks, the said grooves or channels being arranged at angles to the face of the grinding-wheel, substantially as shown and described.

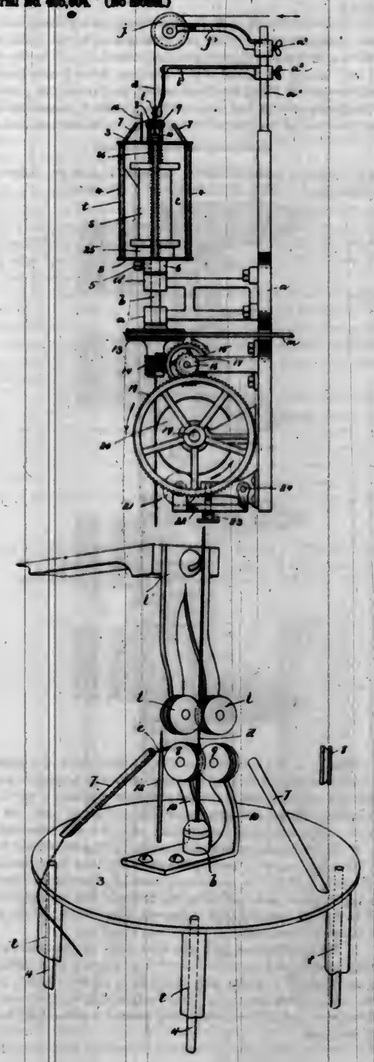
4. A tool-rest provided with a bar adapted to extend across the face of the grinding-wheel and formed at each end with a shoulder for resting the shank of the tool thereon while grinding a belly surface on the tool, and pins having conical heads adapted to be placed in the ends of the said plate opposite the said shoulders, substantially as shown and described.

5. A tool-rest for grinding-machines, provided with a bar adapted to extend across the face of the grinding-wheel and formed at each ends with rows of apertures and a pin adapted to engage the said apertures to form a rest for the shank of the tool, substantially as shown and described.

6. A tool-rest for grinding-machines, provided with a bar adapted to extend across the face of the grinding-wheel and formed at its ends with rows of apertures, a pin adapted to engage the said apertures to form a rest for the shank of the tool, and a second pin formed with a conical head adapted to be supported on the end of the bar, substantially as shown and described.

7. A tool-rest for grinding-machines, comprising a frame mounted to tilt and a bar supported on the said frame and extending across the face of the grinding-wheel, the said bar being formed at each end with a shoulder and on its top surface with grooves or channels extending at angles to the face of the grinding-wheel, substantially as shown and described.

8. A tool-rest for grinding-machines, comprising a frame mounted to slide transversely and adapted to be tilted and a bar supported on the said frame and extending across the face of the grinding-wheel, the said bar being provided on its top surface with grooves or channels extending at angles to the face of the grinding-wheel, the ends of the said bar being formed with pins or shoulders on which are rested the shanks of the tools to be ground to belly surfaces, substantially as shown and described.



9. A tool-rest for grinding-machines, comprising a frame mounted to slide and to tilt, a guideway for the said frame and adapted to be adjusted relative to the grinding-machine, and a bar supported by the said frame and adapted to extend across the face of the grinding-wheel, the said bar having a series of rests for the shanks of the tools to be ground, substantially as shown and described.

10. A tool-rest for grinding-machines, comprising a bar and a tool-supporting plate having a forked end engaging the said bar and means for attaching the plate to the bar, but permitting a swinging motion of the plate, substantially as shown and described.

11. A tool-rest for grinding-machines, comprising a bar and a tool-supporting plate having a forked end engaging the said bar, means for attaching the plate to the bar, but permitting a swinging motion of the plate, and set-screws adapted to abut on the edge of the said plate to limit the swinging motion of the latter, substantially as shown and described.

12. A tool-rest for grinding-machines, comprising a plate provided with offsets having V-shaped grooves in alignment with each other, one end of the said plate being forked for engagement with a supporting-bar, a screw engaging a dent or recess in bar for holding the plate, and set-screws to limit the swinging motion of the plate, substantially as shown and described.

488,043. APPARATUS FOR COVERING WIRE WITH FIBROUS MATERIAL. JAMES BOOKNER, Boston, Mass. Filed Sept. 14, 1891. Serial No. 405,804. (No model.)

Claim.—1. The combination of a rotary tubular spindle, a flier attached thereto and provided at its upper end with a pair of grooved rolls standing at opposite sides of the path of a wire passing through said spindle, the groove of one roll having one side substantially at a right angle to the axis of the roll and the other side oblique thereto, a guide arranged to deliver thread or fibrous material to the wire at a point just above said rolls, and means for feeding the wire between said rolls and through the spindle, as set forth.

2. The combination of a rotary tubular spindle, a flier attached thereto and provided at its upper end with a pair of grooved rolls standing at opposite sides of the path of a wire passing through said spindle, the groove of one roll having one side substantially at a right angle to the axis of the roll and the other side oblique thereto, a guide arranged to deliver thread or fibrous material to the wire at a point just above said rolls, a thread flattening rod extending across the space between the end of the guide and the rolls, and means for feeding the wire between said rolls and through the spindle, as set forth.

3. The combination of a rotary tubular spindle adapted to support a spool placed thereon, a flier composed of two heads, one of which is affixed to the spindle and the other removably carried thereby, the two heads being connected by a plurality of rods, glass tubes on said rods, and means for guiding thread from a spool to a wire passing through said spindle, said glass tubes preventing the sticking of the thread passing from a spool on the spindle to the wire, as set forth.

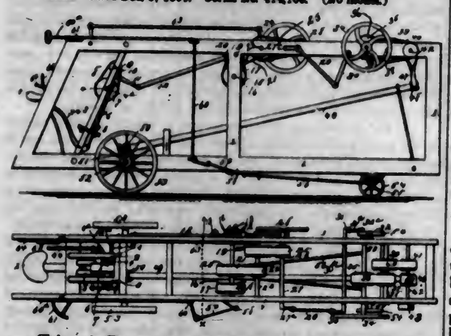
4. The combination of the supporting-frame, the tubular spindle journaled in bearings on said frame, the flier attached to said spindle and provided at its upper end with rolls located at opposite sides of the path of a wire passing through said spindle and with a guide arranged to deliver thread to the wire above said rolls, the wire-guiding rolls supported by a fixed bracket on said frame, the tension-roll located above said guide-rolls, the feed-roll journaled in bearings on the frame, the worm attached to the spindle, the gearing imparting motion from the worm to the feed-roll, and the adjustable pressure-roll bearing on the feed-roll, as set forth.

5. The combination of the spindle, the flier attached thereto and composed of the lower head 2, affixed to the spindle, a plurality of rods 4, affixed to said head, and the head 3, movable on said spindle and rods, and the spool-controlling spring interposed between said movable head and a spool placed on the spindle, as set forth.

488,044. ATTACHMENT FOR ELECTRIC LAMPS. JOSEPH CLIFF, Dorking, England. Filed Mar. 2, 1892. Serial No. 423,426. (No model.)

Claim.—1. In combination, the lamp, the globe A, having a flange a, the reflector-plate extending over the globe, the rigid hook-shaped holders depending from the reflector and adapted to engage the flange a, and the pivoted holder b', also depending from the reflector and adapted to engage the flange, whereby the globe may be secured by slipping its flange in the rigid holders and turning the pivoted holder to engage the said edge, substantially as described.

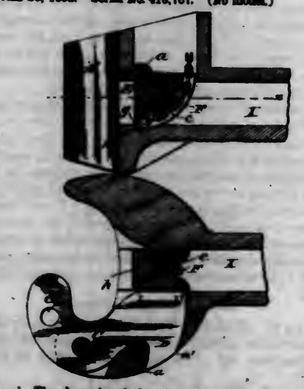
2. In a fitting for electric and other lamps, the combination, with a reflector-plate, of reflecting material made and fitted in several sectors or sections, said plate being provided with fixed holders c and movable holders E or E' for receiving and removably securing said reflecting material, substantially as and for the purposes set forth.



3. In a fitting for electric and other lamps, the combination, with a reflector-plate having lamp-cover holders b b' and lamp-cover A, with flange a, of sectional reflecting material and holders therefor adapted to removably secure same, the said sections of the reflector having openings c' at their adjacent edges to fit around the depending supports b b', all substantially as and for the purposes described and illustrated.

488,045. AXLE-BOX. CLEMENS COLLINS, St. Louis, Mo., assignor of three-fourths to Joseph Kalmbach, same place, and Charles H. Hayden, Tombstone, Ariz. Filed Apr. 30, 1892. Serial No. 431,570. (No model.)

Claim.—The combination, in a journal-bearing for railway cars, of the axle-boxes having upwardly-extending housings, friction-rollers journaled in said housings and bearing on the journals of the car-axles, and the recessed brasses 14, supported above the journals and permitting the rollers to bear upon the journals and holding the journals vertically beneath the rollers, substantially as and for the purpose set forth.



488,046. MECHANICAL MOTOR. DANIEL J. DEAN, Bird Island, Minn. Filed Dec. 5, 1891. Serial No. 414,108. (No model.)

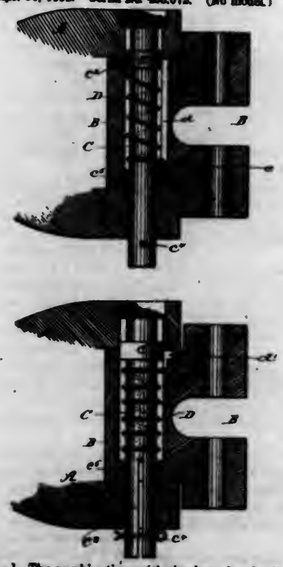
Claim.—1. The combination of the shaft 4, having the drive-wheel 7 and the end cranks 4^a, the pivoted foot-pedals 5, the pitmen 6, the upper shaft 10, having the crank 10^a and the small band-wheel 9, the belt 8, arranged around said wheel, the bar 12, pivoted near its upper end and having the two pawls 13 13, the connecting-link 11, the shaft 15, having the end ratchet 14 and the drive-wheel 16, the shafts 19 and 23, having the band-wheels arranged upon them, the upper transverse shaft 27, having the cranked outer end, the end balance-wheel, and the small band-wheel, the lower shaft 30^a, the pitman 29, the connecting-link 31^a, the shaft 33, having the end disk and end balance-wheel and provided with a band-wheel, and the intermediate and final shafts provided with the band-wheels and the several connecting-belts, arranged as specified, substantially as set forth.

2. The combination, with the pivoted foot-pedals 5, the shaft 42, and the intermediate drive mechanism, of the inclined shaft 49, having the worm-gear on its lower end and the peripheral flange 48 on its upper end, the band-wheel 46, secured on the shaft 42, the removable belt 47, the axle 52, having the central cog 51 and the end road-wheels, and the forward supporting-wheels 54, substantially as set forth.

488,047. CAR-COUPLING. JAMES M. ELLIOTT, Jr., Gadsden, Ala. Filed Jan. 30, 1892. Serial No. 418,707. (No model.)

Claim.—1. The draw-head chambered horizontally to receive the knuckle and having back of the knuckle-pin an opening which passes laterally and entirely through the draw-head and curves at its outside toward the front, in combination with a vertically-pivoted knuckle having at its rear end a lateral hook passing through said opening, curved forwardly at its outer end, and hugging the solid metal in front, substantially as shown and described.

2. The combination of the draw-bar having a central channel or throat and a horizontal chambered head, a locking-tumbler placed in the middle line of the draw-bar and filling the throat when locked, a horizontal axis for said tumbler arranged at the forward end of the same, and a knuckle or coupling-hook, pivoted upon a vertical axis in the draw-head and having its rear end extended to form the broad bearing *b b'* against the tumbler at a point in rear of its axis, substantially as shown and described.



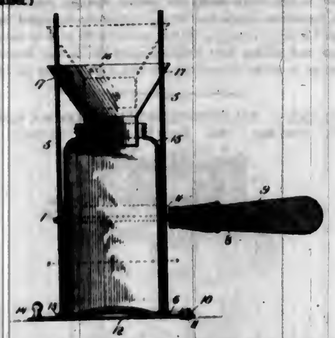
3. The combination, with the draw-head and the knuckle or coupling-hook, of the tumbler having a horizontal axial pin or bolt at its upper front end and an operating-chain connected to the lower front side of the tumbler and passing rearwardly and upwardly around the same, substantially as shown and described.

4. The combination, with the draw-head and knuckle, of the quadrant-shaped tumbler E, having its lower and rear surfaces curved and grooved, a horizontal axial pin or bolt at its upper and front end, and an operating-chain passing down in said groove and connected to the lower front end of the tumbler, substantially as shown and described.

5. The combination, with the draw-head and knuckle, of the pivoted quadrant-shaped tumbler E, having its lower and rear surface grooved to a point near its front face, the eyebolt *g*, secured in the tumbler at the end of the groove, and the chain connected to the eyebolt and extending rearwardly and upwardly, substantially as shown and described.

6. The combination, with the draw-head having chambered jaw, central channel-way or throat, and a shoulder *h* at the front end of the throat, of knuckle B, pivoted upon a vertical axis in the draw-head and having an extended and abutting face *b b'*, the quadrant-shaped tumbler E, filling the front end of the throat and pivoted to play vertically therein, and the operating chain F, connected to the lower front end of the tumbler, substantially as shown and described.

488,048. CAR-COUPLING. JAMES M. ELLIOTT, Jr., Gadsden, Ala. Filed Apr. 11, 1892. Serial No. 428,672. (No model.)



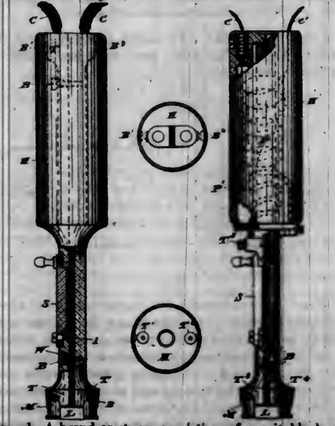
Claim.—1. The combination, with the draw-head, of a detachable pin having means for locking it to the draw-head against turning, the knuckle or coupling-hook pivoted about the pin, and a spiral spring surrounding the pin and attached at one end to the axial pin and at the other to the knuckle, substantially as shown and described.

2. The combination, with the draw-head, of a detachable pin having hub *d'* and means for locking the pin to the draw-head, the knuckle or coupling-hook having an enlarged chamber above and a close-fitting bearing c^5 below, and a spiral spring fitting in said enlarged chamber and having its opposite ends connected, respectively, to the pin and the knuckle, substantially as shown and described.

3. The combination, with the draw-head, of the detachable pin having boss *d'*, with notch or slot d^2, the knuckle or coupling hook having enlarged chamber with slot *d* and recess or hole *e*, and the spiral spring D, encompassing the pin and having its upper end seated in the slot d^2 and its lower end in the recess *e*, substantially as shown and described.

488,049. JAR FILLER AND HOLDER. ISAAC M. FISHER and IDA M. FISHER, Burrows, Mo. Filed Apr. 30, 1892. Serial No. 431,274. (No model.)

Claim.—1. A fruit-jar filler having side standards, a circular receptacle attached to said standards, and a bottom and upper encircling wire support, in combination with a laterally-swinging bottom, substantially as described.

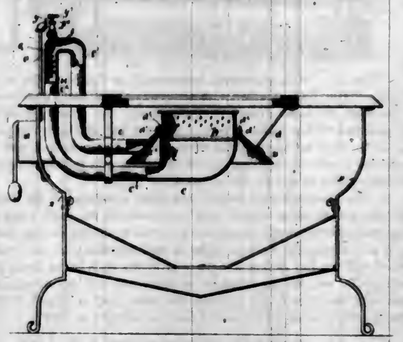


2. A fruit-jar filler having side standards, a circular receptacle attached to said standards, and a bottom and upper encircling wire support, in combination with a laterally-swinging bottom having catch 13 to clasp the bottom wire support and stopping against a side standard, substantially as set forth.

3. A fruit-jar filler having side standards, a circular receptacle attached to said standards, and a bottom and upper encircling wire support, in combination with a laterally-swinging bottom having on one side a catch to clasp the bottom wire support and stopping against a side standard and on the opposing side hinged to the bottom supporting-wire by a rivet loosely operating in a loop in the bottom supporting-wire, substantially as set forth.

4. A fruit-jar filler having side standards, a circular receptacle attached to said standards, and a bottom and upper encircling wire support, in combination with a laterally-swinging bottom having catch 13 to clasp the bottom wire support and stopping against a side standard, and a funnel held in position by the resiliency of the side standards, substantially as set forth.

5. A fruit-jar holder and filler consisting of side standards, a circular receptacle attached to said standards, and a bottom and upper encircling wire support, a laterally-swinging bottom hinged to the bottom supporting-wire and provided with a clasp to engage the bottom supporting-wire, a funnel held in position by the resiliency of the side standards which support the funnel, and a handle attached to the free end of the upper encircling supporting-wire, substantially as set forth.



488,050. BRANDING-STAMP. JAMES S. FITZMAURICE, Sydney, New South Wales, assignor to the Electric Brand Company, Limited, same place. Filed Aug. 17, 1891. Serial No. 403,054. (No model.)

Claim.—1. A brand or stamp consisting of a suitable handle, a sectional metallic shank for supporting the brand, the sections being insulated from each other, a flanged branding-iron secured to the sides of the lower end of the metallic shank, and insulating material interposed between the lower face of the metallic shank and the brand, substantially as described.

2. A brand or stamp consisting of a suitable handle, a sectional metallic shank with insulating material between the sections and across the lower ends thereof, circuit connections, a pivoted switch forming a part of one of the sections of the shank, and a brand bearing against the insulation on the bottom of the shank and having lugs or flanges forming attachments and electrical connections for the current, substantially as described.

488,051. VAPOR-STOVE. RUDOLPH FLICK, Cleveland, Ohio. Filed Jan. 9, 1890. Serial No. 336,207. (No model.)

Claim.—1. In a vapor-stove, a vapor-conducting pipe having a burner at its lower portion, an evaporating apparatus connected with a fluid-supply and with the pipe above the burner, a hot-air-collecting chamber adjacent to the side of and below the upper end of the burner and having an air-inlet, and a hot-air-conducting pipe connecting the said chamber and the evaporating apparatus, the parts combined for the purpose specified.

2. In a vapor-stove, a vapor-conducting tube having a burner at its lower portion, an evaporating apparatus at its upper portion, an oil-supply, a hot-air-collecting chamber surrounding the burner below its upper end and having an opening for feeding air to the burner for combustion, and a hot-air-conducting pipe connecting the said chamber and the evaporating apparatus, the parts combined for the purpose described.

3. The herein-described method of generating hydrocarbon vapor, which consists in feeding hydrocarbon liquid in small particles and atomizing the same to secure vaporization thereof, simultaneously feeding and mixing therewith heated air at substantially the same point to prevent condensation, and feeding the resulting vapor to a burner by gravity, substantially as set forth.

4. The herein-described method of generating hydrocarbon vapor, which consists in feeding hydrocarbon liquid in small particles and atomizing the same within a conductor closed to the surrounding atmosphere to secure vaporization thereof, simultaneously feeding and mixing therewith heated air at substantially the same point to prevent condensation, and feeding the resulting vapor to a burner by gravity, substantially as specified.

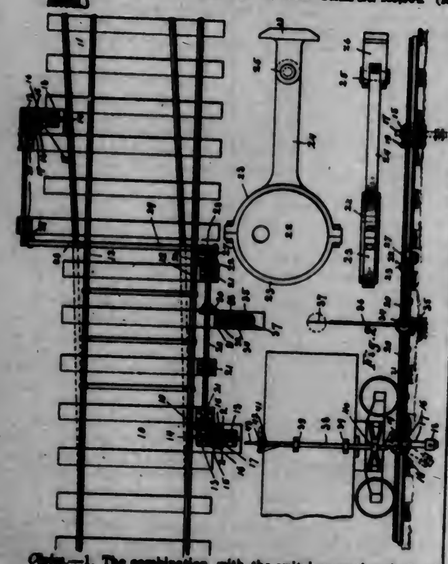
5. The herein-described method of generating hydrocarbon vapor, which consists in feeding the liquid under pressure against an object to atomize and vaporize the same and feeding the vapor to a burner by gravity, and assisting vaporization and preventing condensation by simultaneously conducting heated air from a burner to the point of atomization, substantially as specified.

6. In a vapor-stove, a supporting-frame, a vapor-pipe having a burner at its lower end, an evaporating apparatus at the upper end of the said pipe, a truncated cone surrounding the said burner and aside of its top, and a hot-air pipe connecting this cone and the said vapor-pipe, all combined substantially as set forth.

7. In a vapor-stove, a framework, a vapor-pipe having a vertical portion, a burner at the lower end of said pipe, a hot-air collector adjacent to the burner, a hot-air-conducting pipe connected at its lower end to the said collector and its upper end connected with the said vapor-tube to form with the said vapor-pipe a continuous pipe doubled upon itself, substantially as shown, and an evaporating apparatus in the upper end of said vapor-pipe substantially at the junction of the two pipes, all combined substantially as shown and described.

8. In a vapor-stove, a vapor and a hot-air pipe having each a substantially vertical and horizontal portion, as shown, the upper ends of the two pipes connected to form together a continuous pipe doubled

upon itself, a burner at the lower end of the vapor-pipe, a hot-air collector adjacent to the said burner and below its upper end, and an evaporating apparatus substantially as the junction of the said pipes, all combined substantially as described.

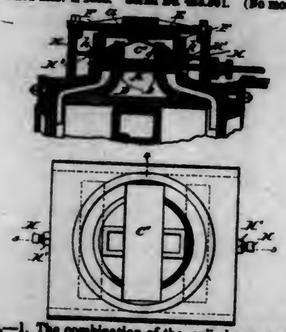


488,052. DERRICK-DRUM. ADAMS C. FERRIS, Rapid City, S. D. Filed Jan. 9, 1892. Serial No. 417,894. (No model.)

Claim.—1. In an apparatus, substantially as described, the combination of the shaft provided with a keyway, the drum proper fitted on the shaft, the outer drum or case fitted over the drum and shaft and provided with a notch or seat *g*, and the key sliding in the keyway in the shaft for securing the drum proper and provided with a projection *i*, movable into and out of the notch *g* in the outer drum, all substantially as and for the purposes set forth.

2. The improved drum herein described, consisting of the shaft, the drum proper fitted on and keyed to the shaft, the outer drum or case fitted over the drum proper and provided in its side with an opening H and having the walls or edges of said opening bent or curved inward and the key sliding in a keyway in the shaft for securing the drum proper and having a portion movable into and out of engagement with the outer drum, whereby the latter may be keyed to turn with the shaft, substantially as and for the purposes set forth.

488,058. SWITCH-SHIFTER. JOHN GILSTRAP and MARTIN L. BROWN, Moscow, Idaho. Filed Sept. 12, 1891. Serial No. 405,804. (No model.)

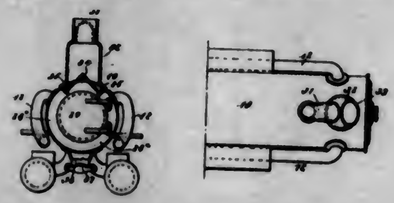


Claim.—1. The combination, with the switch-operating shaft, of a transverse shaft geared thereto, a weighted lever pivoted between its ends on the transverse shaft with its upper end in the path of the train projection, and lugs on the transverse-shaft gear at opposite sides of the said lever to be struck thereby, substantially as set forth.

2. The combination of the two line-shafts at opposite sides of the switch and track, a transversely-sliding switch-bar connected at its ends with the ends of said shafts by pitmen and crank connections, an eccentric secured to one line-shaft, a strap embracing the said eccentric and provided with an arm 24, connected by a pivoted section 26 with the switch-rail, transverse shafts geared to the line-shafts, a weighted lever pivoted between its ends on each transverse shaft, and projections on the transverse-shaft gears, between which said levers work, substantially as set forth.

3. A switch-shifter comprising crank-shafts arranged parallel with the track and connected with the switch-bar, transverse shafts arranged adjacent to the crank-shafts and geared thereto, gear-wheels carried by the transverse shafts and having oppositely-arranged lugs thereon, weighted levers pivoted on the transverse shafts so as to swing between the lugs, and sliding bars mounted upon the cars or locomotive of a train so as to strike the swinging levers, substantially as described.

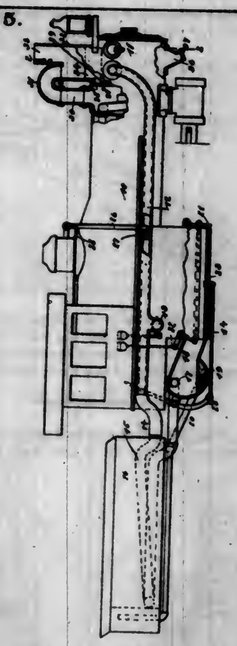
488,054. BALANCED SLIDE-VALVE. MARTIN A. GREEN, Altoona, Pa. Filed Mar. 1, 1892. Serial No. 423,301. (No model.)



Claim.—1. The combination of the cylinder or casing, the pressure-plate having an internal steam-space and provided with portions resting on the valve-seat, whereby to prevent undue pressure upon the valve, the balance-ring fitted in said pressure-plate, and the casing-plate against which said ring rests, said plate being disconnected from the pressure-plate, whereby the casing-plate may be removed to permit access to the balance-ring without removing the pressure-plate.

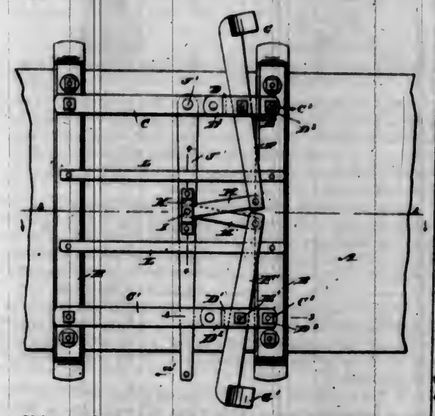
2. The improvement in balanced valves, substantially as herein described, consisting of the valve and its seat, the pressure-plate, the balance-ring fitted to said pressure-plate, a spring-bearing between said plate and ring, and the pressure-plate being movable laterally over the valve and seat independent of any movement toward or from the same, whereby it may be properly set without varying the tension of the spring between the balance ring and pressure-plate.

3. The combination, in a balanced valve, of the pressure-plate provided with a steam-space and with opposite spring pockets or recesses, the balance-ring fitted to the pressure plate, and the bow-spring plate bearing between said balance-ring and pressure-plate and fitted at its ends in the pockets or recesses, whereby it is self-retaining, substantially as set forth.



4. The combination, substantially as described, of the cylinder or casing, the valve proper, the pressure-plate arranged to bear upon the cylinder or casing, whereby to prevent undue pressure on the valve, the screws whereby to set the said pressure-plate to and secure it in any desired position over the valve, the balance-ring fitted to said pressure-plate, and the actuating-spring, all substantially as and for the purpose set forth.

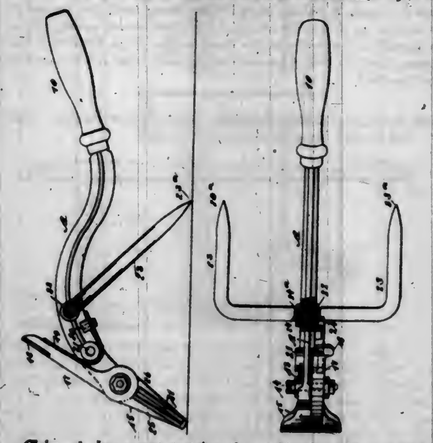
488,055. SMOKE AND SPARK ARRESTER AND CONSUMER. ELIAS J. HADLOCK, Big Spring, Tex. Filed Jan. 13, 1892. Serial No. 417,916. (No model.)



Claim.—The combination, in a locomotive having a transversely-divided front extension 11, of a box 32 over the forward compartment, a deflector at the bottom of the box and upper part of said compartment and having its edges spaced therefrom to permit communication between the two, a stack 30, extending upward from the rear or smoke compartment and discharging through an elbow 31 into the top of said box, a stack 33, leading from the top of box 32 in front of stack 30 and of greater diameter than the latter stack, and the pipes 12, leading from the forward compartment rearwardly into the fire-box above its fuel-space, substantially as set forth.

488,055.

488,056. WAGON-BRAKE. BROOM G. HANEY and WILLIAM A. HANEY, Medora, Kans. Filed Apr. 14, 1892. Serial No. 429,126. (No model.)

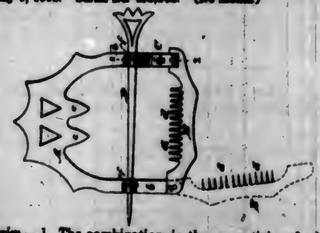


Claim.—1. In a wagon-brake, the combination, with longitudinally-extending bars adapted to be secured to the sills of the wagon-body and keepers secured to the said bars and extending forward from the same, of brake-levers fulcrumed on the said keepers, an operating-lever pivoted on one of the said longitudinal bars L L and extending between the latter and the wagon-body, and a second set of longitudinal bars located between the first-named bars and also adapted to be secured to the sills of the wagon-body, substantially as shown and described.

2. In a wagon-brake, longitudinally-extending bars adapted to be secured to the under sides of the sills of the wagon-body, a keeper secured to each of the said bars and extending downward from the same, and a bolt held in each of the said bars and keepers, in combination with brake-levers fulcrumed on the said bolts and extending through the said keepers, links pivotally connected with the upper sides of the inner ends of the said brake-levers, and an operating-lever pivoted on the top of one of the said bars, extending across the wagon-body over the top of the other bar, the said lever being provided with a depending pin pivotally connected with the overlapping ends of said links, substantially as shown and described.

3. In a wagon-brake, longitudinally-extending bars adapted to be secured to the under sides of the sills of the wagon-body, a keeper secured to each of the said bars and extending downward from the same, and a bolt held in each of the said bars and keepers, in combination with brake-levers fulcrumed on the said bolts and extending through the said keepers, links pivotally connected with the inner ends of the said brake-levers, an operating-lever pivoted on the top of one of the said bars, extending across the wagon-body over the top of the other bar, the said lever being provided with a pin pivotally connected with the said links, and a keeper held on the lower side of said operating-lever and supporting the lower end of the said pivot-pin for the links, substantially as shown and described.

488,057. CARPET-STRETCHER. ROBERT HARRISON, Philadelphia, Pa. Filed Apr. 12, 1892. Serial No. 428,780. (No model.)



Claim.—1. In a carpet-stretcher, the combination, with an arched body terminating at its forward end in a jaw, of a second spring-pressed jaw pivoted upon the body and adapted for engagement with the fixed jaw and feet adapted to act as fulcrums for the body and having adjustable connection with the body, as and for the purpose specified.

2. In a carpet-stretcher, the combination, with an arched body terminating at one end in a handle and at the other end in a fixed jaw, of a spring-pressed jaw pivoted upon the body, the two jaws being provided with teeth, the teeth being adapted for engagement with each other, a thumb-plate connected with the pivoted jaw, and feet of angular construction adapted to act as fulcrum for the body, having an adjustable engagement with the body back of the jaw-pivot, substantially as shown and described.

3. In a carpet-stretcher, the combination, with an arched body having a handle formed at one end and a jaw at the opposite end and provided with threaded openings located at distances apart between its ends, of a spring-pressed jaw pivoted upon the body forward of the openings therein, the pivoted jaw being adapted for engagement with the fixed jaw, and angular feet fitted to enter and turn in the openings of the body, one foot opposite the other, as and for the purpose specified.

488,058. COMB. ELMIRA H. HARPHAM, St. Louis, Mich. Filed May 9, 1892. Serial No. 432,932. (No model.)

Claim.—1. The combination, in the one article, of a lady's back-hair comb and an attached raising and lowering neck-hair comb.

2. The combination, in the one article, of a lady's back-hair comb, an attached raising and lowering neck-hair comb, and a removable dart or pin adapted to engage transversely with the back-hair comb between the latter and the neck-hair comb.

3. The combination of a lady's back-hair comb provided with downwardly-projecting teeth on its upper portion and a lower neck-hair comb having upwardly-projecting teeth and downwardly and upwardly opening and closing pivoted connection with the main or back hair comb.

4. The combination of a lady's back-hair comb provided with downwardly-projecting teeth on its upper portion, a lower neck-hair comb having upwardly-projecting teeth and downwardly and upwardly opening and closing pivoted connection with the main or back-hair comb, and a removable dart or pin adapted to engage transversely with the opposite sides of the main or back-hair comb between the latter and the neck-hair comb.

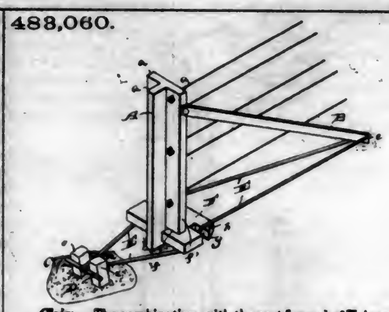
5. The combination of the main or back-hair comb A, having upper downwardly-projecting teeth *c* and side arms or legs *b b*, the lower neck-hair comb B, having upwardly-projecting teeth *d d*, pivoted at its one end, as at *e*, to the one leg *b* below and closing or engaging at its opposite or free end with the lower portion of the other leg *b*, and a spring-catch to hold the same in engagement, substantially as shown and described.

488,059. HORSE-DETACHER. ELIJAH HAYS, Warsaw, Ind. Filed Nov. 6, 1891. Serial No. 411,072. (No model.)

Claim.—1. The combination of the thills and cross-bar, the breeching attachments mounted on the thills, and the tug attachments mounted directly on the cross-bar with the sectional draft-tugs, each consisting, essentially, of two sections provided, respectively, with a hollow cylindrical piece and a rod provided with an enlarged head, said rod being supported in said cylindrical portion and having a spring thereon for holding it normally in its inner position, all substantially as and for the purpose explained.

2. In a horse-detaching device, the combination of the thills and cross-bar, the breeching-detaching devices attached to the thills, the tug-detaching devices attached to the cross-bar, the horizontally-operating bell-crank levers for operating the breeching-detaching devices, the vertically-operating bell-crank levers for operating the tug-detaching devices, suitable connections between said bell-crank levers, and means for operating said bell-crank levers, substantially as set forth.

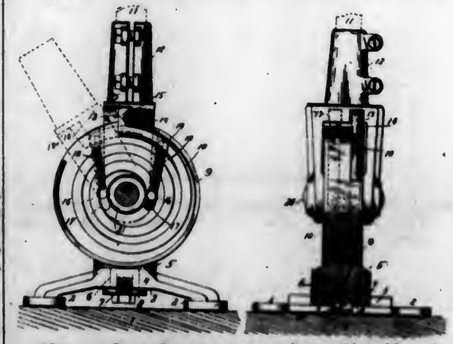
3. The combination, with the cross-bar, of the thills, the transverse slots in said cross-bar, the vertically-operating pins passing through said slots and provided with slotted heads, bell-crank levers engaging said slotted heads, and means for operating said bell-crank levers, substantially as set forth.



4. In a horse-detaching device, the combination of the thills and cross-bar, the breeching-detaching devices attached to the thills, the transverse slots in the cross-bar, the vertically-operating pins passing through said slots, the horizontally-operating bell-crank levers connected through suitable rods with the breeching-detaching devices, the vertically-operating bell-crank levers engaging the vertically-operating pins, suitable connections between said bell-crank levers, and means for operating said levers, substantially as set forth.

5. The combination, with the cross-bar, of the thills, the transverse tags receiving slots in said cross-bar, the vertically-operating pins passing through said slots, suitable breeching attachments attached to the thills, and means for operating said pins, substantially as and for the purpose described.

488,060. IRON FENCE-POST. CHARLES W. HOLM, Troy, Ohio. Filed Mar. 31, 1892. Serial No. 427,319. (No model.)



488,060.

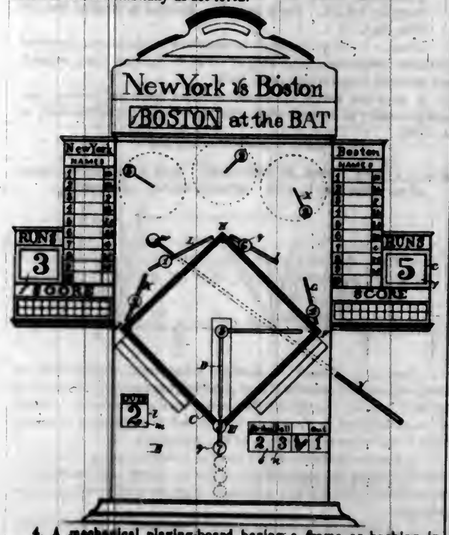
Claim.—The combination, with the post formed of T-iron and having the brace B, of the anchor therefor, the wires connected to said anchor and to the brace, and the binder F, notched to engage the post and for the passage therethrough of said wires, substantially as specified.

488,061. TROLLEY-STAND FOR ELECTRIC RAILWAYS. JOHN C. HOUSE, Pittsburg, Pa. Filed Dec. 21, 1891. Serial No. 415,726. (No model.)

Claim.—1. In a trolley-stand, a pivoted disk provided with a pair of helical springs of like form and having their inner ends projecting into slots in the disk, in combination with tension-regulating screws entering the slots and in engagement with said ends and a forked and recessed pole-socket in engagement with the outer ends of said springs, in the manner and for the purpose specified.

2. In combination with a pivoted disk and pole-socket, a pair of helical springs located on opposite sides of the disk and having their inner ends adjustably secured therein and their outer free ends arranged to alternately engage the pole-socket when the pole is inclined, whereby one spring remains inactive while the other is in operation, in the manner and for the purpose substantially as described.

3. In a trolley-pole stand, a disk having helical springs upon its opposite sides, in combination with a trolley-pole socket forked to pass astride the disk and springs and adapted to alternately engage the free ends of the springs, in the manner and for the purpose substantially as described.



4. In a trolley-pole stand, a disk having springs upon its opposite sides, in combination with a forked trolley-pole socket pivoted to the disk and passing astride the springs and disk, in the manner and for the purpose substantially as described.

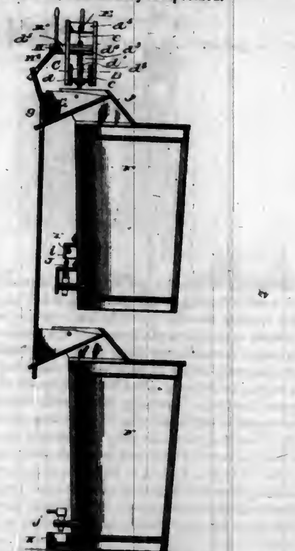
488,062. GAME APPARATUS. EDWARD D. HOWELL, Brooklyn, N. Y. Filed May 25, 1891. Serial No. 394,060. (No model.)

Claim.—1. A mechanical playing-board composed of a frame or backing on which is mounted the mechanism to move the player-figures, in combination with a face-plate covering said backing and its containing mechanism, said face-plate having slots therein to form ways for the runners and separate slots for the base-men and openings to expose the various plays and features of the game, substantially as herein set forth.

2. A mechanical playing-board composed of a frame or backing on which is mounted the mechanism to move the playing-figures, in combination with a face-plate covering said backing and its containing mechanism, said face-plate having therein slots to form ways for the runners and base-men and openings to expose the various plays and features and means for representing the movement of the ball, substantially as herein set forth.

3. In a mechanical playing-board for indicating and reproducing a game of ball, a frame or backing on which is mounted the mechanism to move the player-figures, in combination with a face-plate covering said backing and its containing mechanism, said face-plate having slots therein to form ways for the runners and other slots for the base-runner, substantially as set forth.

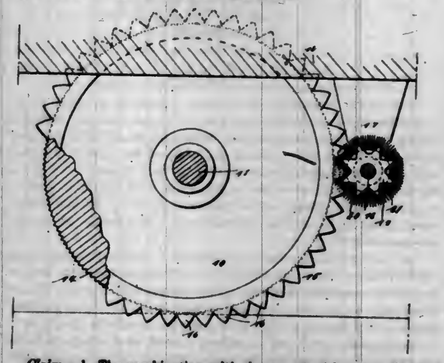
4. A mechanical playing-board having a frame or backing, in combination with a face-plate having slots for the runners and base-men and between said backing and face-plate the mechanism for moving the figures, which consist of, first, the endless tapes or bands within the diamond slot for carrying the runners and the tape within the slot for carrying the figure of the pitcher; second, the figures for representing the base men, short-stop, and catcher mounted on traveling blocks within their respective slots or ways, having the crank-levers and connecting-rods; third, the grooved pulleys having the crank-arms attached and exposed above the face-plate for attracting thereto the figures representing the outfielders, together with the cords or belts for turning the same, substantially as herein set forth.



5. A mechanical playing-board having a frame or backing, in combination with a face-plate having slots for the runners, base-men, catcher, pitcher, and short-stop and suitable holes for the swiveled outfielders and openings to indicate the runs made by each side, the "outs" and "foul" plays made, and the "strikes" and "balls" of the side at the bat, with the mechanism between the face-plate and the backing, as shown, to progressively manipulate the figures' positions and results, as set forth.

6. A series of endless tapes, bands, or belts within the slot which forms the diamond, held in proper relation to each other by means of rollers at the angles, and a line of rollers or drums at one side to receive the tapes and remove the same, said tapes having at intervals slotted openings or sockets to receive the blades of the disk-pins, in combination with said disks and pins thereon, substantially as herein set forth.

488,063. APPARATUS FOR MAKING VINEGAR. RUSSELL M. HOUSER, Louisville, Ky. Filed Apr. 2, 1892. Serial No. 427,518. (No model.)

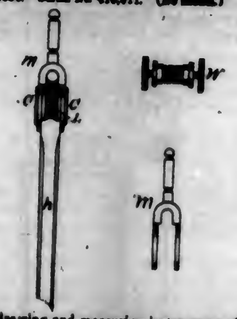


Claim.—1. In an apparatus for making vinegar, the combination of the charging-trough having compartments and means for effecting the discharge of the contents of said compartments, the upper generators having tilting buckets hung in chutes upon the upper ends of said generators, and means for dumping or tilting said buckets, said charging-trough compartments adapted to discharge into said buckets, substantially as set forth.

2. In an apparatus for making vinegar, the combination of the charging-trough having compartments and means for effecting the discharge of the contents of said compartments, the upper and lower generators having tilting buckets hung in chutes upon the upper ends of said generators, aligned upper and lower buckets being connected together and the upper buckets adapted to receive the contents of the compartments of the charging-trough, means for operating or tilting the buckets of the upper and lower generators, and plugs or valves applied to the upper generators and adapted to deliver the contents of the upper generators into the buckets of the lower generators, and means for operating said plugs or valves, substantially as specified.

3. In an apparatus or plant for making vinegar, the combination, with the upper and lower generators, of the plugs or valves applied to the upper generators and means for operating said plugs, the tilting buckets arranged upon said generators and connected together, and means for actuating or tilting said buckets, said plugs or valves being adapted to draw off the liquid of the upper generators into the buckets of the lower generators, substantially as set forth.

488,064. CAR-WHEEL. GEORGE HULL, Binghamton, N. Y. Filed Feb. 6, 1892. Serial No. 420,531. (No model.)

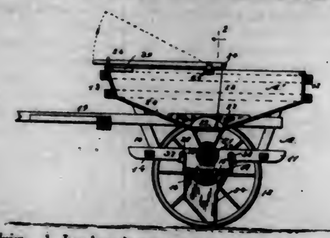


Claim.—1. The combination, with the car-wheel having a flange formed of cutters, of a cleaner supported adjacent to the wheel and adapted to contact therewith, said cleaner being revolved by contact with the wheel, substantially as described.

2. The combination, with the car-wheel having transverse teeth upon its tread-surface and having a flange formed of a series of cutters, of a star-wheel journaled near the car-wheel and adapted to engage the flange thereof, and a brush carried by the star-wheel and held to contact with the tread of the car-wheel, substantially as described.

3. The combination, with the car-wheel having a flange formed of a plurality of cutters, of a star-wheel journaled near the car-wheel and adapted to contact with the flange-cutters, substantially as described.

483,065. CALIPER-JOINT. WILLARD H. ISSELL, New York, N. Y. Filed Dec. 30, 1891. Serial No. 416,611. (No model.)



Claim.—1. In drawing and measuring instruments, the combination of a screw having a right-hand and a left-hand thread formed the one crossing the other over the same surface and corresponding with similar threads or teeth formed on the joints of the instruments and in which the said screw rests, as herein specified.

2. The combination, in drawing and measuring instruments, of a screw having a right-hand and a left-hand thread formed one over the other and meshing or worming into similar threads formed on the circumference of the joints of said instruments, as described.

3. In drawing and measuring instruments, the combination of a screw having both a right-hand and a left-hand thread, one crossing the other, having its bearing in form M and being held in position by the same against the right-hand and left-hand worm-gear formed, respectively, on the separate joints of said instruments or on rings of suitable metal attached thereto, all substantially as described.

483,066. SEED-PLANTER. EBENEZER B. KNIGHT, St. Johns, Canada. Filed Apr. 19, 1892. Serial No. 429,714. (No model.)

Claim.—1. In a broadcast sower, the combination, with a wheel-supporting frame, and a seed-box carried by the frame and having a bottom inclined in direction of its center and provided at its center with a chute, of a valve located above the chute, a lever connected with the valve, a seed-delivery drum or cylinder held to revolve beneath the chute of the seed-box and provided with peripheral grooves or pockets, and a driving mechanism between one of the supporting-wheels of the frame and the seed-distributing cylinder, as and for the purpose set forth.

2. In a broadcast sower, the combination, with a wheel-supported crib-like frame, a seed-box carried by the frame and having its bottom inclined downward in direction of the center, and a trough formed transversely at the central portion of the bottom, of a valve pivotally located above the trough, the pivot being at one side of the center of the end portions of the valve, a lever carried by the body and connected with the valve, a locking device adapted for engagement with the lever, a shaft located below the trough of the seed-box and actuated from one of the frame-supporting wheels, and a seed-delivery drum mounted upon the shaft to turn therewith, the said drum being detachable from the shaft and provided with a series of longitudinal peripheral pockets, as and for the purpose specified.

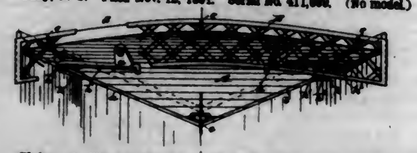
3. In a broadcast sower, the combination, with a wheel-supported body or frame, a seed-box carried by the body or frame and having its bottom inclined from its ends downward to the center, a trough formed at the central portion of the bottom of the seed-box, a pivoted valve located above the trough, a lever carried by the seed-box and connected with the valve, and partitions located longitudinally upon the bottom of the seed-box, the said partitions being adapted to prevent excessive movement of the seed in the direction of the sides of the box, of a shaft journaled in the frame below the trough and actuated from one of the frame-supporting wheels, a seed-delivery drum carried by the shaft and removable therefrom, said seed-drum being provided with a series of longitudinal pockets in its peripheral surface, and a spout located beneath the drum and having a link connection with the frame of the implement, as and for the purpose specified.

483,067. PREPARATION FOR BEVERAGES. ADOLF S. KRUSSER, Hannebhold, Lennie, near Glasgow, Scotland. Filed Oct. 26, 1891. Serial No. 410,125. (No specimens.) Patented in England Mar. 24, 1886, No. 4,114.

Claim.—1. As a new article of manufacture, the herein-described medicinal preparation, consisting in celery or celeriac dried, roasted, and reduced, substantially as set forth.

2. As a new article, the herein-described medicinal powder, consisting in celery or celeriac dried, roasted, and ground, substantially as set forth.

483,068. BOOK OR PORTFOLIO. COLIN B. LEMMONDS, Helena, Mont. Filed Mar. 24, 1892. Serial No. 426,206. (No model.)



Claim.—1. A book or portfolio constructed, substantially as herein shown and described, with a folded expansible foundation, as set forth, wherein the expansibility is restricted or regulated by means of straps attached to the covers and passed through loops or staples fixed in the outer salient angles of the foundation.

2. The combination, with a book or portfolio having a folded expansible foundation, substantially as herein shown and described, of an attached extensible and adjustable back, as and for the purpose set forth.

3. In an expansible book or portfolio, substantially as herein shown and described, as a means for adjusting and regulating its expansibility, a series of straps and suitable staples or buckles secured thereto, as set forth, said straps being attached to the covers and passed outside over the foundation-back.

4. An expansible book or portfolio constructed, substantially as herein shown and described, with a folded foundation fixed between covers and with adjustable straps extending from one cover to the other in contact with and movably attached to the outer salient angles of the said foundation, as and for the purposes set forth.

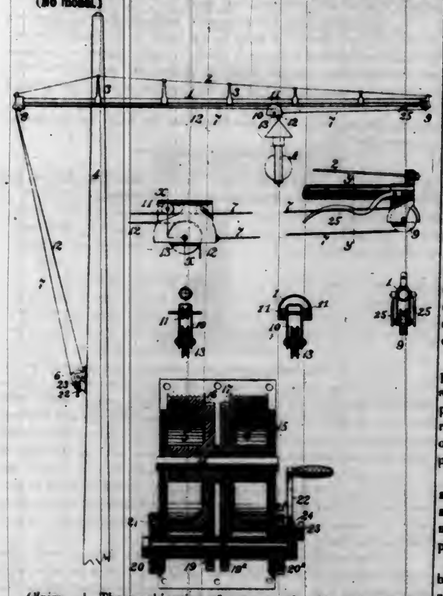
483,069. CORNER BRACKET-SHELF. JOSHUA D. LOSS, Long Eddy, N. Y. Filed Nov. 12, 1891. Serial No. 411,698. (No model.)

Claim.—1. The combination, with a triangular shelf, of a pointed rod adapted for outward adjustment on the shelf at its angle that engages the corner of a wall and locking devices on the shelf, outwardly adjustable at each side edge thereof, substantially as described.

2. The combination, with a triangular shelf, of a pointed rod outwardly adjustable at one angle of the shelf, prongs held to swing outwardly from opposite edges of the shelf, and a locking device for the prongs, substantially as described.

3. The combination, with a triangular shelf having a frieze-plate securable to its front edge, of an adjustable pointed rod located at the angle of the shelf opposite the frieze-plate, similar bent arms pivoted at opposite sides of the shelf and having prongs on their outer limbs, adapted to be projected beyond the side edges of the shelf when the arms are swung toward said edges, and turn-buttons for locking said arms in position, substantially as described.

483,070. LETTER-BOX. LYMAN T. LOOFF, Covington, Ky. Filed July 7, 1891. Renewed May 18, 1892. Serial No. 433,491. (No model.)



Claim.—1. A letter-box consisting of a box divided by partitions into a number of separate compartments, a series of small doors closing these compartments at one of their ends for the use of the rosters of the boxes, and a single door closing the other ends of the boxes for the use of the postman, substantially as set forth.

488,070.

2. The herein-described letter-box, consisting of the box 1, the vertical and transverse partitions 2 3, dividing the interior of the same into the separate horizontal boxes 4, the small hinged doors 5, closing these separate boxes at one of their ends, and the large door 6, provided with a suitable lock and closing the boxes 4 at their other ends, substantially as set forth.

488,071. SUPPORT FOR LAMPS. AUSTIN H. LOGAN, Pittsburg, Pa., assignor of two-thirds to George P. Shane, same place, and Edward G. Miller, Wilkinsburg, Pa. Filed Oct. 27, 1890. Serial No. 369,402. (No model.)

Claim.—1. The combination of a mast and a jib with a trolley movable along the jib, two drums capable of rotation together or independently of each other, mounted in suitable bearings on the mast, and two ropes connected one to each of said drums in such manner that when the drums are rotated in the same direction one rope will be wound on its drum and the other rope unwound from its drum, one of said ropes passing around guides on the jib and connected to the trolley and the other rope passing around a guide on the jib at or near the mast and a guide on the trolley and connected to the lamp, substantially as set forth.

2. The combination of a mast and jib with a trolley movable along the jib, two drums mounted in suitable bearings on the mast, one of said drums being rotatable independently of the other, a rope connected to the independently-rotatable drum and passing over a guide at or near the mast and a guide on the trolley and connected to the lamp, and a rope connected to the other drum and passing over guides on the jib and connected to the trolley, substantially as set forth.

3. The combination of a mast and jib with a trolley movable along the jib, two rotatable drums mounted in suitable bearings on the mast, and two ropes connected to the drums and arranged as described, one of said ropes serving as a support for the trolley, substantially as set forth.

4. The combination of a mast and jib, a trolley movable along the jib, two drums mounted in suitable bearings on the mast and connected to gear-wheels, a rotatable shaft, pinions arranged on said shaft and intermeshing with the gear-wheels, one of said pinions keyed to the shaft, the other pinion adapted to be connected and disconnected from the shaft, and two ropes connected and arranged substantially as described.

488,072. INK-WELL. JOHN W. MACDONALD, Pittsburg, Pa. Filed June 9, 1890. Serial No. 354,640. (No model.)

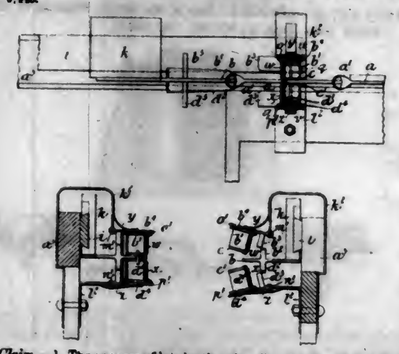
Claim.—1. In a fountain ink-well, a flexible rubber diaphragm centrally apertured and provided with an annular channel formed in the face thereof, as and for the purpose set forth.

2. In a fountain ink-well, a flexible diaphragm having a tapered central aperture and provided upon its inner face with a flange surrounding said aperture and forming part of the walls thereof, said flange being thicker at the base thereof than at the top, as shown and described, and for the purpose set forth.

3. In a fountain ink-well, a centrally-apertured diaphragm formed of flexible rubber, the body thereof immediately surrounding said central aperture being thinner than that part of the diaphragm of greater diameter and next the circumference thereof, the said parts of different thickness being joined by the rubber of the diaphragm, forming an annular channel in the face thereof, as shown and described, and for the purpose set forth.

4. In a fountain ink-well, a flexible rubber diaphragm provided with one or more perforations for the passage of air to and from the reservoir of said well, said perforations being externally closed by an enlargement in the upper extremity of a vertical supply-tube passing centrally through said diaphragm, as and for the purpose shown and described.

5. In a fountain ink-well, a valve for automatically regulating the pressure of air within the reservoir of said well, having for its seat the surface of an elastic diaphragm and for its cap an externally-enlarged part of a supply tube passing through said diaphragm, each so arranged with relation to the other that said valve will automatically open and close with the upward and downward movement of said diaphragm, as and for the purpose set forth and described.



6. In a fountain ink-well, the combination of a supply-tube having a neck in its upper extremity and an elastic rubber diaphragm fitting around said neck, the supply-tube being provided with an enlargement above said neck covering one or more perforations in said diaphragm, as shown and described, and for the purpose set forth.

7. In a fountain ink-well, the combination of a supply-tube, a flexible rubber diaphragm having the body thereof provided with an annular depending flange around its circumference, said flange fitting around an annular shoulder formed on the neck of the well, and a threaded cap-piece screwing onto the well and provided with an annular shoulder formed on the under side of the top of said cap, pressing on the top of the diaphragm around its outer edge and acting to force down said annular flange and expand the diaphragm, as shown and described, and for the purpose set forth.

8. The combination of a body provided with a spirally-formed thread in its upper extremity to receive a flanged cap, having upon its under side and next said flange an annular collar, a flexible rubber diaphragm provided with an annular channel formed in the face thereof, and a supply-tube held to position by the elastic rubber forming the thickened or reinforced part of said diaphragm, as shown and described.

9. In a fountain ink-well, a body forming the reservoir thereof, a cap or cover formed to fit over the top of said body, a rubber diaphragm provided with a depending flange around the circumference thereof, a supply-tube passing centrally through said diaphragm, and a means for automatically regulating the pressure of air within said well, consisting in enlarging the upper extremity of said supply-tube to cover the perforations in said diaphragm when the latter is at rest and be lifted therefrom as the diaphragm is raised by the expansion of air within the well, as shown and described.

483,073. METHOD OF AND MEANS FOR LUBRICATING THE WIRES IN LOOMS FOR WEAVING PILE FABRICS. GIULIO MARCHETTI and HENRY H. MELLOR, Halifax, England. Filed Sept. 3, 1890. Serial No. 363,807. (No model.) Patented in England Apr. 3, 1890, No. 5,210; in France Aug. 26, 1890, No. 207,876; in Germany Aug. 30, 1890, No. 56,667, and in Austria-Hungary Apr. 23, 1891, No. 54,632 and No. 9,445.

Claim.—1. The process of lubricating the pile-wires in a pile-fabric loom, which consists in placing a solid lubricant in tangential contact with said wires and then moving the wires longitudinally, whereby they are lubricated in substantially a longitudinal line only, as specified.

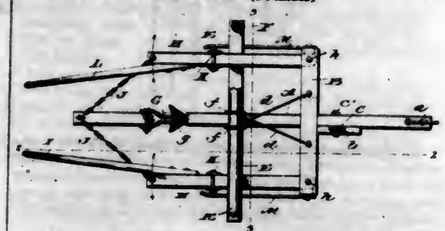
2. The process of lubricating the pile-wires in a pile-fabric loom, consisting in placing a solid lubricant in tangential contact with said wires, then moving said wires longitudinally and revolving such lubricant during the insertion or withdrawal of the wires, and whereby the wires shall be lubricated in substantially a longitudinal line only, as specified.

3. In combination with the pile-wire and means for operating the same, a support for a lubricant, provided with a holder, for positively retaining a solid lubricant in surface contact with said wire, substantially as described.

4. In combination with the pile-wire and means for operating the same, a lubricant-support provided with a holder for positively retaining a solid lubricant in surface contact with said wire, and means for revolving said holder, substantially as described.

5. In combination with the pile-wire and means for operating the same, a lubricant-support provided with a holder for positively retaining a solid lubricant in surface contact with said wire, and a ratchet-wheel and means for rotating the same serving to revolve said holder and its lubricant, substantially as set forth.

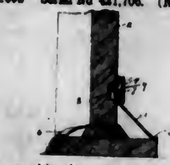
483,074. JOINT FOR ELECTRIC CONDUCTORS. JOSEPH W. MARSH, Pittsburg, Pa., assignor to the Standard Underground Cable Company, same place. Filed Dec. 21, 1891. Serial No. 415,739. (No model.)



Claim.—1. In a joint for electric cables, the combination, with the adjacent ends of the cable-sections, of a recessed supporting-block of insulating material having the adjacent ends of the corresponding conductors united and supported in said recesses, substantially as described.

2. In a joint for electric cables, the combination, with the adjacent ends of the cable-sections, of supporting-blocks of insulating material and provided with recesses and having the adjacent ends of the corresponding conductors united and supported in said recesses, and insulating material applied to the conductors surrounding the block, substantially as described.

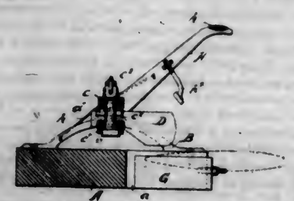
3. The combination, with the adjacent ends of the cables having a series of insulated metallic conductors, of a block of insulating material having peripheral recesses for the reception of the ends of the conductors, sleeves of conducting material embracing the adjacent ends of the corresponding conductors and fitting the recesses in the block, and insulating material surrounding the block and confining the sleeves in said recesses, the whole being provided with insulating material to form a substantial joint between the cables and adapted to maintain the united ends of the corresponding conductors in proper relation with each other and the adjacent conductors, substantially as described.



483,075. CULTIVATOR. JAMES A. MARTIN, Paunsdale, Ala. Filed June 4, 1892. Serial No. 435,480. (No model.)

Claim.—1. The combination, with the central beam and its front cross-bar, of the adjustable side bars with their sweeps, and the feeders pivoted at their forward ends on the ends of the front cross-bar and extended rearward in an inclined direction, with their rear ends broadened and terminating opposite to and flexibly and movably connected with the said sweeps, as set forth.

2. The combination, with the central beam and its front cross-bar, of the side bars pivoted at their forward ends to the front cross-bar, the handles attached to the side bars, the guide-plates on the beam and between which the side bars are guided, the sweeps, the rollers journaled between the ends of the guide-plates, the inclined pivoted feeders connected by chain to the forward sweeps, and the chains connecting the rear ends of the side bars with the beam, as and for the purpose specified.



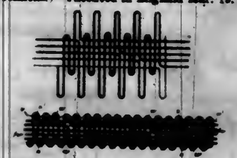
483,076. WEATHER-STRIP. DANIEL D. MAYFIELD, Sullivan, Ind. Filed Feb. 16, 1892. Serial No. 421,706. (No model.)

Claim.—1. The combination, with a door, of a weather-strip constructed of sheet metal and having its upper edge bent at a slight angle and arranged on the door, elastic strips arranged on the inner and outer faces of the upper edge of the weather-strip and disposed opposite each other, and straight fastening devices passing through both the elastic strips and the weather-strip and securing the latter to the door, said elastic strips providing a cushion at each side of the weather-strip at the point of attachment and adapted to yield to permit the weather-strip to have a swinging movement and to expand to hold the weather-strip firmly in contact with the door-sill, substantially as described.

2. The combination, with a door provided with a recess, of a weather-strip constructed of sheet metal and having its upper edge secured to the door and provided with a flange arranged opposite the recess, elastic strips arranged on the inner and outer faces of the upper edge of the weather-strip, the inner one of the elastic strips extending over the recess and forming a cushion, and the metallic casing-strip secured to the door and arranged above the weather-strip, substantially as described.

483,077. CIGAR-BUNCH CUTTER. JOHN G. MILLER and EDMUND YEISS, Newmanstown, Pa. Filed Dec. 9, 1891. Serial No. 414,494. (No model.)

Claim.—1. A machine for slitting cigar-bunches, having an oscillating frame with a series of knives secured thereto, substantially as described, in combination with means for holding the cigar-bunches below the center of the oscillating frame, whereby a sweeping rearward cut is produced, substantially as set forth.



2. The combination of the fixed brackets B, the oscillating frame mounted therein and having knives adjustably secured thereto, the operating-handle H, stop A^3, and spring A, all arranged upon the base-plate A, substantially as and for the purpose set forth.

3. The combination, with the oscillating knife-frame having knives adjustably secured thereto, of the base-plate A, having the portion below the oscillating knives cut away and the projecting end or ends *a* thereof provided with an adjustable guide-facing G, substantially as and for the purpose set forth.

4. The combination, with the oscillating frame comprising clamping-plates *c* and *c'*, of the knives having shanks *d*, adjustably located between said plates, and means, substantially as described, for pressing said plates together to clamp the knives, all substantially as set forth.

5. The combination, with the oscillating frame comprising clamping-plates *c* and *c'*, of the knives having shanks *d*, adjustably located between said plates, caps *d'* upon said shanks inclosing an elastic lining *r*, and means, substantially as described, for pressing said plates together to clamp the knives, all substantially as set forth.

483,078. FIGURED WOVEN FABRIC. ALEXANDER MORTON and JAMES MORTON, Darvel, Scotland. Filed Aug. 24, 1890. Serial No. 363,307. (Specimens.) Patented in England Mar. 19, 1889, No. 4,777.

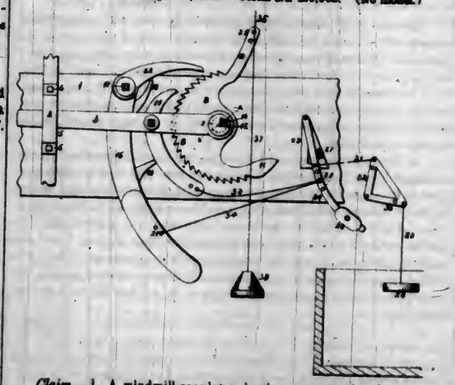
Claim.—1. A tapestry, Brussels, plush, pile, or similar fabric having the pattern-warps arranged so as to produce the same pattern on coincident portions of both sides of the fabric, while the colored warps where not used for the pattern are floated between the piles, as set forth.

2. A tapestry, Brussels, plush, pile, or similar fabric composed, as described, of two distinct weft planes bound together by warps which produce the same pattern on coincident portions of both sides, each weft-plane being bound by binding-warps which do not cross from weft-plane to weft-plane.

483,079. INSECT-CATCHER. WILLIAM A. MCADAMS, Brooklyn, N. Y. Filed Dec. 3, 1891. Serial No. 413,964. (Model.)

Claim.—1. An insect-catcher comprising a net having an aperture in the apex thereof and an elastic pouch or bulb covering the apertured apex and communicating with the net, substantially as specified.

2. An insect-catcher consisting of a conical net with a pouch attached to and removable from the apex thereof, both constructed substantially as described, to the end that the insect may be readily removed from the pouch and that the pouch may be easily cleaned or washed when needed.



3. A self expanding and contracting neck in a pouch or bag, in combination with a net or conical-shaped cloth bag, for the purpose described.

4. A conical net having its meshes closed from the point of the net to a short distance from the point, so as to catch and confine the air when the net is in motion for the purpose of expanding the neck in the pouch and forcing a current of air through the neck and out of the orifice in the pouch, to the end that the insects may have room to pass in the neck and be drawn through into the pouch by the current of air.

5. A pouch or receiver of soft rubber, having a compressed or flattened neck and provided with one or more holes for the escape of air beyond the place of compression, thereby causing a draft of air through the neck of said pouch or receptacle for drawing flies and other insects into the said pouch or receptacle, substantially as specified.

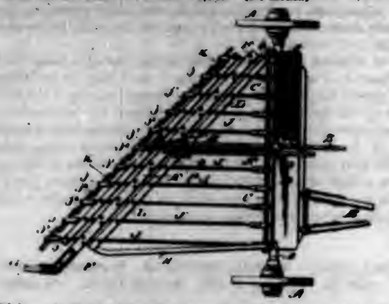
6. An insect-catcher comprising a conical net having an aperture in the apex thereof and provided with an imperforate portion at the apex, a rigid support for the apex of the net, and an elastic pouch covering the aperture of the apex of the net and provided with a hole for the escape of air, substantially as specified.

483,080. WINDMILL-REGULATOR. ELIPHALET C. NORTON, Belvidere, Ill. Filed Apr. 20, 1892. Serial No. 429,962. (No model.)

Claim.—1. A windmill-regulator having a supporting-frame, an eccentrically-pivoted toothed segment, a lever, a pawl on the lever for engaging the teeth of the segment, a detent for the segment, and a connection between the segment and the windmill and between the lever and the pumping-rod.

2. A windmill-regulator having a supporting-frame, an eccentrically-pivoted toothed segment, the teeth being of substantially uniform depth, a pawl on the lever for engaging the teeth of the segment, a detent for the segment, and a connection between the segment and the windmill and between the lever and the pumping-rod.

3. A windmill-regulator having a supporting-frame, an eccentrically-pivoted toothed segment, a lever pivoted off the center of the segment, a pawl on the lever for engaging the teeth of the segment, a detent for the segment, and a connection between the segment and the windmill and between the lever and the pumping-rod.



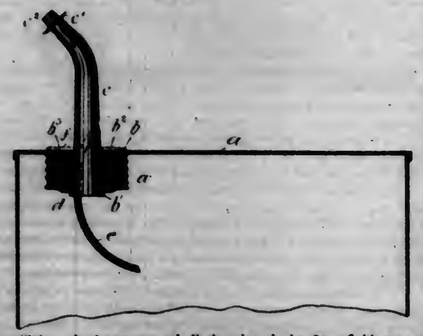
4. A windmill-regulator having a supporting-frame, a pivoted toothed segment, a lever pivoted off the center of the segment, a pawl on the lever for engaging the teeth of the segment, a detent for the segment, and a connection between the segment and the windmill and between the lever and the pumping-rod.

5. A windmill-regulator having a supporting-frame, an eccentrically-pivoted toothed segment a lever, a pawl on the lever for engaging the teeth of the segment, a detent for the segment, a float, an intermediate lever, a spring for this lever, a connection between the float and the intermediate lever, and connections between the lever and the pawl and the detent, and a connection between the segment and the windmill and between the first-mentioned lever and the pumping-rod.

6. A windmill-regulator having a supporting-frame, an eccentrically-pivoted toothed segment, a lever, a pawl on the lever for engaging the teeth of the segment, a detent for the segment, a connection between the segment and the windmill, and a bracket for the lever on the pumping-rod, the bracket composed of a base having two V-shaped bearings and a cap removably held in position over the bearings.

7. A windmill-regulator having a supporting-frame, an eccentrically-pivoted toothed segment, a lever, a pawl on the lever for engaging the teeth of the segment, a detent for the segment, a float, an intermediate lever, a connection between the float and the intermediate lever, and connection between the intermediate lever and the pawl and the detent, a connection between the segment and the windmill, said connections made adjustable, and a connection between the first-mentioned lever and the pumping-rod.

483,081. ROAD-SCRAPER. JOHN S. PALMER, West Duluth, Minn. Filed Feb. 26, 1892. Serial No. 422,816. (No model.)



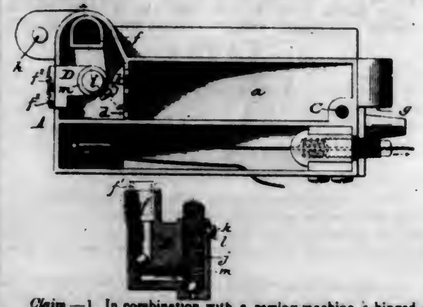
Claim.—1. A road-scraper comprising the main supporting-wheels and axle, the rigid diagonal beam secured at one end to the main axle, its opposite end having a wheel-support and connected with said main axle, a series of scraper-arms independently hinged at their front ends on the axle, their rear ends extended beyond the rigid beam and provided with scraper-blades, and the lifting-lever mechanism connected with the scraper-arms, substantially in the manner and for the purposes described.

2. The combination, with the main axle and supporting-wheels, the rigid beam F, secured to the axle and provided with a wheel-support, of the arms J, carrying the scrapers at their rear end and hinged at their forward end to the main axle, the spring-bar L, disposed in front of and parallel with the beam F, provided with guide-bails *l*, the spring disposed about each bail and held between the bar L and the tops of the arms J, and the lever N, pivotally connected at its outer end to the rigid beam F and formed with a cam portion engaging the spring-bar L, all arranged substantially as shown, and for the purposes described.

3. In a road-scraper, the combination, with the draft and supporting-frame mechanism, of a series of scrapers having their blades arranged to overlap, the overlapping ends having an inwardly-projecting flange adapted to close the space between the overlapping ends of the blades, substantially as and for the purpose described.

4. The combination, with the main axle and supporting-wheels, the rigid beam F, the caster-wheel support, and the connections between such beam and the axle, of the lifting-bar K and the spring-bar L, arranged parallel to the beam F, and the springs and bail devices on the bar L, the scrapers having their arms pivoted at their front end to the axle, their rear ends having flexible connections with the bar K, the levers N and S, operating the bars K and L, respectively, and the mechanism for holding the levers to their adjusted position, all arranged substantially as and for the purpose described.

483,082. FLUID CAN OR VESSEL STOPPER. WILLIAM H. PAYNE, Philadelphia, Pa., assignor, by direct and mesne assignments, to Cramer P. Hoskins and Gustav G. Alter, same place. Filed Dec. 19, 1891. Serial No. 415,574. (No model.)



Claim.—1. A stopper and discharging device for a fluid can or vessel, comprising a tapped nipple integral with one of the walls of the can or vessel, an internally-tapering bushing adapted to be screwed into the nipple and provided with a countersunk head having a tapped wall, a tapering nozzle afforded a range of play through said bushing and provided with an air tube and vent, and an externally-threaded cap adapted for insertion into the countersunk head of the bushing to close the can and retain the nozzle in closed position, substantially as and for the purposes set forth.

2. In a stopper and discharging device for a fluid can or vessel, an internally-tapped nipple integral with one of the walls of the can or vessel, an externally-tapped bushing adapted to be screwed into the nipple and provided with a countersunk head having a tapped wall, a yielding gasket secured between the bottom of the countersunk head and the lower end of the bushing, a nozzle afforded a range of play through said gasket and provided with an air tube and vent, and an externally-threaded cap adapted for insertion into the countersunk head of the bushing, substantially as and for the purposes set forth.

3. A nipple integral with one of the walls of an oil-can, a bushing adapted for insertion in the nipple and comprising a tube bent back upon itself and provided with internal perforated horizontal partition, a gasket interposed between said horizontal partition and a flange on the lower end of the bushing, a discharge-nozzle afforded a range of play through said gasket and partition, and a cap adapted to be screwed into the inner portion of said tube above the partition, substantially as and for the purposes set forth.

483,083. WAXING DEVICE FOR SEWING-MACHINES. MARSHALL H. PEARSON, Leicester, England, assignor to the John O'Flaherty Company, Montreal, Canada. Filed Nov. 2, 1891. Serial No. 410,561. (No model.)

Claim.—1. In combination with a sewing-machine, a hinged or pivoted waxing apparatus containing a pump to be actuated by a moving part of the machine, and means, substantially such as shown and described, for moving the free end of the said waxing apparatus into and out of line with the said moving part, whereby the actuation of the pump may be controlled.

2. A waxing apparatus comprising a cold-wax compartment *a*, pump compartment *b*, shuttle-thread compartment *c*, and a heating-chamber common to all, substantially as shown and described.

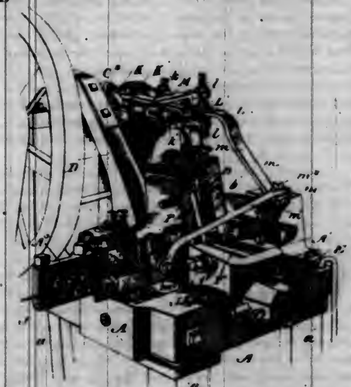
3. A waxing apparatus comprising a cold-wax compartment *a*, a pump-compartment *b*, interposed upright partition *e*, having the holes or perforations *d* at its lower end near the base of the compartment *a*, and a heating-chamber common to the compartments *a* and *b*.

4. In combination with a sewing-machine, a waxing apparatus provided with a pump having a plunger to be actuated by a moving part of the machine, the slotted case, the screw projecting from the plunger through the slot, and the plunger-spring.

5. In combination with a sewing-machine, a waxing apparatus provided with a pump having a plunger to be actuated by a moving part of the machine, the slotted case, the screw projecting from the plunger through the slot, the plunger-spring, and the arm bearing upon the screw.

6. In combination with a boiler having the compartment *b*, a pump located therein and adapted to take its supply of wax therefrom, and a wax-cup into which the needle dips and which is also located in the said compartment *b*, all substantially as shown, whereby the surplus wax flowing from the wax-cup is delivered directly into the compartment *b*.

483,084. BICYCLE-BELL. EDWARD D. ROCKWELL, Bristol, Conn., assignor to the New Departure Bell Company, same place. Filed Mar. 9, 1892. Serial No. 424,329. (No model.)



Claim.—1. A standard with a gong secured thereto, having a lug on its inner face, a pivoted lever, a hub rotatable on said standard, a hammer secured thereto, adapted to strike said lug, means connected with said lever and hub for rotating the latter in one direction, and a spring secured to said hub and said standard for returning the hub, as and for the purposes set forth.

2. A standard with a gong secured thereto, having a lug on its inner face, a pivoted lever with a projection thereon, a hub rotatable on said standard and having a hammer secured thereto, adapted to strike said lug, means connected with said lever and hub for rotating the latter in one direction, a spring connected with the standard and hub for returning the latter, and a stop with which said lever and projection thereon are adapted to engage, substantially as and for the purpose specified.

3. A standard with a gong secured thereto, having a lug on its inner face, a pivoted lever, a hub rotatable on said standard, and a hammer secured thereto, adapted to strike said lug, a flexible connection attached to one end of the lever and to the hub, and a spring secured to said hub and said standard for returning the hub, substantially as and for the purposes specified.

483,085. ATTACHMENT FOR CUT-NAIL MACHINES. CHARLES F. ROTH, of Ironton, Ohio, assignor of one-half to the Kelly Nail and Iron Company, same place. Filed June 24, 1891. Serial No. 397,288. (No model.)

Claim.—1. In a wire-nail machine, the combination of mechanism for gripping and heading a nail-blank with mechanism for feeding a length of wire for another nail beside the nail-blank while the latter is being operated upon by the gripping and heading dies, substantially as specified.

2. In a wire-nail machine, the combination of the gripping and heading mechanism with mechanism for feeding in a nail-blank beside a previously-fed blank while the latter is being operated upon by the gripping and heading dies, and mechanism for pointing the second blank simultaneously with the release of the finished nail by the gripper and header, substantially as described.

3. In a wire-nail machine, the combination of mechanism for feeding the wire into the machine beside a previously-cut nail-blank while the latter is being operated upon by the gripping and heading dies, mechanism for pointing and severing a nail-blank from the wire simultaneously with the release of the finished nail by the gripper and header, and mechanism for gripping and heading a severed blank while another length of wire is being fed into the machine over the severed blank, substantially as described.

4. In a cut-nail-making machine adapted to make wire nails, the combination, with the cutting-lever, of the moving knife or cutting-jaw, the upper pointing-tool mounted in said lever, and the feeding attachment adapted to feed in a length of wire while a previously-fed blank is being operated upon, substantially as described.

5. The combination, with the cutting-lever carrying the moving knife or cutting-jaw and the upper pointing-tool, of the bed pointer holder, the lower pointing-tool, and means for feeding a length of wire while a previously-fed blank is being finished, substantially as described.

6. The combination, with the cutting and gripping devices and the feeding mechanism for feeding a length of wire to the machine beside a previously fed and severed blank, of a spring-arm adapted to lift and maintain the uncut end of the blank in position to be acted upon by the cutting and pointing tools, substantially as described.

7. The combination, with the main shaft and the eccentric thereon, of the wire-feed plate, a vibrating bell-crank lever having a rocking connection with the eccentric-strap and a pivotal connection with the feed-plate, and adjusting means for varying the feed of the wire, substantially as described.

8. The combination, with the wire-feed plate and the mechanism for simultaneously pointing and severing a nail blank, of the vibrating arm, the pivot-post, the rod connected therewith, the pitman and universal joint connecting said pitman and rod, and the eccentric for actuating said vibratory arm to feed a length of wire beside the previously-fed blank, substantially as described.

9. The combination, with the wire-feed plate and the mechanism for pointing and severing a nail-blank, of a vibratory arm connected to said plate, the pivot-post rigidly secured to said arm, the shaft or rod adjustably connected to said pivot-post, the pitman, the ball-and-socket joint connecting said pitman with said rod, and the eccentric for actuating said vibratory arm, substantially as described.

10. In a convertible cut-nail and wire-nail making machine, the combination, with the gripping-lever and heading-lever of the cut-nail machine and suitable gripping and heading devices, of a pointing-lever, a removable upper pointing-tool holder adapted to be used interchangeably with the cutting and pointing levers of the cut-nail machine, and a feeding attachment adapted to feed a length of wire while a previously-fed blank is being operated upon, substantially as described.

11. In combination with the main shaft, the eccentrics mounted thereon, the wire-feeding mechanism, substantially as described, connected with one of said eccentrics, the gripping mechanism, and the pointing-lever carrying the upper pointing-tool, connected with and adapted to be operated by the other eccentric, substantially as described.

12. The combination, with the cutting-lever having a recessed head or socket, of the upper pointing and cutting dies or tools mounted therein, the bed-socket for the lower dies, removable and interchangeable dies mounted in said bed-socket, whereby the machine is adapted for making nails or staples, and feed mechanism for feeding a length of wire while a previously-fed blank is being operated upon, substantially as described.

13. The combination, with the cutting-lever and the bed-socket, each adapted to receive removable dies, of the gripping, cutting, and heading devices, and feed mechanism adapted to utilize the full motion of the machine by advancing a length of wire to the dies beside a previously-fed blank and while the latter is being operated upon, substantially as described.

14. The herein-described removable bed-pointer holder having a horizontal arm and a depending socket-piece connected to the extremity of said arm, substantially as described.

15. In a nail-machine, the combination of the removable bed-pointer holder having a horizontal portion adapted to lie in the bed-piece recess and a socket portion connected to the inner end of the horizontal portion, with the pointer or tool removably secured in said socket-piece, substantially as described.

16. The combination, with the wire-feeding attachment and the cutting and gripping devices of a cut-nail machine, of the bed-pointer holder, the upper pointing-tool, and an auxiliary attachment, substantially as described, for operating the upper pointing-tool, substantially as described.

483,086. GAS HEATING-STOVE. ROWIN ROOD, Pittsburg, Pa., assignor to the Fuel Gas and Manufacturing Company, same place. Filed Aug. 28, 1891. Serial No. 404,107. (No model.)

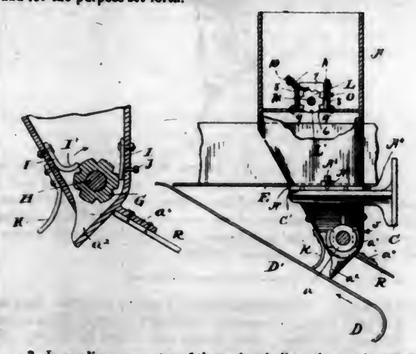
Claim.—1. In a gas heating-stove, the combination of an inner shell, an outer shell, a burner located between said shells near their lower ends, a series of annular chambers being formed between said shells and communicating at alternately-opposite ends one with another, said chambers forming a continuous passage in alternately-reversed directions around the inner shell for the products of combustion from the burner, and an outlet leading from the upper chamber of the series, substantially as set forth.

2. In a gas heating-stove, the combination of an inner shell having air inlet and discharge openings at its lower and upper ends, respectively, an outer shell closed at top and connected to the inner shell, a burner located between said shells near their lower ends, a series of annular chambers being formed between said shells and communicating at alternately-opposite ends one with another, said chambers forming a continuous passage in alternately-reversed directions

around the inner shell for the products of combustion from the burner, and an outlet leading from the upper chamber of the series, substantially as set forth.

3. In a gas heating-stove, the combination of an inner shell having air inlet and discharge openings at its lower and upper ends, respectively, an outer shell closed at top and connected to the inner shell, a burner located between said shells near their lower ends, a series of horizontal flanges interposed between and fitting on the inner and outer shells, each provided with an opening or blank space, a series of inclined flanges, each connecting one end of a horizontal flange with the end of the adjacent horizontal flange on the opposite side of its blank space, and an outlet leading from the outer shell above the uppermost horizontal flange, substantially as set forth.

483,087. TOY. GEORGE W. THOMAS, Baltimore, Md., assignor to George W. Bishop and Nathaniel Offeen, same place. Filed Nov. 7, 1891. Serial No. 411,196. (No model.)



Claim.—1. The toy consisting, essentially, of a frame and a toy figure supported inside the frame by elastic strips extending across the frame from side to side and supporting said toy figure, and a projectile attached to the frame by an elastic cord.

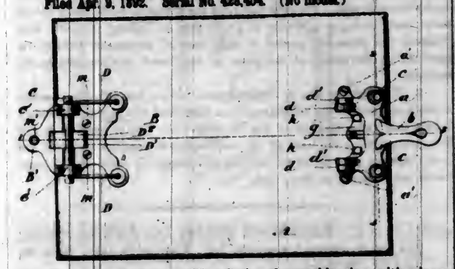
2. The toy frame consisting of a single piece bent like a tennis-racket, a toy figure supported within the open part of the frame by elastic supports extending across said frame from side to side, and a projectile attached to the frame by an elastic cord, all substantially as described.

483,088. SANDING APPARATUS. WILLIAM W. WALLACE and RAYMOND C. PENFIELD, Willoughby, Ohio, assignors to J. W. Penfield & Son, same place. Filed Mar. 4, 1892. Serial No. 423,736. (No model.)

Claim.—1. In sanding apparatus of the variety indicated, a sand-container comprising two sections located the one above the other in open relation with each other and bolted together, substantially as indicated, in combination with a supporting-bracket at either side of the container, the lower section of the container at the upper end and at either side thereof having a laterally-projecting flange resting upon and removably secured to said supporting-brackets, substantially as set forth.

2. In sanding apparatus of the variety indicated, a sand-container having a laterally-projecting flange at either side, in combination with supporting-brackets, upon which said laterally-projecting flanges are adapted to rest, the lateral flange and bracket at one side of the container being vertically slotted inward from their outer edges, as at 4, the last-mentioned lateral flange having an upwardly-projecting lug or pair of lugs adjacent said slot, an eyebolt pivotally secured to said lug or lugs between the side walls of the slot aforesaid, and a nut mounted upon the shank of the eyebolt and adapted to engage the lower side of the horizontal member of the bracket, said bolt being adapted to swing outwardly upon its pivotal bearing, substantially as and for the purpose set forth.

3. In sanding apparatus of the variety indicated, a sand-container having an opening for the passage of the bar of clay, an endless traveling apron located in line with the aforesaid opening and having an inclined section adjacent the sand-container, the latter having one or more rearwardly-projecting lugs or members, and a plate constituting the bottom of the opening aforesaid and bent over the edge of said rearwardly-projecting lugs or members, said plate extending forward of the sand-container and bridging the space between the latter and the aforesaid endless apron, but without making contact with the latter, substantially as and for the purpose set forth.



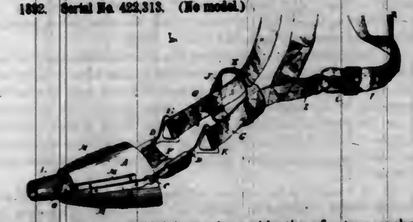
4. In sanding apparatus of the variety indicated, a fluted or grooved feed-roller located in the lower part of the sand-container, scrapers or cut-offs supported at opposite sides of said roller, the free end of the scraper located at the side of the roller opposite to the direction of rotation of the roller, being bent upward and bearing upon the roller, and the free end of the other scraper being adapted to merely make contact with the periphery of the roller, substantially as set forth.

5. In sanding apparatus of the variety indicated, a fluted feed-roller located in the lower part of the sand-container and scrapers or cut-offs supported at opposite sides of said roller and extending approximately the entire length of said roller, the free end of the scraper located at the side of the roller opposite to the direction of rotation of the latter, being bent upward and bearing upon the periphery of the roller, and the free end of the other scraper being adapted to merely make contact with the periphery of the roller, and a set-screw or bolt for holding the free end of the last-mentioned scraper in proper position relative to the periphery of the roller, substantially as set forth.

6. In apparatus for sanding the top and bottom surfaces of a traveling bar of clay, a sand-container, an endless traveling apron for conveying the bar of clay, said apron having an inclined section, a fluted or grooved roller located within or partly within the sand-container and above the line of travel of the bar of clay, said fluted or grooved roller being adapted to feed sand from the container and discharge the same onto the traveling bar of clay, a fluted or grooved roller located in the lower part of the sand-container below the line of travel of the bar of clay and adapted to feed sand from the container to the inclined section of the endless traveling apron, and suitable means for confining the discharge of sand to that carried in the flutes or grooves of the rollers, substantially as set forth.

7. In apparatus for sanding the top and bottom surfaces of a traveling bar of clay, a sand-container, an endless traveling apron for conveying the bar of clay, said apron having an inclined section adjacent the sand-container, a fluted or grooved roller located within or partly within the sand-container and above the line of travel of the bar of clay, said fluted or grooved roller being adapted to feed sand from the container and to discharge the same onto the traveling bar of clay, and a fluted or grooved roller located in the sand-container below the line of travel of the bar of clay and adapted to feed sand from the container to the inclined section of the endless traveling apron, substantially as set forth.

483,089. PAPER-FILING DEVICE. HENRY A. WINTERMUTE, Philadelphia, Pa., assignor of one-half to James M. Coryn, same place. Filed Apr. 9, 1892. Serial No. 428,454. (No model.)



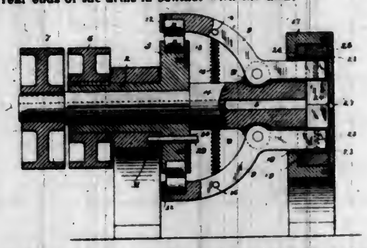
Claim.—1. In a paper-filing device, the combination, with a base-plate provided with a base-spring and a pair of journal-bearings, of a shaft partially rotating therein and carrying curved filing-wires, said shaft being cut away in two coinciding arcs of a circle, substantially as described.

2. In a paper-filing device, the combination, with a base-plate provided with journal-bearings and a shaft partially rotating therein and carrying filing-wires, of a pair of flat springs of unequal length, one permanently fixed in said recess and the other resting loosely thereon and beneath the said shaft, substantially as described.

3. A paper-punching device provided with a pair of parallel upright guide-posts *h h*, in combination with a base-plate *a*, on which the same are fixed, and a hinged cutting-plate open at the top to expose the guide-posts and the edge of the paper to be punctured, substantially as described.

4. In a paper-punching device consisting of a part carrying a cup-shaped male die and a part carrying a countersunk female die, an annular spring-cushion surrounding the male die and operating to discharge from the face thereof and through the countersunk opening of the female die the cut-out pieces of paper, substantially as described.

483,090. ARTIFICIAL ARM. JOHN E. WORTHAM, Grand Tower, Ill., assignor of one-half to Herbet C. Sells, same place. Filed Feb. 20, 1892. Serial No. 422,313. (No model.)



Claim.—1. In an artificial arm, the combination of a stump-socket, opposite swinging arms pivoted to said stump-socket, fastening-straps connected with the swinging ends of said arms and having crossed shoulder portions secured over the shoulders and to the body of the wearer, and a tool-socket secured to the tapered end of said stump-socket, substantially as set forth.

2. In an artificial arm, the combination of a stump-socket, opposite fastening-straps connected with opposite sides of said socket and having crossed shoulder portions taking over the shoulders and fastened across the breast of the wearer, an arm-strap secured to said opposite straps and fastened around the arm, and a tool-socket secured to the tapered end of said stump-socket, substantially as set forth.

483,091. SWAGING-MACHINE. CHARLES H. VARINGTON, Torrington, Conn., assignor of one-half to Patrick F. Deeley, same place. Filed Feb. 29, 1892. Serial No. 423,808. (No model.)

Claim.—1. The combination, with the sleeve having a disk 3 at its outer end and rollers in the periphery thereof, of a mandrel journaled in said sleeve and having pivoted thereto arms having rollers at their rear ends adapted to engage the rollers in the disk, means for imparting rotation to said sleeve and said mandrel independently of each other, a die-plate at the forward end of the mandrel, dies in said plate the backs of which are adapted to be engaged by the forward ends of the arms, a suitable case inclosing the die-plate and the forward ends of the arms, a spring for holding the rollers in the arms in contact with the rollers in the disk, and means for locking said disk and said die-plate against rotation, so that the successive blows of the dies may be delivered in the same plane or in a constantly-changing plane.

2. The combination, with the mandrel, die-plate, and dies, of arms 9, pivoted to the mandrel, the forward ends of said arms being adapted to engage the backs of the dies and their rear ends being provided with rollers, a disk between the rear ends of said arms, provided with peripheral rollers and depressions between said rollers, means for revolubly supporting said mandrel and disk, and a spring adapted to hold the rear ends of the arms in contact with the disk.

3. The combination, with the mandrel and dies, of arms 9, pivoted to the mandrel and adapted to actuate the dies, disk 3 between the rear ends of said arms, said arms and said disk being provided with sockets comprising more than a half-circle, rollers in said sockets, plates for retaining said rollers against lateral displacement, and means for revolubly supporting said mandrel and disk.

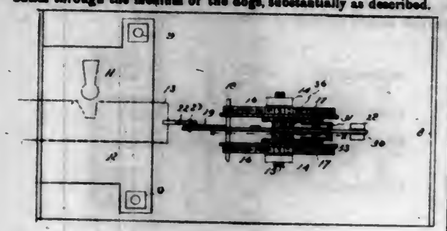
4. The combination, with the mandrel, the arms pivoted thereto, disk 3 between the rear ends of said arms and having peripheral projections, and the spring acting to press the arms against the disk, of the die plate and the dies adapted to be actuated by said arms, a case therefor having an opening to receive the mandrel and arms, and means for revolubly supporting said mandrel and disk.

5. The combination, with the disk, mandrel, die-plate, and dies, of arms 9, pivoted to the mandrel and having screws at their forward ends the points of which are adapted to engage the dies and the rear ends of which are provided with rollers adapted to engage other rollers upon the disk, a spring for holding said arms and said disk in engagement, and means for revolubly supporting said mandrel and disk.

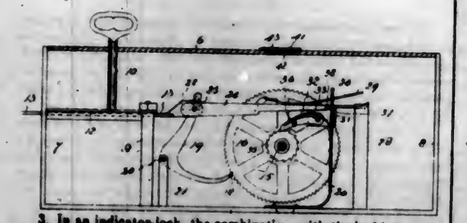
6. Standard 1, having hole 31, sleeve 2, journaled in said standard, disk 3, carried by the sleeve and having a hole 30, adapted to register with hole 31, and rollers in its periphery, and the mandrel journaled in said sleeve, in combination with the die-plate and dies, arms 9, pivoted to the mandrel, the forward ends of said arms being adapted to engage the backs of the dies and the rear ends provided with rollers to engage the rollers on the disk, a spring acting to hold the arms in contact with the disk, and a pin adapted to engage holes 30 and 31 to hold the disk against rotation when the mandrel is rotated, and means for revolubly supporting said mandrel and disk.

7. The combination, with the mandrel, disk 3, and the arms pivoted to the mandrel, said disk and said arms having rollers 11, of a spring acting to hold the arms in contact with the disk, the dies, the die-plate having hole 33, the die-case having hole 32, and a pin adapted to engage said holes to lock the die-plate against rotation when the disk is rotated, and means for revolubly supporting said mandrel and disk.

8. Disk 3, having rollers in its periphery, the arms pivoted to the mandrel and having rollers adapted to engage the rollers on the disk, and the mandrel having at its forward end a disk 19, in combination with the die-plate secured to said disk, said disk and said die-plate having slots to receive the ends of the arms, dies lying between the ends of the arms and adapted to be acted upon thereby, and means for revolubly supporting said mandrel and disk.



9. The combination, with the dies, mandrel, and arms pivoted thereto and adapted to actuate the dies, of disk 3 between the rear ends of said arms, having in its periphery sockets comprising more than a half-circle, rollers in said sockets, a plate secured to the disk to retain the rollers in place, substantially as described, and means for revolubly supporting said mandrel and disk.



483,092. INDICATOR-LOCK. DEWITT E. YOUNG and WILLIAM F. LITTELL, Wellsville, Colo., assignors, by mesne assignments, to The Littell Indicator Lock and Car Seal Company. Filed Sept. 14, 1891. Serial No. 405,707. (No model.)

Claim.—1. In an indicator-lock, the combination, with a locking mechanism, of rotating indicating mechanism loosely mounted and having no definite limit to its forward movement, a spring carrying dogs engaging a notched rack formed on said indicating mechanism.

and a bar connecting the spring with the lock, whereby as the lock is actuated the spring is placed under tension and suddenly released, acting on the indicating mechanism through the medium of the dogs, substantially as described.
